On the whole, we fancy that Miss Stretton is better for short stories than for three-volume novels. She has scarcely staying power enough to carry her without mishap to the end of a long endeavour; but she is almost perfect in her shorter sketches, and she has a singularly tender and pleasant method. We are sorry, however, to have to note one or two grammatical inaccuracies, such as "different to," "falling upon" a lower thing, and some others; and we are surfeited with repetitions, such as that of the various personages shutting themselves up in their own rooms whenever things go amiss, or they get into perplexity and trouble. Nevertheless with all its faults, and we have not spared them, *Hester Morley's Promise* has its own special charm—of manner rather than of matter, it must be understood. Miss Stretton would do well to avoid all the tumultuous themes of crime and passion; hers is essentially the style corresponding to the "pearly grey" of a painter, quiet, refined, subdued, but neither cold nor uninteresting. Into such a style as this it is a terrible mistake to import the glaring colours of murder and adultery; descriptions of respectable old village-towns like Little Aston, and of scholarly tradesmen like John Morley, are more to the purpose artistically, and infinitely more refreshing and delightful to the reader.

GERMAN LITERATURE.

THE most important part of the second volume of F. Spiegel's great work on Ancient Persia* is devoted to the religion of the country. The author retracts his former opinion that the dualism of the Zendavesta represents a transition from polytheism to monotheism, and is rather inclined to regard it as a development of the latter creed, occasioned by the difficulty of accounting for the origin of evil. He seems even disposed to adopt Kosowicz's view of the monotheistic character of Zoroastrianism at the period of the Behistun rock inscriptions, which would fix the origin of the dualistic theology at some point in the interval between Darius Hystaspes and Alexander the Great. The modifications in Persian thought he considers due to Semitic influence. He strongly suspects the belief in the sole and uncreated deity of Ormuzd to have been derived from the Semites, and asserts the Semitic origin of the doctrine of the resurrection of the body as taught in the Zendavesta. Many of the points of resemblance between the Zoroastrian and other theologies are sufficiently striking, especially in the sacramental system of the former, and in its eschatology. It is also startling to encounter the doctrine of the Roman Church respecting works of supererogation, and their application towards remedying the deficiencies of the pious. In the first section of his treatise Herr Spiegel discusses the character of the extra-mundane, and as it should seem impersonal, divinities, Boundless Time, Space, Light, and Darkness. Then follows the account of Ormuzd, who cannot in the writer's opinion be identified with any other Aryan divinity, and of the beneficent spirits called into being by him. The third chapter treats of Ahriman, in Herr Spiegel's opinion as distinctively a creation of the Persian mind as Ormuzd, and of his retinue of demons. The designation of these by the word which in Sanscrit denotes Gods is probably a vestige of the ancient schism of the Persian from the Indian religion, and a parallel case to the alteration effected by Christianity in the signification of *caluwu*. The next principal division of the volume is devoted to the obscure and interesting subject of Persian sects and heretics; especially the Zervanites, or deniers of the self-existence of the evil principle, and the Manicheans. In this part of his work the author has made much use of Arabic authorities. The second half of the volume is occupied by a clear and interesting sketch, evincing political insight as well as erudition, of Persian history from the commencement of the Achaemenian dynasty to the subversion of the Empire by Alexander the Great.

In the preparation of his learned work on the Epistles of Ignatius, Dr. Zahn† has been indebted to the unpublished labours of the late K. F. Arndt, whose treatise was completed for the

* *Eränische Alterthumskunde*. Von Fr. Spiegel. Bd. 2. Leipzig: Engelmann. London: Williams & Norgate.

† *Ignatius von Antiochien*. Von Theodor Zahn. Gotha: Perthes. London: Asher & Co.

press so long since as 1831. Since that period the interest in the subject has been revived by the late Dr. Cureton's discovery of an ancient Syriac version, to which, however, Continental scholarship has in general refused the importance at one time accorded to it in England. Gratifying as it would be to be able to believe ourselves in possession of the authentic text of so venerable a monument of Christian antiquity, we must acknowledge that Dr. Zahn's arguments against the originality of the Syriac text are irresistible; its meagreness and inconsecutiveness manifestly stamp it as a mere epitome. It may be feared that he is less successful in his vindication of the genuineness of the shorter Greek recension of the Epistles. Apart from such stumbling-blocks as the allusions to Gnostic heresies, and the impossibility of the development of episcopal pretensions to so vast an extent at so early a period, the letters are formal and polemical, utterly devoid of the lively touches of feeling which the situation of the writer would naturally have called forth, and of any signs of intimate acquaintance with the congregations which he is supposed to address. They seem almost ludicrously inadequate to their professed design of affording comfort and encouragement to a persecuted Church; but it is easy to see why they may subsequently have been concocted for doctrinal purposes. When, indeed, after a lecture to the Trallians on the duty of utter, even abject, dependence upon their bishop, he assures them that his expostulation is dictated, not by any immediate necessity, but by a presentiment that it may be useful at a future time, the manufactured character of the entire address seems almost too plain for argument. Dr. Zahn is ingenious and acute in his criticism on the Longer Recension, which he maintains to have been unknown to Eusebius, and to have been fabricated between A.D. 360 and 380 by Acacius, or some other eminent Arian theologian, for controversial purposes. It is somewhat difficult to understand how the forgery of a defeated party could have obtained such general currency. The latter part of the volume consists of a study of Ignatius as a theologian and an ecclesiastic, the value of which must depend upon the authenticity of the writings attributed to him. Dr. Zahn's views on these points are not always lucidly expressed, and his treatment of the subject is much too prolix.

Madlle. Ludmilla Assing has not found it convenient to state on the title-page of her edition of "Gentz's Diary" that three-fourths of the first volume is merely a reprint of a publication brought out by herself twelve years ago. Yet such is the fact; the Diary, down to the end of 1814, having been published in 1861. The lady, however, has carefully provided that purchasers of the former edition shall derive no benefit from this circumstance, by including the Diary for 1815 in the present volume, thus compelling them, unless they are willing to put up with an imperfect set, to buy the remainder over again. It may be questioned whether the object would warrant the outlay; at all events it should be clearly understood that the impending publication will probably be very voluminous, and the proportion of chaff to wheat much more considerable than formerly. The Diary to the end of 1814 exists only in the shape of an abstract made by Gentz himself, who had rejected whatever he considered uninteresting. He did not carry this abridgment further, and the remainder of the journal, to the end of 1828, is inevitably full of insignificant details, not one of which do we expect Madlle. Assing will spare us. To vend rubbish at the price of history would seem to be the final cause of this lady's being, and the triumph of her art. At the same time the ocean of triviality will no doubt contain some real pearls, which may profitably be fished for by those who are fortunate enough to obtain an inspection of her volumes gratis. There is not much of interest so far in the new portion of the Diary, beyond the additional touches contributed to the unique portrait of the diarist, with his magnificent intellect and childish foibles, his political courage and personal cowardice, his selfishness and generosity, his laboriousness and effeminacy, the dignified eloquence of his mercenary pen, the strange alliance in him of the cynicism of a political adventurer with the enthusiasm of a patriot.

A Treatise on the Greek Verb, by Georg Curtius †, is no doubt an important work in a philological point of view, but it is extremely technical, and of purely grammatical interest. The first volume, a good ordinary octavo, embraces in the writer's conception about half the subject. This prolixity is in some degree excused by the comprehensiveness of the field of inquiry, which now extends more or less to the formation of the verb in all Aryan languages.

The name of Wilhelm Dindorf is a sufficient guarantee for the merits of his *Lexicon to Æschylus* ‡, of which it is only necessary to say further that it is preceded by a short preface treating of the MSS. of Æschylus and the condition of the text.

Dr. Arnoldt's work on the choral parts of Aristophanes § is an examination of the manner in which these were brought upon the stage, involving the endeavour to distribute the choral songs among individual speakers where they do not appear to have been recited by the whole body of the performers.

Dr. Hartel's studies on Homeric prosody || relate principally to

the lengthening of short syllables before liquids. Three-fifths of the instances in which this takes place cannot, Herr Hartel says, be explained, unless on the assumption of some peculiarity in the pronunciation of liquids in Greek, the nature of which he endeavours to investigate.

The second volume of Dr. Bastian's "Ethnological Researches" * is, like the first, an undigested mass of information, chiefly serviceable inasmuch as it brings information scattered through an entire library of travel into the manageable compass of a single volume. The first section treats of the migrations of the American nations, the second of the aboriginal inhabitants of Africa, divided into groups, the third of the historical revolutions which have affected the Turanian race in Central Asia. An appendix adduces facts respecting the theology and psychology of barbarous nations. A more indefatigable compiler than Dr. Bastian never existed, but there seems less and less prospect of his proving himself to be anything more.

A Guide to Constantinople †, prepared by the Director of the Imperial Museum, at the instance of the Minister of Public Works, cannot fail to be serviceable to the visitor to that city. From the writer's official position he is better acquainted than most with the Ottoman department of his subject, while he appears by no means inattentive to classical and Byzantine antiquities. He incidentally mentions several unpublished Greek MSS. in the public library which he has had the opportunity of consulting—all, however, of a late period of the Byzantine epoch.

A companion volume to the foregoing, but executed on a larger scale, and including a much greater variety of topics, is devoted to the city and province of Smyrna. Dr. von Scherzer ‡, the Austrian Consul-General, has brought to this task the industry and accuracy formerly displayed in the compilation of his well-known volumes on Oriental commercial statistics, and has obtained the assistance of competent auxiliaries. Professor Fürst, for instance, has contributed a valuable Report on the intellectual and educational condition of Smyrna, which appears to be by no means unsatisfactory so far as the Christian population, whether indigenous or immigrant, is concerned. The Turkish schools are naturally backward, partly owing to the dearth of teachers, partly to the apathy of the population. However little the political results of Greek independence may have hitherto corresponded to expectation, there seems no doubt of its immense moral effect in not only uniting the Greeks as a nation, but in inspiring them with a spirit which has prompted the most strenuous efforts and devoted sacrifices in the cause of intellectual culture, which is rapidly rendering them the preponderant race throughout Asia Minor. Of the Turk personally Dr. Scherzer and his coadjutors entertain the most favourable opinion; he is sober, honest, affable and tolerant, but intellectually unfit to maintain the struggle with his quick-witted competitor, and exceedingly at a disadvantage from his exclusive liability to military service. The relations of the various races among each other are represented as very amicable on the whole. The larger part of the work is devoted to commercial statistics, both as regards the immense and undeveloped resources of the country and the competition of the manufacturing countries of Europe for the import trade. Agriculture is in a backward condition, and likely to remain so until the means of communication are improved, and as long as the bad system of farming out the taxes is persisted in. The volume is accompanied by an agricultural map, showing the nature of the produce raised in the various districts of the province.

Books of travel and other works relating to the Baltic provinces of Russia have of late been usually prompted by national feeling, either in the form of sympathy on the part of Germans for their oppressed countrymen, or of the disposition of the latter to proclaim their grievances. Paul Hunfalvy's § visit to the country was dictated by similar motives, not however bearing reference to the Germans, but to the Estonians, the long separated and almost forgotten kindred of the writer's Hungarian countrymen. The Ugrian affinities of the latter are, he complains, generally unknown or ignored in Hungary, and he is at some pains to establish the point by unimpeachable philological evidence. The literary part of his work is indeed the most valuable, for the principal interest at present attaching to the humble and inoffensive Estonians relates to the efforts now being made to preserve their nationality by the revival of their language, the publication of its ancient remains, and the creation of a popular literature. By far the most important work in Estonian is the national epic, the *Kalewipoeg*, a poem, or rather a collection of ballads, in 19,000 verses, in which the mythical traditions of the race are embalmed, bearing great analogy to the Finnish *Kalewala*. The original text was edited in 1857 by Kreuzwald; a German translation appeared in 1862; and Mr. Baring Gould has given some account of it for English readers in *Fraser's Magazine*. M. Hunfalvy enumerates the chief works in Estonian—principally, of course, of an antiquarian or educational character—which have appeared of late years, and gives an abstract of a pretty story of village life by Madlle. Jannsen, the only modern work of imagination in the language, except the poems of the same author. A comprehensive Dictionary has been recently published by Herr Wiedemann, who is now engaged upon a grammar. Five newspapers and other periodicals are published, with a collective circulation of about 7,000 copies. The population being estimated at 600,000, it would certainly appear that the Athenians are not a reading people. Much, however, is being done to remedy the depressed state of education among them, and M. Hunfalvy apparently does not consider that the nationality is in serious danger of absorption. In questions of administration he sides in general with the Germanist against the Russian Government's neglect of its treaty obligations and fraudulent religious propaganda; his language, however, is extremely moderate.

Wolfgang Helbig's extremely interesting work on the mural decorations of Pompeii, and other remains of Campanian art, is, according to the author's own account, principally designed to establish a criterion of distinction between the original works of artists of the imperial period and their imitations of their predecessors; and, in the second place, to show that the objects of these imitations or reproductions usually belong to the period of Alexander and his successors. The investigation of this latter proposition necessitates a copious inquiry into the characteristics of the art of this latter epoch—its realism on the one hand, its endeavour to express vague and indefinite sentiment on the other—its voluptuousness and sensationalism, counterbalanced by a more lively perception of the charms of inanimate nature than had been known to the classical age of Grecian art. The loss of all examples of Hellenic painting compels the author to have recourse to the remains of Alexandrian literature, and he shows at great length that the landscape backgrounds and other subordinate details of Pompeian pictures frequently correspond with remarkable accuracy to the poetical descriptions of Theophrastus, Apollonius Rhodius, and the epigrammatists. He adduces reasons for considering that the miniatures of the Vatican Virgil and the word-pictures of Nonnus are reproduced or modified from Alexandrian originals. The inquiry consequently takes a very wide range, and the interest of the book is by no means confined to archaeological subjects. The general tendency of Herr Helbig's criticism is to depreciate the inventiveness of the artists of the Roman Imperial period, and to represent them as mainly dependent upon their predecessors for their subjects, although the merit of their execution is admitted. In fact, the exhaustion of all motives derivable from the ancient mythology rendered this inferiority inevitable in the higher walls of art; but the busts and coins of sovereigns, the battle-scenes of Trajan's column, and even the performance of the Pompeian artists in genre and humorous subjects prove what ability remained for the treatment of the realistic aspects of ordinary life, and indicate what might have been expected if, as in modern times, a Dutch school of art had succeeded an Italian.

The distinction of Dr. Max Wirth† as Statistician-General of Switzerland, and as a writer on subjects of public economy in general, promises well for the success of Meyer's "German Annual" under his editorship. The work is designed to afford a complete prospectus of the intellectual life of Europe for the year, especially in the departments of science, industry, and political economy. This has been attainably performed, and the articles are especially valuable for the mass of statistical information which they contain. There are also creditable contributions on the fine arts, and on the chief literary productions of the year. The general survey of politics is hardly sufficiently copious, and the preponderance, excusable but unduly, accorded to German affairs in this and other departments of the work, has not occupied the observation of the editor, who promises that it shall be remedied in future issues.

ADVERTISEMENTS.

WAGNER SOCIETY, St. James's Hall.—SIX ORCHESTRAL and CHORAL CONCERTS, Friday Evenings, November 14, December 12, January 21, February 13, March 13, April 13. Conductor, Mr. E. Hammer. Subscription for the Series, 12s. 6d.; Single Tickets, 1s. 6d., 2s. 6d., 3s. 6d., 4s. 6d.

SIR EDWIN LANDSEER, R.A.—It has been decided by the President and Council of the ROYAL ACADEMY to exhibit at their annual WINTER EXHIBITION a COLLECTION OF THE WORKS OF the late SIR EDWIN LANDSEER, R.A. As they are very desirous that all honour should be paid to their late distinguished Member, they have decided to exhibit his Pictures and Drawings, by Sir Edwin Landseer, to intimate their willingness to CONTRIBUTE the same to the President and Council, Royal Academy of Arts, Burlington House, Piccadilly. The Exhibition will be supplemented by Pictures of Deceased British Artists. The Exhibition of Works by Ancient Masters will be resumed in the following season.

DORÉ'S GREAT PICTURE OF "CHRIST LEAVING the PRETORIUM," with "Night of the Crucifixion," "Christian Martyrs," "Francesca da Rimini," "Neophyte," "Aqueduct," &c., at the DORÉ GALLERY, 35 New Bond Street. Ten to Six. Admission, 1d.

ELIJAH WALTON'S EXHIBITION, including "A Storm at Sea" and "Sand Storm in the Desert," and many new and important Drawings, Alpine and Eastern, NOW OPEN at Burlington Gallery, 101 Piccadilly. Ten to Six. Admission, with Catalogue, 1d.

EDINBURGH VETERINARY COLLEGE.—Under the Patronage of the HIGHLAND AND AGRICULTURAL SOCIETY, the LORD PROVOST, Magistrates, and Council of the City of Edinburgh, Trustees of the late Professor DUGG. Founded in 1823.

The FIFTY-FIRST SESSION will be OPENED on Wednesday, October 24, by an ADDRESS, delivered in the Theatre of the College at Two o'clock, by Professor FEARLEY (Principal).

Medicine, Surgery, and Cattle..... Professor FEARLEY (Principal).
Anatomy..... " Munro, M.D., F.R.S., F.R.S.
Physiology..... " Young, M.D.
Chemistry..... " Dewar, F.R.S., F.R.S.E.
Comparative Pathology..... " Walley, M.B., F.R.S.

The Matriculation Examination for Students entering for the first time will be conducted by the Rector of the Royal High School, at 10 o'clock, on application to the SECRETARY. For Fees, and other information, apply to the Secretary, Wm. DUNNISON, Esq., M.D., F.R.C.S., 49 Albany Street.

HYDE PARK COLLEGE for LADIES, 115 Gloucester Terrace, Hyde Park.

The SENIOR TERM begins November 1.
The JUNIOR HALF-TERM November 1.
Prospectuses, containing Names of Professors, Terms, &c., may be had on application to the JAMES HAZEN.

GREEK CLASS.—Class to be formed in November for LADIES.—Apply to Mrs. E. COOK, 8 Blandford Square, N.W.

EDUCATION in GERMANY for YOUNG LADIES.—Delightful spot. Liberal, cheerful home. Terms, 50 Guineas per annum. No Extras. A thoroughly good General Education, and every accommodation a Lady may wish to acquire. University Prospectus sent daily.—Mr. and Mrs. KORN, Highgate, N. London.

MALVERN COLLEGE.

President and Visitor.—The Lord Bishop of WORCESTER.
Head-Master.—The Rev. ARTHUR FAIRB, M.A., late Fellow and Tutor of New College, Oxford.

There are two Departments—the CLASSICAL and the MODERN. Pupils are trained for the Universities, the Civil and Military Examinations, and the Professions.
There is a LOWER SCHOOL preparatory to either Department, a Gymnasium, &c.
There are five Boarding-Houses within the College Grounds, occupied by the Head-Master and four of his Resident Staff.
Board and Tuition under fourteen, 200—over fourteen, 220. For Non-Resident Scholars an extra fee of 25. Special advantages for Sons of Clergymen and Householders.
For further information, apply to the Head-Master.
The Next Term will begin on Monday, January 20.

MARLBOROUGH COLLEGE.—In December next there will be an EXAMINATION for FIFTEEN FOUNDATION SCHOLARSHIPS, of the value of 500 per annum each, tenable with any other scholarship during continuance at the School. These Scholarships are confined to Sons of Clergymen being members of the Governors.—Apply to THE BURSAR.

SCHOLARSHIPS and EXHIBITIONS.—An EXAMINATION will be held at MARLBOROUGH COLLEGE on Friday, 20th and 21st, for the purpose of selecting candidates for the above-mentioned Scholarships and Exhibitions. It will be for one or two years, according to merit, and to either Classical or Mathematical Candidates.
For Particulars apply to the HEAD-MASTER.

MARSHAL MACMAHON AND THE CONSERVATIVES

THE French Royalists have shown that they are not too proud to take a leaf out of an enemy's book. After deposing M. THIERS for trying to make a Republic without Republicans, they are now determined to make a Monarchy without a King. They can have no real wish to see Marshal MACMAHON President for ten years, but their political imagination is limited, and, having failed to get what they want, they are fain to put up with a colourable imitation of it. Still the policy of the Royalists pure and simple is more intelligible than the policy of the Conservatives pure and simple. France, it is clear, must suffer more than she has yet suffered before she will put up with the Count of CHAMBORD. If he is ever to be accepted as King, it must be in the character of a refuge from anarchy, and the best chance of producing anarchy is to saddle France for ten years with a President whom she does not want. It is a chance that may fall through the wisdom and self-control of the Republican party; but the Royalists naturally hope that this self-control will soon break down, and that France will be given over to intolerable license, to be quickly followed by equally intolerable repression. Upon this formless chaos HENRY V. will descend like the Divine Spirit at the making of the world. At his appearance order will resume her sway, and a new political creation will rise out of the deep. It is a tremendous risk to run for the sake of a possible Restoration, but to those who think a Restoration the one thing needful this is obviously not a valid objection. What shall it profit a Legitimist if he gain order and prosperity and lose his King? But the Conservatives who are acting with the Royalists in this matter have no such excuse to offer. Their conduct ever since the 24th of May displays extraordinary ignorance of what constitutes a really strong Government. The reason why one French Government after another has proved so weak is that not one of them has had any real foundation in the public opinion of the nation. The great mass of Frenchmen have accepted any Government that has been given to them. An adventurer who could once lay his hand on the bell-rope might count on the obedience of all the servants, and French Revolutions have by degrees resolved themselves into a series of rashes to get hold of the bell-rope. Ten days ago the Royalists stood very near it; to-day it is almost within the grasp of the MacMahonists. But power thus secured will at best be held on the old precarious tenure. The most hopeful sign about French politics in 1871 was that all reasonable politicians seemed to be becoming conscious that the way to establish a strong Government was to wait until a genuine preference for one form of government over another had developed itself in the country. Now the Conservatives of the Right Centre have unlearned their momentary wisdom, and are ready to impose the Count of CHAMBORD upon the nation one day, and Marshal MACMAHON the next. The old delusion of a strong Government—strong, that is, in the momentary support of the army and in nothing else—has returned to its hold over them; and instead of welcoming the preference for a Republic which is beginning to grow up in France as the best road out of the political dilemma, they are only in the greater hurry to set in an opposite sense before the growing opinion has declared itself so loudly to be false.

We are far from saying that no prolongation of Marshal MACMAHON's power would have been allowable in the present emergency of France. On the contrary, it might have been very expedient to give him half of

tenure during the interval which will be required to carry the country through the present political crisis. If the proposal of the Right had been to declare the Marshal President until the constitutional laws had been passed, or even until the dissolution of the existing Assembly, the Left might very well have accepted it as providing timid citizens with a guarantee that order would be maintained during the process of consolidating the Republic. But to declare him President for ten years is a proposal differing only in degree from the design of making France a Monarchy. The essential vice of the two proposals is the same. They are both attempts to bind the country by the decree of an Assembly which no longer represents the country. The MacMahonists are just as set upon snatching a vote before the vacant seats are filled up as the Royalists were the week before last, and they are set upon it for the same reason. They know that the country is not with them, and that even the trifling addition which the partial elections would make to the numbers of the Assembly would probably be enough to convert their majority into a minority. There is nothing necessarily vicious in a President being elected for a prolonged period. If the French nation, or even the existing Assembly with its full tale of members, had decreed the mode of the President's appointment, had defined the extent of his powers, and had regulated his relations with his Ministers, there would have been no objection to the duration of his power being fixed at ten years. But when those indispensable preliminaries are wanting, such an election is tantamount to the appointment of a dictator. Marshal MACMAHON is intended to rule with absolute power until such time as laws have been passed which shall make the Ministers absolute enough to dispense with his aid. What the nature of these changes is to be is shadowed forth in the Marshal's Message. Existing laws, he says, do not arm the Government with sufficient strength "to discourage" factions, or even to make itself obeyed by its own agents. "The press abandons itself with impunity to excesses" which would end by corrupting the public mind. The "municipalities forget that they are organs of law, and leave the central authority without representatives." The Marshal might have put all this in a shorter compass, if he had simply said that the Government finds itself powerless to suppress Republicanism. This is the sum and substance of the law's offending. The factions which the Government is unable to discourage are the majority of the electors throughout the country. The agents whose obedience it cannot command are the officials who are bidden to prevent the return of Republican members, and who plead that the task assigned them is an impossibility. The corrupting press stands for the journals which are sufficiently cautious in the utterances of their views to escape the decrees of suppression which are freely dealt out to newspapers that dare to defend the existing order of things against such licentious attacks as those of the *Univers*. The municipalities who leave the central authority without representatives are the Councils-General, who set the wishes of their constituents above the hints of the Prefect, and boldly tell the Government that the people of the department desire a Republic. Marshal MACMAHON's supporters fondly hope that with ten years of power secured to him all these evils may be set right. When it is no longer safe for the subjects of a Republican Government to show themselves Republicans there will be an end to factions. When a new electoral law has purged the constituencies of all dangerous voters, the Prefects will no longer allege inability to execute the orders given them.

When Republican journalists are either silenced or banished, the excesses of the press will be all in the right direction. When the municipalities have been remodelled and made the creatures of the Central Government, they will be eager to win pardon for the independence into which they have lately been betrayed. These are the blessed results which society is to gain from the possession of an Executive power "solicitous for its future and able to defend it with energy."

In the debate of Wednesday the Left wisely rested their opposition to the extension of Marshal MACMAHON'S reign on the impropriety of conferring a ten years' lease of power before the nature of the power had been determined. No one can say precisely what it is that the Marshal will probably be made in the course of to-day or to-morrow. Until now he has been the delegate of the Assembly, holding office at its bidding, and capable of being removed at any moment by a hostile vote. Even if it be granted, for the sake of argument, that it is desirable to put an end to this state of things, it cannot be desirable to make the Chief of the Executive irremovable until his relations with the Legislature and with the country have been discussed and settled. Conservatives must be extraordinarily fond of leaps in the dark, or they would not be so anxious to give themselves up body and soul to a ruler of whom they know nothing but that he has proved himself a brave soldier and a vacillating politician. But the Marshal's Message fails altogether to show that there is any necessity for giving this sudden permanence to the Executive. The party strife which he deprecates was entirely provoked by the Conservatives. As M. DUBAUX pointed out, until the visit of the Count of PARIS to Frohsdorf, France had been absolutely tranquil under Marshal MACMAHON'S Government, and the first note of disturbance was given by the Royalist intrigues, and by the suspicion of Government complicity in them. For all the agitation of the past three months, as for all the agitation which must follow the unjustifiable prolongation of the PRESIDENT'S term of office, the Conservative party is directly and solely responsible.

LEGAL VACANCIES AND APPOINTMENTS.

THE death of Vice-Chancellor WICKENS was followed almost immediately by that of Chief Justice BOVILL, so that the Long Vacation ended with the loss of two Judges, each eminent in his way, and with a number of new appointments at the disposal of the Government. The late Vice-Chancellor was in many respects a model of what may be termed the University type of judge. He knew a great deal of law, but he knew a great deal of many other things; and what he knew he knew well. With very wide reading, a singularly retentive and accurate memory, and sound judgment, he had the resources of literature at his command in a degree which few rival who have given themselves up to literature altogether. As a lawyer he was noted while at the Bar for the lucidity, good sense, and accuracy of his opinions, and everything seemed to show that he would as a judge acquire a commanding reputation. But affliction and ill-health prevented him from doing justice to his powers after he became Vice-Chancellor, and he has now died too early to leave a judicial reputation behind him. But the judgment of a profession is rarely wrong, and so much could scarcely have been expected of a judge without a strong probability existing that the result, if it could have been ascertained, would have conformed to the expectation. Chief Justice BOVILL was an equally good type of what may be termed the non-University judge. He began in a solicitor's office, he worked hard, he made himself an excellent commercial lawyer, he was a useful and successful advocate, and he won general good will, and even affection, by unflinching good temper and easy geniality, and by innumerable acts of kindness. He was for some time in Parliament, but without in any way seeking to make himself conspicuous, and even when he was a law officer he merely did the work that came in his way. Few law officers shine in the House of Commons if they have a large private practice. They are overworked, and overworked men are obliged to get through their daily task as they can. There have been some exceptions, of whom the present CHANCELLOR is one of the most conspicuous; but the pressure of work tells so much on most law officers that they are content to serve the Government and their private clients as fairly and honourably as they can, and let things go on if possible until some

superior sort of judgeship falls vacant. Chief Justice BOVILL went through the House of Commons and the posts of Solicitor and Attorney General in the due course of deserved promotion. When he was made a Chief Justice, lawyers of all parties thought that he had honourably earned the distinction, and were pleased that a man popular and acceptable had not been deprived by ill fortune of an adequate reward. It was the first TICHBORNE case that made his name and appearance familiar to the public, and no one could deny that a case of a most extraordinary character, length, and interest was placed under the superintendence of a legal dignitary who displayed an admirable patience and assiduity, and a cheerfulness which not even the prolonged tediousness of a never-ending story could dispel or materially impair.

The post he has quitted will naturally be filled by one of the chief performers in the drama over which the late Chief Justice presided. Custom decides that, if the Attorney-General is willing to take a vacant Chief Justiceship of the Common Pleas, he is to have it; and even if custom did not give him the place, Sir JOHN COLERIDGE would have an indisputable claim to fill it. In Parliament it can scarcely be said that Sir JOHN COLERIDGE has fulfilled his early promise. He has never got beyond the second rank of speakers; and although he has never fallen short of what a prominent supporter of the Government is expected to do, he has rather succeeded in saying well what he has obviously had to say than commanded the admiration of his audience by the display of unusual powers. He has played no original part in legislation, and has on more than one occasion explained in his defence that he considered or found that original legislation was beyond the sphere of a law officer. Nor has he been very successful in the difficult task of watching over the drafting of Government Bills, and calculating the effect of amendments and interpolations. Still he has now and then shown a width of view and a general grasp of a considerable question which have done much to increase his reputation, and he has taken advantage of several opportunities when he has been able to make himself useful to his friends by conciliating the sympathies of an important ecclesiastical party with the policy of advanced Liberalism. However he may be replaced, the Government will lose more than it will gain by his disappearance into the tranquil dignity of a Chief Justiceship. Opinions will vary as to whether it is likely that he will do more than fill the office he is understood to have accepted in an adequate and satisfactory manner. In the discussion of mere legal points he has not established more than an average reputation; but of all men a judge finds it the easiest to advance rapidly in the knowledge and comprehension of law. To be eminent as a lawyer is, however, only one of the qualifications of a good Chief Justice. He has other functions, the discharge of which in a masterly manner lies at the bottom of much of the respect which in England is generally felt for the heads of the law. He has to maintain the dignity of his court, to make juries and listeners feel that they are in the presence of a superior person; and he has to show on the occasion of important trials that he can co-ordinate disjointed facts, and weave threads of various colour and texture into a whole on which an opinion can be satisfactorily pronounced. In these spheres of official duty Sir JOHN COLERIDGE is sure to attain a success beyond the average of success attained by his predecessors in office. He will look and behave like a Chief Justice, and this is an advantage which no one will underrate who understands that Chief Justices live in a shifting world of listeners which wants to see and hear them, before it forms an estimate of the amount of respect or admiration due to them. Of the power of the new Chief Justice to marshal facts, to arrange evidence, to tell a long story clearly, no proof is needed after his very remarkable display of skill in this department of legal work, when, in a speech that ran into weeks, he massed together the evidence for the TICHBORNE defence. Whether he shone in cross-examination during that trial is a point to be variously decided according to the judgment or prepossessions of professional critics; but no one would think of contesting that he managed to tell a story as long as several Waverley Novels put together with wonderful clearness, method, and continuity.

Mr. HENRY JAMES will, as a matter of course, become Attorney-General almost before he has had time to show himself as Solicitor-General; and fortunately he does not forfeit his seat by the change. His seat is, however, to be

attacked by a petition, and although it is not to be supposed that the petitioners will allege that he was cognisant of any corrupt practices, or personally mixed up with them, every candidate runs the risk of having indiscreet friends who are more anxious that he should win than careful how he wins. No contest could have more the appearance of being fairly fought than that which the SOLICITOR-GENERAL waged at Taunton, and the petition now presented is not, it is said, countenanced either by the defeated candidate or the local heads of the Conservative party. However this may be, if there are persons at Taunton who have satisfied themselves on reasonable grounds that bribery or corruption was practised during the recent election, they are not only entitled to have the matter inquired into, but they are rendering the public an unmistakable service by insisting that an inquiry shall be made. It will be very much to be regretted if an Attorney-General in the first flush of success, like Mr. JAMES, forfeits his seat because some foolish and misguided persons with whom he has unhappily established a relation amounting to agency have chosen behind his back to take measures on his behalf of which he would have most strongly disapproved. But if misguided people of this sort are to be restrained, nothing could be more likely to restrain them than by selecting a conspicuous example to show that not only are their efforts entirely frustrated in the long run, but they have actually inflicted a most cruel blow on the man they wished to serve. How petitioners are to prove their case under the Ballot is a most interesting question, and if it is practically found, on an occasion which will attract such attention as the trial of a petition against the ATTORNEY-GENERAL, that under the Ballot there is great difficulty in getting legal proof of offences that will unseat a member, the consequences on the eve of a general election may be most serious, and the cost of getting into Parliament may suddenly be enormously enhanced. For the vacant post of Solicitor-General the Government has to choose between a thoroughly competent man like Mr. HARCOURT, to whom there are some objections, and men to whom there are no objections, but who are not as yet in that position at the Bar, or in the House, which law officers have generally obtained before they receive their appointment. The objections to Mr. HARCOURT are that, as his practice was at the Parliamentary Bar, he has necessarily since he entered Parliament had less to do with the practice of his profession; and that he has assumed to the Treasury Bench the position rather of an equal than of a possible subordinate. These objections are, however, of little or no weight as compared with the attainment of the great object of getting the best man into a vacant office; and it will be for Mr. HARCOURT to decide whether he prefers the easy path of professional promotion, or the more difficult, but more interesting, road to political eminence.

THE FALL OF THE CANADIAN MINISTRY.

THE Canadian Ministry, by resigning office without waiting for the result of Mr. MACKENZIE's motion for a vote of censure, have escaped the formal condemnation which, it may be assumed, would otherwise have been passed on them; but it is difficult to understand what advantage they imagine that they have obtained by this proceeding. Their resignation is necessarily an acknowledgment that they have lost the confidence of the House of Commons, and it is also open to the interpretation that they were conscious of the weakness of their case, and possibly afraid that the more thoroughly it was examined the worse it would appear. The Canadian Parliament has been expressly invited by the GOVERNOR-GENERAL to prosecute or complete at its discretion the inquiry which has been held by the Commission. There is, however, apparently nothing further to discover; for the whole controversy turns, not on disputed facts, but on the opinion which may be formed of the character of the transaction. The advocates of the late Ministry boast, with a certain amount of truth, that Sir JOHN MACDONALD and his colleagues gave their evidence with perfect candour; and perhaps they may have been the more communicative because the whole story had already been published in full. It would have been useless for Sir JOHN MACDONALD to anticipate the apology offered for him by the Duke of Manchester, even if it had been possible that the Prime Minister of CANADA could be as careless of accuracy as an amateur observer.

The Duke, having recently visited Canada, and feeling, as he says, no political prejudice in favour of either party in the Dominion, has given an opinion on the Pacific Railway scandal which would have been open to question even if it had not been founded on a misapprehension of the facts. The Duke begins his narrative with the statement that Sir JOHN MACDONALD "had given a charter for the Canadian Pacific Railway to 'Sir' HUGH ALLAN and some United States colleagues." He then states that the Opposition took advantage, in the canvass preceding the general election, of the concession of a great public work to a Company which included foreigners. The Ministers, finding their party supremacy endangered by the popular clamour, then applied to Sir HUGH ALLAN for pecuniary assistance; and as there is in Canada no political Secretary of the Treasury, the PRIME MINISTER received cheques for the money necessary for elections, and gave receipts for the amount. "This was disgraceful; for one 'man may steal a horse, while another may not look over 'the hedge.'" The Duke of MANCHESTER in the same ironical tone asserts that the Railway charter was cancelled or surrendered some weeks ago, and that the PRIME MINISTER had committed a great mistake in not communicating the fact to the press of Canada and of England. It seems that, in the Duke's opinion, a Secretary of the Treasury would be perfectly justified in receiving, for the purposes of an election, money from a contractor who had immediately before obtained a valuable concession from the Government. As no such act of dishonesty is known to have been committed in England in modern times, a peer of high rank ought not gratuitously to insinuate that English Ministers are not superior in morality to the most corrupt politicians on the other side of the Atlantic.

As the Duke of MANCHESTER has not yet discovered that the practices which he defends are obsolete in England, his judgment on the Canadian controversy is entitled to little weight. Notwithstanding the extravagant tolerance which the Duke professes, he has only satisfied his conscience of the innocence of the Canadian Ministers by imagining an order of events which has not occurred. It is not true that Sir JOHN MACDONALD first granted the contract, that the Opposition then attacked his decision, and that finally he appealed to Sir HUGH ALLAN for pecuniary support. The contract was never given to the Company which included American subscribers. On the contrary, the only redeeming point in the conduct of the Ministers was their demand that the two competing Companies should be amalgamated, for the express purpose of excluding American influence. When the proposed union failed in consequence of the refusal of the Inter-Oceanic Company to amalgamate with the Canadian Pacific, a new Company was formed under the presidency of Sir HUGH ALLAN; and the advance of money was anterior to the final conclusion of the bargain. In a letter of the 6th of August, 1872, Sir HUGH ALLAN informs his American associate, Mr. M'MULLEN, that the Government had on the previous day granted the contract to a Company to be formed of Canadians only. He states in the same letter that "this position has not been obtained without a large outlay of money. I have already paid over '200,000 dollars, and I will have at least 100,000 'dollars more to pay.'" Of this sum of 40,000l. or 60,000l., Sir JOHN MACDONALD had by his own acknowledgment received 9,000l. for the purposes of the election; yet the Duke of MANCHESTER can see no impropriety in the transaction, except that the PRIME MINISTER was imprudent in signing the receipts. Canadians and Americans of lax consciences will welcome the acknowledgment that the exchange of Government patronage for money is commonly practised in England; and perhaps they will not accept that contradiction of the Duke's implied assertion. He has probably held himself aloof from the details of politics, and he may have founded his belief on traditions handed down through three or four generations. There are always persons incapable of observing the world around them, who would attribute to Mr. GLADSTONE the practices of Sir ROBERT WALPOLE, and judge of Lord NORTHBRIDGE's administration of India from the declamatory invectives of BURKE. Not only would a Parliamentary Secretary of the Treasury who should be guilty of the practices which are imputed to Sir JOHN MACDONALD and his colleagues, on the exposure of his corrupt dealings, be driven from public life; but he would involve the Government which he served in political ruin. The Duke of

MANCHESTER is perfectly right in holding that it makes little difference whether receipts for bribes are signed by a Prime Minister or by a confidential subordinate; but his estimate of the political morality of England is founded on utter ignorance.

LORD DUFFERIN's assent to the prorogation of the Parliament after the adjournment has been satisfactorily explained in a long despatch which has been approved by Lord KIMBERLEY on behalf of the Crown. As it had been announced on the eve of the former adjournment that the Parliament would only meet again for the purpose of the prorogation, many members were not in attendance; and the enormous distances of Canada would have rendered it impossible for many of them to obey a hasty summons. It happened that the strength of the Opposition lay in the home districts, while some of the Ministerial supporters were in Europe, and some beyond the Rocky Mountains. No proof was tendered to the GOVERNOR-GENERAL that any member of the majority had changed the opinion which the House had before the adjournment tacitly expressed in favour of immediate prorogation. The worst that could happen was the loss of two months; and the interval, instead of being wasted, was occupied by the inquiry of the Commission. If the House of Commons had acquitted the Ministry by refusing to pass Mr. MACKENZIE's vote of censure, the GOVERNOR-GENERAL would no doubt have complied with Parliamentary precedent, whatever might be his private opinion. If the House had, at its previous meeting, been fully attended, Lord DUFFERIN would probably have declined to allow his Ministers the respite afforded by a prorogation. An English nobleman who has studied the course of public affairs more carefully than the Duke of MANCHESTER is not likely to have regarded with complacency or indifference a plausible charge of corruption against his Ministers; but his conduct, as he explains it in his despatch, was constitutional and prudent. That it was upright and honourable no Englishman had previously doubted; and the vituperation of Canadian newspapers is probably the result of habit rather than conviction.

The result of the resignation of Sir JOHN MACDONALD and his colleagues will be shortly known. Probably it may not be thought necessary by their successors to resort to a dissolution. The differences which divide the contending factions are scarcely intelligible to English minds, nor is the appellation of the "Clear Grit party" calculated to afford political information. It may be hoped that the political conflict will not prevent or delay the construction of the Pacific Railway. The fear that American speculators might be interested rather in the rival line through the States than in the Canadian enterprise explains, and perhaps justifies, the jealous care of the Government to dispense with the aid of foreign capital. It would probably have been more expedient to sustain Sir HUGH ALLAN's contract than to postpone indefinitely the construction of the railway; but the concession has been surrendered, not, as the Duke of MANCHESTER supposes, through feelings of delicacy, but because the Company has failed to procure the necessary capital in England. The accused Ministers are entitled to the benefit of a practical demonstration that the concession which they are said to have sold has been found valueless by the holders.

THE BENGAL FAMINE.

ENGLISHMEN may fairly regret this autumn that communication with India is so rapid and so perfect. If it were in our power to avert the terrible disaster with which, according to the telegrams, Bengal is threatened, we could not know of it too soon. But when we can simply sit still and hope that the accounts are exaggerated or premature, it would be well if we did not receive them except in sufficient detail to furnish their own corrections. To Englishmen an Indian famine is the worst of all famines. The sufferers are their own fellow-subjects, and therefore it comes home to them as though it were in Ireland or in Lancashire. And yet they are as powerless to render any assistance as though it were in China or Persia. All that can be done must be done on the spot. It is allowable, therefore, to sift to the utmost the statements furnished by the telegraph, because there is no one to be stimulated into action, and consequently, if things are made out worse than they afterwards prove to be, there is no practical gain to compensate for the mental distress which exaggeration causes. No

doubt, if the worst inference from the telegrams is the true one, the prospect is very terrible. Bengal Proper, with its thirty millions of inhabitants, is one of the most densely peopled countries in the world. By the Census of 1871 it appeared that the food-producing area contains an average population of 650 souls to the square mile, or one to each half-acre. If the rice crop were to fail completely, this whole population will be thrown on the hands of the Government of India. In 1770 this actually happened. The rains had ceased prematurely in the previous September, and the December rice crop was as so much dried straw. The spring pulse crop kept off starvation for a short time, but when that was consumed the people died by millions. There is an alarming similarity, as regards the weather, between 1873 and 1770. The rains which should have lasted through September and have been succeeded by October showers, came altogether to an end about the middle of the former month, and now, unless the winter is as abnormal as the autumn, it is too late to look for them. On the other hand, if the causes of famine are as present as they were in 1770, it is far from certain that they have been equally fertile in results. Those who are most likely to be well informed are still doubtful whether there will be any famine, and whether the scarcity which seems inevitable will not be felt in Behar rather than in Bengal Proper. If this view of the case turns out to be correct, it supplies two sources of encouragement. The greatest of the rice producing districts will not be affected, and the province actually visited by scarcity is one in which the people do not trust to rice so exclusively as in Bengal Proper.

Happily the condition of Bengal is very different now from what it was in 1770. The English Governors had then no adequate experience of what famine meant, and even if their knowledge had been greater, their powers of giving effect to it were too small to be of much avail. There was no free expenditure of money. "The utmost," says Mr. HUNTER, "that the Council, when pressed by the Court of Directors as to Government relief efforts, could show was a distribution of 9,000*l.* among thirty millions of people." Even if the money to buy grain had been forthcoming, the means of distributing grain were wanting. Now there are roads and railroads at the disposal of the Government of India, and with four months' warning—for it seems that, as in 1770, the real pinch of the scarcity will not be felt before March—a great deal can be done in the way of collection and transportation. Rice can be imported by sea from British Burmah and Cochin China, though in the latter market the Chinese are now formidable rivals of the Indian buyer; and Bengal is now connected by railways with Central and Southern India. The inducement of high prices, and the pressure of Government orders, will bring all the available grain into the suffering districts; and the principal difficulty—in itself no doubt a sufficiently formidable one—will be to convey it to the villages lying away from the great lines of road. There is some comfort in the reflection that in so many respects the prospect now is better than the prospect in 1770. Instead of a grant of a few thousand pounds, there is the whole treasury and the whole credit of the Government of India. It is true that money will not create food, and that all the imported food that the Government can lay hands on may be insufficient to meet the demand. But the force of money as a food collector has never been tested; since, though money was to be had in Orissa in 1866, there was no means of conveying the food when bought to the district which was being depopulated for want of it. Instead of a total want of means of communication, there is a system of roads, incomplete indeed according to our present notions, but still opening up in some degree districts which a century ago were altogether unapproachable. A further difference in favour of 1873 lies in the wiser policy of the Government as regards private trade. In 1770 the Government set its face against the hoarding of grain; and the consequence was that prices remained low, and consumption did not lessen, until the whole stock of food was on the eve of being exhausted. Now prices are rising at the very first hint of scarcity, and the result will be that food will be compulsorily husbanded from the outset. In all these ways the disaster will be met, if met it has to be, at an advantage to which 1770 presents no parallel.

The periodical recurrence of famines, or threatenings of famine, completely disposes of two objections which have of late years been taken to the policy of the Indian Govern-

ment. Why, it has been said, should so large a balance be maintained in the Treasury instead of being left to fructify in the pockets of the taxpayers? Those who have recently asked this question will hardly care to press for an answer to it just at present. A Government which may any year have to maintain sixty millions of people for months together ought not to leave itself without an ample reserve. It might indeed in ordinary years go about its business with empty pockets, and trust to borrowing what it wants whenever the necessity presents itself. But taxes levied to pay the interest on loans are, to say the least, as heavy a burden as taxes levied to maintain a balance, and it is certainly not desirable that the Government should be considering how to raise money on the easiest terms at a time when every moment is wanted, and every energy ought to be available for the work of collecting and distributing food. Still more conclusive is the answer which the alarm of famine furnishes to the argument that the Government of India has been too lavish in its expenditure on public works. It is only on exceptional occasions that the real meaning of this expenditure can be recognized. If there had been no Government expenditure on roads and railroads in Bengal, the prospect before us would probably have been as hopeless as in 1770. If there had been no Government expenditure on irrigation in provinces where the rainfall is less than it ordinarily is in Bengal, those provinces would have been constantly open to the danger to which Bengal is occasionally exposed. There may be lavish expenditure on public works in the sense of money being laid out on unprofitable works, or on works which promise to be less remunerative than others which might have been undertaken in their place: but, in the sense of money laid out upon works of recognized utility, it is scarcely possible that the outlay should be too large. After all that has been done in the way of road-making, there are districts in Bengal which can only be reached by a tedious and costly journey across a trackless country and unbridged rivers. It is here that the pinch of the apprehended scarcity will be felt, and, but for the public works undertaken by the Government of India, what is now true of some districts would have been true of almost all. Indeed in Bengal more roads are still the great specific against famine. Irrigation might be introduced by constructing a dam across the Ganges, and diverting its flood waters into artificial channels, but this expedient would be utterly useless in any but exceptional years. Roads, on the other hand, are always useful as auxiliaries to trade, while on the occurrence of great scarcity they make the worst forms of famine impossible. In proportion as the food supply of all India becomes available for the districts in which the crops have failed, the burden of the calamity is distributed over a larger area, and is shared by the whole country in the shape of higher prices, instead of overwhelming a particular province in the shape of hopeless starvation.

SPAIN.

THE state of Spain, and more especially of Carthage, would be ludicrous if it were only a fiction. Anarchy, moral degradation, and universal imbecility are in real life not ridiculous but melancholy objects of contemplation. Fifty years have passed since SHELLEY extolled in eloquent and incoherent verse the glories of "a land which now is free." At that time a successful rebellion in Spain had temporarily taken the place of a vile and bigoted despotism; and ever since, at frequent intervals, the Spaniards have tried, as opportunity occurred, the experiment of a pure democracy in which obedience, loyalty, and order have not been deemed essential conditions of political society. They may now boast that they are a stage in advance of other European communities which are engaged in a downward progress. The leaders of the Paris Commune were perhaps less contemptible than the actual or recent rulers of Carthage; and the French nation, notwithstanding its recent disasters, retained sufficient vigour and discipline to crush internal treason. In England Republicans and Socialists are, fortunately for themselves and for others, still too weak to exemplify, like ROQUES BARÇA and CONTRERAS, their principles in practice. The Carthagena insurrection seems to be rapidly approaching its close; but it is a national disgrace that it should be allowed to expire by its own inherent weakness. On the land side a considerable army, well supplied with siege artillery, has only established a blockade; and the Spanish Admiral has run away

from the rebel squadron, which would probably not have ventured to resist an attack. One Carthagena merchant vessel has been captured on the open sea. According to the latest accounts, the insurgent Government had resigned, or had been forcibly dissolved; and perhaps the rebellion may now be exclusively maintained by the liberated convicts who were at the beginning of the revolt released from the gaols. A government of professional thieves is perhaps the extreme form which has yet been assumed by liberty, equality, and fraternity; but there must be a point at which even Spanish toleration will be exhausted, and the convicts would probably be glad to submit on condition of an amnesty. Whatever may have been their former crimes, they are comparatively guiltless of treason; for they can scarcely be blamed for exchanging penal labour for service in the rebel ranks. When the rebellion has finally collapsed, the PRIME MINISTER will issue a grandiloquent proclamation on the triumph of national unity; but it remains to be seen whether he will have the courage to shoot the civil and military ringleaders. There is an account in a nursery story-book of a family of children who were allowed for a single day to do exactly what they liked. The tale of course fulfils its didactic purpose by showing the mischief and confusion which ensued from a temporary suspension of parental authority. The history of Spain since the overthrow of the Monarchy illustrates the same moral more forcibly, because the incidents have occurred in a natural sequence of cause and effect, and not by arbitrary selection.

The war in the mountainous Northern provinces will be interrupted by the winter. The Carlists have perhaps little to fear from the Republican troops; but it is difficult to understand how they can obtain sufficient funds to keep an army together. The failure of the expected Restoration in France will probably discourage the Spanish Legitimists, though they have no reason to apprehend any display of ill-will to their cause by the Provisional Government of Marshal MACMAHON. DON CARLOS in his military Court at Estella occupies a more respectable position than the helpless Pretender who prattles at Salzburg about the white flag and about HENRY IV. He is said to show his good sense by discountenancing the negotiations of some of his supporters with General CARRERA. No advantage would be likely to arise if the chief command were entrusted to an elderly exile who has not visited Spain for thirty years. In his youth CARRERA was known as a spirited partisan, and also as one of the most cruel of the unscrupulous chieftains of either party. He had no opportunity of displaying military genius; and his name is probably but little known to the younger generation. If the Carlists of the present day had been fortunate enough to find another ZUMALACARREGUY to lead them, they would by this time have driven the Republican Government from Madrid; but their actual chiefs are probably well advised in declining to cross the Ebro. The Royalists have no hold on opinion or feeling in the greater part of Spain. Even Admiral LOBO declined to obey the orders of a Pretender who not unnaturally assumed that he must be a traitor. The more thoughtful Carlist leaders apprehend that, even if they could overthrow the Republic, they might perhaps not reap the fruits of victory. The majority of the nation which three or four years ago supported a Constitutional Monarchy has probably been reinforced by converts from Republican theory as it has been exemplified in practice. The Republicans took advantage of the timidity and of the divisions of their opponents to obtain power by surprise. Since the date of their success they have proved to demonstration their inability to maintain good government or national unity. The Monarchical Moderates and Progressists have prudently abstained from any attempt to accelerate the reaction which they may reasonably anticipate. Their leaders have even offered their aid to the only honest Republican Minister who still survives the failure and disruption of his party. CASTELLAR has already held power longer than any of his recent predecessors; and as he has got rid of the Cortes, and will soon be relieved from the embarrassment of the Carthagena insurrection, he may perhaps maintain himself for a few months longer. Behind him there is no available leader of the Republican party; and his succession will probably devolve on the adherents of DON ALFONSO. Notwithstanding the pertinacious prejudice of Admiral TOPETA against the family of Queen ISABELLA, her son is now the only possible candidate of those advocates of Monarchy who are not prepared to acknowledge DON CARLOS. No foreign aspirant will tempt

the fate of King AMADEO; and, when the Republic has become impossible, it will be necessary to choose between the absolutist and the constitutional Pretender. No military chief of any faction has either the ability or the reputation which could enable him to become a competitor for supreme power.

One of the oddest incidents of anarchy and civil war is the explosion of the antipathy to England which is ordinarily latent. Englishmen are accustomed to vilification, and neither Spain nor any other country will ever exceed the injustice and violence of the Americans during their domestic troubles; but the hostility which the Carthagena insurgents share with the Republicans of Madrid is unusually whimsical. Admiral YELVERTON has on several occasions saved the rebels from the crime, and some towns on the coast from the inconvenience, of a bombardment; but he has in the most courteous manner abstained from interfering with the belligerents on either side when they have seemed likely to screw up their courage to the pitch of fighting. If an English squadron had destroyed or captured the insurgent fleet, all parties in Spain would have unanimously denounced the jealousy which had prompted an attack on a rival maritime Power, as Spanish historians persuade their countrymen that the main object of the Duke of WELLINGTON'S Peninsular campaigns was the ruin of certain cotton manufactories at Madrid. Of the two adverse complainants the insurgents are the less unjust. The capture of the *Almansa* and *Vittoria* and the subsequent transfer of the vessels to the possession of the Spanish Government was an undoubted violation of neutrality; but it is difficult to understand why the party which profited by the irregularity should habitually denounce the English Government. The capture of Spanish merchant vessels by the Carthagena squadron is an anomalous exercise or exaggeration of the rights of war; but the ships of a Government which can keep the sea against its enemies cannot be treated as pirates. The German, the French, and the American cruisers on the coast abstain from treating the rebels as pirates without incurring the animosity which is concentrated on the English. When the insurrection has died out, it is highly probable that the Republican Government will allow the officers and crews of the rebel ships to escape with impunity, or perhaps to enter the regular service. It is highly undesirable that England should take part in a domestic quarrel, with a certainty of incurring the resentment of both parties.

FRENCH FINANCE.

M. MAGNE has presented to the PRESIDENT a careful and interesting Report on the financial position of France, and a very instructive portion of his statement consists of an elaborate tabular comparison of the Budgets of 1869 and 1874. The Budget of 1869, which is taken as the last year unaffected by the war, contemplated an income of 74 millions sterling and an expenditure of less than 71. The Budget of 1874 contemplates an income of 100 millions sterling and an expenditure of an almost exactly equal amount. Thus France has now to find 30 millions sterling a year more than before the war. How does this happen? The loans raised have imposed an additional charge of 16 millions sterling. The Government has borrowed 60 millions of the Bank of France, and is to repay it with interest at one per cent. by instalments of eight millions a year. To the 16 millions interest on the new loans there is therefore to be added eight millions for the repayment of the Bank of France, or 24 millions out of the 30 millions of increased expenditure. It must be observed that the total cost of the war is taken by M. MAGNE at 371 millions sterling, while the loans produced 270 millions, and the Bank lent 60. The war therefore cost 40 millions more than the public loans and the loan from the Bank supplied. This surplus was provided by borrowing, or rather not paying, 13 millions, representing the value of the portion of the Eastern Railway taken over by the Germans in part payment of the indemnity, by raising 12 millions in 1872 and 1873 through increased taxation, and by the application of various sums at the disposal of the Government, especially the reserves of the Military Savings Banks, and a sum of four millions sterling authorized to be borrowed in addition to the 270 millions produced by the public loans already mentioned. One instalment of eight millions was repaid to the Bank in 1872, and M. MAGNE sees his way to repaying a second instalment of eight millions in the financial

year of 1873; and if the remaining instalments are punctually paid, the expenditure of 1879 will provide for the final liquidation of the Bank advance. From that year the 30 millions of excess now apparent beyond the Budget of 1869 will be reduced to 22 millions. How much further it will be reduced is very difficult to say. To the 16 millions of interest on the new loans must be added a million representing the interest on the money due to the Eastern Railway Company, and that on the four millions loan still to be raised. Thus 17 millions sterling will be a permanent charge, until France enjoys once more a credit in the markets of the world which will permit the conversion of the recent loans into loans bearing a lower rate of interest than five per cent. A margin of five millions thus remains; and if we examine the details of the estimates of 1874 we find that the army, apart from the cost of restocking it with new materials of war, requires four millions sterling a year now beyond what it required in 1869. Much of this increase must be permanent, partly because the war has made necessary a reorganization of the army on a more expensive scale, and partly because the funds in hand for providing for the calls on the military chest have been spent. Three millions is a moderate amount to reckon as a permanent increase on this and other heads, and if we add this sum to the 17 millions of interest on loans, we have a permanent increase of 20 millions. If all other things remained the same, we might therefore say that France will have to pay 30 millions increase until 1879, and 20 millions afterwards. It is not of course probable that after 1879 it will be true that France will then be spending 90 millions as against 70 millions in 1869, because prices will probably rise before then, the expenditure on public works is now cut down to a very low figure, and France saves at present nearly a million by not having a Monarchy. But we may take 20 millions as the basis of permanent increase attributable to the war, to which will have to be added the additional expenditure if prices rise, if a Monarchy is restored, and if public works are again pushed forward.

The 100 millions sterling above mentioned is not, however, the whole expenditure of 1874. In addition to the Ordinary Budget, M. MAGNE, after the fashion of French financiers, has an Extraordinary Budget, under which seven millions more are to be spent, five millions being devoted to supplying the army with new material of war. But M. MAGNE has, according to his figures, got the money for this, though there is more obscurity in his statements on this head than on any other. He says that he shall meet this call on the public purse with the proceeds of the balance of the Public Loan not yet issued, and make out the remainder from the sums he has still to get from the Bank. He also goes into some calculations which seem to show that he will have something over to meet the Extraordinary Budgets of future years, if any are wanted. Experience shows that Extraordinary Budgets are almost always wanted by French financiers. The Extraordinary Budget of 1869 amounted to nearly five millions sterling; and as this Extraordinary Budget of 1869 is included in the 70 millions of that year's expenditure, while the 100 millions of the Budget of 1874 is only the sum of the ordinary Budget, the real way of stating the facts seems to be that the Ordinary Budget of 1874 exceeds that of 1869 by 35 millions, and that the Extraordinary Budget of 1874 is seven millions as compared with the five millions of 1874; but that, as the whole of the seven millions of 1874 is to be provided by borrowing, the total charge to be met by current taxes is only 30 millions more than it was in 1869. But, then, will Extraordinary Budgets ever cease in France? If there was an Extraordinary Budget in 1869 of five millions, why should there not be in 1879? What figure we are to add as the permanent average of future Extraordinary Budgets is of course only guesswork, but something must be taken, or no allowance is made for the financial habits of the French. With all that we recollect of French finance for many years, it does not seem at all an exaggeration to estimate the permanent Extraordinary Budget at a little over three millions. The real permanent increase after 1879 may therefore be taken at 23 millions and a fraction, or one-third of the 70 millions which the taxpayers paid in 1869. Every taxpayer in France will thus, in consequence of the war of 1870, pay after 1879 1s. 4d. where he paid a shilling in 1869, and for the sum to be repaid to the Bank until 1879 we have to add about three-halfpence more. The expenditure of the French Government before the war was very much the same as that of the English Government. We may call 70 millions sterling in round numbers the expenditure of

each. To compare what the English taxpayer pays with what the French taxpayer pays if the same sum is to be produced in both nations, would be a task extremely laborious and complicated if done accurately; but for rough and ready purposes we are not far wrong in taking the taxpayers of the two countries as on the same level; and it will, we think, bring home to the ordinary Englishman the exact pecuniary consequences of the French war with a degree of clearness that big figures cannot produce, if we say that the net results of the war place the French in the same position as we should be if we had for the next six years to pay 1s. 6d., and ever after 1s. 4d., where we now pay a shilling of Imperial taxation.

M. MAGNE in his Report insists with great prudence and firmness on two fundamental points—that taxation shall be increased to any point necessary to inspire the conviction that the nation is prepared to meet the calls on it out of revenue; and, secondly, that the advance of the Bank of France shall be repaid punctually as the instalments fall due. On the latter point it is specially necessary that he should insist, as every groaning taxpayer must fondly say to himself how easy and pleasant it would be not to pay the Bank, but merely to owe it the money, paying a higher interest for it, so far as the lowness of the interest now paid is determined by the agreement to repay the principal in a given time. The use of repaying the Bank is twofold. It is the necessary preliminary of a return to a metallic currency, and until France returns to a metallic currency a great deal of business by which the country used formerly to profit must be lost to it. In the next place, the value of the banknote is in a great measure determined by the good faith which the Government keeps with the Bank, and the knowledge possessed by the public that something is being done steadily and without fail, year by year, to make the notes once more convertible into coin. The issue of the Bank has increased in the last twelvemonth from about 105 millions to about 120 millions sterling, and it is scarcely possible that this increase should have been made without a fall in the value of the paper currency, unless the holders of notes have been inspired with confidence by the resolution of the Government and nation to submit to very great sacrifices in order to fulfil the engagement with the Bank. For the year 1874 M. MAGNE finds, as things now stand, a deficiency of seven millions, which has arisen mainly through the withdrawal of the projected duties on raw materials and the abolition of the tax on shipping, and the large increase in the sum which has to be paid to guaranteed railways. M. MAGNE first proceeds to diminish the proposed outlay of the year by a sum of nearly two millions, and then he proposes to raise, by an increase of taxation, between five and six millions, so as not only to balance the Budget, but to have a surplus of more than half a million. His mode of getting what he wants is simplicity itself. He would like to show financial genius and devise new taxes, but he frankly owns that neither he nor any one he has consulted can think of any, except on a very insignificant scale. He accordingly asks that existing taxes may be increased, which, as he justly remarks, is much the easiest way of attaining the desired result, although theoretically it may not be a very good way. He is especially sorry to have to propose an augmentation of the duty on salt, as he has repeatedly spoken against proposals for such an augmentation. But he wants money so much that he is now obliged to forget his own oratory. More than half of what he wants is to be got by putting an increase of half a decime on registration duties, indirect contributions, sugar, salt, and goods carried at a slow rate by railways. There is little interest in the details of this proposal. M. MAGNE makes no pretensions to improve the existing system of taxation, or to approximate towards an equal imposition of burdens. His only thought is how to get the money, and to discover the shape in which additional revenue can be most quickly and easily voted by the Assembly, and collected and paid into the Treasury. All he has to say by way of defence for himself, and comfort for the taxpayer, is, that the financial state of things which he now contemplates is only temporary. Before very long the Treaties of Commerce by which France is now bound will expire, and then the opportunity will come for originality in financing; while in any case a few years will see the Bank paid off, and then what is put on, now can be easily remitted, and the taxpayer have his burdens lightened.

THE POLICE.

A VERY serious question has again been raised as to the character of the Metropolitan Police. We say again, because unfortunately it is not a new question. Those who pay any attention to the proceedings in the police courts must have observed that the question turns up there with increasing frequency, and it has been presented more than once in precisely the same form as at the present moment. Four years ago several bank clerks were accused of disorderly conduct in the Haymarket, but the magistrate said he did not believe the evidence of the police, and dismissed the charge against the clerks. Now, as it happens, it is several officers of the First Life Guards, instead of bank clerks, who have to complain of the police; but of course the social position of the victims does not affect the quality of the outrage. The persons of officers of the Life Guards are not more sacred than those of other people. It is certainly to be regretted that Colonel FRASER and his subalterns should have been rudely handled by the police, and should have had the unpleasantness of having to appear at the bar of a police court. But, if this were all, it would be comparatively a small matter. It might be said that police constables are only men, that they are liable to make mistakes like other people, and that even Guardsmen must take the risk of suffering from a mistake with the rest of the public. The seriousness of the thing lies in the relation which this case bears to other cases of a similar kind. Only the other day a barrister was dragged to a police cell on a charge of being drunk, and was then further charged with being disorderly because he resented a blow from one of the constables. The magistrate held that he was quite sober. Several correspondents of the *Times* complain of similar outrages. One of these—a doctor—having remonstrated with a constable on the brutality of his behaviour to a man in his custody, was himself kicked, charged with being drunk and disorderly, and narrowly escaped conviction. In his cell he found a young gentleman who was charged with being drunk and creating a disturbance, but whom he knew, as a medical man, to be perfectly sober. Two other instances are also given in which an attempt to take the number of a constable immediately led to a counter-charge of disorderly behaviour. It is impossible to suppose that these cases are isolated or accidental. They indicate a dangerous temper on the part of the police, and this temper is pretty sure to be exhibited when occasion offers. When people suffer in this way there is a strong temptation to say nothing about it. Many men would rather submit to a kick or a blow than appear in a police court, with a regiment of policemen ready to swear that they were drunk and riotous; and when the magistrate has once given his decision, it is less disagreeable to pay the fine than to attract greater publicity to the case by denouncing the police. It may be assumed, therefore, that the cases of this sort which come to light are only a small proportion of those which really happen.

It is unnecessary to repeat in detail the story of the officers of the Life Guards; but there is one point upon which, if the magistrate has been correctly reported, it is necessary to make a remark. The officers came into collision with the police at the Argyll Rooms; and Mr. KNOX is reported to have said that "the first thing that astonished him was to find Colonel FRASER and four young officers going to the Argyll Rooms." He added that if they went there "they must expect possibly that certain things might happen; but that was a matter which concerned Colonel FRASER himself." Mr. KNOX did not explain what things he meant; but he can hardly have intended to suggest that people who go to the Argyll Rooms must be prepared to be beaten by the police and falsely charged with disgraceful rioting. We are not at present called upon to discuss the character of the Argyll Rooms, or the propriety of allowing such establishments to be open at all. It is enough that the magistrates have licensed the Argyll Rooms, and they certainly did so with their eyes open and knowing perfectly well what sort of a place it is. There was a discussion on the subject, and a licence was granted by the casting vote of the chairman, who said he would on this occasion give way to his feelings of good nature. Mr. KNOX might have said that he was astonished that the magistrates should license a house of this kind; but if such places are open, it is certain that people will go to them, and those who go have as much right, not only to the civility, but to the protection, of the police as if they were in St. Paul's or Westminster.

the mind all reference to officers of the Life Guards and to the Argyll Rooms. A number of men were in a public place; a question arose as to whether they were blocking up a passage, and the police immediately set upon them, shook them violently, bumped them against the wall, and then carried them off to the station-house and falsely charged them with behaving in a disorderly manner. This, at least, is the magistrate's summing-up of the evidence. He said he believed that the defendants were sober, that they did not strike the constables, and that they were treated with great violence; and also that there was great excess on the part of the police. Of course the magistrate may have been mistaken in taking this view of the case. All we have to go upon is that this was the view he took, and that he therefore dismissed the charges against the defendants. If this decision is correct, it has a very serious bearing on the character of the police. There were some half-dozen policemen concerned in the affair; they all told the same story and backed up each other; and the magistrate held that their evidence was unworthy of belief. This is obviously a very grave thing to say in regard to such men. They are not casual witnesses, who appear for once in court, and are never likely to be connected with any other case. They are permanent officials, who are constantly making charges and giving evidence; and upon their evidence, if they remain in the force, the liberty and characters of a vast number of persons will depend. Some of our contemporaries have remarked on this state of affairs that it is impossible it can rest here. We hope so too, but we have not forgotten the case of the bank clerks. Mr. BRUCE, who was then Home Secretary, declined to put the policemen on their trial, and said that they were men of excellent character, although one at least of them had previously distinguished himself in other instances by his recklessness and brutality. The result was that the men whose evidence the magistrate refused to accept were retained in the force *pour encourager les autres*.

We have now Mr. LOWE instead of Mr. BRUCE at the Home Office, and Mr. LOWE may possibly be disposed to take a line of his own. He once spoke disrespectfully of the money market when he was at the Treasury, and he may perhaps show himself equally independent of the traditions of his new department. There are one or two facts which may be pointed out for his consideration. Nobody can pretend that the character of the police has been improving of late years; on the contrary, it has been notoriously, and even avowedly, deteriorating. The number of cases in which the evidence of the police is rejected as unworthy of confidence appears to be increasing. There are at present some half-dozen murders—the Eltham murder, the Hoxton murder, the Great Coram Street murder, the Thames mystery, and several others—to which they have been unable to discover any clue; and the manner in which the German clergyman was treated in the Great Coram Street case supplies a startling example of the rockless stupidity with which such matters are taken in hand. The Chief Commissioner complains in his latest Report that the number of assaults on the police is continually increasing; but an explanation of this may perhaps be found in the behaviour of the police to the public. It is not every one who has the disciplined self-possession of Colonel FRASER and his companions; and it is not surprising that constables should occasionally find their violence repaid in kind. Then, again, there was the mutiny of last year; so that, while the relations between the police and the public are becoming worse, the domestic condition of the police can hardly be regarded as satisfactory. It is impossible to put all these things together without coming to the conclusion that there is something wrong with the constitution or administration of the force. Nor do we think it is very difficult to discover the origin of the malady. Take the case of the bank clerks in 1869. The constables, notwithstanding the judicial decision against them, were retained in the force. Take the mutiny of 1872. Here again we find the same weakness and the same surrender of discipline. The men were forbidden to agitate for an advance of pay; they agitated, and at once got what they wanted; and, with a few exceptions, the mutineers were taken back into the service.

But there is something more than weakness in the management of the force; there is also a radical error of principle. The idea of those who command the police seems to be that the reputation of the force must be supported at all hazards, and that it must be defended against the public as if against a natural enemy. It

might have been expected that the Chief Commissioner and his associates would feel bound to consider the public at least as much as the body over which they are placed; but this does not appear to be their view. Whenever any scandal or outrage occurs, every effort is made to hush it up and smooth it over. It is natural and reasonable that the Commissioners should endeavour to defend their men against what they believe to be unjust attacks; but apparently they do not understand that the most effectual means of defence, when charges are brought against any member of the force, is to encourage, and not to try to stifle, inquiry. It is true that when a conflict of evidence occurs it may be difficult to say on which side the falsehood is; but it would at least be well that the police should know that, if they cannot justify themselves clearly and decisively in making accusations, they must expect to suffer for it. The object should be to make the police exceedingly careful in bringing charges and giving evidence, and the only way to make men careful is to fasten responsibility sharply upon them. At present there is practically hardly any check on police testimony. A constable is led to expect promotion in proportion as he displays his activity in getting up cases; he is rarely cross-examined, and what one constable says, all the rest feel bound in honour to maintain. It is this false idea of what is required by the honour of the corps which is at the bottom of the mischief. It would seem that it was not until after Colonel FRASER called out to his companions not to strike the police, but to take their numbers, that the police became especially violent. In Mr. BELT's case, and in the case of the *Times*' other correspondents, the same thing may be observed. It is evident that the tactics of the police are to turn upon any one who dares to criticize their behaviour or to hint at a complaint, and to charge him with misconduct. This is, of course, a system of terrorism, and terrorism of a kind against which the public are, as individuals, particularly helpless; and we are sorry to say that it has to a certain extent been encouraged by the authorities.

It is to be hoped that Mr. LOWE will not repeat Mr. BRUCE's mistake, but will insist upon a full public investigation of the charges against the police. The only way to maintain the character of such a force is by strict and rigid, but not necessarily harsh, discipline. Whenever any doubt is thrown on the testimony of the police by a magisterial decision, the constables in question should at once be considered to be on their trial, and the trial should be an open one. A private inquiry at Scotland Yard may satisfy the Commissioners, but it will certainly not satisfy the public. The whole of our arrangements with regard to prisoners waiting trial are barbarous in the extreme. A superior class of officials ought to be on duty at the various stations to decide whether charges should be recorded, and medical advice should at least be within call. It is much easier than is perhaps supposed to make a sober man appear to be drunk and disorderly by the simple process of shaking him violently, squeezing his throat, and bumping his head against a wall; and there are many cases of sickness which are mistaken for drunkenness. It is impossible not to observe without regret and alarm the growing antagonism between the public and the police, especially when we reflect how artificial after all is the protection which the latter afford, and how much their authority depends on character and prestige. It is an antagonism which is at once unnatural and unnecessary, and it is of the greatest importance that an endeavour should be made without delay to restore the reputation of the force.

AUSTRIA, GERMANY, AND EASTERN EUROPE.

THE Turkish Government is, with tardy prudence, patching up a quarrel with Austria in which it had rashly become involved. The dispute began with complaints from the Christian inhabitants of a border province of oppression practised by their Mussulman neighbours. In Bosnia religious divisions are not connected with distinctions of race, for a considerable part of the population during the height of the Ottoman power voluntarily adopted the dominant faith; but in the East religion forms a stronger bond of union than language or national origin; and it is highly probable that some at least of the grievances of the Bosnian Rayahs may be well founded. The Austro-Hungarian Government interfered with representations on behalf of the complainants; and its right to remonstrate

seems to have been admitted by the appointment of a Joint Commission, which included among its members the Austrian Consul in Bosnia. Before the result of the inquiry was officially known the Turkish Government circulated a separate Report, in which the Austrian Consul was denounced as the leader and instigator of the Bosnian malcontents. About the same time, and perhaps in consequence of the provocation given by the Porte, Prince MILAN of Serbia was received by the Emperor of AUSTRIA without the introduction of the Turkish Ambassador. If the troubles in Bosnia were really caused by the intrigues of Austrian functionaries, it would have been judicious not to call public attention to an interference which might gradually assume the form of a protectorate. The Austrian Government seems to have believed that the conduct of Turkey was intentionally unfriendly; and the matter was thought sufficiently serious to form a subject of discussion between Count ANDRASSY and Prince BISMARCK during the late visit of the German Emperor to Vienna. In consequence of the Austrian Minister's representations, the German Ambassador at Constantinople has been instructed to warn the VIZIER that no support was to be expected from the Imperial Government of Berlin in any diplomatic contest with Austria. The intimation has been sufficient to effect its object; and it is now announced that the Porte is ready to offer any satisfaction which may be required by the Austrian Government, and that Count ANDRASSY has replied to the Turkish overtures in a conciliatory tone. If there were no other reason for avoiding squabbles with neighbouring Powers, the present anxiety of the Turkish Government to re-establish its pecuniary credit in European money markets would furnish sufficient reason for renewing amicable relations with Austria.

It is not surprising that the Russian Ambassador, General IGNATIEFF, supported the recommendations of his German colleague. There can be no doubt that the Emperor ALEXANDER is sincere in his determination to maintain his intimate alliance with Germany; and, as soon as Prince BISMARCK interested himself in repressing the unseasonable pretensions of the Porte, the Russian Embassy could scarcely fail to support his demands. Nevertheless it is suspected, on plausible grounds, that the whole disturbance was originally promoted by Russia. The old question of *Cui bono*, or who is to be the gainer by a quarrel between Turkey and Austria, admits of only one answer. It has always been the wish of England to promote the most cordial feeling between the Ottoman Government and the Power which is above all others interested in preventing foreign aggression on Turkey. France at present takes but little part in Eastern diplomacy; nor could Marshal MACMAHON or his Ministers have any intelligible motive for encouraging dissension between Turkey and Austria. It is well known that since the acquiescence of England in the repudiation by Russia of the Treaty of 1856, the Porte has cultivated the friendship and protection of its ancient adversary. General IGNATIEFF would probably see without regret the dissolution of the natural alliance between Austria and Turkey; and he might not unnaturally be inclined to stimulate the jealousy of the Porte against a claim of interference on behalf of its Christian subjects. In some of the narratives of recent occurrences probable conjecture has been enlarged into positive statements that General IGNATIEFF was the author of the misunderstanding with Austria. It would appear that he has not so far committed himself as to be unable now to recommend a policy of conciliation. The designs of Russia against Turkey have for some time past been suspended, although there is no reason to suppose that they have been abandoned. Only three years have elapsed since the denunciation of the Treaty of Paris; and neither the arsenals and fortifications of the Crimea nor the Black Sea fleet have yet approached completion. The extension of the Empire in Central Asia occupies the attention and the resources of the Russian Government, and there is at present no prospect of a European war. It is probable that Russian statesmen are consciously unable to foresee the results of German preponderance on the Continent; and the establishment of cordial relations between Germany and Austria cannot fail to affect all political calculations.

No Turkish Government can believe that the national interest could be consulted by a rupture with Austria; but perhaps crafty politicians may rely on the material interests which would prevent irritation from growing into settled hostility. Those Turkish Ministers who have during the present generation been worthy of the name of statesmen have been careful neither to repose excessive confidence in

Russia nor to alienate the good will of Austria; but personal feelings have much to do with Oriental policy; and it is possible that since the loss of his ablest advisers the SULTAN may prefer private and domestic objects to the welfare of his dominions. He is understood to be strongly bent on a scheme for altering the Ottoman law of succession, so as to prefer the son of the deceased sovereign to the eldest male of the Imperial family. The firman which was lately granted to the KHEDIVA contains a similar provision for the descent of the supreme power in Egypt; and there can be little doubt that the SULTAN welcomed the opportunity of establishing a precedent which may apply to the succession in his own family. The Russian Ambassador may perhaps have countenanced the SULTAN's natural desire, which indeed might coincide with the public interest if only Turkish institutions were strong enough to bear the shock of a change. The succession of brothers, which may sometimes be expedient in warlike ages and in an unsettled condition of society, involves the gravest disadvantages. In the family of OTHMAN, the sanguinary precautions which jealousy of collateral successors formerly suggested gave rise to the proverbial charge of fratricide against the Turkish Sultans. In milder times the reigning Emperor has every temptation to regard his brothers as his own enemies, and as the rivals of his sons; and at the best he feels that he is only a life tenant, and perhaps thinks that he is not required to care greatly for a dominion which is not destined to pass to his descendants. There is undoubtedly a risk in possible minorities and regencies, but the balance of convenience would be in favour of direct inheritance and primogeniture, if only it were possible to guard against the risk of a disputed succession.

Although Prince BISMARCK has never publicly announced his opinions on Eastern policy, the interests of Germany afford a sufficient clue to his probable intentions or wishes. When Mr. CORDEN's political sympathies came for once into conflict with his devotion to the doctrine of peace, he peremptorily declared that the Northern Americans ought never to desist from war until they had reconquered the free navigation of the Mississippi. Less philanthropic politicians may affirm with equal confidence that a vigorous ruler of the German Empire would not tolerate the possession by Russia of the mouths of the Danube. The occupation of the lower course of the river by Austria might perhaps be thought less objectionable; but the left bank from the Austrian frontier to the sea is already subject to the nominal and qualified sovereignty of a Prussian Prince. The House of HOHENZOLLERN, like the House of COBURG, maintains a Catholic branch for the accommodation of those Latin nations which may happen to require a King Consort or a new dynasty. Coburg Kings occupy the orthodox thrones of Belgium and Portugal; and three or four years ago a Catholic HOHENZOLLERN was on the point of becoming King of Spain. His brother had already acquired the precarious sovereignty of the Danubian Principalities, under the feudal and theoretical superiority of the Porte. Prince CHARLES of Roumania married a Russian Princess, who has at present no children; and a younger brother has lately arrived in the Principality to make himself familiar, in anticipation of a possible vacancy, with the language and customs of the country. Neither of the Princes would be disposed to act without the sanction of the Imperial chief of the House of HOHENZOLLERN, and it may therefore be presumed that the German Government intends for the present to control the Danubian provinces through a dependent ally. The claims of the Turkish Government will cause no embarrassment, and they may sometimes serve a diplomatic purpose, when it is found convenient to insist on the necessity of referring any complaint of a foreign Government to Constantinople. As long as Germany and Austria act in concert, the Eastern question is not likely to endanger the peace of Europe.

THE WORK OF THE LONDON SCHOOL BOARD.

IT was hardly to be hoped that the second election of a School Board for London should not be an occasion of disappointment to the friends of elementary education. Three years seem a long time to look forward to, and calculations of what may be done in it are rarely borne out by the record of actual work. When the Board was first appointed the real difficulties of making elementary education universal were known to few, and it was allowable to be sanguine of the results which the new machinery would achieve. Now that the term of office of the first members

has come to an end this new machinery is found to be an improvement indeed on the old, but only an improvement. The educational condition of London is better than it was in 1870, but it has undergone no revolution. Men who have passed through some spiritual crisis often find their old habits returning upon them insensibly; and after three years' experience of the London School Board the familiar difficulties about getting children to school and keeping them there seem to recur with scarcely diminished intensity. The statement of what has been done prepared by direction of the Board shows that much of this shortcoming is attributable to the extent of the foundations that have to be laid in order to secure that the work shall stand. The labour of ascertaining the amount of school accommodation requiring to be provided was not slight. On the theory that the number of children in regular attendance at elementary schools should amount to one-sixth of the population, the Board would have had to provide about 252,000 school-places. But in many parts of London the proportion of children who must be withdrawn from this number as belonging to the middle and upper classes is very much beyond the average. The Board accordingly worked out the question themselves. They took a list of the children of school age who slept in London on the night of the 2nd of April, 1871, and made inquiries from house to house into the circumstances of every one of them. The result of this process was to reduce the number of necessary places to 112,000, while voluntary schools supply about 308,000 places. When these figures are looked at side by side, they sufficiently answer the charge that the Board has set up schools out of simple rivalry to existing schools. The estimate that there are 112,000 children in London requiring school accommodation will seem to many persons extraordinarily small. It is less than the estimates given nine years ago by the London Diocesan Board of Education and by the Committee of the Bishop of London's Fund, in both of which no reference was made to any but Church schools. Room has already been found for 50,000 out of the 112,000, and when all the new schools now in course of building are finished, there will be places for 86,000 children. When to these are added the 21,000 children accommodated in temporary buildings, the discrepancy between the demand and the supply will not appear very great. To a certain class of objectors, of which Canon GREGORY may be considered as the type, and the meeting at St. James's Hall on Thursday as the field-day, the Board appears to have built schools without sufficient regard to the fact that the ground is already occupied by voluntary schools. This is certainly not the case as regards London generally; and even if a Board school should here and there, from difficulty in obtaining a site, or from miscalculation, be set down unnecessarily near to a voluntary school, it is hardly a matter that calls for serious comment. If the new school is not wanted at this moment, it is certain to be wanted as soon as compulsion comes fully into operation, and, considering how often the provision of school accommodation lags behind the need of it, we may be patient with the rare cases in which the need is anticipated.

The facts bearing on the application of the compulsory by-laws are less satisfactory. Since the spring of 1871 there has been an increase in the average attendance at efficient schools of 59,425 children, of whom 26,261 are in Board schools and 33,164 in voluntary schools. So far there is an undoubted gain, but it is a gain which is counterbalanced by the continuance of a large number of children in inefficient schools. The figures given by Mr. HOLLOND in the *Times* have not been challenged by either of the members of the School Board who have replied to his letter. From these figures it appears that in Old Castle Street, Whitechapel, there is a Board school accommodating 1,200 children, but having a daily attendance of only 200. This is "in the midst of a dense, ragged, and semi-criminal population" which could furnish the missing thousand at a moment's notice. The explanation of the children's absence is that large numbers of them professedly attend a Ragged School a little distance off. According to Mr. HOLLOND, this school is utterly deficient in plant and in educational power, while the attendance of the children is very irregular. We can easily believe, therefore, that children may be on the books of the schools for years without mastering the first rudiments of education. It is clear that attendance at such a school as this ought not to serve as a reasonable excuse to a summons under the by-laws; but the School Board has hitherto refrained from taking proceedings in

these and similar cases. At first sight it may seem that the Board has in this respect been culpably lenient; but Mr. E. N. BUXTON's letter in the *Times* of Wednesday shows that something can be said in its defence. Until lately parents living in these districts have been urged to send their children to the Ragged Schools. They have now been told that they are no longer to be allowed to keep them at home, and it is a very natural inference that they will sufficiently comply with the law by doing what they have so constantly been bidden to do. If, when they do this, they were treated as breakers of the law, Mr. BUXTON is right in saying that they would be simply puzzled. The true way out of the difficulty would be for the managers of Ragged Schools to discontinue their work. Ragged Schools were once useful as a stop-gap in the absence of anything better; they are now, for the most part mischievous. They rarely give an efficient secular education, and they have little or no power of securing regular attendance. Every one of the children now in the Ragged School to which Mr. HOLLOND refers would, if it were closed, be obliged to attend the Board school in Old Castle Street.

There is very little chance, however, that the managers of this and similar institutions will be persuaded to take this course. They have probably opened the school for religious rather than for educational purposes, and Mr. BUXTON is no doubt right in thinking that the great obstacle to their being closed is the fear which the managers feel that, if the children are handed over to the Board schools, they will be taught no religion. It is useless to reason with a conviction of this sort. It would be almost easier to convince school managers that their religion is false than to convince them that, even if it be true, a Ragged School is no longer the proper place in which to teach it. How such fears are to be overcome it is hard to say. Mr. BUXTON looks forward to a time when Ragged School managers will have "satisfied themselves that the religious teaching in Board schools is both earnest and thorough," and will consequently "no longer hesitate to transfer their children where they will receive in addition efficient secular teaching." We have no faith in this coming to pass, because we have no expectation that the religious teaching in Board schools in London will ever be of a kind to satisfy men who really care about religion. Thorough and earnest religious teaching will, in the great majority of cases, be what is called sectarian teaching; and though, so far as the Education Act is concerned, the religious teaching in a Board school may be completely sectarian—provided that it is not conveyed in authorized formularies—it is hardly possible that it should be so in schools founded by so composite a body as the London School Board. There are only two alternatives which seem at all adequate to meet the difficulty. One is that the School Board should come to an arrangement with the managers of Ragged Schools, under which persons appointed by them shall have the right of giving religious instruction at prescribed hours in the Board school, in consideration of the discontinuance of the Ragged School. The other is that the Board should give notice to the managers of the Ragged Schools that unless, after a reasonable interval, they can prove that their schools are efficient, the parents of the children in attendance at them will be proceeded against in the same manner as though they did not send their children to school. Mr. BUXTON is afraid that to do this on a large scale would only "shock public opinion and retard the acceptance of the principle of compulsion." Probably public opinion has rather a stronger stomach than Mr. BUXTON gives it credit for. It is plain that, if benevolent persons are allowed, on the plea of teaching children religion, to prevent their receiving efficient secular instruction, an immense loophole will be opened to evasion of every kind. There is no hardship in saying to such persons, You are at liberty to teach religion as much as you like, and you are at liberty to combine it with secular instruction, provided that this secular instruction be really what it professes to be. What you are not at liberty to do is to keep children away from Board schools under the pretext that they will receive efficient secular instruction in your schools, and then to provide instruction which is practically worthless. To do the public justice, there is no reason to suppose that they would be in any way shocked at managers of Ragged Schools being addressed in this way. If the London School Board is to condone inefficient schools lest the acceptance of the principle of compulsion should be retarded, so little good can come from such acceptance that it is hardly worth while to scheme for it.

AUTOBIOGRAPHY.

EVERYBODY has recently been reading Mr. Mill's Autobiography. The book, whatever else we may think of it, suggests one general remark. We may, that is, say of autobiographies what can be said of no other form of literature—namely, that they are almost invariably worth reading. The causes are obvious. The first conditions of good writing are that a man should be keenly interested in his subject, and that he should know more about it than other people. Everybody is, of course, interested in himself; and if, in one sense of the words, we are very apt to be more mistaken about our own characters than our neighbours, yet we are certainly in the possession of an amount of information upon the subject which enables us to speak as men having authority. Moreover, in this particular case we have the singular felicity of communicating more than we know. Scarcely any autobiography, however carefully the author may have kept in mind the fact that he was writing for a posthumous audience, is entirely free from some form of insincerity. But the veil which he may have drawn over his own character does not blind the reader, although it may be quite impenetrable to the writer. In telling us what he thinks of himself, he can hardly avoid letting us know what we ought to think of him. The interest which every one takes in his own life is an equally important condition of success. We may learn to know a man's character from other sources besides his direct statements. A collection of letters, for example, may form a kind of unintentional autobiography, which has the merit of being less consciously directed to produce a given impression. But then a man need not, and generally does not, put any large part of himself into his letters. He writes many of them wearily, and against the grain; a large part of them consists of mere barren facts; and it is only on special occasions that he allows his deepest emotions really to overflow into his correspondence. Now the very fact of sitting down to write about himself to his posterity, the solemn feeling that he will have passed from this world before his letter reaches its address, moves the strongest springs of character in any but the most frivolous of men. Confessions addressed to a priest are apt, as we may venture to assume without actual experience, to be of a mechanical and perfunctory nature; but we can hardly imagine any one who has put himself in presence of that mysterious confessor, the unborn reader of a coming generation, not to speak for once from the heart. That he may lie or exaggerate is unfortunately not improbable; but it is something to know what are the lies which a man likes to tell about himself under very impressive circumstances. Rousseau's *Confessions* is in many ways not a very nice book, and in some ways it is simply revolting; but few books have ever been written which exercise a more powerful, though it is a rather questionable, fascination. The spectacle of a man taking a morbid pleasure in revealing things about himself which many men, equally guilty, would have died rather than avow even to the remotest audience, is a kind of psychological curiosity which is worth whole libraries of dry statistics or of frigid argumentation. Rousseau is of course an exceptional case, even amongst autobiographers; but revelations of character, similar in kind though inferior in degree, let us into the secret of a man's nature, and even of the epoch which he represents, more rapidly than the most laboured analysis from outside inquirers.

Indeed it may be said, in some sense, that the autobiographical element in all literature is that which is the most permanently interesting. We see Shakespeare behind Hamlet, and even Milton behind Satan. The figure of the creator, dimly refracted through the artistic symbols, is what really interests, though its precise features may baffle us. Every great poet, however unconscious of the process, is really drawing his own portrait in his writings; and a sympathetic reader is always trying to reconstruct the worker from his works. But the more direct and conscious autobiographical purpose goes for a good deal in most powerful writing. It would be easy to illustrate this truth from the most impressive novels in the language. In many cases, of course, we are only left to conjecture. But we have recently learnt how much of Dickens's best writing was simply autobiography superficially disguised. Miss Brontë's novels were all but pure autobiography; and we need not point out how often Tom Jones was the representative of Fielding, or Roderick Random of Smollett. We must admit, however, that the argument is not strictly fair. Autobiography of the indirect kind is deficient in one of the main elements which give special interest to the undisguised variety. The writer does not feel that he is voluntarily placing himself on his trial; and he is, of course, at liberty to arrange, select, and modify as may seem good to him. He probably hopes that his personal interest in the matter will escape detection; and it may be urged, with some truth, that we are using the word autobiographical in a sense which makes it nearly identical with all expression of a man's most intimate emotions.

To descend, therefore, to the most genuine autobiographies, we may maintain that, even when written by men of no remarkable power, they have a value altogether disproportionate to their literary excellence. To take, for example, a familiar period, one may learn more of the true spirit of the eighteenth century in England from half-a-dozen autobiographies than from the most elaborate histories written by unimaginative people. If you wish to know what was the kind of animal generated by the political corruption of the period when "all men" or "all those men" (whichever be the correct version of the phrase), had their price, their most intimate peculiarities are laid bare in Bubb Dodington's

Diary. No humourist could have drawn such a picture without being charged with gross exaggeration, and yet we instinctively recognize its entire, because unconscious, truthfulness. The utter want of any semblance of political principle, the total incapacity to recognize genius or virtue when he accidentally comes across it, the servile crawling before the contemporary distributors of patronage, coupled with an amusing indignation against the inferior wretches who try to curry favours by similar acts with himself—and all this covered by a decorous veil of unctuous sentiment, and an obviously genuine conviction that he is really one of the most deserving and least appreciated of mankind—compose altogether the portrait of a snob of the purest water by the side of which even Thackeray's keenest satire seems to be wanting in vividness. One can hardly avoid a feeling of gratitude to the writer who is so quietly probing his own weaknesses for our benefit, and placing himself in a museum of morbid anatomy, when he fancies himself to be claiming a niche in the temple of fame. Or, to take a less extreme case, a very interesting portrait of the ecclesiastic of the period is given by Bishop Newton. If not so consummate a snob as Dodington, he yet shows a general complacency in commemorating the great men to whose favour he owed his elevation, and the lady by whose services he even succeeded in obtaining the notice of Royalty, which is in its way almost as touching. His most characteristic touch is the record of the episcopal achievements upon which he specially prided himself. He succeeded in demolishing a tenement occupied by a chimney-sweep in the immediate neighbourhood of the Deanery of St. Paul's, and managed to substitute for a certain fixed post which obstructed one of the approaches a post with a hinge fastened by a padlock. He obviously hopes that his posterity will feel a warm emotion of gratitude to the dignitary who rendered such services to the Church, and values himself more upon his activity in that direction than upon the confutation of the Deists, which, with the help of Lord Bath's interest, smoothed his path to preferment. Newton's name suggests another admirable specimen of the worldly bishops who ornamented the period. Watson of Llandaff was a man of real power, though scarcely furnished on the Evangelical model. He tells us, with the most charming frankness, how he became a professor of chemistry, though he knew nothing of the science; how he dropped his chemistry as soon as it had served his purposes to become professor of divinity, in equal ignorance of the study; how—of course from the highest motives—he resolved to limit his further theological studies to the Bible; and how, equally from the highest motives, he felt it to be his imperative duty, when at once bishop and professor, to live at a distance from his diocese and his University, in a charming residence on the banks of Windermere, and there to devote himself to agriculture and to providing for his children. He takes great credit for not abandoning himself to field sports or social dissipation, and is evidently convinced that he is a pattern prelate. It would of course be absurd to take such men as fair representatives of an epoch which was not devoid of many noble characters who did not happen to write their lives. But the worldly side of the dignitaries of that time, the utter want of any sense of responsibility or of any lofty ideal of life in many of the most conspicuous men of the day, could not be more forcibly portrayed by any amount of descriptive writing. A complementary picture might be added from Gibbon's admirable Autobiography. The celebrated account of his love affair, when he "sighed as a lover" and "obeyed as a son," distances in a few sentences the art of the most skilful novelists. Nowhere can we find a more effective description of the genuine student temperament, which prefers the pleasures of a library to all the excitements of social and active life; of the strong but limited intellect, supreme in accumulating and arranging facts, but utterly blind to their spiritual significance; and of the cynical conservatism which rejects all the faiths upon which society reposes, but shrinks with selfish indolence, instead of generous sympathy, from any proposal to follow up scepticism by destruction. None but the most powerful of imaginations could have conceived or described so forcible an illustration of a certain type of character and intellect; but Gibbon performs the task for himself quite unconsciously, and with absolute perfection.

When we contemplate such a group of characters we recognize the weakness of all external portraiture. A gallery of great or even of small men, painted by themselves, is more interesting than all the imaginary progeny of novelists. Perhaps it is a general condition of such writing that the authors must belong rather to the secondary class. To write an autobiography usually implies an estimate of your own importance which, if it is not irreconcilable with greatness, is more commonly indicative of weakness. A diseased vanity like that of Rousseau generally prompts the writer, though of course there are many conspicuous exceptions, to take posterity into his confidence. When we think of the autobiographies that have been written, we cannot fail to regret the absence of those that might have been written. If Shakespeare had condescended to let us into a few of the details which have puzzled generations of biographers, we could have afforded to sacrifice a good many of his inferior plays. Even when a man of first-rate eminence, like Goethe, condescends to give us some of his early recollections, he is apt rather to stimulate than to satisfy our curiosity. It is for the most part only the little or the eccentric writer who can tell us all about himself in a few pages, or who can fancy that the world would care to read, or has a right to exact, his confessions. And yet we must acknowledge the truth of the often-quoted remark that anybody who would give us a genuine

record even of the most insignificant life would contribute something of real value to our knowledge of human nature. Perhaps it would be as well if scruples could be quieted by a general understanding that everybody who has passed a certain period of life should compose his autobiography. It should be regarded as a duty, not as a voluntary sacrifice to vanity, for every human being to tell us as well as he could how he came to be such as he was, and in what spirit he discharged his duty and looked upon the universe generally. Of course we do not mean to imply that all such records should be published. Nobody who regards with awe, and something like dismay, the vast torrent of literature that is being constantly discharged upon the world would rashly make any proposal for increasing its volume. "The rain it raineth every day," and every day, too, brings its burden of stupidity, vanity, and folly with which somebody has thought fit to spoil a certain quantity of paper. Such records as we have suggested should, as a general rule, be preserved in the family of the writer; they would in most cases have a certain interest for his immediate descendants; and at the end of a generation those documents which appeared to be simply valueless might be committed to the flames, whilst a small minority might possibly be deserving of communication to the world. If, as we must fear would be inevitable, considerable masses of pure rubbish would thus be accumulated, there would also be certain grains of genuine and permanent value which on our present system are now lost to the world. One great incidental benefit would be that which was contemplated by Mr. Mill—namely, that the trade of the ordinary biographer, the person who panders to the appetite of the many-headed beast, would be to a great extent spoilt; as more authentic materials would destroy the necessity for those vast accumulations of useless details which often do duty for the lives of remarkable men.

THE PYRENEES.

IN his sensible and practical *Guide to the Pyrenees* Mr. Packe complains that very few Englishmen, in proportion to the crowds who flock to Switzerland, think it worth while to visit a mountain region which he declares to be superior to the Alps in many of the elements of beauty and picturesqueness. This complaint seems to us so far well founded that the Pyrenees certainly receive from the present generation of tourists and mountain-climbers far less attention than they deserve. At the great centres of resort, such as Luchon and Bigorre, some stray English shooting-coats, and now and then, but very rarely, an alpenstock or ice-axe, may be seen; but even at Luchon and Bigorre we doubt if more than two or three English people can be counted for every hundred who pass through Zermatt or Interlaken in the autumn months. On selfish grounds the traveller in the Pyrenees may be glad that it is so, and that he is not exposed to meet here, as he does in the Alps, all the familiar faces of Piccadilly. Nevertheless it is a real loss to our countrymen to know so little of a piece of country which is not only most charming in itself, but almost as unlike the Alps as it is to Norway or to the Highlands of Scotland.

That the Pyrenees are on the whole equal to the Alps in either majesty or in beauty, we cannot think that even the two enthusiasts who have done most to explore their recesses, Count Henry Russell and Mr. Packe himself, will seriously venture to maintain. In the first place, they are greatly inferior in height, no Pyrenean summit reaching twelve thousand feet, and only two, the Maladetta and Pic des Posets, exceeding eleven thousand. Owing to this and to their lying further south than the Alps, there is of course very much less snow; and the glaciers, although good so far as they go, are few in number and quite trifling in size, the biggest not more than three or four miles in length, and a good deal even of this rather to be called *névé* than glacier proper. For the same reason the glaciers do not descend nearly so low as in the Alps; and one has none of those exquisite contrasts of glittering ice with bright green pastures and fir woods which give such a charm to Chamouni and the valleys of the Oberland. In the Pyrenees, glaciers and snowfields lie far up near the axis of the chain, at the head of high and rocky valleys, difficult of access except to the stalwart pedestrian, and where that pedestrian will find at night no rest for his burning head and wearied limbs. Towards the centre of the range there are some spots—Gavarnie, for instance, the Lac de Gaube, and (in the neighbourhood of Luchon) the Lac d'Oo and Port de Venasque—from which these snow slopes and glaciers of the higher peaks may be well seen; and these views are very noble. But for the most part one scarcely discovers the snows from the valleys; and towards the two ends of the chain snow and ice are wanting altogether. How much the landscape suffers by this want, no one who has been on the Wengern Alp or the Gôrner Grat, or at Courmayeur or Macugnaga, needs to be told. Nor is there anything in the shapes of the mountains themselves, fine as they are, which quite atones for this defect. The higher peaks are usually very steep and rocky; and as there is a great deal of diversity in their geological structure—some, like the Maladetta and the Canigou, being composed of granite; others, Pic des Posets, for instance, and the noble Pic Malaitous, of schist; and others again, such as the Vignemale and the Mont Perdu with its cluster of attendant summits, of limestone—there is no want of variety in their forms. But few of them have anything very marked or striking about their outlines; they lack that sort of peculiar character which one gets to know a mountain

by, and for which one loves it, as one does Monte Viso, or the Aiguille Verte, or the Eiger, or the Gross Glockner, not to mention the Matterhorn, to which neither the Pyrenees nor any other chain can show a rival. Moreover, these Pyrenean peaks are too much of a height, and seem somehow, when you enjoy a wide view, to be crowded rather too much together. It is not merely that the valleys are narrow below, for so they are in the Alps; but towards their heads they do not spread out into great open spaces or plateaux, like those which we have round the Riffel, or in the Upper Engadin. In the Pyrenees a great mountain seems to have hardly room enough to show itself properly off, so much is it jostled by summits of scarcely inferior height which distract the attention, and deprive a wide view of the unity and centrality which a single dominant peak or group of peaks gives it. The Maladetta is an exception, for it stands well by itself; but the Maladetta lacks nobility of form; it is a long serrated ridge, whose highest top (Pic Néthon) lies away back from the side whence one commonly sees it, and by no means looks its height. Add to this that the Pyrenees want large lakes, though they have many beautiful little tarns whose vivid blue and green surpasses anything to be seen in the Alps, and it will be seen that they cannot sustain a comparison with the greatest mountain scenery of Switzerland and Savoy.

It may be fairer to compare them with those parts of the Alps which are of the same average height, such as large parts of Tyrol and Styria, the Bavarian highlands, or the mountains of Venetia; and against three of these regions they can fairly hold their own. They are bolder than anything in Styria, Salzkammergut, or Bavaria, though they want the exquisite lakes of the two latter; they are richer and warmer in tone than most parts of Tyrol, and in the views they afford of the great plain of France they possess an element of majesty which it cannot parallel. But the Venetian Alps, with even less snow than the Pyrenees, and of no greater height, have a weird splendour of form and a gorgeous variety of colour which one seeks in vain on either side of the Pyrenees. If the latter have any summit as grand as the tower-like Sasso di Pelnio, or any valley as marvellously picturesque in its changing scenes as that of the Cordevole, above and below Caprile, it remains to be discovered in the scarcely explored recesses of Aragon or Catalonia; and those parched and stony lands are the last place where one can expect to find it.

In spite of all that we have said, the Pyrenees have many and great charms, charms which would perhaps make them in time more dear to one who lived among them than the austere splendour of the Swiss Alps. The tone of colour is generally warmer, the wood in the valleys is richer than that of Switzerland or Tyrol, the flowers seem even more abundant and more brilliant. The high cols are not so long as in the Alps, so that one passes faster from vines up to snow, and down again from snow to vines. Then the rivers and brooks—and this is perhaps the most characteristic, as it is the most pervading, delight of the Pyrenees—are all bright and sparkling, dazzlingly white in their endless cascades, green as emerald in their great swirling pools. The country is a paradise to the bather, for there is water everywhere; it is always clear, and it is always cold. And a landscape-painter, what with this abundance of streams, the deep colours of the higher mountains, the soft warm tints and profuse vegetation of the narrow gorges below, would, we are inclined to think, find a far more copious material fit for sketching than in most parts of the Alps.

As regards facilities for travel, the Pyrenees are well off in one respect, and shockingly ill off in another. At all the fashionable bathing-places, Eaux Bonnes, Cauterets, St. Sauveur, Bagnères de Bigorre, Bagnères de Luchon, there are excellent hotels, certainly not more expensive than those of Switzerland, and for all practical purposes quite as comfortable. To be sure they are not managed with so much reference to English wants; but as one does not see Englishmen and Americans to right and left at the table-d'hôte, and is not persistently addressed in an unintelligible tongue by the English-speaking waiter, this is a defect which no sensible man will regret. But, out of these few familiar spots, the inns are mostly poor, and when one penetrates the recesses of the valleys, and endeavours to find a night's lodging well up on the mountains at more than four thousand feet above the sea, one finds either none at all, or some hovel compared to which a cave or a pine wood is in fine weather much to be preferred. With the single exception of the snug little hostelry at Gavarnie, there does not seem to be a single inn in the Pyrenees in keen bracing air where a mountaineer can count upon finding enduring food and enough of it, a clean bedroom, and a tolerable bed. There are but few at all, and those that exist, at Lac d'Oo, for instance, or Lac de Gaube, would tempt nobody to spend more than one night. This want of high inns is really the great drawback, in a mountaineer's eyes, to the enjoyment of Pyrenean scenery. For one wants not only to be able to mount a Pic or a Port without a long walk out of the hot valleys, but also to get familiar with the character of the mountains by living up among them, and seeing them under different conditions, at different hours and in all states of the atmosphere. And, setting climbing apart altogether, there is the pleasure of living in a keen, vivifying mountain air where one hardly needs to take exercise in order to gain appetite and health, and has wide views spread before one without the necessity of going to look for them. There are places in the Pyrenees which might in these respects be made to vie with Murren, or the Riffel, or St. Moritz; but they have not yet been, as the French say, utilized, and do not seem likely to be. For the ideal of Frenchmen and Spaniards is a

luxurious hotel in a warm valley, with cafés and ball-rooms and carriage-roads; and the English visitors are quite too scanty to be worth making special provision for. And therefore those few adventurous spirits who have explored the higher Pyrenees, and in particular Count Russell, who seems from his Guide to have climbed nearly every peak, and pass, have laid their account to sleep constantly in the open air, which, to be sure, it is easier to do here than in the colder climate of the Swiss and German Alps. Up to eight thousand feet fuel may be found, and with a good warm sheepskin bag, a waterproof, and a guide to carry provisions, it is quite possible to have a pleasant night even without the shelter of a cave.

We have left ourselves no space to discuss the merits of the Pyrenees in other respects, scientific, artistic, and historical. The flora is very rich and varied, the geology extremely interesting, and still only partially explored, and there are many picturesque old towns in the lower valleys and scattered along the northern base of the mountains. The castles of Lourdes and Foix, the churches of St. Bertrand de Comminges, Luz, Bigorre, St. Lizier, Cornella, and many other places, are well worth seeing; and if bad weather suggests a run down into the plain, the student of mediæval architecture will find abundant occupation in Albi, Montauban, Toulouse, and, above all, in Carcassonne. As to Spain, the inexperienced might expect the same sort of pleasure in crossing into it, and noticing the contrasts of climate, vegetation, customs, architecture, which are so interesting when one passes from the German to the Italian side of the Alps. But the Spanish Pyrenees seems to be distinctly inferior in all respects (except as regards their botanical wealth) to the French. They are bare, dry, and stony; their forms are, speaking generally, less bold and noble than those of the more northern peaks; there are few villages in the upper valleys, and the *posadas* (inns), where they exist at all, are detestable. An enthusiast, whether of a scientific or artistic turn, may enjoy himself in the wilds of Catalonia and Aragon; but no one else will. Nor can the cities of Northern Spain be compared with those of Northern Italy. Barcelona, Saragossa, Pampelona, are not more inferior to Venice, Verona, and even Milan, than are lesser places like Puycerda Tolosa to Udine, or Brescia, or Como.

If in their higher regions the Pyrenees are more lonely and desolate than the Alps, the lower valleys, at least on the French side, seem much better peopled than those of Switzerland or Tyrol, and the inhabitants are a more genial and pleasant race, we will not say than the Tyrolese or Venetians, but than either the Swiss or the natives of central and northern France. Very fair guides, among them two or three really first-rate men, may be found at Eaux Bonnes, Cauterets, Gavarnie, and Luchon. And it is worth while to add that there is an excellent provision of guide-books. Besides the large and small editions of Joanne, which give the ordinary tourist all the information he needs, the pedestrian has Mr. Packe's excellent Guide (already referred to), and Count H. Russell's *Les grandes ascensions des Pyrénées*, a model in its way of clear and concise directions for the paths over the higher peaks and passes; and a great mass of valuable information respecting the natural history and the antiquities of the district has been published by the Société Raimond, whose headquarters are at Bigorre. If this society, to which and to whose distinguished and amiable President, M. Émile Frossard, every one interested in the Pyrenees is under great obligations, could only succeed in inducing the communes, some of which are very wealthy, or private persons, to establish plain but comfortable inns high up on the mountains, as it has itself done on Pic du Midi de Bigorre, it would do the one thing that remains to make the Pyrenees one of the most attractive fields in Europe—in some ways the most attractive—for the mountain-climber as well as for the lover of picturesque beauty.

DECAY OF THE RELIGIOUS ORDERS.

THE Pope is reported the other day, in giving audience to the superiors of Religious Orders now dismissed from Rome, to have varied his customary invectives on the usurping Italian Government by a severe, but no doubt well merited, rebuke addressed to its latest victims. Providence, as we are often reminded, can make use of the most unlikely instruments, and in this case Victor Emmanuel is the unconscious minister of Divine retribution on the shortcomings of the banished communities. They had forgotten the spirit of their rule, and allowed a grievous laxity to creep in among them; and if ever they should be suffered in happier times to return to Rome, a searching reform will be required. Dispassionate or unfriendly critics, both Roman Catholic and Protestant, have said as much again and again, but the indictment has been resented as a malicious libel. Henceforth they can appeal to the authority of the supreme and infallible Pastor in evidence of its truth. Not long ago, for instance, Father Hyacinthe, at the very time when he was offering to return to the Carmelite Order, and declaring his unaltered admiration of "the monastic ideal," took occasion to observe that, after ten years' experience, his illusions as to its practical realization were completely dispelled, and that, while ready himself to re-enter his convent if he could do so without being called upon to violate his conscientious convictions, he would not advise others still free to undertake the conventual life, such as it now is. He had learnt, he said, by experience, where to put his finger on the irremediable evil of Religious Orders in their actual form, and was convinced that a

change in the very conditions of their existence could alone rescue them from decay. After such emphatic testimony from the most opposite quarters it would be mere waste of time to multiply proofs of a fact sufficiently notorious; but an inquiry into its causes could hardly fail to have a high interest, both theoretical and practical. Anything like a complete investigation of the subject would lie far beyond our limits, but a few suggestions which throw some light on it may be offered here. One great Order, indeed, does not appear to have been represented in the assembly to which the Pope addressed himself, nor is it at all probable that his censure was designed to include the Jesuits. Their sins against society, and in one sense against morality, have no doubt been grave enough, graver indeed than any that can be laid to the charge of other religious bodies. But they are of a totally different kind, and are not of a nature to elicit Papal rebuke or to reflect on the characters of individuals. The latest historian of the Jesuits, Professor Huber, who is not likely to err on the side of a too favourable estimate, while noting occasional exceptions, fully admits that their personal conduct and undeviating fidelity to their rule have been, on the whole, unimpeachable. The main charge against them in fact comes pretty much to this—that they have loved their rule "not wisely but too well"; so well that they have persistently striven from the first to make it in substance, if not in form, the universal rule of Christendom. For the last three centuries, it has been sometimes said, and not by unfriendly critics, "the Society of Jesus is the Catholic Church put into commission"—at all events, they have done their best to make it so. Their political intrigues, their slippery ethics, their miraculous devotions, and their extravagant theology, which culminated in the Vatican decrees, have been all along subservient to one paramount aim—the aggrandizement of the Church, that is of the Papacy, through the aggrandizement of their own Society. On the object aimed at, and the means employed for its attainment, this is not the place to dwell. The point is simply referred to in illustration of the characteristic speciality of the Jesuit as distinguished from other Orders in the Church, which has no doubt acted as one main preservative against that gradual process of moral corruption to which most, if not all, of them have sooner or later succumbed. *Corruptio optimi pessima* has passed into a proverb, and those who set the highest price on what its votaries call "the life of angels" should be the first to admit that, in ceasing to be angelic, it becomes something less than human. But what is the secret of this seemingly inevitable declension, to which Protestant and sceptical writers are never weary of pointing with such bitter scorn, as though monks were preternatural monsters of selfishness and vice? Perhaps a glance at their origin may suggest a truer, as well as a more charitable, verdict.

Monasticism cannot strictly be called a creation of Christianity, for it finds its prototype among the Buddhists and in the Jewish sects of Essenes and Therapeutæ. However, the Church remoulded the institute and gave it a new direction, and we must content ourselves here with tracing its Christian history. Egypt was its birthplace and Antony its founder in the third century, when it first took the form of the eremitical life of the *Lauræ*; but Pachomius soon afterwards gathered several thousands of recluses into common buildings under a common rule, and thus established the monastic or cenobitical life, properly so called. We cannot linger here over its development in the East; but it may be remarked that it has throughout retained there, in accordance with Oriental temperament, much of its original character of pure contemplation, with the abuses obviously incident to such an ideal. The solitude of the Egyptian *Lauræ* survives in the zoophyte existence of the vast monasteries of Mount Athos, as described by modern travellers. At the same time it would be a great mistake to imagine that in the days of their early fervour the Eastern monks were mere selfish drones, or even mere contemplatives in the better sense of the term. To take the extreme case of Simeon Stylites, who spent several years on the top of a pillar thirty-six ells in height, and whose career has been doomed by Tennyson to a somewhat dubious immortality, we are told by an eye-witness, Theodoret, that hundreds of thousands came to hear his preaching, and were so moved by his exhortations that they received baptism; while he drew many more to repentance and reconciled enemies who brought their disputes to him for arbitration. The words of Theodoret about him, quoted with approval by the Protestant historian Neander, may indeed be fairly enough applied to the general subject of monasticism. "As princes," he observes, "at different times adopt different emblems for their coinage; as of lions, or stars, or angels—in order to enhance the value of the gold—so has God caused piety to assume new and varied forms, to rouse the admiration, not only of believers, but of the unbelieving world also." To put the same idea in other words, we may say that each new Order was in its turn an attempt, more or less successful, to meet some felt want in the religious life of the period; but then the Order lives on when the occasion which evoked it has passed away, or when other agencies have superseded its original design. And this alone would go far to account for the inevitable progress of decay.

It will be seen that Western monasticism, with which we are here more immediately concerned, was borrowed from the East, and was therefore of later origin. Athanasius was the first to import it, during his exile, and it was recommended by the influential advocacy of men like St. Ambrose, St. Jerome, and, above all, St. Augustine. But Augustine was no blind panegyrist

of the system; he insisted on the great care to be used in sifting the motives of new recruits, and on the obligation of manual labour in the monasteries as well as prayer. The real founder of Western monasticism, however, was St. Benedict, a century later, whose rule was followed, with more or less modification, by every later community in the Latin Church, till the establishment of the Mendicant Friars in the thirteenth century by Francis of Assisi opened a new epoch in monastic history. Benedict innovated not less extensively on Eastern models of the cenobitical life than Francis on the rule of Benedict. Active labour, both manual and intellectual, as well as public ministrations, assumed a prominent place in his institute; most of our ruined abbeys, so familiar to the tourist, and many of our parish churches, were in the hands of the Benedictines before the Reformation, while the Cistercians, who held several more, are only a "reform" of the Benedictines. They were also during the darkness of the middle ages the chief custodians of such learning as was preserved. But already in the eighth century the great Benedictine Order showed signs of incipient corruption, and another Benedict, of Aniane, less known to fame, laboured hard for its renovation, with very partial success. The Cistercian reform, rendered memorable by the name of St. Bernard, was more effective; but readers of Montalembert's eloquent History, which might almost be called a panegyric, of Western Monasticism, will remember that even he finds occasion frequently to deplore the incursions of laxity and moral deterioration. The Franciscan rule of strict poverty for the Order as well as the individual monk was designed to exclude one main danger of the elder religious corporations. And for a time the Friars Minor were at once the favourites and the devoted servants of the multitude, to whom they ministered; but time proved that the profession of mendicancy, like the possession of wealth, may lead to idleness and corruption, as the zeal for orthodoxy which animated the first Dominicans in the pulpit degenerated rapidly into the ruthless cruelty of the inquisitor. But there can be no doubt that the excessive multiplication of endowments, and of members chiefly drawn from the lower classes, whose object in taking the habit was to escape the necessity of labour or military service, has been one main source of corruption in monastic bodies. In Scotland, before the period of the Reformation, a third of the landed property was in ecclesiastical hands, and a large proportion of the land in Italy and Spain was similarly held before the recent changes. The Jesuits, it is true, are enormously wealthy, though their property is not in land; but it has never been their temptation to spend money on personal indulgence or display, and the rigidly despotic organization of the Order would render any deflection of individuals or particular houses from the prescribed standard almost impossible. In giving to his Society its military and aggressive character and its ambitious aims, Ignatius Loyola adopted a very powerful precaution against the inroads of moral laxity. Whether the remedy prescribed has not proved worse than the disease, at least as regards the public action and influence of the Order, is another question. In the rude society of the age of St. Bernard it was thought next to impossible for any one to lead a godly life in the world, and accordingly the word "conversion" came to be used as synonymous with taking religious vows; and it was much the same feeling which in an earlier age peopled the Egyptian *Laura* with its vast army of solitaries. No one would exactly urge this plea in the present day. But the desire to save his own soul was generally blended, at least in the mind of the Western monk, as was conspicuously the case with St. Bernard himself, with a desire—natural and laudable in itself, though easily liable to degenerate into a vulgar ambition—to exert an influence for good on the world he had abandoned. And thus we are brought round to the fundamental question whether the important functions confessedly discharged in other times by the great Religious Orders are not, under the altered social conditions of the present day, either superseded or transferred to instrumentalities of later date. One thing, at all events, is clear, that the monastic institute can offer no guarantee against the recurrence of what appears to be in practice the inseparable accident of corruption, unless it can establish some better title than mere ancient prescription to a new lease of life.

DANGEROUS SHIPS.

THE first thing that strikes one perhaps in reading the evidence taken by the Royal Commission on Unseaworthy Ships is that some of the Commissioners appear to have entered upon the investigation in what can hardly be regarded as a very promising frame of mind. Many of the questions addressed to witnesses relate not to facts, but to matters of abstract argument on which it was idle to take evidence, and indicate a disposition to assume at the very outset of the inquiry that it is not worth while to take any precautions to prevent loss of life at sea, since no precautions will absolutely prevent lives being lost from one cause or another. It was asked, for example, whether any amount of inspection and surveying would prevent bad navigation, whether surveyors might not make mistakes, whether certificated ships had not been lost, and so on. One of the witnesses replied very reasonably that no doubt surveyors were apt to make mistakes, just as doctors sometimes made mistakes; and that ships would occasionally go down in spite of inspection; just as crimes were committed in spite of the police. "When you see murders increase," said Mr. McIver, "instead of

falling off, you do not decrease your policemen. Policemen do no harm, though they do not prevent murders. Inspections contribute to good workmanship, and good workmanship contributes to safety." Losses occur even with careful surveying; but the question is whether surveying does not to some extent prevent losses. In reference to the proposal to impose a penalty on deck-loads, Mr. Milner Gibson observed, "So that a vessel coming safely across the Atlantic to a British port would be fined for having arrived safely?" Mr. Farrer answered "Yes"; but the proper answer is obviously No. The shipowner or captain would be fined, not for having accomplished the voyage safely, but for having imperilled the lives of the crew. It would be absurd to enact a penalty which should be applicable only to people who went to the bottom of the ocean. A very considerable part of this bulky blue-book will be found to have been contributed by the Commissioners themselves, although they might more appropriately have reserved their observations for their own Report. The course of the inquiry would have been greatly simplified, and its results would have been brought out in a more distinct and definite form, if the Commissioners had only taken the trouble at the beginning to determine the points to which it should be directed, and had then kept to them in order. We will endeavour to compress the gist of the evidence into a rapid summary.

The first question to be considered is whether, in point of fact, unseaworthy ships are habitually sent to sea. Unseaworthy ships may be divided into two classes—those which are unsound in themselves, and those which are dangerous from being overloaded. We will take the question of unsoundness first. On this point the evidence is naturally conflicting, and it is necessary to observe the qualifications with which much of it must be received on account of the personal circumstances and bias of the witnesses. A number of shipbuilders and shipowners were examined, who all testified to the excellence of their own ships, but, as a rule, professed not to know much about their neighbours' ships. On the whole, they were disposed to take rather a favourable view of the strength of ships. Mr. McIver, however, senior partner in the Cunard Company, expressed a very decided opinion that there was a great deal of defective shipbuilding, arising partly from the ignorance of shipbuilders, who knew very little of the business they had taken up, and partly from carelessness and false economy. Mr. Lamport said he found that even vessels built under Lloyd's survey were not always soundly built. "There is plenty of material, but it is badly put together." A bad ship, he added, is not often built on the Mersey, or the Thames, or the Clyde; but a bad ship is often built on the Tyne or the Wear. Mr. E. J. Reed believes that there is a great deal of bad iron and of bad work too; and that the long type of ship now coming into vogue requires careful calculations as to strength, which are seldom made. Several surveyors of the Board of Trade gave evidence, generally in favour of the ports at which they were stationed, though some of them admitted that matters were less satisfactory elsewhere. Thus surveyors at Cardiff and Newcastle, who spoke well of the Cardiff and Tyne shipping, had no hesitation in giving a bad account of Belfast; and the surveyor of the Iron Ship Registry at Liverpool, who thought highly of Liverpool ships, said the East coast must rank lowest for workmanship in shipbuilding. It may be assumed that officers permanently stationed at any place would not add to the comfort of their lives by saying anything which would offend the persons with whom they have daily to do business. A harbour-master at Newcastle frankly acknowledged his reluctance to give evidence, as he had suffered so much unpleasantness for having spoken out about the *Sea Queen*. In a former article we quoted some of the evidence of Mr. B. Martell, chief surveyor to Lloyd's Register, as to the defective condition in which ships are often sent to sea. There are some seven hundred vessels above a hundred tons which have been struck off Lloyd's Register, many of which are positively known to be unsound, while there is a moral certainty that the rest are also defective. Mr. Martell gave instances in which ships were found to be unseaworthy on survey, and were expunged from the Register, because the owner would not make the necessary repairs, and these ships afterwards went to sea and were lost. Mr. Harper, secretary of the Salvage Association of Lloyds, thinks that, of some three thousand or four thousand ships leaving London, Liverpool, and Glasgow reported to his Association, forty would be unseaworthy; and that this is, on the whole, a fair proportion of the ships which go to sea in that condition. A curious question, Mr. Harper said, is what becomes of all the old ships. In London there are from thirty to forty shipbuilders and only five shipbreakers. Other witnesses who were questioned on this point were also unable to say what was done with old ships, for they were rarely seen in the process of being broken up; and the obvious inference would seem to be that a ship is really kept going until she comes to a violent end. Mr. B. Waymouth, secretary to the Committee of Lloyd's Registry for Classification, mentioned a case in which "devils," or short bolts that do not go through the vessel, were used. It was a Jersey ship, and there were three or four other cases about the same time. There had been complaints of similar frauds in Clyde-built ships, but none had been reported to Mr. Waymouth's Committee. He recollected in one instance seeing a vessel in which a plank had been gouged out and the holes stopped up with putty to make it appear that there were bolts there. He had also heard of copper bilge bolts being put in a vessel to show to the surveyor, and the copper bolts being afterwards taken out and trenails substituted. In Mr. Waymouth's experience the quality of the iron is often very defective. He was once

in a yard when some iron was delivered. He tested it with a hammer, and it snapped off like a piece of glass; yet that iron was going to be used for a ship. Afterwards, when the plating was to be tested, a punch, beautifully got up, just of the size to fit a finely-made die, was produced, which cut through it like a razor. When the plating was punched with the ordinary punches, it started off in fractures in every direction. A list of some hundred vessels marked in Lloyd's Register Book with a black line was put in. These vessels had been struck off either because they were not up to the standard of their class, or because the owners declined a survey; and the remarks appended to some of them are highly suggestive, as, for instance, the following:—"Waterway, caulking, &c., defective; survey declined." "Wormed in bottom." "Not fit for any character; trenails, planks, &c., defective." "Bad case; many rotten timbers." "Majority of timbers exposed; also ceiling and bolts defective." "Wales wormed, waterway seams open." "Class expired; put back, making water; recommended the vessel to be docked; not worthy of any class." "Put into Belfast strained and making water; recommended to be docked; sailed without repairs." It does not, of course, follow that all the vessels thus distinguished by a black mark are necessarily defective; but there can be little doubt that many, and probably most of them, are so. Classification raises the value of a vessel; and an owner who was willing to pay for repairs would not decline a survey. Mr. Rundell, Secretary to the Liverpool Underwriters' Association, gave 225 as the number of "black sheep" on his list during eleven years, or an average of twenty a year.

The next question is as to overloading, and here again the evidence is conflicting, and rather general than specific. There is a natural disinclination on the part of witnesses to give offence to their neighbours, for which allowance must be made in weighing their testimony. Mr. T. S. Miller calculated that more than twenty, perhaps twice as many, ships left Cardiff clearly overloaded during the last twelve months. Mr. Neate, Board of Trade Surveyor, said that formerly vessels at Cardiff used to be very deep in the water, but there had been lately a great improvement. He thought, however, that two-thirds of the coasters, if rigidly surveyed, would be stopped, though coasters did not often come to grief. Mr. Wawn, Board of Trade Surveyor, did not think that overloading prevailed extensively in Sunderland. Captain Sandeman, Surveyor at Liverpool for the Salvage Association of London, was of opinion that Liverpool ships load very fairly; still he had known vessels go to sea in a very unsound state and very deeply laden, so that it would require very fine weather indeed to carry them safely to their destinations. Mr. Lamport said that neither he nor his overlooker could recollect a case of a vessel from Liverpool having been lost by overloading. As to Newcastle, Mr. Hall, shipowner, expressed the equivocal opinion that there was not more overloading there than at other ports. Mr. Bullock, harbour-master, had from time to time seen vessels very deeply laden leaving the Tyne, but purposely refrained from making special observations lest it should give offence. A gunner in the Royal Navy said he had been thirty-six years at sea, and he would not like to go to sea in many of the vessels he saw leaving the Tyne; some had only two feet of freeboard. Sometimes there were half-a-dozen very deep ships in a week. "I see," he added, "some very old wooden ships go out, which we call broken-backed. I remember an old brig, said to be a hundred years old—she was wrecked during the gales, and was purchased—and after the weather got fine, she was got off, and she still goes to sea." Lieutenant Reed, R.N., had also observed many ships on the Tyne dangerously deep in the water, the freeboard being often much less than three feet.

Deck-cargoes were strongly condemned by almost every witness who was questioned on the subject. Mr. O. B. Walker, of the firm of Price, Potter, and Co., timber merchants, said the timber ships were almost the worst affixed, and deck-cargoes added greatly to their danger. It would be worth while to pay higher freights for ships that did not carry deck-loads, as the cargo would not be lost so frequently, and shippers would also save in insurance, as the rate would be less. If it were possible to enforce restrictions in regard to deck-loads, all parties would, he thought, be gainers, irrespectively of the saving of life. "So we may take it," said Mr. Merrifield, "that there exists a sort of vicious custom of deck-loading which is prejudicial to all parties concerned when we take them collectively as having a consolidated interest, but which custom some one always has an individual interest in keeping going?" "Yes," was the reply. Mr. Lamport, shipowner, Liverpool, took a similar view. Deck-loads, he said, were dangerous not only because they obstructed the navigation of the vessel, and were apt to lead to overloading, but also because the logs could not be fastened so as to prevent their moving in bad weather, and when they moved they loosened the stanchions, perhaps also splitting the covering-board, and strained the vessel, which became leaky or water-logged. Mr. E. Rankin, Liverpool, also held that it would be well if deck-loads could be prohibited entirely; shipowners would get a higher rate of freight to compensate them for the reduction of cargo. These opinions are confirmed by the appalling catalogue of disasters to timber ships, which is supplied by the Board of Trade. During the months of November and December last year, as far as reported up to the 7th of January, no fewer than 52 were totally lost and 113 damaged; of these 165 vessels, 121 carried deck-loads and 44 had none; as to the remainder, there was no information on this point. Ninety-five were lost. These losses were pretty well divided between the American and Baltic trades. Mr. T. S. Miller, Collector of Customs at Cardiff, stated that

when on the west of Ireland he frequently saw wrecks arising from deck-loads. "In one or two instances they were turned quite over, and in one instance I have gone out with a steamer and have pulled the vessel in with the masts underneath and the bottom upwards." Mr. Hatchelor of Cardiff never carried a deck-load in the autumn, or winter, and never lost a timber ship. It was explained by Mr. Farrer that the old Act prohibiting deck-loads was repealed on account of its being evaded by ships taking in deck-loads at foreign ports; and it was also pointed out that there were difficulties in the way of uniformly forbidding deck-loads of cattle and other things. The Canadian Legislature has this year passed an Act prohibiting deck-loads from the 1st of October to the 16th of March; and if a corresponding measure were passed in England, the United States might perhaps be induced to follow suit. There could not be much difficulty in providing for exceptions under a special licence.

Putting all this evidence together, it is impossible to resist the conclusion that a considerable number of ships are every year sent to sea in a dangerous condition. Many of these ships are unsound, if not absolutely unseaworthy; but it is possible that danger arises more frequently from excessive cargoes. It would be rash, however, to assume that ships are often knowingly sent out in a dangerous state. There are cases, no doubt, in which rotten ships are despatched with worthless cargoes for the sake of the insurance-money, but these cases are not common. As a rule, shipowners would rather that their ships should not be lost, and they probably flatter themselves with the reflection that the vessels have always a fair chance of reaching their destination in safety. The evil is that the temptation to make the most of a vessel, by loading her heavily, keeping her in incessant use, and economizing in repairs, tends to reduce the chances of safety to a point at which they almost disappear. It is a matter of everyday experience that somehow or other very frail, deeply laden vessels do somehow or other contrive to keep afloat, and even to make many voyages. They may be constantly in peril, and a rough breeze or any little accident to the machinery or other fittings would be pretty certain to make an end of them. But by mysterious good fortune the accidents happen the other way; there is a smooth sea and favourable winds, and all goes well. Still it is a slender thread to trust to, and the question is whether owners should be allowed to trust to it. There can be no doubt how the present system works. Shipowners may be assumed to be, on the whole, as humane and honourable as other men; but in the long run the management of a business is invariably influenced by pecuniary considerations. There is a well-known French proverb about killing the mandarin. It is supposed that, if you want a fortune, you have only to touch a knob on the wall; it kills a mandarin, but your victim is out of sight and far away, while the fortune you gain is in your hand. It is much the same with shipowners. Their vessels do not necessarily pass under their personal supervision; perhaps they never see them at all, and in any case they do not personally survey them and direct the stowage of cargo. So they shake off their responsibility on the captains and stevedores; and at the same time make themselves safe by insurance. If the captain and stevedores are satisfied, if the crew are willing to sail, why, the owner asks himself, should he interfere? Whatever happens, he is secure against loss. He is anxious to get the utmost degree of profit out of the ship, so he shirks repairs and packs her as full as she will hold. The captain and stevedores are his servants, and are anxious to keep in with him, and are therefore afraid to give offence by raising any question as to the soundness of the vessel or the amount of cargo. It is true the captain's life is at stake, but then so is his living, and a captain who wants to be sure of employment must not be too particular. Thus it will be seen that the whole drift of the present system is to make owners and captains reckless, and to lead them to trust, not to reasonable conditions of safety, but to mere chances of safety—the chances of fair weather luck. It is really nothing more than a form of gambling. There is competition between shipowners, and there is also competition between shipbuilders and between insurance agencies; and all this competition tends in the same direction. Shipbuilders give bad materials and scamped work. Insurance agencies reduce their scale of precautions. But all these interests are covered in one way or another, and it is the sailors alone who suffer. It seems to us that the natural way to remedy this evil is to find some means of turning the tendency of the system the other way, so that owners should know that, if they lost ships, they would be decidedly the worse for it.

But how is this to be done? The powers with which the Board of Trade has been invested, and which we are glad to observe it is diligently exercising, of detaining, examining, and, if necessary, condemning unseaworthy ships, is undoubtedly a step in the right direction. The mere detention of a vessel is of course an annoyance and loss to the owner or hirer; and it will therefore be his interest to keep the vessel in such a state that there shall be no room for suspicion as to its seaworthiness. The conditions under which criminal penalties may be inflicted on persons who knowingly send a dangerous ship to sea require to be made more stringent, and the means of enforcing them should also be systematised, so that they may be more readily and promptly put in action. If this were done, and if penalties were provided for the summary recovery of compensation by shipwrecked sailors or the survivors of those who perish at sea, there would be a counterpoise to the mischievous effects of insurance, and shipowners would be made to feel that, on the whole, it was their interest not to run the risk of losing vessels. The principle of the

law should be that ships ought not to be lost, and that when a loss occurs, the burden should lie on the owner or hirer of showing that it was not his fault. With regard to a load-line and compulsory survey, it is certainly reasonable that in a matter affecting important commercial interests, and which is further complicated by international difficulties, great caution should be observed in resorting to coercive legislation; but there is one thing which the evidence makes abundantly clear, and that is, that in every well-conducted shipping business there is a calculation as to the depth to which each vessel can safely be immersed, and also a careful system of survey. Mr. M'Iver of the Cunard Company, Captain Fenwick, Mr. Geo. Marshall, and Mr. Sterry were all agreed on these points. The majority of shipowners are honourable and prudent men, and it is difficult to see why what they find it necessary to do should not be made compulsory on all. A universal fixed load-line is of course absurd, but every owner should be bound by an estimate of maximum loading capacity; and a system of surveys, not necessarily by the Government, but by a public board, in which all the classes interested in maritime enterprises should be represented, appears to be not impracticable. It is certain that no amount of inspection will absolutely prevent mistakes and accidents; but inspection would tend to make owners and captains more careful, and that is what is wanted. At the least shipowners should be compelled to register full particulars as to the construction and capacity of their vessels, and also to mark them so that their depth in the water may be apparent to every one; this information would be available in any proceedings that might be taken against them.

LORD AIRLIE AND DEER-FORESTS.

IF Lord Airlie's evidence before the Committee on the Game Laws at all resembled his letters to the *Times* and the Editor of the *Fortnightly Review*, it must have gone a considerable way towards lightening a ponderous blue-book. If it did not cast a steady light on the subject under investigation, at least it must have furnished an amusing psychological study. We imagine that we have obtained already a good deal of insight into Lord Airlie's idiosyncrasy from the letters we have had the privilege of perusing, brief and self-contradictory as they are. We figure to ourselves the writer as a man endowed with an active and singularly mobile intellect; quick to take up positions and entrench himself in them, quicker still to abandon them on an afterthought and to shift his ground. Happy in the possession of intuitive perceptions, he leaps with confidence towards his conclusions; but before he is safely landed on his legs, it flashes upon him that he has made a false start. His conscience being as sensitive as his mind is quick, he is in haste to recant whenever he recognizes himself to be in error. The strange thing is that experience should never have taught him to distrust himself and those first impressions of his, and so spare himself the gratuitous humiliation of his honourably candid avowals. "Cross of St. Andrew, that is what I call an onslaught," said the archer Le Balafre, talking of the descent on the Durwards of Glen-Houlakin by the Earl's ancestors. We may say very much the same thing of his Lordship's original attack on the natural enemy of grouse and deer. He assaults the revolutionary innovator with a blending of invective and sarcasm which would have been singularly happy had it only had a substantial foundation. However, the letter as it read was a very pretty letter indeed; and, to parody another sentiment by another of Sir Walter's heroes, many a man has fought it out knee deep in printers' ink on a far less plausible quarrel. Yet the determined onslaught turns out to be an anachronism so far as its author's state of mind was concerned; and had not the letter been duly and recently dated, we might presume that it had been delayed by irregular postal communications between the Forlshire hills and Printing House Square. For, by way of prelude to it, Lord Airlie had addressed three letters to the Editor of the *Fortnightly*. No. 1 appears to have been practically identical with the *causa belli* published in the *Times*. No. 2 is a frank admission that, on reading Mr. Beesly's article a second time, Lord Airlie did "not think it conveyed the imputation I thought it did, except by a somewhat forced construction"; while No. 3, following fast on No. 2, and arriving by the very next post, makes the further concession "that, on looking closely into my evidence, it appears to me that there were some answers of mine which, with a little ingenuity, might be made to bear the construction which Mr. Beesly put upon it." Under the circumstances we can understand Lord Airlie's "desire not to enter into a controversy with Mr. Beesly," although we do not doubt that it was a creditably conscientious impulse that drove him to reconsider that sage decision. Finally, after successive alternations of sentiment and conviction, each of them duly transmitted to the *Times* for the approval of the reading public, Lord Airlie has reverted to those second thoughts which are proverbially the most trustworthy. He has apologized for "warm language and reckless imputation in terms which, speaking soberly, do him the very greatest credit, and there is nothing left for us but to express a wish that the deer and the forests had found a more discreet advocate. For the "recreation plea" in favour of forests, as Mr. Beesly calls it, can have but a single meaning in these days when mind takes precedence of muscle. It must mean that these wild sporting grounds, with the changes of scene and air which they offer, are the recreation grounds of many of the overwrought men who direct our politics, our finance, and our trade.

It means that the bracing effects of the moors and the forests on the faculties that create the wealth of the country, and the intellects that take charge of its most important interests, far outweigh the value of an extra few thousand head of sheep and black cattle, or an infinitesimal displacement of population from outlying districts to more crowded centres. But if Lord Airlie's letters are to be taken in illustration of the effects of deer-stalking on the intellectual powers, we fear that many persons who have read them might be converted to Mr. Beesly's unsympathetic way of thinking, and be inclined contemptuously to dismiss the recreation plea.

For ourselves, we regret that Lord Airlie should have thought it necessary to speak when he had far better been silent, because we are much more in sympathy with him than with his opponent. Mr. Beesly writes of "Lord Airlie and his friends" as if our Highland shootings were monopolized by a little knot of titled aristocrats. In point of fact, as Mr. Beesly must know very well, it is a matter of money and not of caste. The love of sport is general in all classes, from princes of the blood to the labourer who marauds on the squire's covert, or the shoemaker's apprentice who goes out with his rusty pistol after the smoke-stained sparrows of the suburbs. When a man who has that love rises in the world and has earned the means of gratifying his tastes, he indulges in shooting quarters as in other luxuries, just as the Durham collier begins to invest his increased wages in pianos. There is no monopoly whatever in the matter, except in the sense in which one class of incomes have a monopoly of mansions in Belgravia, while another and a larger class have a monopoly of a plurality of rooms, and of animal food every day for dinner. Unless we are prepared to be absolutely utilitarian and penny-wise and pound-foolish, we ought to regard our deer-forests as not the least precious of our national possessions. Not only are they recreation grounds at our very doors, but they are sanctuaries for many of the most picturesque species of wild animals, which are being rapidly exterminated everywhere else. Thanks to the natural characteristics of our Highlands, coupled with our Game-laws, nowhere else within the limits of civilization do we find at once such excellent sport and so much of the exhilarating freshness of primitive nature. There is very good shooting on some of the great feudal domains in Germany and the Austrian Empire—domains that are jealously preserved by their hereditary proprietors; but everywhere else game is gradually being hunted down. What with democratic legislation, extreme subdivision of properties, and an exceedingly lenient law of trespass, which remains as often as not a dead letter, the game on the Continent is going the way of the wolves on the Scotch mountains and the bustards on the English downs. "Hunted like a partridge" might be said of the birds of France quite as truly as of those of Judea. Were it not that French birds are for the most part of the red-legged breed, who are taught by a merciful provision of Providence to run in the drills, in place of rising on the wing, we suspect that French partridges must have been extirpated long ago, beyond the bounds of such estates as Ferrières. The very thrushes in France have an exceedingly rough time of it in the autumn, and lark-shooting is, we understand, by no means what it used to be on the first day of the licence season on the plain of St. Denis. Belgium, with its little patches of rich grain and root crops, would be the very paradise of hares and partridges if it did not swarm with small proprietors. As it is, game is as scarce in the Flemish markets as the tame rabbits of Ostend are plentiful. There might be fair shooting in Spain, but every muleteer carries a long fowling-piece at his back or across his saddle-bow, so that it is but seldom that the stranger tourist has the luck to obtain a shot in passing. In Italy you only make a heavy bag if you take your life in your hands, and, fortified by a mixture of port and quinine, venture in the malaria after boars or waterbirds down in some of the marshes or *maremme*. So it is all over the more civilized parts of Europe. In Scandinavia sport has become the most doubtful of lotteries since the days when Lloyd wrote his fascinating volumes; and even Lloyd did little more than enough to tempt the very enthusiastic. You may get your two or three couple of riper; you may scorch them over a fire of wood, and then retire to your repose on the straw in a barn. But unless you are young and vigorous, entering upon life instead of being worn by its labours, the sport does not compensate you for the privations. If you want anything less tame than bagging feathered fowl and furry innocents, you must go a very long way nowadays to look for it. The energy of the English race, and the attraction of veins of gold in the Sierras, have almost depopulated what were once the happy hunting-grounds of the great North American Continent. The herds of buffalo have disappeared from the valleys of the Red River of the North and the Saskatchewan. You can no longer organize hunting trips from St. Paul or St. Louis; you must make your way to the southward, among the brigand gangs of New Mexico and the scattered remains of the tribes of the Apaches and Comanches. To the shores of Southern America is a long sea voyage; and to do any good on the Pampas, when you get there, you must have learned to sit an unbroken steed, and handle the lasso and bola like a Guascho. The great mountain ranges of Central Asia are practically inaccessible to European sportsmen; and very few of our hereditary legislators or business men care to turn out after man-eaters in the pestilential jungles of Hindustan at the season when the heat is most terrible to natives of the temperate zone. If they did, they would scarcely return invigorated to Westminster or Lombard Street. In Australasia, among the kangaroos and apteryxes, there is no shooting to speak of. In Africa

the districts ranged by Harris, and even by Gordon Cumming, have been abandoned by all the nobler game; and, to bring home ivory or skins of the roan antelope, you must go a journey of months into the remote interior. In short, the sportsman unattached has every day to go further and further afield, until his expenditure in time and money threatens to fall little short of the fancy ronts of the deer-grounds. The day may not be far distant when, to get any decent shooting without hiring it, you will have to trust yourself among savages who have scared away poachers by the ferocious reputation which their practices have made for them.

Deer-forests and moors are worth a great deal to us at present, but they are likely to become absolutely invaluable if things go on as they are doing; just as space in a city becomes precious when the suburbs are spreading themselves over what used to be fields. The Highland shootings lie within easy reach of trains and telegrams; you need not make your will and communicate with the Insurance Company before going there. On the contrary, you have abundance of the most healthy excitement, as the man knows who has killed a hart of ten—or missed him—after a long and anxious stalk. You may even sprain an ankle, or have a serious slip in scrambling up the face of some precipice; or, after the droning which you may infallibly count upon, it is possible that you may have a severe cold that must be cured without the assistance of a doctor. But there is no chance of a father of a family or of his country being struck down by malaria or "Yellow Jack," hugged by paws, tossed on tusks, or dragged off in claws into the jungle. Yet you can cast yourself loose from your home habits after breakfast with a highly stimulating sense of independence, feeling yourself the Nimrod or the Hawkseye of the period, knowing that on your own astuteness, endurance, coolness, and skill it depends whether you shall send home the shooting-pony empty or laden. Meanwhile, to say nothing of the magnificent air, and of walking with an earnest purpose instead of taking an aimless constitutional, you are moving all the day long in a grand open-air menagerie, expanding your mind and intelligence in observation of the habits of the animal creation. Lord Airlie is a sportsman, and no doubt is keenly alive to all this. But, had he written ever so wisely, he would never have made converts of the gentlemen who have no rural tastes in common with him, and who apply the harshest rules of utilitarian logic to pursuits and enjoyments of which they are utterly ignorant.

* FIRES.

IT may be taken for granted that some inquiry ought to be made into the origin of fires. A Bill providing for such inquiry has been brought into Parliament, but has made no progress. It is suggested that a new officer, to be called a Fire Marshal, ought to be appointed, and it is answered that there is an ancient officer, the Coroner, on whom this duty might be devolved. Mr. Payne, the Coroner of London, reminds us that in the year 1845, his father, Mr. Serjeant Payne, who was Coroner for London and Southwark, "acting on the old authorities," revived the ancient practice of holding inquests in cases of house-burning where there had been no loss of life. The example thus set in London was followed in other parts of the kingdom, "with manifest advantage to the public"; but unfortunately the Court of Queen's Bench checked this useful practice by a writ of prohibition, which was granted on the ground that a coroner has no power to hold an inquisition respecting the origin of a fire. Mr. Payne suggests that this defect of power might be supplied. The coroner, being already in office, has at hand the means for carrying into effect the intentions of the proposed Bill at small expense. If necessary, an assessor might be appointed in special cases. He thinks that inquiry should be made in every case where any portion of the house is actually burnt, and that such inquiry should extend, not merely to the origin of the fire, but also to the structure of the premises and the water supply. Certainty of inquiry, he says, is the great deterrent of crime, and therefore it matters little whether the inquiry be made by the coroner or his deputy and a jury, or by the coroner or his deputy alone, so that it be known that an inquiry will certainly be made. We think that in this Mr. Payne is clearly right. The Insurance Offices would in many cases exert themselves to assist such inquiries, and they would be able and willing to employ persons skilled in detecting and exposing fraud. Mr. Payne would prefer to have a jury, say of half-a-dozen inhabitants of the neighbourhood, because they would be likely to be acquainted with the habits of those frequenting the premises; and it may be added that they would have a strong interest in the efficient prosecution of the inquiry. The proposal to appoint a Fire Marshal for London is open to the objection that it leaves the rest of the country without provision; whereas, if the coroners were employed everywhere, it would be easy to supply skilled assessors in difficult or important cases. We can partly judge how the coroners would work such inquiries from observing what happens after a serious railway accident. By the assistance of an officer of the Board of Trade, useful investigations are often made, and at least lines of inquiry are suggested which may be pursued afterwards. The proposed Fire Marshal, the coroner, or the coroner's assessor, would be equally entitled to call for the assistance of the Metropolitan or City Police, the Fire Brigade, and the Salvage Corps. All these officers would doubtless be equally ready to expose "the faults and neglect of District Surveyors, the

inattention, error of judgment, or want of skill of firemen or police, the deficiency of water supply, the existence of improper manufactures." Whatever other defects coroners may possess, they cannot be accused of a disposition to understate their own importance. They would usually possess the will to prosecute inquiry into the causes of fire as far, to say the least, as could be reasonably desired.

But if the present condition of the metropolis, as regards liability to fire, be as bad as has been lately represented, there seems to be occasion, not only for special, but general, inquiry. We are said to be all living amid tremendous perils, some of which are assumed by those who undertake to warn us to be preventable; and if that be so they ought to be prevented. The Fire Marshal may inquire and report; and if the Tichborne case has finished, and Parliament has not begun, his report and the evidence on which it is based may have a chance to be generally read. But it appears to us that the condition of London requires either immediate legislation or inquiry as preliminary thereto. Committees have sat and taken evidence already upon this subject, but if more work of the kind is required, let it be done without delay, and then let the necessary legislation follow. It certainly does seem to the superficial observer wonderful that we make no sufficient effort to protect ourselves against notorious and apparently preventable dangers which beset our daily life. This month never comes round without an explosion of fireworks, causing more or less destruction of life or limb. Surely now that we can have fireworks at the Crystal Palace and Alexandra Park, they ought to be strictly prohibited elsewhere. We want neither coroner nor Fire Marshal to explain to us that making fireworks in a crowded neighbourhood is dangerous, and if we cannot or will not put a stop to this practice, we must take the consequences. A letter in the *Times* describes what the writer calls a "fire-trap," which means, as we understand, a small court at the back of a house, filled with packing-cases, straw, shavings, and other equally inflammable materials. The upstairs lodger thinks the safety of his life and manuscripts the most important consideration, while the tradesman on the ground-floor thinks that before all things business must be carried on. The *Times* improves the occasion by reminding its readers that we are all in this great city "slumbering on a volcano." In many cases houses are so built or situated, and combustible materials are so arranged, that if preparation had been made for a conflagration, the "fire-trap" could not be more complete. We can all call to mind cases to which this description is exactly applicable, and although it is not to be doubted that many fires are due to "fire-raisers," yet the fires most fatal to life are usually due to "fire-traps." There are many places in London where the wonder is not that fires do happen sometimes, but that fires do not happen every night. It seems to us, perhaps, shocking that the business of firework-making should be carried on in a six-roomed house in a street in Lambeth. But habit reconciles men to everything. This case is specially unmanageable either by coroner or Fire Marshal, because the explosion killed the man who caused it, and he has gone beyond the reach of censure. This man and his wife occupied two rooms on the ground-floor, and he let the first floor to one family, and the second floor to another. It appears that the man carried on, unknown to his neighbours, the business of a firework-maker in the house, and had in it a store of gunpowder and other explosive materials. He was pursuing his usual occupation when the explosion occurred. He was making fireworks on Tuesday morning in preparation for next day's demand. It appears impossible to prevent the sale and use of fireworks on the 5th of November, and perhaps if the police attempted to interfere effectually, they would be accused of sympathizing with the Pope. At any rate every boy spends his pocket-money in buying squibs and crackers. The demand inevitably calls forth the supply, and if fireworks are not made in Lambeth, they will be made somewhere else. The explosion blew out the front parlour window, hurled the artist's lifeless body through the opening, crushed the walls, blew up the ceiling, killed the artist's wife, and set fire to the house. It may be questioned whether the Papists have ever done so much harm by their plots as the Protestants have inflicted upon themselves in commemorating their deliverance. The most ineradicable of national customs seems to be this of letting off fireworks in November. The house was rapidly destroyed, and the remains of eight persons were afterwards found among its ruins. The Coroner will be amply seized of this case in virtue of its fatal termination, but really there is nothing to be said or done upon it. The law can hardly reach either the people who sold materials to the artist, or the people to whom the artist sold his works. Dealers in such articles take care not to know more than they cannot help.

It must not be supposed that the Legislature has neglected to provide against firework-making in crowded neighbourhoods, but unfortunately its enactments have proved ineffectual for their purpose. We find that the deceased artist would have been liable to a penalty of 10*l.* under an Act of Parliament which was passed in 1860, and which probably was called forth by some unusually disastrous explosion. In this particular case the artist has paid the highest penalty, and it is difficult to see how any penalty can prevent a needy man carrying on a secret trade. Our lives are at the mercy of our neighbours on an alarming and almost uncontrollable extent, nor does it add to our composure to be told that buildings reported fire-proof are usually the most dangerous of all. The best point about our system is the promptitude with which fires are checked. In this respect it is probable that we are far ahead of Boston and Chicago. Indeed a competent

authority has said that the fire brigades of the great American cities are little more than an excuse for young men to strut in uniform. The fire at Lambeth was confined to the house in which the explosion occurred; and a recent fire at a solicitor's office in the City only resulted in the destruction of part of a law library and some law papers, which, as the newspapers put it, were "practically worthless." We are glad to hear that on this occasion a so-called fire-proof room did preserve valuable documents from destruction. We think that the Fire Marshal or coroner would be useful in helping to detect incendiarianism, which, however, is most frequently committed in warehouses, where life is not immediately endangered. Many a man would cheat an Insurance Office who would not wilfully cause a fellow-creature's death. There are men who would do both; but those unmitigated scoundrels are comparatively rare. There is no doubt that inquiry into the origin of fires ought to be thoroughly made in all doubtful cases; and the efficiency of the Fire Brigade should be maintained and extended. Also, in order that the Fire Brigade may do its duty, a constant supply of water must be provided, and any necessary outlay for this purpose will be according to sound economy. But when all has been done that can be done for safety, we shall still be liable to be blown into space by some unlicensed pyrotechnist.

THE TRADE UNIONISTS AND MR. LOWE.

A DEPUTATION of Trade Unionists has waited on Mr. Lowe for the purpose of demanding the abolition of the criminal penalties at present attached to various acts of dishonesty and violence which the Unionists are in the habit of committing in order to promote the coercive objects of their Societies. Mr. Lowe said that the statements of the deputation would receive careful consideration; and they certainly deserve consideration, because they bring into a strong light the position which the Trade Unionists are bent upon assuming towards society, and the consequences which may be expected if the Government and Parliament should be weak enough to give way to them. Apart from the question of the general law of conspiracy—a large question which we have more than once discussed—the specific demands to which the Unionists are content to confine themselves for the present are that the Criminal Law Amendment Act should be wholly repealed, and that the Masters and Servants Act should be amended by cutting out the criminal penalties of breach of contract, and making it simply a matter of civil damages. It appears that these laws as they now stand have caused great annoyance to the Unionists, and have interfered very much with their operations. It is unpleasant to be put in prison for picketing or breach of contract, and this naturally operates as a discouragement to practices which are regarded as essential to the success of these combinations. If the only object of penal legislation were to please those against whom it is supposed to be directed, we should be disposed to say that the Unionists had made out a strong, and even an irresistible, case against the Acts in question. If, however, it should be thought that the object of the law is, not to afford immunity to particular classes of offenders, but to protect the public at large, then we think that the statements of the deputation supply the strongest evidence of the usefulness and efficacy of the statutes which are complained of.

The impudence of the demands of the Unionists is appropriately matched by the audacity of their misrepresentations. It is complained that the Criminal Law Amendment Act is directed exclusively against Trade Unionists; and this is true, but not exactly in the sense which was implied by the members of the deputation. They wished to convey the idea that under this Act Unionists alone are liable to punishment for acts which other persons may commit with impunity. This is certainly not true. The Act applies to all classes indiscriminately, and if it strikes practically at the Unionists alone, that is only because the Unionists alone are in the habit of committing the offences which it is intended to check. If employers were to take to rattening and picketing, they would at once bring themselves within the scope of the law. They abstain from these offences, and therefore the law does not touch them. It touches the Unionists because the Unionists are partial to outrages of this kind. Unionists have, however, a very easy way of obtaining relief from the disagreeable penalties of which they complain, and that is by simply refraining from picketing and rattening. When the Act was passed great care was taken to remove from it any expressions which could by any ingenuity be construed into an invidious reference to working-men, and to make it applicable to all classes alike. The same course was followed with regard to the Masters and Servants Act. Under that Act nothing can be done to an employed person which may not, under similar circumstances, be done to an employer. It simply enacts that wilful breach of contract may be punished, at the discretion of the magistrate, either by civil damages or imprisonment. If working-men are usually punished by imprisonment, the reason is simply that there is no other way of getting at them. A civil remedy against a man who is here to-day and gone to-morrow, and who has no property of any kind, would obviously be a farce. An employer, on the other hand, has a fixed place of business, and there is no difficulty in making him liable for any claims which can be proved against him. To repeal the criminal part of the Act would be practically to give free license to all working-men to take advantage of their employers by suddenly leaving off work. Suppose that a house is being built, or a ship loaded, and that at a critical moment the workmen

choose to go away; the loss which is thereby inflicted on their employers may be very serious; but civil proceedings against the men would be an utter mockery. There would first be the difficulty of discovering the men, who would no doubt disperse in all directions; and there would be next the difficulty of obtaining damages from men who had no money.

Mr. Howell, who was one of the chief spokesmen of the deputation, said that they did not want the law to be made in favour of Trade Unionists; all they sought was to be placed on a footing with other citizens. But in the Acts which they denounce they are put on a footing with other citizens. Anybody, no matter whether he is a Unionist or non-Unionist or employer, who commits certain specified offences, is liable to be punished for them. Mr. Howell went on to say that Unionists were not in the habit of condoning or palliating any of those offences against which the law was supposed to be levelled; but we have some recollection of a Trade Unionist demonstration a few months ago at Maidstone in honour of men who had just finished the term of imprisonment to which they were condemned for a wicked and dastardly attempt to plunge London into darkness; and we have certainly no recollection of any Unionist speaker or journalist having ventured to censure the disgraceful conduct of those men, who not only broke faith with their employers, but endeavoured to inflict a cruel and wanton injury on a vast multitude of innocent persons who had nothing whatever to do with the gas-stokers' private quarrels. The leaders of the Unionists were also aware of the Sheffield outrages long before they were exposed by the Royal Commission; but they waited till there was no help for it before they expressed any public disapprobation of these atrocities, and they did so even then in very mild and equivocal language. Mr. Howell says that what the Unionists desire is that the offences in question should be dealt with under the ordinary laws of the country; but, as the fact is that they are peculiar offences which cannot be dealt with by the ordinary law, it may be inferred that what is really desired is that they should not be dealt with at all. Mr. Howell is also of opinion that picketing is very much misunderstood. The object of picketing, we are assured, is merely to give information to workmen who come from a distance as to the state of trade matters; but there are different sorts of information and different ways of conveying it. The information which the pickets have to communicate is that non-Unionists must make up their minds to be persecuted in every possible way unless they obey the dictates of a body to which they do not belong, and whose authority they repudiate; and the way in which this information is conveyed is by setting men to dog the steps of independent workmen, and to threaten them with the penalties of disobedience to the Union. Mr. Mundella, who is a member of Parliament, and at least ought to know something of the contents of Acts of Parliament, is reported to have said that the "law against these offences, instead of applying to the whole community, applied only to Trade Unionists, and not to the masters." It is incredible that Mr. Mundella should have said this, because it is quite untrue, and the truth must surely have been within Mr. Mundella's knowledge. The law applies to all persons, no matter to what class of the community they may belong, who commit certain offences. Mr. Mundella added that in business they were accustomed to threats, and he could name several men in the House of Commons at the head of large firms who were told that, if they did not cease to supply goods to co-operative stores, tradesmen would cease to do business with them. And what, he asked, was that but a threat? No doubt it is in one sense a threat, but the law does not undertake to put a stop to all threats. It is a threat to say that you will not buy goods at a shop unless prices are lowered, but there is no necessity for the application of the criminal law in such a case. What is important is that personal freedom of buying and selling should be maintained. It is complained that, while the masters may send round a black list, the men may not send out pickets; but the men may circulate a black list, if they choose, in the same way as the masters; and if the masters attempt picketing, they will suffer for it just the same as the men. The men are at liberty to refuse to work at certain shops, and the masters are at liberty to refuse to employ certain men. But if either masters or men resort to anything in the shape of physical molestation or intimidation, they will equally be punished for it. It may be unfortunate for the men that they cannot carry out their schemes without violence; but social order must be maintained, even though it causes "annoyance" to working-men, and interferes with the coercive discipline of Trade Unions.

The great mistake which is constantly made by the Unionists is in supposing that they are the people of England. If they were, it would no doubt be reasonable and proper that the laws should be shaped according to their own ideas of social happiness. As it happens, however, there are other people who are entitled to some consideration. The Unionists are only a part, and only a comparatively small part, of the community, and their private arrangements, however convenient to themselves, cannot be tolerated as laws imposed on the general public. Anybody can belong to a Trade Union who chooses, but then it is necessary to reserve an equal right to anybody not to belong to a Trade Union if he does not think it desirable. The authority of the Unions must be restricted to the circle of those who voluntarily choose to submit to it. It is well that the full import of the demands which have just been made should be distinctly understood. What is asked is practically nothing less than that Unionists should be allowed to break contracts with their employers, and to molest and intimidate their fellow-workmen,

whenever it suits their purposes, with perfect impunity. The question is, therefore, whether these offences are detrimental to society, and whether it is necessary to punish them. It is said that what the Unionists want is, not to escape punishment, but only to be put under the same laws as other people. It is obvious that, if they would be liable to punishment under the general law, they would gain nothing by the change. Mr. Howell justifies picketing as "not morally wrong, or in any sense unlawful"; and it might be said that rattening was only another much misunderstood means of giving information to workmen. There may perhaps be some people who believe that the freedom of picketing and rattening would be productive of social harmony and happiness; but it may be worth while to remember that this freedom, if allowed to one class of the community, must in fairness be extended to the rest. It need hardly be said that the worst consequences of universal molestation, intimidation, and breach of contract at pleasure would fall upon the working classes. They would suffer not only from being treated as they now wish to be allowed to treat others, but also by the commercial distrust and disorganization which would be produced. Employers would be unable to accept contracts except at a fancy price, in order to cover their risks, and the market for labour would suffer accordingly. It is to be hoped that the Government, in considering this subject, will remember that large public interests are at stake.

COAL MONOPOLY.

WE regret that the supposed discovery in the columns of the *Times* of the "Secret of Dear Coal" proves on examination to be no discovery at all. A gentleman who owns a colliery is entitled, in addition to rent, to a certain number of tons each year free of cost. Through the intervention of a friend who is a director of a Railway Company, this gentleman is enabled to have these coals delivered at his house in London. He puts the price of coal at the pit's mouth at 18s. 6d. per ton, and the cost of carriage and delivery at 8s. 6d. per ton, so that the total cost would be 27s. per ton, whereas the market price of the same quality of coal is 37s. per ton. It has probably occurred to many readers of this statement that they might buy coal at the pit's mouth and have it forwarded by railway, and thus save 10s. per ton which now goes into the pocket of the London dealer. A writer in the *Times* did attempt this, and he is very angry at the refusal of a Railway Company to forward the coals that he has purchased. He seems to think that he has only to make his grievance known to have it removed; but unfortunately Railway Companies, so long as they keep within the law, are able to disregard complaints in newspapers. They are not bound to carry coals for persons who purchase at the pit's mouth, and if Parliament undertook to compel them, they would probably warn legislators to look out for themselves in case a train should come into collision with a coal-truck. A system has grown up which gives to certain dealers a practical monopoly, and it is to be feared that the system cannot readily be changed. A correspondent of the *Times* correctly states that Railway Companies, not being "common carriers" of coal, are not bound to carry all such coal as may be offered for carriage, and that the carrying of coals for colliery-owners only is not an unlawful preference. This is the existing law, and we doubt whether Parliament could be persuaded to change the law.

A case which occurred a few years ago may be usefully employed to illustrate the existing law. The complainants, as well as other coal-merchants, had been allowed the use of certain wharves or depôts at the stations of the London and North-Western Railway for the reception and deposit of the coals consigned to them respectively. For this accommodation each coal-merchant paid a remuneration to the Company. The practice of the Company was to apportion the accommodation at the different stations amongst the coal-merchants who required it; and each coal-merchant used his wharf as a kind of store for his coals until they were sold, and required to be removed. From the nature of the inland coal-trade the wharf or depôt accommodation is almost essential to its being carried on profitably to the merchant. It also promotes the traffic of carrying coals upon the railways; and the practice of providing such accommodation is very general upon the railways. In the course of the year 1869 an additional station was opened upon the Rugby and Stamford line at Lubenham. There was a space of ground attached to the station which was suitable for coal wharves, and it was sufficient in extent to afford the usual accommodation for more than one coal-merchant. The complainants thereupon began sending coals to Lubenham station for sale, and such coals were unloaded and deposited and stored in the usual way. Afterwards a rival coal-merchant obtained a lease of the whole of the wharf accommodation at Lubenham, and thereupon the Company refused to allow any such accommodation to the complainants. This refusal virtually prevented coals being sent by the complainants to Lubenham, and they applied to the Court of Common Pleas for a rule calling upon the Company to abstain from giving to one merchant the exclusive advantage of depositing coal at the station, or to give similar accommodation to the complainants. There could be no doubt that the effect of what had been done by the Company was to exclude the complainants from any share of the facilities for the coal trade which existed at Lubenham, and thus to create a monopoly of the trade in favour of another dealer, and to the

prejudice not only of the complainants, but of the public. There was, however, a difficult legal question in the case, and before asserting to it we will observe what light is thrown by this case upon the present condition of the coal trade. We can see that even at a small provincial station there was no idea of allowing the public to import their own coal. It was originally intended to divide the wharf accommodation among at least three dealers, and afterwards the Company allotted the whole to one dealer only. The complainants, being deprived of their wharf, assumed that they were deprived of the opportunity of importing coals into the neighbourhood of Lubenham, and if this were true of dealers, it would necessarily be true of a person who desired to import for his private use. Further, if it were true of Lubenham, it would be still more true of London. It was contended that the case did not come within the provisions of the Railway Traffic Act, 1854, and two judges held that it did, while two other judges held that it did not, come within that Act. The Railway Companies, as we all know, have secured a monopoly of the carrying trade, but this was granted to them, and is to be used, for the benefit of the public. The object of the Act of 1854 was to compel the Companies to act with impartiality to all persons desirous of using the railway, and to secure that all should be placed upon equal terms. The Legislature has restricted the Companies from using their railways for the benefit of one person to the exclusion of others, and has required that all persons should be treated alike. At the same time the Legislature has considered that due regard may be had to any peculiar circumstances, as well as to the safety and convenience of the public, and to the fair interests of the Companies themselves. It was urged, on the other side, that the complaint related to matters wholly distinct from the receiving, forwarding, and delivering of coals, which were the only matters as to which the Court was authorized to interfere. The matter of the complaint arose after all that concerned the conveyance and delivering of the coal was at an end.

We are not concerned to decide between these opposing views. It is manifest upon the case that the coal traffic by railway is entirely in the coal-owners' or the dealers' hands. In theory any person is entitled to run his private train from Euston Square to Manchester; but we know that this is practically impossible. The privilege of importing one's own coals from the pit is likely to prove on examination equally illusory. An enthusiastic correspondent of the *Times* believes that as soon as the public thoroughly understands the difficulty a remedy will be applied. We have done our best to make the position of things intelligible, but we have no sanguine expectation of improvement. Railway officers will say that, if their arrangements are interfered with, they cannot be responsible for consequences. This, indeed, is what a railway officer did say in an earlier case which arose out of a system of storing coals in cells or depôts until they could be sold by an agent on behalf of the coal-owner. At the date of that case the Companies knew nothing of merchants, and only made arrangements for the convenience of coal-owners. A witness said, "The order must go through the depôt agent. I apprehend this is a principle which cannot be departed from without injuring the traffic of the line and hazarding the public safety." Among other causes of the dearth of coal, this is one—that the means of transport are limited. It has been suggested that the canals, now to a great extent disused, might be repaired and used in relief of the railways for the carriage of coal and other heavy goods which need not be carried rapidly.

A correspondent of the *Times* correctly says that the Railway Companies have the power to refuse, and do accordingly refuse, to carry coal for private persons. It will be understood, from the reference which we have made to decided cases, that such refusal would not be an undue preference to the coal-merchants within the meaning of the Railway Traffic Act. It appears, indeed, that a question was put to Government on this point last Session in the House of Commons, and the answer given was the only answer that could be given by those who understood the law. The answer, we are told, took the public by surprise, and its practical effect on the price of coal in London was felt to be very serious; but no legal remedy has been suggested, except an alteration of the law so as to make Railway Companies common carriers of coal. "But," says the writer in the *Times*, "unless the law could be extended to make Railway Companies provide the public with free wharves and sidings for coal-trucks, the right of carriage would be practically useless." It comes, in fact, to this that if we Londoners desire to buy our coal at the pit's mouth we must make a railway to bring it up to town and sidings and wharves to deliver it. Coal, like fish in the well-known song, may be said to be bought with the lives of men, for undoubtedly the coal trains on our railways are the cause of many serious accidents. There will never be the security which ought to exist on busy passenger lines until heavy goods trains cease to run upon them. Looking at the enormous consumption of coal in London, it would certainly appear desirable to make corresponding arrangements for supplying it. The managers of railways represent that the advantage possessed by coal-merchants over private consumers is not owing to any combination between Railway Companies and dealers in coal, but arises from the natural course of trade, which has placed all railway wharves and sidings at the disposal of those "registered" traders who could bring the largest amount of traffic over the lines of railway. This representation suggested the idea of introducing the co-operative system among consumers of coal. It was felt that clergymen, gentry, and tradesmen could not themselves become "registered" traders in coal, so as to obtain facilities for its conveyance by railway; but it appeared possible, by

combination, to produce a coal-selling company whose patronage would be so valuable that both Railway Companies and colliery-owners would be willing to aid its operations. It is stated that this result is now in a fair way of being realized by an association which has obtained the advantages of railway traffic and wharf accommodation hitherto accorded only to coal-merchants. There seems no reason why such associations, if worked prudently, should not succeed. But we fear that the idea of an individual householder ordering his coal at the pit's mouth and having it forwarded by rail to London is visionary. If this can be done without interfering too far with other and more important traffic on the railways, let it be done. But experience rather tends to show that it could not be done.

WINTER EXHIBITIONS.

NO less than five Galleries are now open, exhibiting a total of more than a thousand works. The general impression left on the mind is that seldom has mediocrity been so greatly multiplied. Mechanical manufacture is more than ever in excess of true art creation; new ideas are scarce, and the old conceptions necessarily grow each year more trite by reason of reiteration. As a consequence, few and far between are the pictures which show the freshness of immediate contact with nature, while the vast majority of contributions look like vague generalizations of something half remembered and half forgotten, or hasty sketches and fugitive thoughts muddled and marred in the studio, and at last sent out in despair. Winter Exhibitions have become the acknowledged refuge for such abortions; and it is equally singular and unfortunate that the most dismal of works are deemed appropriate to this lark and desolate season of the year. Beforehand we might have supposed that one of the beneficent ends of art was to bring sunshine into our dwellings; but the stranger who shall have gone the round of these Winter Exhibitions will come away with the solemn conviction that the peculiar province of the art of painting at present is to bring to the year's decline a sense of shadow, decay, and death.

"The French Gallery, Pall Mall," in opening its "Twenty-first Winter Exhibition," may be supposed to have arrived at years of discretion; a shrewd eye for business has indeed never been here but one thing wanting; the pictures are always wisely selected with ulterior ends. We have been taught to expect the pleasure of seeing painters of two classes—either those who have made a reputation or those who are just rising to a reputation; intermediate men have to seek their fortunes elsewhere. On entering the room it strikes us as a bad sign that Mr. Dickens's weak and conventional "Ophelia" should find a post of honour; but on looking round compensation comes in the works of Mr. Long, Mr. Burgess, Mr. Holl, and others of the English school. Among foreign artists we once more greet with pleasure M. Jules Breton, M. Castrès, M. Olays, and M. Mesdag. We are accustomed to look to Mr. Burgess and Mr. Long for the nut-brown Spanish maid, the stately Spanish priest, and the picturesque Spanish peasant, all of which John Phillip was the first to domesticate among us. Mr. Long has in "Don Antonio" hit upon an effective subject; a bevy of girls present themselves in a row ready to be hired as servants by El Padre and his housekeeper; the latter not unnaturally wishes to choose the oldest and the ugliest because the safest, but the sly Curé has his eye on the prettiest. The artist prophetically points the moral by painting on the wall the temptation of St. Anthony. Mr. Long has improved in execution since we saw him last; his manner was always pleasingly persuasive, and he has now gained strength with moderation. Mr. Holl, who also stands well with the Academy, will advance his reputation by a pathetic scene of "Want"; a young mother pinched by poverty is driven to part with her wedding-ring. The subject is treated with quiet reticence; it is not overdone; the drawing and the execution are alike firm. From the borders of the North Sea again come the best marine-painters. M. Olays has a sunny cheerful way of floating heavy craft, full sail, on shallow sandy seas; no man is more true to the sky and shore of Holland. M. Mesdag, too, is quite at home in "Shrimping on the Dutch Coast"; he always seizes on a subject with resolute grasp, yet his vigour is not destructive of delicacy. M. Jules Breton, the pathetic painter of peasant life in Brittany, falls for once into comedy; so true is it that tears are akin to laughter. "The Happy Moment," a humorous scene of love-making, was painted long ago; the style belongs to the cheerful domestic school of the Netherlands. Since then the artist has given himself studiously to melancholy; in his most cheerful moods he seldom rises above the "joy of sorrow." It is impossible to see too much of this true artist; in Vienna he stood out strongly by well-chosen master-works. We cannot quit this Gallery without emphatic mention of M. Castrès, an artist who, since the late war, has made himself a place among the great military painters of France—a nation which has ever won brilliant battles on canvas. "Outside the Ambulance," and "The March, Dinner-time, Franco-Prussian Campaign," are true to the life, as if painted on the spot. The artist is keen in observation, trenchant in hand; he might himself indeed have borne a sword. Like Xenophon, he narrates what he witnessed.

We have no often spoken in praise of "the Society of French Artists" in New Bond Street, that we may be permitted to pass over briefly this "Seventh Exhibition" as far from the best. And yet this Gallery, by a spell peculiarly its own, continues to com-

bine the power of attraction with repulsion. What is most ~~there~~ in French genius here congregates; the hatred of beauty is exalted into heroism, the impatience of finish becomes something more than impertinence. On this occasion the greatest sinner against good taste is M. Levy; "Christ at the Sepulchre" exceeds in vulgarity and irreligion the worst products of the lowest decadence. Such a work does great harm every way; we devoutly wish that England could be saved from all like importations. More welcome is another great achievement, M. Delacroix's "Entombment," which, though a display of savage power rather than of sacred spirit, possesses as a matter of course physical force with glory of colour. We have in former seasons dwelt on the tender loveliness of landscapes by M. Corot, on the uncompromising naturalism of M. Millet, on the Orientalism of M. Fromentin and of M. Huguet. We would gladly enlarge on many works tempting to criticism, but we may hope to meet old acquaintances again in the coming spring. Of Mr. M'Lean's Ninth Exhibition in the Haymarket we have space only to say that the examples of British and foreign schools are well chosen.

A unique collection of one hundred and twenty "Original Sketches and Studies in Oil" by M. Édouard Frère will not escape the notice of artists and others. We have been among the number of those who feared that finality had overtaken M. Frère, that his art had become restricted in its monotones, and circumscribed even to monotony in its sentiments. But here, when taken into the confidence of this simple lover of nature, this pathetic painter of peasant life, we find how year by year he has been quietly occupied in gathering fresh materials among meadows, homesteads, and humble dwellings of the poor. During the times while France has been racked by revolution and dismembered by war, this painter has possessed his soul in peace. The quietude of these "studies" is their charm; no passion has broken the placidity of those dwellers remote from the noisy city, no dark cloud shadows the sky, no fierce wind disturbs wold or wood. M. Frère is as serene as Claude, yet far more simple; as gentle as Stothard, yet, as these outdoor sketches show, less artificial and more naturalistic. And in passing round the room where these small gems are seen without distraction, we are less disposed than heretofore to accuse Mr. Ruskin of hyperbole, when, in a well-known criticism on M. Frère, he asks, "Who could have believed that it was possible to unite the depth of Wordsworth, the grace of Reynolds, and the holiness of Angelico?"

Two French artists often seen side by side in our exhibitions—M. Meissonier and M. Frère—have little in common, save in their small cabinet scale. Last spring we had the pleasure of criticizing a collection of studies in Pall Mall by Meissonier—works which might offer interesting comparison with the sketches by M. Frère, now on exhibition in Waterloo Place. Meissonier is photographic; he focuses his figures, his lights scintillate, his details are microscopic. M. Frère proceeds on an opposite system; he is less emphatic, concentrated, and detailed; the outlines of his figures melt into his backgrounds, his details merge into generalities. And yet in all that he does he is no less the consummate artist than his great contemporary, no less felicitous in seizing on a salient point, and far more sympathetic in his approach to his subject, and heart-moving in his appeal to the spectator. His children are dutiful, not rebellious; merry-making, it may be, as schoolboys, but not mischief-making as the *gamins* of M. Gavarni. The boy "Waiting for the Ferry," also sundry other boys—one, for example, seated on a wall, another standing by the seashore—are all pattern boys for goodness, obedience, and quietude. Moreover, they are ever children of nature; they have grown up in sun and shower amid flowers and hedgerows.

These "Sketches" admit of classification. First may be mentioned simple landscapes; outdoor studies full of daylight, true in tone, quiet in sentiment, and specially graceful in the interlacing branches of trees. Next are street scenes, wherein the artist, ever true to the spot, strives for quiet play of light and shade, and carries the eye onward to a distant vista. These subjects are obviously chosen because useful as backgrounds. For similar ends, boats lying on the beach have been faithfully portrayed. Then come subjects which are expressly Frère-like; in one we recognize an old woman peeling carrots, in another a village shoemaker, in a third a gossip by the way. The artist has such sympathy with his subject that the picture comes spontaneously, almost indeed without forethought, yet always under knowledge; little elaborated, yet displaying infinite pains, watchfulness, and patience. What strikes us in these fruits of many years is their essential unity; the figures have grown in concord with the trees, the cottagers are born to their humble dwellings. Nature and humanity are coloured and clothed alike; of such peasants it were scarcely irreverent to say that Solomon in all his glory was not arrayed like one of these.

The Dudley Gallery is so far below what we have a right to expect that we think it becomes a serious question whether this Winter Exhibition of Oil Pictures should not be discontinued, at least for a time. The Spring Exhibition of Water-Colour Drawings is so greatly superior that we can hardly understand how the Committee, which in the spring is identified with success, can consent in the winter to become responsible for failure. It is true that some few kind-hearted Academicians and Associates still stick to the old ship in this its seventh year. But nevertheless Mr. Leslie, A.R.A., and others naturally reserve their best for Burlington House. As matters now stand, we perhaps only too naturally find eccentricity on the increase, just as talent is on the wane. Washed-out Mr. Whistler, ink-black Mr. Hamilton Macdunn, starchy naturalistic

M. Legros, with sundry other abnormal geniuses who play far from pleasing parodies on nature, scarcely make sufficient excuse for the merely mediocre men who for the most part hold possession of these walls. Of course there are found scattered here and there some sterling works. We need scarcely stop to praise Mr. Watt, R.A., Mr. Marks, A.R.A., Mr. Hodgson, A.R.A., and Mr. Leslie, A.R.A. Also, almost as a matter of course, everything that comes from the studio of Mr. Alma-Tadema must be above par; but to criticize the mere byplay of men who within the twelvemonth will appear elsewhere in greater force were waste of time and space. The use of this Gallery from the first has been, that talent outside the Academy congregates within its walls. Thus Mr. Stanhope, in "The Labours of Psyche," shows that nobility of conception, that allegiance to high, historic, and imaginative styles, which have often here obtained more consideration than within the Royal Academy. And among less conspicuous works we should be sorry to pass without a word of Mr. Raven's "Llandilo and the Vale of Towy," a landscape full of daylight and of golden colour passing into tender grey. Also as a brilliant vision, though in miniature, may be named "Low Water," by Mr. O. W. Wyllie, a scene of flooded sand, sunny sea, and clouded sky, full of lively incident and of sparkling light. Mr. Binyon and others might likewise be mentioned as affording samples of those gleams of southern sunlight which seldom fail to illumine the Dudley Gallery.

We confess that the duty of criticism becomes irksome when there is little worthy of being criticized. The office of the critic can scarcely be to correct where correction is hopeless; it is rather to encourage where promise lies. As for these Winter Exhibitions, there is little reason why they should exist at all, save as markets. Galleries at this season seem to serve as drainage to take away dregs and surplus produce which otherwise might lie stagnant and unproductive.

REVIEWS.

TODHUNTER'S HISTORY OF THE THEORY OF ATTRACTION.*

MR. TODHUNTER is chiefly known to students of mathematics as the author of a series of admirable mathematical text-books, which possess the rare qualities of being clear in style and absolutely free from mistakes, typographical or other. If any fault is found with them, it is sure to be on the ground that they seldom notice the brilliant dodges and catch-questions which are dear to examiners, and that thus they require to be supplemented by oral or written tradition derived from the great mathematical "coaches" of Cambridge, if the student is to distinguish himself in competitive examinations. Nor is Mr. Todhunter's reputation as a teacher very dissimilar. Undergraduates regard him as a lecturer who has the strange taste to prefer a problem solved by the ordinary methods of analysis to one that has been solved by a special device suitable to it alone. This may seem incomprehensible to the true devotees of the Tripos; but there are many who have watched the results of the Cambridge system who would gladly see Mr. Todhunter's ideas on mathematical education more widely adopted. Thanks to the intense competition for the highest places in the Tripos under the abnormal stimulus of the great prizes that are given for such success alone, each subject that forms a part of that examination has been carefully mapped out, the leading types of questions that can be set upon it have been separately studied, and to each has been fitted a special method admirably suited to meet or avoid the difficulties of that particular class of questions, but paying dearly for its special applicability thereto by the very limited range of its powers. No doubt mathematics thus studied are much less dry than they otherwise would be; but the student, after finishing his course at the University, finds himself with neither the skill nor the patience to carry through one of those long analytical investigations by which discoveries are made. To no other cause than this can we attribute the painful fact that, with the exception of a few publications by men who have escaped the evil influences of the style of teaching by not remaining in residence, no mathematical work has of late emanated from Cambridge that merits higher praise than that of being a good educational text-book, and but few papers that have risen above the level of elegant contributions to elementary mathematics. The sole exception that we should make would be in favour of the mathematical histories from the pen of Mr. Todhunter, who is, as we have seen, the one least infected with the faults of the existing system. The present work is the third that he has written, and it makes us long for a time when the many fine mathematicians at Cambridge will cease to waste their intellects in devising "tips" for their pupils, and will take to extending or reducing to order the vast mass of higher mathematics which already exists, but which is so neglected by us. Of such work Mr. Todhunter is doing his share, for, though we have had but one important original investigation from him, yet such histories as his are at present more valuable than original work. They at once enable the mathematician to make himself master of all that has been done on the subject, and also give him a clue to the right method of dealing with the subject in the future, by showing him the paths by which

advance has been made in the past. This is specially needed by English students, who are usually deficient in learning rather than in power, and who too often waste time in rediscovering what has already been arrived at by others. Moreover, unlike many branches of history, such work as this need never be repeated if it has once been carefully and conscientiously done, and it is therefore with unmingled satisfaction that we see it adopted as his special subject by one whose cast of mind and self-culture have made him one of the most accurate, as he certainly is the most learned, of Cambridge mathematicians.

The subject of the work before us does not yield in interest to that of either of its predecessors. Though the difficulties of the analysis will doubtless limit its circle of readers even among advanced students, yet none can feel indifferent to the history of the advances of the theory of attraction, the discovery of which was the greatest exploit of England's greatest mathematician. It is with his investigations that the history commences, and though in every branch of physical astronomy "sound knowledge practically begins with Newton," yet nowhere does his genius show itself more markedly than in his applying, as he did, his new theory to the determination of the figure of the earth. The phenomena of astronomy which suggested to him his famous law would have been equally well explained had he supposed that the power of attraction was inherent in the heavenly bodies alone, and an inferior genius would doubtless have contended himself with such a hypothesis. Huyghens and the followers of Cassini and Descartes (when they had abandoned more ridiculous theories) held the theory in this form long after the publication of the *Principia*. But Newton had mentally emancipated himself from the superstition that the heavenly bodies were entities so important that they might be expected to have special laws of nature of their own. By attributing attractive power to every particle in the universe, and considering the attraction of the heavenly bodies to be merely the sum of the attractions of the particles that composed them, he did more than advance physical astronomy; he dealt a fatal blow to that vanity which gave vitality to most of the delusions of the middle ages—namely, that nature must regard as of chiefest importance that which is so to us. No subsequent discovery has given a clearer example of how nature treats the small and the great with undistinguishing regard. To us such ideas are familiar, but we must put ourselves back in thought to the state of opinion in Newton's day if we would appreciate the genius shown in at once coming to the conclusion that, were the theory of attraction a true one, then must this earth itself be shaped thereby. And his attempt at arriving at the shape of the earth from such considerations before accurate measurements had taught it to us was as masterly in method as the idea was bold. No doubt his solution was imperfect; without the aid of the Calculus as it existed at a much later day than his, it could scarcely fail to be so. But in reading his investigations with the aid of the admirable explanations of Mr. Todhunter, one is astounded at the marvellous skill with which he avoided the dangers of his imperfect method, and, though working in the dark, managed yet to obtain results that closely approximate to the truth. Here and there we come upon one of those apparently random guesses whose subsequent verification has caused Newton's mind to be regarded as a psychological mystery, as when he conjectures that the density of the earth must be between five and six times that of water, the value usually given now being five and a half times. And when we reflect that in the very book in which the theory of attraction was first enunciated there was a solution of this most difficult problem, so nearly complete that it can be said that "it was a bold outline, in the main correct, which succeeding investigators have filled up, but not cancelled," we can estimate how vast was the genius of Newton, and how much the world has lost by that fatal forty years' silence which has rendered but half his life a glory to his native land.

In a volume of essays recently published, Mr. Todhunter states his conviction that, in proportion to her population, England yields to none of the nations of the world in the eminence of her mathematicians. One naturally turns to a history like this for confirmation of a statement so flattering to our national pride. But we find no support for it therein. The author himself is forced to admit that the successors of Newton did but little to maintain the proud position that he had won for England in every branch of physical astronomy. Maclaurin, it is true, did good work in proving sundry propositions which Newton with admirable judgment had assumed, and also in extending in other ways our knowledge of attraction. But though this work was worthy of one of whom it is recorded in a memorial inscription that he became Professor at Edinburgh *ipso Newtono succedente*, yet we fear it does not entitle him to rank with the three great writers on the subject, Clairaut, Legendre, and Laplace. If we extend the list it is not Maclaurin but D'Alembert that we must first include, though Mr. Todhunter has, we think, shown that his clumsy methods and numerous blunders render his contributions more remarkable for quantity than value; and those portions which are not disfigured by actual mistakes consist too often (like his famous dynamical principle) of rediscoveries in a less serviceable shape of propositions which Newton and others had already given to the world in far preferable forms. Thus the whole credit of the later development of the theory must go to France. And though of the four great names that we have just given the name of Clairaut may perhaps be the least famous, it is doubtful whether his contributions can justly be put second to those of any of his illustrious fellow-countrymen. The first who attacked the

* *A History of the Mathematical Theories of Attraction and the Figure of the Earth, from the time of Newton to that of Laplace.* By I. Todhunter, M.A., F.R.S. 2 vols. London: Macmillan & Co. 1877.

problem of a heterogeneous earth composed of strata of different densities, he so far solved it that subsequent investigators have rather changed the form than the nature of his solution, and have extruded it only inasmuch as they have facilitated its application. Just as the advances which the Calculus had made in the half-century that divided him from Newton enabled him, while following the path pointed out by the latter, to surpass him far in the results that he was able to obtain, so in turn he left his work to be developed by means of the new forms that the Calculus was about to take in the hands of such intellectual giants as Legendre and Laplace, after the lapse of a second half-century. These later developments of the theory form the subject of the greater part of the second volume of the present work, and it is specially in these that the reader will feel grateful for the admirable arrangement and clear style so characteristic of Mr. Todhunter's works. The problems are of course much more intricate than those attacked by previous writers, and the analysis is proportionately more difficult; yet the reader can easily follow the progress of the theory, since each step in advance is duly noted, and its exact significance shown. As might be expected, an important part is played by the remarkable expressions which English mathematicians (following Dr. Whewell) associate with the name of Laplace, though due in at least an equal degree to Legendre, and which, in respect of their peculiar suitability to the problems of attraction, afford one of the best instances of the flexibility of modern analysis when treated by a masterhand. It is with Legendre and Laplace that the history nominally ends, and rightly so, for the theory left their hands in much the same form in which it now exists, and in a state which will more than satisfy any demands that are likely to be made upon it for a long time to come.

The care with which the book has been written is at least as apparent in the less important parts as in those on which we have been dwelling. From the shortest memoir to St. Augustine's *Treatise on Natural Philosophy* in twenty-four thousand Latin hexameters, nothing seems too unimportant for at least a passing notice. And we see with pleasure that Mr. Todhunter has not declined to preserve from oblivion many little details of the life and works of the men of whom he writes, which have perhaps but slight value if regarded from a strictly mathematical point of view, but which nevertheless add greatly to the interest of the work. Among the chapters that are specially interesting on this account are those which treat of the memorable measurements of meridian arcs in Lapland and Peru—measurements which finally demolished the theory so tenaciously held by the followers of Cassini—namely, that the polar diameter of the earth was the longest diameter. Newton, it will be remembered, had maintained from the first that the earth must be flattened at the poles, but the existing measurements of Picard and Cassini had been claimed as evidence to the contrary, until the more accurate measurements of Maupertuis in Lapland and Bouguer and La Condamine in Peru finally settled the question in favour of Newton, and won for the first-mooted the witty compliment from Voltaire on having "aplatis les pôles et les Cassini." And though the later chapters are, strictly speaking, beyond the scheme of the book, since they deal with writers later than Laplace, yet they are not the less interesting on that account, and they save the work from the appearance of incompleteness which it would have had if it contained no mention of the labours of Poisson and Plana. On the whole, we think that the Syndics of the University Press have seldom used the funds at their disposal with better results than in undertaking the publication of this valuable contribution to our mathematical literature.

THE PILGRIMAGE OF THE TIBER.*

THERE is always a charm about river pilgrimages, whether the pilgrims are an Oxford four paddling quietly down to Henley, or Livingstone tracking the current of the Congo or the Nile. Running water has a beauty and a life of its own, which hardly needs the additional delight of novelty and stillness to fascinate one in an excursion. Even in the commonest English stream the pilgrim will find an England he has hardly known—an England of quiet meadows and little hamlets unvisited by the tourist, pleasant country inns which the devotees of rod and line keep secret from the world, picturesque reaches where great woods come down to the water's edge, or where the stream bursts from dark gorges to sun itself in great valleys set thick with corn, or to lie asleep beneath the shadow of grey church-towers. The Nile is of course the great haunt of river pilgrims; and we have heard of few as yet who have followed the adventurous example of the muscular Evangelical who did the Jordan and the Lake of Galilee in his canoe. But Nile and Jordan are a long way off, and it is in Italy or in France alone that a river pilgrim can find the charm of new scenes or picturesque beauty combined with the charm of a moderate expense. Italian rivers have, no doubt, difficulties of their own. They are apt to be either mud ponds or mill-races, and to offer a pilgrim the alternative of being stranded at every mile, or being whirled down their currents in company with up-torn trees and the fragments of burst bridges. With the exception of the Po, indeed—a river which presents its voyagers with no view but that of its banks—their course is generally too brief a one to be very satisfactory. But in the Tiber Mr. Davies has lighted on a

model river for river pilgrims. Its course is long enough to afford plenty of variety in point of scenery and general interest, without falling into the opposite fault of being too long to traverse in a reasonable holiday. A week or two will carry any active traveller from Ostia to the simple little fount among the Apennines of which Mr. Davies gives us a description at the close of his book:—

By the side of the little stream which here constitutes the first view of the Tiber we penetrated the wood. It was an immense beech-forest, perhaps some part of it virgin to the tread of man. The trees were almost all great gnarled veterans, which had borne the snows of many winters; now they stood basking above their blackened shadows in the blazing sunshine. The little stream tumbled from ledge to ledge of splintered rock (here a limestone, in which small nummularites and other organic remains are visible); sometimes creeping into a hazel thicket, green with long ferns and soft moss, and then leaping once more noisily into the sunlight. Presently it split into numerous little rills. We followed the longest of these. It led us to a carpet of smooth green turf, amidst an opening of the trees; and then, bubbling out of the green sod, embowered with white strawberry blossoms, the delicate blue of the crane-bill and dwarf willow-herb, a copious little stream arose. Here the old man paused, and resting upon his staff, raised his age-dimmed eyes, and pointing to the gushing water, said, "E questo al chianca il Tevere a Roma!"

"And this is what they call the Tiber at Rome!" But between this little fountain and Rome lies a land of romance. The Apennines, with their wild forests of beech and chestnuts; the vast Umbrian plain, with Perugia and Assisi looking down over its meadows and streams; the woodlands of Todi and the maize-fields of Orte cleft by the deepening stream; the forked top of Soracte, seen mile after mile as the centre of the landscape; grey towers perched each on its hill-top, with dome and campanile etched out against the sky; mediæval fortresses, Roman aqueducts, Etruscan masonry, growing rarer and rarer till they give place to the solitude of the Campagna; the sudden vision of Rome, and again the solitude, till Tiber pours out past fever-swept towns and desolate river-reaches into the sunny sea—these form a series of pictures which an artist could hardly fail to seize on, and which Mr. Davies has turned, on the whole, to good purpose in his book.

Our only quarrel with him is when he puts down his pencil and exchanges the artist for the antiquary. Italy is a land of history, and half its charm, no doubt, is lost if we look at it without a memory of its past. Here and there Mr. Davies gives us glimpses of its past to very good purpose. We hardly know better illustrations of the life of the middle ages than may be found in some of the extracts from city chronicles which he has inserted towards the close of this book; indeed we are half tempted to revisit Perugia, if only to realize the feuds in its Piazza, or the preaching of Fra Bernardino, or the Miracle-Play in which "Eliseo de Cristofano, a barber of the gate of St. Angelo," played so prominent a part. In all mediæval matters, indeed, Mr. Davies is tolerably well at home; but in classical matters he gives himself up blindly to the guidance of the Roman antiquaries, and a very wonderful business they make of it. The whole school of Roman antiquaries, it must be remembered, still live in an age not only before Sir George Lewis, but centuries before Niebuhr or Boissac. Men with every appearance of sanity point out to you the exact spot where the wolf suckled the famous twins, or where Remus jumped over the wall of infant Rome. As to Romulus, he is as familiar to them as Pio Nono himself. All the legends of early Rome are regarded as exact history, and are told with perfect gravity in the funniest way in the world. Nothing can be more comic than the unflinching faith with which Mr. Davies, or the Roman antiquary who has instructed him, tells the old Livy-stories of our school-days, or than the modern and journalistic air which he sometimes gives to them. When we are told that, after the Rape of the Sabine, "Romulus endeavoured to excuse his conduct," gravity fairly gives way. But it is not always that a laugh rides us of the feeling of weariness at the amount of classical padding with which the earlier part of the book is weighted. Grant what amount of faith in Roman legends we may, there can be no possible reason for dragging in the whole story of Cincinnatus the moment we have passed the Castle of St. Angelo, when we have already been favoured with biographies of every emperor who was buried there, not to mention subsidiary accounts of Gregory the Great, Marozia, and Crescentius. This is sheer book-making; and it is all the more unbearable that the heaviness is not redeemed either by depth or accuracy. Nothing can be more meagre and insufficient, for instance, than the account we find here of the very curious tenth-century house which bears the name of Cola di Rienzo, but which Gregorovius identifies with the dwelling of the Crescentii. Sometimes we have statements which are sheer blunders, as that "the flat turret indicated adherence to the Ghibelline cause; a triangular indentation cut on the summit, attachment to the opposite Guelph interest." Verona is full of indented battlements erected by the great Ghibelline house of the Scalas. It is yet worse when the great Gothic King is called "Totilus," and the Imperial son of Germanicus is pronounced to be, not Caius Caligula, but Carnealla, and buried under that name in the mausoleum of Augustus!

Here, however, our quarrel with Mr. Davies stops. The moment he shuts his Lamprière and takes up his pencil again, the book becomes pleasant and picturesque. In most of his descriptions we catch not only a vivid sketch of the scene before him, but the local colour which only thorough familiarity with Italian scenery can give. Take, for instance, a vignette which illustrates the Roman Campagna in the early morning:—

Through vistas of grey olives the vast plain of the Campagna was seen to stretch away, streaked with thread-like roads and dim lines of ramparts.

* *The Pilgrimage of the Tiber*. By William Davies. London: Sampson Low & Co. 1872.

aqueducts, spotted with groves of trees and towered medieval fortresses—faras, with a little white dwelling here and there, and perhaps a trail of thin, blue smoke curling gradually into nothingness. Almost twenty miles away, the dome of St. Peter's, clearly distinguishable in all its outline, though every trace of Rome was lost in distance, stood like the sentinel of this beautiful land; at the furthest horizon some faint, faint lines marking the region of far-off mountains. But if the distant prospect was lovely, not less so was that immediately surrounding. A neighbouring fountain, at a turn of the road which ran by, springing from a dim, cool grotto half buried in ferns and straggling trailers, gave refreshment to groups of picturesquely dressed wayfarers and their well-laden beasts of burden, the travellers themselves gossiping gaily or singing loudly, inspired with the delightful season. Beneath the trees a shepherd watched his flock, the sheep cropping the nutritious herbage with now and then a bleat of satisfaction, whilst a tinkling bell borne by one of them mixed its pleasant ringing with the rural voices that filled the air, and the gentle murmur of falling water.

There is a pleasant surprise in this gay picture of a scene which painter and word-painter alike have vied with each other in rendering in the gloomiest tones. But, lonely as the Campagna is, Mr. Davies is quite right in the impression he conveys; for there is no gloom in its loneliness. The exquisite purity of colour which is its special characteristic, the delightful peace and silence, the space and brilliancy of light, the picturesqueness of every common object—from the savage head of the buffalo, bent beneath his heavy yoke, to the wild shepherd and wilder shepherd-dogs—the deep herbage flushed with the scarlet and purple of wild flowers, and above all the ever-present mountain-line, etched out against the sky by its delicate fringe of snow in the spring-tide, begot a feeling of repose and delight in which all sense of gloom is lost. Visitors to Rome are a very wonderful race, but no part of their conduct is so marvellous as their neglect of the Campagna. We stop short, indeed, of the enthusiasm of a landscape-painter of our acquaintance, who believes that people will never discover the beauty of the Roman landscape till some kind hand has "smashed the old stones" which at present engross their attention; but there is no reason why the interest of visitors should not be more equally distributed between art and nature. As it is, Englishman after Englishman returns from the loveliest scenery in the world without having caught a glimpse of it save in the orthodox drive to Tivoli or the orthodox view from Monte Mario.

Not the least charm about Mr. Davies's book is his hearty sympathy with and appreciation of the Italian people. Nothing is more really humorous than the sly Italian humour, and one or two of the stories in the book catch something of its flavour. At Mentana, the scene of Garibaldi's defeat, the travellers were a little horrified to find the most benevolent-looking priest in the world, but a town without a school. They very naturally asked a small boy who was looking on why the benevolent-looking priest did not start one. "When he first came," the boy answered, "he tried very hard to do so; but we were all so stupid we could not learn anything whatever, so he gave it up." "And how does he occupy himself now?" asked the questioner. "Now," said the boy, "he goes to sleep." One can almost see the inevitable little shrug and the twinkle of the eye with which the conversation closed. We remember what a fund of amusement peasants in Southern Italy seem to get in crediting themselves with a *testa dura* when they are questioned as to their letters, and how, like the little inn at Mentana, they show a pride in the invincible nature of their ignorance. But the whole thing is simply fun, as any one who has ever spent an hour in an Italian school can testify. We have seen English schools and French schools, but the only schools where we ever saw children really alive at their work are the schools of Italy; and as to the natural capacity of the people, it is really immense. The same peasant-girl who calmly informs you she is a "block-head" will think it nothing very wonderful to produce one of those exquisite "canti" which show how living a thing poetry still is in Italy. What English peasant would dream of such a little gem of verse as this?—

Vola, palomba, quanto puoi volare,
Saluta in alto quanto puoi salire,
Gira le monde quanto puoi girare,
Un giorno sile mie mani han-da venire!

"Fly, dove, as far as you can fly; mount as high as you can mount; wheel round the wide world as far as you can wheel; one day you will have to come to my hands!" There are few more delightful collections than that of the "Canti Popolari Toscani" from which Mr. Davies has taken some songs of which he gives fair versions; but songs of this sort are, in fact, untranslatable. Their charm lies in the simplicity of phrase which conveys their tender and passionate imaginings. Nor is poetry the only art which still lives among the Italian peasantry. The best aim in Verdi are airs which he has caught from the mouths of Sicilian herdsmen, and in the little town of Veggiano every man, woman, and child has an instrument, and can play it. "I have seen," said an informant to Mr. Davies, "a little child of three years old take the violin upon its knee, and play not merely with accuracy, but with a style and manner quite surprising." And yet the peasants of Veggiano have no music-master, any more than the peasants of the Tuscan Apennines have a model for their songs.

Mr. Davies is clearly a landscape-painter; and his fancy goes out more kindly to the fields and the woods than to the art of man. We owe to a little disappointment at the cold and mangrove-ways in which he deals with the great pictures and frescoes he meets in his path. For the *Elber* does not only through a land historical and picturesque, but part some of the great centres of Italian art. Setting Rome of course aside, we have the frescoes of Luca Signorelli at Orvieto, the innumerable works of Pietro at Perugia,

the wonderful display of the whole school of Giotto at Assisi, and the less familiar, but quite as interesting, specimens of Pietro della Francesca in his own birthplace at Borgo San Sepolcro. Luca's work is done full justice to, but the rest are passed by with small notice. It is odd, too, that in his account of Todì, Mr. Davies should omit all notice of the most illustrious of its sons, the composer of the "Stabat Mater," Jacopone de Todì. A sketch of the wild, romantic life of the great lawyer whom the sight of his dead wife's hair-shirt drove for ten years to madness, and who rose from his madness to become the first of the poets of Italy after St. Francis himself, would have enlivened the streets of the sleepy town on its Umbrian hill-top. If this pleasant little book runs into a second edition, its author may well make room for Jacopone and a few more mediæval heroes by cutting out the wearisome pages of vamped-up Roman legend. As it is, we are afraid that, coming as they do in the very opening of the "Pilgrimage," they may blind a good many readers to the real merits of a book whose author knows how to see, and knows how to tell what he sees.

THE ROXBURGHE BALLADS.*

THIS is the beginning of an edition—an *editio princeps* we gather—of a collection of ballads ranging from the year 1560 to 1700, which was begun by the famous Robert Harley, Earl of Oxford, and enlarged by various collectors, the Duke of Roxburghe among them, and which is now in the British Museum. As the collection fills two folio volumes, and contains above a thousand broadsides, it is plain that in the three parts before us we have only a small instalment of what is to come. And collections of this kind have a very different look in the eyes of the book-collector, who collects books, broadsides, &c., for the sake of collecting them, and in those of one who, when they are collected, is quite ready to use them for more general purposes. To the one they come to have a kind of value in themselves; to the other they are valuable only so far as they illustrate some point of history, language, manners and customs, or anything else. Now there are very few compositions so utterly worthless that they do not in this way throw some light upon something; but to the inquirer who is not possessed by the genuine spirit of collecting for its own sake the phrases or allusions which do in this way illustrate anything often seem to come few and far between, and sometimes to be hardly worth the trouble of hunting them out among a mass of matter which to the outside world is often neither specially interesting nor specially instructive. Here and there we come upon a piece which has a direct historical bearing, though, when we remember how largely Lord Macaulay and others have drawn on contemporary ballads and broadsides, we do not find so many of these as we might have looked for. A very large number turn merely on the well-worn subjects of love, marriage, and conjugal faithfulness, among which of course it is only incidentally that we are likely to light on illustrative matter of any kind. And, very unluckily, most of the pieces are without dates. The editor seems carefully to preserve the printing and arrangement of the ballads, though of course in a paged book there can be no attempt to preserve the actual appearance of the broadsides. Most of them have woodcuts of the rudest and most grotesque kind, one or two of the best of which seem as if they had walked out of Sir John Maundeville. And certainly the fair maidens to the extolling of whose loveliness many of the pieces are devoted look anything but lovely, some of them hardly human, in their portraits. Thus in the two pieces headed "*Amantium ira amoris redintegratio est*" and "*the Maydes Answer*"—two pieces very full of references to Penelope, Cressida, Cynthia, *Æneas*, *Dido*, and what not—the "*Maye and sweetest Nell*," "*pearlless Paragon*," "*Phoenix of the World*," and so forth, shows only a faint approach to the human countenance, though in the second cut her ruff and a huge posy in her hand are plain enough. The same cut serves some time afterwards for the "*Cruell Shrow*." The lover in the first picture, as he draws near to his "best and dearest," at once reminds us of the knight in Sir John Maundeville who so calmly walks away while the loathly serpent lady comes after him; it is only minute study which shows us that the costume and gesture are not exactly the same. But where the maid makes her answer, the lover appears much less heroic in figure, but with a marked air of surprise. The next pair, the two constant lovers, Anthony and Constance, appear with some pretence at landscape in the background. Constance, who is unmistakably both human and female, is most elaborately dressed, with a wasp-like waist, and she has an Elizabethan house behind her and the sun looking down in a corner. She trips along with a jaunty air, while Anthony, who looks very sad, has the dress and full-bottomed wig of a gentleman of Charles the Second's reign, with what seems to be a castle-gate on a hillside behind him.

The first piece in the collection is a ballad in praise of the city of York, which is exalted above all other cities, save only London, and in some respects it is set above London itself. The date of this is 1584. The chief merit of the Northern metropolis is made to be mainly in the excellence of its archery and of its Aldermen, the two firms of merit joining together in the person of a skilful archer and Alderman, Maltby by name. The Earl of Cumberland and the better known Earl of Essex, the favourites of Elizabeth, both appear at the shooting-match, and the poet remarks on the

* *The Roxburghe Ballads*. Parts I. II. III. London: Bohn & Turner.

good agreement between the nobles and the civic dignitaries as something in which York had the advantage over London:—

God save the Cittle of Yorke therefore,
That had such noble frendes in store
And such good Aldermen: send them more,
and the like good lucke at London;
For it is not little love to see
When Lords and Aldermen so agree,
With such according Communitie,
God sende vs the like at London.
*Yorke, Yorke, for my monie,
Of all the Citties that ever I see,
For mery pastime and companie,
Except the Cittle of London.*

But besides the Earls there were visitors at York whom one would less have looked for:—

At Yorke were Ambassadors three
Of Russia, Lordes of high degree;

and the poet goes on to tell of the wonder and delight with which they looked at the English archery. Some good advice is given to the Earl of Essex, as to one who "is now young and prosperous," and it is added that

To use such properties vertuous
deserves great praise in London.

The ballad ends with a prayer for the Queen and for the encouragement of archery, and also

God graunt that (once) her Maiestie
Would come her Cittle of Yorke to see,
For the comfort great of that Countree,
as well as she doth to London.

The next piece has also to do with Yorkshire and archery, recording "The Life and Death of Sir Andrew Barton"—his knighthood is specially insisted on throughout—the famous Scottish pirate, as he seemed in English eyes. Charles Lord Howard commands, and the aged gunner Peter Simon does great things; but the man whose arrow actually struck the great enemy was

A Bowman rare,
whose active hands had gained fame,
A Gentleman born in Yorkshire,
and William Horsely was his name.

At the end he is knighted for his exploit, and his companions, both of higher and lower degree than himself, all get fitting rewards.

Then there is a ballad of Anne Askew, "I am a Woman Poor and Blind." It is aimed throughout at Bishop Gardiner, being one long play on his name:—

Long have I sought, but fain would find,
What Herb in my Garden were best to be.
A Garden I have which is unknown,
which God of his goodness gave to me,
I mean my body, where I should have sown
The seed of Christ's true verity.

Then,

With whole intent and one accord,
unto a *Gardiner* that I did know,
I desired him, for the love of the Lord,
true seed in my garden for to sow;

and so it goes on through the whole piece. The piece has no date, but, as the series begins in 1560, it must be several years after the death of Stephen Gardiner, and a good many years after that of Anne Askew. A companion piece to this is "A Rare Example of a Vertuous Maid in Paris, who was by her own Mother procured to be put in Prison, thinking thereby to compel her to Popery; but she continued to the end, and finished her life in the fire" (p. 43), also without date. Then comes the well-known story of Pretty Pesse, the mythical version of Earl Simon, who is turned into a warrior fighting for the English King's title "in delicate France," and where the mythical tale seems made up of fragments of the no less mythical tales about the blindness of Belisarius and the escape of Harold.

The "Catholick Ballad," a little further on, has a date, 1678, and an author's name, "Walter Pope, A.M. of the Royal Society, and some time Fellow of Wadham College." It goes through most of the usual points of controversy in a coarse style. Just now one is struck to find the dogma of infallibility so fully taken for granted, so long before it became a dogma. The virtue is said to lie in an old chair left at Rome by St. Peter—the curule chair of Pudens or any other:—

For this sacred old wood is so excellent good,
If our doctors may be believed,
That whoever sits there, needs never more fear
The danger of being deceived.
If the Devil himself should (God bless us) get up,—
Though his nature we know to be evil,—
Yet whilst he sat there, as divers will swear,
He would be an Infallible Devil.

Elsewhere we have "A Courty New Ballad of the Princely wooing of the faire Maid of London by King Edward," and "the faire Maid of London's answer to King Edward's wanton Love." The King must be Edward the Fourth; there are no historical details, yet one cannot but be reminded of the story of Elizabeth Woodville—more accurately Elizabeth Grey—though she was not a maid but a widow, and had nothing specially to do with London. Two pieces are Scriptural, "the Constancy of Susanna"—where the heroine looks not a little like a wooden doll—and "the Story of David and Bersaba," where the poet does not go on, like Sir John Maundeville, to say that the city of Bersabea took its name from

her. There is a sermon in verse under the heading "A Discourse of Man's Life," written fittingly in a more solemn metre, approaching to the effect of Gray's *Elegy*, though without the alternate rimes. And this is followed by a small *Divina Commedia*, or at least a small *Paradiso* and *Inferno*; the poet was doubtless too good a Protestant to bring in the third division. Here they take the form of "the Dead Man's Song, whose dwelling was neere unto Basings Hall in London." He sees the usual sights during a temporary death of five hours. The woodcuts are of the very meanest; yet they keep closely to the traditional forms, the Judge sitting on the rainbow, and hell drawn as the open jaws of a monster.

There are also incidental references here and there which have some value. "Come, buy this new Ballad" has no date, but it is marked by two allusions which seem to bring it within the sixteenth century:—

There be many rich men,
both Yeomen and Gentry,
That for their owne private gaine,
hurt a whole Countrey
By closing free Commones;
yet they'll make as though
'Twere for common good,
but I know, &c.

There be diners Papists
that, to save their Fine,
Come to Church once a moneth
to heare Sermons Divine,
The Pope giues them power,
as they say, to doe so;
They save money by't too,
but I know, &c.

In "Constance and Anthony" we read how

Anthony up was tane
By an English Runagade,
With whom he did remain
at the Sea-roving trade:
I'th nature of a slave
he did i'th Galley row;
Thus he his life did save,
but Constance did not know:

and the "runagade"—a form seemingly intermediate between "renegade" and "runagate"—is presently called "this English Turk." In a strange piece called "an Excellent New Medley," we read how

Hard hearted men make Come so deare,
Few Frenchmen love well English beere;

and how "the Dutchmen thrive by Sea and Land." The poet adds—

I read in moderne Histories,
The King of Sweden's Victories;

and presently "Duke Humfry lies in Pauls." In another called "A Bill of Fare" is an allusion which we do not understand:—

Three dozen of Welsh Ambassadors bak't,
Which made such a noise it was heard through ye town;
Some, hearing the echo, their foreheads so ak't,
That many a smile was orecome with a frowne.

Then in "Blew-cap for me," in which a Scottish girl refuses all lovers save one of her own people, there are satirical sketches of various nations; there is the French, the Spaniard, the Netherland Mariner, also

A Welchman, that had a long sword by her side,
red pritchies, red Tublet, red Coat, and read Peard,
Was make a great shew with a great deal of pride,
and tell her strange tale that the like was nere heard;
Was reckon her pedigrees
long before Frute;
No body was by her
that can her confute.

and also—

A haughty high German of Hamborough towne,
a proper tall gallant, with mighty mustachoes;
He weepes if the Lasse vpon him doe but frowne,
yet he's a great Fencer that comes to ore-match vs.

Ought not the Hamburg man to have been rather Low German than High?

MARJORIE DAW.*

MR. ALDRICH, the author of this little collection of novelettes, stands, so the *Chicago Evening Press* informs us, "at the head of American story-writers to-day." One of his stories, according to the *Hartford Courant*, is a "thousand times wittier than the sparkling society sketches of N. P. Willis." "Our literature," adds the *Boston Daily Post*, "can boast of nothing better in one of its highest, but most difficult departments, than these bright, fanciful, and humorous sketches." We have fairly repeated the advertisements prefixed to *Marjorie Daw*, that our readers may have their expectations aroused accordingly. Are we, in fact, about to have the pleasure—one of the rarest that fall to the critic's lot—of introducing to a new world of readers a genuine and hitherto unhackneyed genius? Is the great American novelist come at last? and will he introduce us to a form of art at once original and delightful? We should be very glad, could we conscientiously do so, to answer these questions in the affirmative; and yet we must admit that our own antispa-

* *Marjorie Daw*. By Thomas Bailey Aldrich. London: Routledge & Sons.

tions were not of a very sanguine order after reading these flattering testimonies. Perhaps it is the narrow-minded prejudice characteristic of Englishmen which has led us to regard American superlatives with a certain degree of suspicion; but the fact certainly remains that we unconsciously make a considerable deduction from the nominal value of those tributes before accepting them for genuine currency. On the other hand, we must guard ourselves against the danger of the reaction too often due to extravagant eulogy. It would be very cruel to make poor Mr. Aldrich suffer for the excessive zeal of his friends. Accordingly, having purified our minds as carefully as possible from either kind of prejudice, we are happy to express our opinion that Mr. Aldrich writes pleasant and graceful little stories enough, and may not improbably do better in future. We fail to recognize in him an American Walter Scott, and we cannot honestly say that he is destined in our opinion to eclipse the reputation of Hawthorne. Still anybody who likes literary trifles may read him without fear of offence from bad taste, if he is not likely to be dazzled by unusual exhibition of power. If Mr. Aldrich does not aim very high, if his pathos is not very deep, and his humour not specially keen, he has got a certain gracefulness of style which is not unattractive in its way. Perhaps, however, the best way of giving some more accurate gauge of his merits than can be derived from mere general terms of commendation is to give some account of the story which gives its name to the book, and which is perhaps the most ingenious trifle.

Poor Mr. Flemming is laid up in New York by a broken leg. The weather is hot, everybody is away for the holidays, and Mr. Flemming naturally becomes extremely irritable. Books have no charm for him, except that he keeps a pile of Balzac near his sofa to throw at his servant on the smallest provocation. His doctor begins to fear that he will fret himself into a serious illness, and writes to a common friend in the country to beg for at least some cheering letters. This friend, a Mr. Delane, is unable to come to his friend in person, but begins as lively a correspondence as he can manage. Delane describes the rather remote country district in which he is rusticating, but naturally is rather hard up for topics interesting enough to catch the attention of the invalid. He therefore snatches at the only approach to an incident, by describing a lovely young woman, Miss Marjorie Daw in fact, whom he can distinguish from his window swinging contemplatively on a hammock. The invalid is pleased with the description, and begs Delane for further information. Accordingly it comes out by degrees that Delane has made the acquaintance of the beautiful Marjorie; then he has long conversations with her, and indeed ventures to begin something like a decided flirtation. The flirtation, however, comes to little, and from an interesting cause. It appears that, although Miss Daw has never seen Mr. Flemming, she is so struck by his friend's description of his merits that she gradually refuses to talk about anything else. Mr. Delane is puzzled by her enthusiasm; but begins to believe in theories of spiritual affinity which may bring together two distant souls without any of the usual material means of communication. Meanwhile Flemming is naturally touched by the extraordinary interest expressed for him by the invisible beauty. He forgets his broken leg, and resolves, in spite of everything, to go into the country and there see the exquisite Marjorie face to face. His friend in vain raises difficulties, introduces an angry parent in the background, and passionately assures Flemming that his personal interference will only bring about awkward complications. Flemming, piqued and excited, finds that his leg is sufficiently cured, and in spite of mysterious telegrams of an obnoxious character, rushes off to be introduced to the lady. And then—our readers have possibly anticipated the catastrophe—it turns out that Miss Marjorie Daw is a mere figment of Delane's imagination, invented in order to draw off his attention from his broken leg. The device has been only too successful, and it is not surprising that its bold originator finds it expedient to retire for a time from the wrath of the invalid who has thus been tricked into self-forgetfulness. Some writers of a moralizing tendency might think it expedient to tack an explanatory moral to this little fable. Mr. Aldrich does not trouble himself with any such matters; and we may be grateful to him for his reticence. The story is, as it will be seen, a mere trifle; but, such as it is, it is well done, and the secret upon which it depends is covered with considerable cleverness till the end. The remaining stories vary from the sentimental to the extravagant; one of them, about the accidental interment of a living man, may have been suggested by Edgar Poe, though Mr. Aldrich makes a joke of his story before reaching the conclusion; and another upon an old bachelor with a craze about a son whom he might have had if a lady had married him, and who might, in that case, have been killed by tumbling off a roof, is apparently designed after the model of Hawthorne. Neither of them can be called first-rate; but we may fairly say that they are better than the average run of magazine stories.

It will be plain from what we have said that we do not quite recognize the coming novelist in Mr. Aldrich; but we are inclined to ask, even in reading fictions of this modest order, whether it is possible as yet to discover any national American flavour distinct from that of other literatures. M. Taine, as we know, has written a book showing how completely all the characteristic qualities of English writers have been the product of three determining causes—the race, the climate, and the epoch. Our satisfaction in his brilliant explanations is a little diminished by the recollection of the extreme facility with which events may always be explained

after they have happened. Given a Shakespeare or a Byron, and it is delightfully easy to show that a Shakespeare or a Byron was the inevitable product of a given race acted upon by a given set of circumstances. It would be a more unassailable triumph of criticism if somebody would construct a theory of a literature from purely *a priori* considerations. An excellent opportunity is offered in regard to America. Let M. Taine, or any person of equal omniscience, sit down and tell us precisely what will be the characteristics of American literature when completely developed. His speculations could not be verified, it is probable, for a generation or two, but it would be extremely consolatory to his grandchildren to know that they had had so clever an ancestor. We must confess ourselves unequal to the task for the present, and indeed it is one of no little complexity. The influences noticed by M. Taine are not easily estimated in this case. The Americans are perhaps not yet acclimatized; they still have something of the constitution which they acquired in our fogs, and what remains tends to unfit them for their fiercer suns and frosts. The race, again, is exceedingly heterogeneous; and it remains to be seen what kind of amalgam will be formed, and how an infusion of Teutonic mysticism, or of the mercurial Celtic element, will act upon the substratum of Anglo-American intellect. We should only be inclined to say one thing positively—namely, that we utterly distrust any prophecy that may be made. Meanwhile, however, if we may venture to argue from existing facts rather than from abstract speculation, we fancy that we can detect something characteristic about the tendencies of American literature, whatever may be the ultimate form of its development. Even these light stories have what may be interpreted as a stamp of nationality. We do not speak of certain Americanisms in language and style; nor even of the more external peculiarities of the writing. The difficulties, indeed, under which every American author more or less labours make themselves felt. The loss of the picturesque and the general simplification of social forms deprive our cousins of a fertile source of interest. Such characters, for example, as the stern parent or the oppressive peer of good old British fiction are fairly exiled from the country. How can parental tyranny be introduced when a young lady enjoys and exercises the privilege of seeing her own friends whenever and however she pleases, without the slightest reference to the prejudices of her family? If Americans have still a certain taint of snobbishness about them, and even fall down before a lord when they are on this side of the Atlantic with as good a will as the most determined worshipper of rank in England, they cannot display their peculiarities in their own country, or, at least, not in the old way. There is, it would appear, as keen a struggle for social eminence among certain classes in New York as in England; but the idol before whom the worshippers bow is but a swollen mass of greenbacks and shoddy, and is by no means so picturesque an object as the conventional aristocrat of our native land. Driven from such forcible contrasts, the American writer who confines himself to describing his contemporaries is obliged to seek for his effects in a different order of observations. The ordinary American indulges in that peculiar humour which sometimes strikes us as cold and cynical, and sometimes as simply vulgar. The man of greater acuteness tries to make up for the want of the picturesque by greater refinement of observation. He catches something of the French neatness of construction and delicacy of insinuation, and sometimes makes us fancy that the more nervous and highly strung American will thus engraft a more delicate growth upon the rather coarse and earthly trunk of English literature. Some of Mr. Aldrich's stories certainly show a dexterity which we should hardly expect from a writer of the same rank in England. He is writing for an audience quicker at taking a hint and less anxious for strong stimulants. On the other hand, there is a curious tendency in the American to seek for interest in queer psychological observations, such as Hawthorne adorned with admirable literary skill, or as were put to worse purposes by Edgar Poe. The story which we have noticed about the monomaniac bachelor who weeps over a non-existent son is an example of this kind of writing; and though in weak hands it encourages that prurient love of the marvellous which expresses itself in American spiritualism, it certainly opens many resources for the genuine artist. Although we can dimly discern these tendencies, we are unable to say how they will ultimately be blended into a concrete whole; and are content for the present to watch with interest any symptoms of the growth of new forms of literary art.

BESANT'S FRENCH HUMOURISTS.*

IT has been asserted by skilful critics of literature and manners that the French as a nation are deficient in the quality of humour. To this statement there can be no better reply than Mr. Besant's book. The author traces the stream of humour in France from its earliest attainable source down almost to the point it has now reached, dwelling on the most famous authors, omitting only, for reasons stated in the preface, besides the writers of the fifteenth century, the names of Clément Marot and Voltaire. For all those whose talents go to swell and complete this long and powerful river, Mr. Besant claims, and justly, the possession in common of one quality, which is in itself peculiar and original, the

* *The French Humourists, from the Twelfth to the Nineteenth Century.* By Walter Besant, M.A., Christ's College, Cambridge. Author of "Studies in Early French Poetry," &c. London: Richard Bentley & Son. 1873.

esprit gaulois. To define this accurately is probably as difficult as to translate it; and the author's definition of it as a quality which wraps the satirist's darts in flowers, and administers his harmless poison in wine, is perhaps as near to the truth as one can expect to get. Whether this lightness of touch and good temper compensate for the irreverence and merely animal enjoyment which Mr. Besant allows to be their concomitants is another question. But to come to the subject-matter of the book; the author discovers the earliest form of satire in the "sirvente," an imitation of monkish rhymes, half in Latin half in French, which made its appearance close on the heels of the "chanson," or pastoral song of the *Langue d'Oïl*, sung by the *trouvères*. Of two or three of these "chansons" Mr. Besant gives some very pretty translations, one so pretty that we are tempted to quote it:—

It is early in the morning,
At the very break of day,
My love and I go roaming
All in the woods to play.
The dew, like pearl-drops, bathes our feet,
The sweet dew-drops of May.

In the sweetest place of any,
Mid the grasses thick and high,
Caring nothing for the dew-drops
That around us thickly lie,
Bathed and lapp'd in glittering May-dew,
Sit we there, my love and I.

As we pluck the whitethorn blossom,
As we whisper words of love,
Prattles close beside the brooklet,
Sings the lark and coos the dove.
Our feet are bathed with May-dew,
And our hearts are bathed in love.

This, written by one of the numberless song-writers who abounded at the latter end of the eleventh century, has a fresh ring and sweetness that would do credit to the most charming of song-writers, Peacock. In the hands of one possessing so much mastery of his subject and his pen as does the author of the *French Humourists*, it may have gained something of this even in the process of translation; if this is not so, it does not deserve the slighting remarks with which it is dismissed. A little later than the date of this song comes Guyot, who has by some been called the first satirist of France, to which title the author takes exception on the ground that it is unfair to choose a man who represents a certain *genre* of literature, and call him its inventor. Whether Guyot has any claim to the title of inventor or not, he must be credited with speaking his mind when he calls the age he lives in "horrible and stinking." After him, in the thirteenth century, we have Rutebeuf the *trouvère*, a type of the Bohemian poet of all times—poor always and thriftless, oppressed with a propensity for gambling which is irresistible because he does not choose to resist it, married to a wife who brings him too many children and grows old and ugly, which natural result of the course of time he resents as an insult aimed at himself. But not the less are his songs lively and merry until worse things overtake him; he loses first his money, then the sight of one eye, and finally he "patches up his old body for heaven," and dies in the bosom of the Church. At this time he probably repented the authorship of the *Chanson des Ordres*, in which he impartially flagellates every order of monks, and wherein is to be found one of the earliest types of the hypocritical priest who turns up all through French satire till he culminates in Tartuffe. Rutebeuf was the author also of the best of the old miracle plays, and of several *fabliaux*, one of which, translated in good verse by Mr. Besant, is remarkable both for its own merits and for bearing a resemblance in its leading idea to the Norse legend of the man whose soul could find no reception, either above or below, after his death. From Rutebeuf Mr. Besant takes us to the *Romanes of the Rose*, which, as he says, for two hundred and fifty years continued to live as a sort of Bible in France, a reservoir of morality, science, and even religion. Begun by Guillaume de Lorris, in about 1240, it was continued by Jean de Meung, in about 1280, according to the author's computation, which appears to be well founded. Intended by the first writer as an allegory, it was taken up by the second more as a vehicle for his own ideas than for any other purpose. The allegory, in the first instance, does not seem to have had any other meaning than the evident one, although the ecclesiastics forced a religious one upon it, as they had before that time done in better known examples; and Molinet, in the fifteenth century, went so far as to assert that the singing of birds heard by the youth in the Garden of Delight represented the preaching of holy doctors.

However this may be, the *Romanes of the Rose*, as continued by Jean de Meung, had an enormous success and an enormous influence. Out of the confused mass of opinions which Jean de Meung pitchforked into it, Mr. Besant selects four salient points—his hatred of monks, his protest against the extravagant respect paid to women, his wish to communicate in the common tongue as much science as he could, and his desire to circulate certain vague principles of republicanism which were beginning to appear. In spite of his objection to monks, he seems to have been an orthodox churchman enough; for he is found siding with Guillaume de St.-Amour in an attack on the "Eternal Gospel" of Joachim, Abbot of Flora, the authorship of which St.-Amour, following, as Mr. Besant tells us, "the instincts of his time, flatly ascribes to the Devil, the alleged author of so many theological books." Nor was his republicanism of a very violent nature, for

we find him six hundred years ago discussing in perplexity the very same questions of politics, religion, and science which vex the minds and fill the journals of the nineteenth century. Confused crude mass as it was, his poem deserved the success it has obtained, because it was the work of a man of true sympathy and power; it was the only cheerful book of its time, because the only one of genius; while the smaller poets bewailed the presence of the darkness, Jean de Meung looked on to the light beyond and sang of its radiance.

In the account of Eustache Deschamps, who followed in the wake of Jean de Meung, the most noticeable thing is the speech of Adam to the world. There is a resemblance in this to Leibgeber's speech of Adam in Jean Paul's *Siebenkäs*; and in its refrain, "*vous estes tous d'une pel revestus*," there is a hint of *Sartor Resartus*. After Deschamps comes a name far better known than his or than Jean de Meung's, that of Rabelais, about whom, as one would expect, Mr. Besant has much that is interesting to say. Those who would find a masterly sketch of this giant of satire's life and works cannot do better than look at that contained in the *French Humourists*. Three points may be here noticed; that Rabelais began to write at the age of fifty, that Pantagruel the wise and majestic, not the intellectual but soulless Panurge, is the true hero of Rabelais, and that there are three things which the satirist never attacks—royalty, the art of medicine, and Christianity. Mr. Besant, however, disposes very summarily, in the negative, of the question whether Rabelais was a Christian or not; and, having rescued him from all the real evil that clings to his reputation, he sums up by declaring that, although Rabelais was a great moral teacher, he destroyed all earnestness in France for centuries to come, and that it would have been better for France had his book been hoisted into the sea and sunk. Both these assertions may be questioned. Lovers of Montaigne, who follows Rabelais, will question also Mr. Besant's statement that the *Essays* owe their greatest charm to the fact that they reveal, not only the secrets of a soul, but of a soul not much above the commonplace. As a general truth, Mr. Besant's statement to account for the popularity of commonplace writings, that the mass of the public like the easy wanderings of a mind of their own level, is very good; and his picture of a pyramid of popularity with Tupper and A. K. H. B. at the base is well conceived; but one cannot help thinking that it would be well for the commonplace if such a soul as Montaigne's were only a little above it. After Montaigne comes the celebrated *Satyre Ménippée*, the work of many pens, which appeared after the meeting of the States in 1593; of its extraordinary wit and bitterness Mr. Besant's extracts in translation give a good idea. Then follows Mathurin Régnier, called by the author the king of French satirists, in whose two lines—

Je diray librement pour finir en deux mots,
Que la plus part des gens sont habillés en sots—

is one original of a saying which startled the world as a novelty when it was said again in plain English by a great writer some years ago.

One would wish to speak of Mr. Besant's clever remarks on St.-Amant, on Voiture and Benserade, on Boisrobert, who seems to have been a kind of Falstaff; but it is impossible to do justice to them in a limited space, and we go on to Scarron, about whom the author appears to have fallen into a curious mistake. In one page he tells us that Scarron was pre-eminently a writer of burlesque and nothing else, and thereupon he gives a nearly accurate description of the function of burlesque, in which there is no room for anything lofty, anything pure or real. A few pages later he tells us how Scarron laughed, with but a rueful laugh, at his own sufferings; how under his mask of raillery we can see the bitter pains of disappointment convulsing his face. Such laughter as this surely belongs to the regions of comedy, not of burlesque. In true comedy there is always a sad, even a tragic, under-current; in burlesque there is nothing serious, or rather the outward shape only of seriousness is or should be preserved, to make a grotesque contrast to the rollicking fun beneath it. However, Scarron no doubt did write a good deal of burlesque, and it is ungracious perhaps to cavil at a point of this kind where so much is good. Of La Fontaine Mr. Besant gives a lively sketch, beginning with reminding us of the contempt we felt in our school-days for a writer who could employ in cold blood French of so idiomatic a nature ("How different," says Mr. Besant, "from the great Cæsar, who, mindful of his destiny, wrote for the third form!"), and ending by comparing him with some justice to Mr. Dickens's Harold Skimpole. To Boileau the author gives the highest praise as a versifier, as a critic of taste, as a master of language; but he emphatically denies him all claim to the title of poet. In the highest sense of the word perhaps he was not a poet; he was not exactly a creator; but cannot he who fashions the rude materials of others into a form well-defined, beautiful, and harmonious, be said to have made that form? If Pope was a poet, so certainly was Boileau; and we cannot help quoting against Mr. Besant his own statement earlier in his book that no writer invents. Of Molière's life and times an excellent picture is given in the *French Humourists*. His own life was saddened by a marriage which ended in misery, but for this sorrow he found some consolation in the friendship of such men as Boileau and Racine. Very interesting is the account of the founding of the Troupe de Monsieur, out of which, amalgamated with the Hôtel de Bourgogne and the Théâtre du Marais, grew afterwards the Comédie Française; and very curious is the resemblance between the state of society which gave rise to the *Précieuses Ridicules* and the *Femmes*

Savantes, and the agitation about Woman's Rights which goes on at the present day. Molière is but little read in England now; his works are known chiefly through an occasional performance by a French company; yet the lightness and keen brilliancy of his comedy have no rival save in Shakespeare. In what estimation the man himself was held by the great of his day is proved by the Prince de Condé's answer to one who came to him saying "I have brought you Molière's epitaph." "Would to God," said the Prince, bursting into tears, "it was Molière bringing me yours."

From Molière Mr. Besant takes us to Regnard, second to Molière as Ben Jonson was to Shakespeare. He is chiefly known by his comedies—few people probably have read his travels in Lapland—and best by the best of these, the *Folies amoureuses*, which is impossible and conventional, but sparkling with gaiety and animation. Gresset is remembered only by his poem of *Ver-vort*, of which Mr. Besant gives an admirable and nearly full translation. The story of the pious parrot sent from one convent to another, and picking up oaths and loose talk from the sailors on the way, has been repeated in many forms since its first appearance. Poor Gresset later on, terrified at the horrible fate of young La Barre, who only a hundred years ago was tortured and put to death for having omitted to salute an ecclesiastical procession, wrote an abject apology to his bishop for having been the author of anything so light and worldly as *Ver-vort*. His comedies apparently required no apology on the ground of lightness. The singularly dramatic life of that clever adventurer Caron de Beaumarchais is put by Mr. Besant into a semi-dramatic form, and may give materials to any modern playwright who chooses to study it. After him Mr. Besant closes his list with Béranger, to whom he assigns perhaps a higher place than is deserved. That he was a man whose life as well as his songs may well bring the tears into our eyes, that he was a man of intense humanity and large sympathy, will not be denied; but to say that there has been no lyricist like him in any language, and that he is in some sort the Shakespeare of France, is going somewhat too far. With more propriety he might be called the Burns of France. Indeed, further on Mr. Besant allows that in Béranger, in spite of his many poetic qualities, there is something which we miss, and he deserves credit for the discovery that this something is the fact that we look to be led by the poet, and we find him always following; that we listen for the voice of a man, and we hear the voice of the multitude. The author concludes his book by pointing out one quality which is common to all the French singers of whom he has told us, that they all strike the chord of regret for wasting life and coming death. This is true enough, but it is less true that "we in England, less natural than the French, have agreed not to harp upon this great human sorrow." Here, as in his last sentence, where he claims for French humour an absolute supremacy over English, most readers will judge the author to be blinded by partiality. He has, however, displayed great good taste in keeping this opinion out of sight till the last page of his book; he has made a witty and interesting book out of an excellent subject, and has shown that he possesses himself a large share of that quality of humour in which he claims pre-eminence for the French nation.

SCHERFF'S INFANTRY WITH THE OTHER ARMS.*

WE are not sure that the old wording, "Tactics of the Three Arms," would not have been more appropriate to the purpose of Major Scherff's new volume than that on which he has fixed. It is to be remembered, however, that this is published as the third of a series bearing the general description "Studies of the New Tactics of Infantry"; and hence the author has no doubt felt bound to preserve in his title-page the predominance of that great arm to which he directs his chief attention throughout, though his first Part only was devoted to it to the exclusion of the higher combinations which generals have to employ. This favour to the infantry will not, however, lessen the importance of what he writes of the other arms. Indeed there is an absolute thirst just now among educated soldiers for sound teaching on this head of combined tactics. It is beginning to be understood that strategical study, however interesting to the many in the abstract, can only be of practical service in the hands of a chosen few; whereas every soldier worthy of the name hopes, or at least longs, for the opportunity of handling a mixed force. And whilst this is generally felt, it is equally certain that, as the old handbooks utterly fail of their usefulness in the rapid and violent changes which have come over war, so very few soldiers have the power to sit down and draw up codes for themselves out of the historical incidents lately transacted in France. To do this requires a power of analysis in reading the true causes of success, and a mastery over the use of the facts so brought out, which it would be vain to look for in any one who has not joined great opportunities to special gifts.

Major Scherff's treatment of his new subject is of the same character which has marked his earlier productions; and, as we before described it, it is the very reverse of that of Boguslawski, in that he neither marshals individual facts from the late war in support of his views, nor brings principles down to the invariable test of its experience. He is ever looking further onwards. Without the prophetic genius of May, he is yet engaged in the same task that occupied that gifted writer a few years since, of carrying his countrymen forward from the successful efforts of the past to the

possibly more serious struggles of the future. He gives two distinct reasons in his preface to the new Part for this determined avoidance of the use of historical examples or recent experiences of war. In the first place, he says, this method has been so widely used in modern military literature that it would be superfluous to add more in this direction. In the second place, he has from the beginning resolved to follow rather the discursive than the dogmatic mode, and only to seek to attain, as far as is possible in so very practical a matter, the logical abstract view.

Much of this preface of his, which is by no means the least interesting part of the work, is devoted to the demonstration of his favourite thesis of infantry being above all the arm that must be studied. And here he takes pains, as many readers will be glad to see, to redeem his work from the reproach to which he had laid it open—as we in our former notice had felt bound to remark—of excusing the injustice done by others to May whilst he lived, and their ingratitude to his memory. In explaining and illustrating his illustrious predecessor's remarks made in 1867 as to the vast importance which the skilful tactical use of artillery would exercise in the next war, he employs language which can hardly be regarded as less than an apology for the slighting expressions employed in his first Part. In the *Tactical Retrospect* he now sees "the flashes of divination" (*divinatorischen Lichtblicke*) which May's admirers have long claimed for it, and throws his whole strength into his argument to show that it is those who have built up an exaggerated ideal of the power of artillery on May's words, and not May himself, who have been misleading others on this point. "To us," is Scherff's own view, "May seems rather to have only desired to indicate a means by which the preponderance might be gained in future wars, if such could not be attained, as it was in 1866, by means of a better weapon." In short, here May was right, and understood the proportions of the arms, though others have misinterpreted him as putting the artillery for the future constantly in the first place.

For, if you want to be sure, as Major Scherff ably points out, which is the really important arm, observe which it is that gives its own special importance to any of the others, at special eras. That the splendid achievements of Seydlitz's horse, for example, were ever possible, was due directly to the strictly line tactics of the infantry of their day. That modern artillery ever attained the degree of influence which it has of late confessedly reached, is due as directly to the use or misuse of infantry columns. And it is the skirmishing tactics of infantry (which throughout his work he insists have as completely banished the column as the column destroyed the line) that have given to the careful strengthening of the position, and to the musketry trenches of the engineer, their newly increased importance. For though we have spoken of "the three arms" as the familiar term of old tactical writers, our author, more logically exact, never forgets that there is now a fourth, whose humbler labours the science of modern battles has made indispensable to its older comrades.

We shall not survey this volume in detail. It would be doing its elaborate chapters great injustice to attempt to treat them thus in our short space. The general plan follows that of the first in its separation of the general subject into what the author decides to be its different phases—the Approach, the Introduction, the Accomplishment, and the Use made of that "Tactical Decision" which is the real object of the whole. Each of these would need a separate review to do it justice, and from any one of them might be taken special parts which would serve to illustrate the breadth of view and the clearness of thought which combine in the author's treatment. Such, for instance, is that discussion of the best organization of cavalry when actually employed alone in such a service as the covering of a frontier, or the watching of a hostile army, which reduces to scientific principles the whole of the Uhlan practice of the war. Infantry have here, of course, to be left altogether out of the question, and artillery also, except such light batteries as form an integral part of every large cavalry force. Nowhere else can there be found any such careful consideration of the motives which should govern the distribution of the troops employed in such a service, and the arrangements for their command. And the chapter is a sufficient proof of itself of the peculiar many-sidedness of the training which has given its just reputation to the special body over which Count Moltke personally presides. And yet with all this universality in their education, it can also be said of the Prussian General Staff that no science bearing on military events is there without its special representatives; and as we write these lines we read the order in which its renowned head, in the name of the whole, pays a farewell tribute to the memory of the late Colonel Von Sydow, whose close geographical studies, as is truly observed, have given his name an honoured place among the first scientific men of his time.

But to return to Major Scherff. We will now notice briefly his treatment of one special topic, the composition of a light advance guard, the *Vorhut*, for which we have no special word in our vocabulary, since it is the advance of the *Avantgarde* itself, and destined to cover the latter in just the same proportion in which this covers the main body of an army or a corps. How it is to be made up is the question; and in his reply we observe that Major Scherff is not afraid to discard the standing Instructions of his own service when they conflict with practical utility. We shall follow his own words, as they will be new to our readers, and can hardly be improved upon:—

As to its formation. Its task begins with the reconnoitring planes; it ends with the resistance which gives time for the troops covered to form up. It is easy to make the needless deductions. First, the divisional cavalry, or

* Die Infanterie im Verband mit den anderen Waffen. Berlin: Beth. 1873.

at any rate by far the greater part of them, should march at its head. This arm it is which is charged with the close reconnoitring of front and flanks, and the connexion with the grander reconnoissances conducted far to the army's front by the cavalry divisions sent on. As it can play but a subordinate part in the real struggle of the infantry division, so its being placed in force with the advance takes nothing from the strength of the whole.

The probable necessity for a combat demands as a second line infantry, the proper representative of the action fought to gain time. The general reasons for keeping the advance as low in strength as is consistent with its purpose apply especially here. This is the arm which can carry out its assigned task with the least proportion of strength; which it is hardest to bring back out of an engagement once fully entered on; and which most sensibly weakens the division behind if it be thrown away with the advance.

A supply of artillery is advisable. Only by using its fire can the actual fact of an encounter with the enemy be established. It can clear away trifling opposition, and enable the march to go on. It gives a sort of support if the defensive has to be assumed; and if a demonstration of attack be necessary, it enables it to be done to advantage. As, however, real fighting is not the business of the advance, a minimum strength of one battery will generally suffice.

As to the engineers, their special business, almost without exception, puts this arm at the head of the column.

With this extract we take our leave for the present of Major Scherff and his thoughtful essays. But there is a word we would say here on the philosophy of those who write and those who read such books as that from which we are parting.

It is from no bloodthirstiness, we are sure, nor even from any mere professional lust for war, that Major Scherff and other writers of his class throw their full efforts into the task of improving on the military past of the German army, and bringing it up to their own ideal of military perfection. We know well that such science as theirs is obnoxious to many; most of all to the prophets of a creed who ceaselessly preach peace and fraternity among nations whilst war against all society is in their hearts. Those who were wont to denounce the swagger of the typical soldier of bygone days, whom they felt instinctively as an obstruction in their path, have at least as much reason to hate the calm science of the military teacher of the present day. But, writing not for destructive philosophers, but for the mass of educated Englishmen, we may take leave to point out, that in seeking a high standard for their profession, the leading military minds of Germany—and of other countries so far as they follow these—are but acting as practical men should do, in accepting the facts of the world around them. They find their age to be one of war. This may be lamentable; it may be exceptional; but it is nevertheless admittedly the truth. They see that for a time at least diplomacy in its stricter sense has been superseded by arms. By arms all the great political achievements of the age have been accomplished; and to arms still those look who have great political projects in view. Very little is there to be discovered at present of any counterbalancing force. The one attempt made by Great Britain to bring in a new mode of settling international differences has not been so successful as to call forth admiration from others or exultation from ourselves. We shall hardly repeat the experiment very soon, and it is little likely to be imitated by our neighbours. In brief, the great nations around us are as resolved to maintain large forces as to improve their fighting powers. We do not dare—whatever peace doctrinaires may say—to close our eyes to this truth. And as we cannot pretend to rival our continental neighbours in the quantity of soldiers under arms, it becomes all the more the duty of those among us who have the power to take care that the quality of our troops, and among other points their mastery of such tactical secrets as those Major Scherff unfolds, does not fall behind the demands of the age.

RUSSIAN METRICAL ROMANCES.*

EVEN to Russians themselves the vast tract of sterile land which stretches towards the North-East from St. Petersburg to Archangel is very little known. It is not an inviting part of the country; a land of forests and swamps, and one in which travelling is not a luxury. There a scanty population maintains with difficulty an unequal struggle against the unfriendly forces of nature. The soil is in many places so marshy that no cart can be driven over it, and only sledges can be used, and it is with the greatest difficulty that the hard-working peasant can rear upon it a scanty crop of oats. To him are unknown what the moujik in other parts of Russia considers the necessities of life—grain for making *kasha*, cabbages for stewing into *shchi*, gherkins for giving a savour to existence. Only in the neighbourhood of the great Lakes Onega and Ladoga, which keep up an uninterrupted water-communication with St. Petersburg, would the conditions of peasant life be considered by a South-Russian at all endurable. The cruel climate, the dreary winter nights, the thankless soil, the hard fare, the ceaseless labour which characterize this part of the Russian Empire, all tell heavily against its inhabitants, all seem to be most unfavourable to their chances of health and happiness. And yet, according to the testimony of the compiler of the work now before us, an eye-witness on whom full reliance may be placed, these supporters of an almost desperate conflict with the summer's burning heat and the winter's deadly cold, with frequent fever and not unfrequent famine, are a sturdy, brave-hearted, and God-fearing race, who in the midst of incessant strivings after small and very uncertain gains keep their tempers and even retain

their spirits. But stranger still is the undoubted fact that this bleak region is the special home of Russian minstrelsy; that amid these sombre forests and melancholy swamps have been preserved the remains of the Russian epics; that these hard-handed and illiterate farmers and fishermen still chant at their work, or beside their hearths, those songs about the heroes of olden days which have long ago sunk into silence in almost all other parts of the Empire.

It was in order to perfect his already extensive acquaintance with these rustic minstrels that Alexander Hilferding, the President of the Russian Ethnographical Society, started in the summer of 1872 on a proposed tour through the Olonets Government. During a previous visit he had written down an immense mass of the poetry orally current in that province; but, before publishing it, he wished to go over the same ground again, with the view of giving a few final touches to his work. On the 22nd of June he wrote to his wife, saying that he had just completed a successful voyage of seventeen hours in a barge, in which he had taken his passage for the sake of conversing with the peasants it was conveying. Five days later he was lying at Kargopol, prostrated by an attack of typhus fever, which he had doubtless contracted on board the barge, and on the 2nd of July he died. Like Professor Fedchenko, so recently lost to Russia on an Alpine glacier, he was taken away in the prime of life, at a time when there was every reason to hope that long years lay before him of honourable labour and well-deserved success. Fortunately, however, for science, the results of his industry have not perished with him. Not only has he left behind several works of great value published during his lifetime, but since his death there has appeared the collection of Popular Poetry which he was engaged in completing during the expedition which proved so fatal. It forms a bulky double-columned folio of about seven hundred pages, and it contains a vast mass of poetry, chiefly of what may be called an epic character, which is of the greatest interest, not only to the student of mythology and folklore, but also to the historian and the philologist. We need not dwell upon the dialect in which it is written, the peculiarities of which are of minor interest to English readers; but we will attempt to give some idea of the general character and the leading features of the principal romances, if they may so be styled, which it contains.

The greater part of those poems belong to what is known as the Kief or Vladimirian cycle, relating the doughty deeds of a small band of heroes at the Court of Vladimir, "Great Prince" or Grand Duke of Kief. Like Charlemagne among his Paladins or Arthur in the midst of his Knights, Vladimir forms the central, though not always the most prominent, figure on the minstrel's stage. And Kief is the point around which the heroes circle, often roaming far away on divers missions into heathen lands, but always returning to the holy city where their lord spends his time in a succession of banquets and other regal festivities. From these he every now and then is abruptly summoned by evil tidings. Enemies are at hand, a heathen foe has sworn to hew down the walls of the stately city, to dishonour "God's churches," and to consume with fire the gleaming palace of the prince. Vladimir sinks at once into the deepest dejection, and wanders disconsolate through his halls, weeping and wailing and refusing to be comforted, till one of his champions comes to his aid, and sweeps away the threatening hosts as the wind scatters the chaff. Then Vladimir returns to his interrupted revels, and once more the ears of men are cheered by the clatter of dishes and the clinking of flagons, their nostrils rejoice in the savour of "white swans," and their hearts are made glad by copious draughts of "green wine." It may seem strange that the name of Vladimir, historically rendered illustrious by the "Equal-to-the-Apostles" saint and monarch who Christianized Russia and laid the foundations of its Empire, as well as by the prince, surnamed Monomachus, whose renown at a later period justly spread far and wide, should be associated in romance with so unheroic a person as the monarch whom the Bulinas represent as ruling at Kief. But the poems relating to that city are evidently of a character the reverse of historical, seeming to be founded for the most part on dimly remembered traditions, probably of a mythical nature, which once related to other actors and other scenes, but which in the course of time became applied to the person and the court of a monarch whose name had impressed itself upon the memory of the people. What is really remarkable is that the popular memory should have been able to retain so well the unwritten songs sung in honour of the almost imaginary ruler of a long-forgotten principality—of that city of Kief which, after being ruined by the Tartars, remained during so many centuries subject to Lithuanians and Poles, until the fact of its actual existence must have been effaced from the recollection of the peasantry of Great-Russia, even in those districts in which its ancient glories were still hymned by rustic minstrels. Of no small interest is the fact that far away on the confines of civilization the weariness of an Arctic winter night is still dispelled by the voice of the village rhapsodist, chanting in a strange archaic measure songs which speak of fruits and foliage unknown to his Northern clime, of warriors in gleaming armour, of chieftains in princely array, of heroic adventure and of royal revels. And these songs have been handed down to their reciters by a long line of peasant ancestors, who, under by no means easy conditions, preserved in their humble circles at least a considerable portion of the floating mass of semi-epic poetry which the singers of olden times devoted to the praises of existing personages, or to the preservation of current traditions. So strange to some

* *Oneshkiya Bulinini*, &c. [*Onega Bulinas*, written down by A. F. Hilferding in the summer of 1871.] St. Petersburg. 1873.

minds has appeared this tenacity of the popular memory, that there were not wanting sceptics who long refused to acknowledge the authenticity of the Russian poems of this class published at different times during the present century. But the appearance of the great collections of Raibnikof and Kréefsky, with their full and exact descriptions of the reciters from whose lips their contents were taken down, almost put an end to such doubts, which were finally set at rest by the appearance last year at St. Petersburg of one of the principal rhapsodists—a peasant all but fourscore years old, whose portrait is given in the present volume—who sang his songs before royalty and in the presence of assembled science in such a manner as to gain the entire confidence of his hearers as well as the medal “for merit.”

The poems contained in this collection are 318 in number, but many of them are variations of the same tale, the distinct themes treated in them being about ninety-two. The story which occurs most often, no less than twenty-four versions of it being given, is that of Dobruinya and Alyosha. The former hero is the model “gentleman” of Vladimir’s Court, noble by birth, brave in the field, courteous in the hall. The latter, on the contrary, bears but an indifferent reputation. A *popovich*, or priest’s son, he is supposed to have the “greedy eyes” attributed to ecclesiastics by Russian proverbs; he behaves to women in an unknighly manner, his courage is not above suspicion, mighty warrior though he be, and implicit reliance is not to be placed upon his word. Such is the suitor who woos Dobruinya’s wife after her husband has been absent for six years without any news being heard of him. Vladimir, though Dobruinya’s uncle, supports Alyosha’s suit, but the Slavonic Penelope refuses to yield her hand until twelve years have passed. Then she is obliged, though sorely against her will, to accede to his prayer. The wedding feast commences, but it ends of course in the old familiar way. Like Ulysses, Dobruinya returns in time to rescue his prudent wife and punish the audacious suitor. As in the “King Horn” story, he reveals himself by a ring which he drops into a cup from which the bride drinks. Like the sun after its nightly or wintry eclipse, he shines forth again after his long absence, and all is brightness and joy. It is an old story, but the manner in which it is treated is novel and curious. Less familiar to us is the tale which tells how Dobruinya won the hand of the singular maiden who afterwards became the heroine of the story just now quoted. One of its many versions is to the effect that Vladimir’s favourite niece was carried off one day by a winged snake or dragon. Now Dobruinya had already had a passage of arms with this snake, which had attacked him while bathing, contrary to his mother’s commands, in the enchanted river Puchai, and had forced it to promise it would no longer haunt Holy Russia, no longer vex Russian souls. So he is sent by Vladimir to negotiate the liberation of the fair captive. After rescuing her, Dobruinya is accompanying her back to Kief, when he comes across the traces of what he assumes to be a gigantic war-horse. So he leaves Alyosha to take charge of the princess, while he himself follows in the track of the mysterious steed. After a time he comes up with a heroine of the Brynhildr class, who is riding across the plain “in maiden meditation, fancy free,” and he most ungallantly bestows upon her three swashing blows. But she, unmoved as Skrynnir affected to be under Thor’s terrific strokes, pays no attention whatsoever to the first and second of Dobruinya’s attentions, but after undergoing the third she remarks:—

Methought the gnats were biting,
Lo it is a doughty Russian champion tillying!

Then she seizes him “by his yellow curls” and drops him, horse and all, into “her deep pouch.” But after a time her horse complains of the double weight, so she draws him out, saying:—

If he be old I will cut off his head,
But if I like him I will marry him.

And the result is that she rides away with him to Kief, where she, after being baptized, becomes his wife. The story is of special interest, inasmuch as it seems to have been greatly affected by two widely differing influences, the one Scandinavian, the other Central Asiatic. Traces of those, as well as other influences—Byzantine, Lithuanian, Finnish, &c.—are to be found in most of these poems, which were originally composed, in all probability, by minstrels who, like the old *trouvères*, framed the skeletons of their romances out of any fitting bones which lay near at hand, without troubling themselves as to the nature of the osseous they came from. But the Sagas of the North were probably familiar to the Kief princes and nobles, the descendants of Rurik and his Scandinavian compatriots, and many a wild tale from Central Asia must have been brought into Europe by the Tartars, whether as conquerors or as traders, so that the North and the East are likely to have produced on the popular literature of Russia such an effect as actually seems to be evinced by some of its metrical romances.

By far the most popular of the heroes of these romances is Ilya Muromets. The son of a peasant farmer in the neighbourhood of Murom—the Russian critics, it may be remarked, lay great stress on the democratic nature of the Bullinas as opposed to the aristocratic tone of all lays of chivalry—he lies for thirty years as a cripple among the ashes beside his father’s hearth. Then a magic draught is given him by certain supernatural visitors, converted in the *stiches* or semi-religious poems into “God’s angels,” and he rises from his humble resting-place as strong as Cinderella, was fair. From that time his life is passed in a series of heroic adventures, a continuous narrative of which has been given by a

writer of the present day, who has, as it were, sewed together the various fragments relating to Ilya (Elijah), and so produced a sort of epic of respectable length bearing the suggestive title of *Ilyada*, or “the Ilyad.” The hero’s first triumph is over a band of robbers, brigands like to those who, even in modern times, were wont to lend an added terror to the gloomy forests of Murom; his second is gained before the walls of Chernigof, the siege of which by countless Pagans he raises by his unassisted valour; his third, the record of which forms the theme of one of the best known *skazkas* or Russian *Märchen*, is his defeat and capture of Solovei (the Nightingale), a dreaded “highway robber” who besets the road to Kief, descending upon unwary travellers from his “nest,” built among “the branches of seven oaks,” as the robber nobles used to pounce down from their rock-perched castles on merchants sailing along the Rhine. Solovei’s chief power lies in the force of his screech, which appears to have resembled that of what in factory towns is known as a “devil,” all living beings, as a general rule, falling to the ground when they hear it. But Ilya sets the screecher at nought, knocks him out of his nest by a well-aimed shaft, and leads him in triumph to the court of Vladimir—as is represented in a large picture which was on view last year in the Russian department of the South Kensington International Exhibition. The subsequent adventures in which Ilya distinguished himself are too numerous to be more than referred to here.

We have mentioned the three chief personages of Vladimir’s Court, but there remain many other heroes of whom some notice ought to be taken. There is, for instance, that eminently mythical being Dunai (Danube), who, having obtained for Vladimir the hand of the Lithuanian Princess Apraxia, gains for himself that of her sister Anastasia. But at the wedding feast he becomes wroth with his bride, who claims to be a better shot than he, so he challenges her to come forth into the plain and compete with him. She successfully splits an arrow on a knife placed on his head, but when, in spite of her assurance that he has taken too much wine at the wedding breakfast to be able to shoot straight, he insists upon attempting a similar feat at her risk, his arrow pierces “her white breast.” Then, after listening to his wife’s dying words, the Slavonic Cephalus falls “upon his sharp sword,” and his blood mixes with hers. Another hero of a pathetic story is Stavvor, a prince whose wife is as wise as she is fair. One day when Vladimir’s guests are boasting at table, this one of his domains, that one of his gold, “the wise man of his old mother, the fool of his young wife,” Stavvor plays the fool’s part, declaring that his wife is clever enough to trick Vladimir and all his Court. By way of retort courteous Vladimir flings the boaster into a deep dungeon, where he long lies disconsolate. But at last his wife hears the sad news. Straightway she crops her flowing locks, dresses herself in man’s attire, appears before Vladimir in the character of a son of the King of Poland, and asks for his daughter’s hand. Vladimir is taken in and consents. At the wedding feast the supposed prince complains of depression, and asks for a song to cheer him. Vladimir’s minstrels try their best, but he becomes more and more dejected. At last Stavvor, who is renowned for his musical talents, is brought forth from his dungeon. He sings, and the gloom clears off from the brow of the bridegroom, who asks for a private interview with the singer. Having revealed herself to him, the disguised lady then returns and tells the truth to Vladimir, who for some time “hangs down his bold head, and fixes his bright eyes on the brick floor,” but eventually recovers his spirits, forgives Stavvor and his wife, and returns with renewed appetite to the feast. Very different from the sage heroine of this story is the first wife of Mikhailo Potok, a Helen who elopes with a Lithuanian Paris, and when Potok comes in search of her, first turns her Menelaus into a white stone, and afterwards, when he has been disenchanted, crucifies him against a wall with four nails. Equally fickle is the wife of Bezmyer, whose charms prove fatal to the seductive Churilo; and equally dangerous is Marina, a Circe who by magic spells gets the young Dobruinya into her power, and then sends him afield in bovine shape. On the whole, the younger heroines of these romances do not show to advantage, but they appear to improve as they grow older. They are apt to be annoying as daughters and wives, but they make excellent mothers. Thus the forward young princess who proposes marriage to the rich Solovei Budimirovich, when he comes sailing from beyond the blue sea to Kief, contrasts unfavourably with the dignified mother of the still more wealthy Diuk, who receives in so stately a manner the envoys who are sent by Vladimir to test her son’s description of the splendour of his Indian home.

Here we must pause, though we have left still unnamed full many a gallant hero who gaily feasted at Vladimir’s table or boldly repelled his foes afield—though we have not even alluded to the really historical poems of the Moscow as distinguished from the Kief cycle, which Mr. Hilferding’s rich and varied collection contains.

CHURCHYARD LITERATURE.*

IF all epitaphs were as solemn as those selected by Messrs. Palliser, our churchyards would cease to yield the entertainment which they have afforded to the loungee from time immemorial. Such

* *Epitaphiana; or, Curiousities of Churchyard Literature.* By W. Palliser, F.R.S. London: Samuel Tinsley. 1873.

Maxims for Monuments; or, Epitaphs selected for Study and Application. By F. and M. A. Palliser. With Designs by Flaxman and Others. London: John Murray. 1873.

a result is certainly to be deprecated, as removing one genial link between dead and living. We have not a word, however, to say against the suggestion of Mr. Fairley, the editor of *Epitaphiana*, that a censorship of epitaphs should be sharply exercised by the parish priest; for the examples of bull and blunder, bungling, piracy, and slovenly orthography—to say nothing of worse solecisms against good taste—to be found on tombstones, are beyond question "legion." There can be no doubt, for instance, that under proper supervision no monumental slab should have been allowed to bear such an inscription over an infant of eight months as

Since I have been so quickly done for,
I wonder what I was begun for;

especially when, as *Mottos for Monuments* remind us, Prior left this faultless pair of couplets to meet the same occasion:—

Happy the babe who, privileged by fate
To shorter labour and a lighter weight,
Received but yesterday the gift of breath,
Ordered to-morrow to return to death.

But while vulgarity and vile taste require exclusion from the sepulchral enclosure, it is a mistake to banish from it all scintillations of the peculiar humour which finds its vent in a cheerful effort to make the best of the inevitable. Our notion is that neither the mottoes of F. and M. A. Palliser, as a whole, nor yet the epitaphs collected by Mr. Fairley, but a compromise between the two, and a well-considered mixture of grave and gay, would answer best. In all churchyards, and in all collections of epitaphs, there is room for a very sweeping elimination of the kind of epitaphology which savours of presumption, and which must be offensive to a correct taste. We refer to such as predicate of one who has died, not in infancy, in which case it might be admissible, but after having had experience of life, "I have found the joys of Heaven"; or such as say of the departed, "Each duty done, they rest in peace," and so anticipate the final award. *Mottos for Monuments* include many samples of this fault, and any reader's recollection of family monuments and mural tablets will no doubt supply similar instances of this presumption, which, apart from more serious objections, is very provocative of hostile criticism. In truth, there is great room for the multiplication of really humble epitaphs, of a kindred type to that in p. 74 of the "*Mottos*":—

And when I lie in the green kirkyard,
With the mould upon my breast,
Say not that she did well or ill,
Only "she did her best."

The expression of faith and hope is of course thoroughly germane to the occasion; but those who compose inscriptions for the monuments of their relatives, or for themselves, are too apt to overstep this, so that a humble epitaph is really a rarity. Hence we are disposed to commend highly those epitaphs which cultivate brevity; such, for example, as Albert Dürer's "Enigra vit," or that in Whithy Churchyard, "Gone home"; though it cannot be denied that this quality is carried to excess in the epitaph on a sailor, "Grounded," on Grimaldi, "Here I am," and on an angler, "Hooked it." Mr. Fairley cites one inscription to the memory of "Susan Mum" which supports our view of the matter, though it may also represent the cautious reticence of those who erected it. Susan Mum's epitaph runs, "Silence is wisdom."

The scope of *Mottos for Monuments* does not comprehend the rather numerous class of epitaphs which consist of a more or less happy play upon the name of the deceased; whereas in Mr. Fairley's collection Mrs. Mum's epitaph, just cited, is only one out of many of this type. He gives the whereabouts of that on Mr. Miles:—

This tombstone is a Mile stone:
Ha! how so?
Because beneath lies Miles,
Who's Miles below;

but he is wisely silent as to where the inscription over Owen Moore is to be found:—

Owen Moore is gone away
Owing More than he could pay.

It is hardly likely that, however disappointed at the unforeseen insolvency of the deceased, his executors would have gone to the expense of venting their chagrin and airing their wit on a tombstone. It is quite otherwise in the case of the complacent epitaph in Sunning Hill churchyard, which runs—

My debts are paid, as you will see;
So trust in God, and follow me.

Churchyards doubtless contain good, bad, and indifferent samples of this sort of epitaph, the preponderance being, we fear, on the side of vulgarity and stupidity. How neatly the play on names may be handled may be seen in Orshaw's epitaph on Dr. Brook, which is perhaps none the worse for having rather a classical than a theological tone:—

A Brooke whose stream so great, so good,
Was loved, was honoured, as a flood;
Whose banks the Muses dwelt upon
More than their own Helicon;
Here at length hath gladly found
A quiet passage under ground;
Meanwhile his loved banks, now dry,
The Muses with their tears supply.

It is obvious that Mr. Fairley's search has been directed towards facetious and jocular epitaphs, without special regard to refine-

ment or the want of it. Hence he is livelier than the collectors with whom we are comparing him. Messrs. Palliser, for instance, favour us with two or three "trade" epitaphs, as we may call those which touch upon the culling of the deceased in his lifetime. That "On a Labourer," written by "Old Humphrey," is not amiss, as epitaphs go:—

He labour'd in the fields his bread to gain,
He ploughed, he sow'd, he reaped the yellow grain;
And now, by death from future service driven,
Is gone to keep his harvest-home in Heaven.

And another "On a Mariner," in the next page, from *Churchyard Thoughts*, if it makes a little too sure of the "port," is still an example of well-sustained comparison. As we might expect, Mr. Fairley's samples are of a lighter cast. One is "On a Surgeon" "who bled for his own and his country's good"; another, "On a Linendraper"; a third, seemingly written by the compiler, "On a Collier," which is not particularly good; and a fourth, which is happier, "On a Country Sexton":—

He, that had carried many a body brave,
Was carried by a fever to the grave;
He carried and was carried; that is even.
Lord! make him porter to the gates of Heaven.

That on the actress, Mrs. Oldfield, which is extremely neat, had its origin probably in the concise epitaph of the Elizabethan player, "Exit Burbage"; for it runs:—

This we must own, in justice to her shade,
The first had exit Oldfield ever made.

Not much exception can be justly taken to the epitaph which turns to account the trade or calling of the deceased, unless it be in that low and ludicrous development of it which we suspect sprang from the fatherland of Burnum; the development which appends a rider for the benefit of survivors and successors. Though Upton-Severn churchyard has the credit of a perfect specimen of this in the advertisement of the "Landlord of the Lion's" resigned publican son, it is outdone in practical prose by Jane Smith's American epitaph on a monument erected by her husband, a marble-cutter, "as a tribute to her memory and a specimen of his work. Monuments of the same style, 250 dollars." A curious question seems to attach to one of the trade epitaphs in Fairley's collection, that on a watchmaker, beginning, "Here lies in horizontal position the outside case of," &c. &c. &c., and ending, after a series of references to the deceased's calling, with the hope of "his being taken in hand by his Maker, and of being thoroughly cleaned, repaired, and set agoing in the world to come." Mr. Fairley tacks this to the monumental stone of one George Routledge, lying in Lydford churchyard, on the borders of Dartmoor, who died November 14, 1802. In a collection of Epitaphs and Inscriptions printed for Lackington and Co. in that very year, the same epitaph, with the substitution of a fictitious name, "Peter Pendulum," and the omission of the date of death, is said to be taken from the churchyard of Conway, North Wales. What we should like to know is, whether the Peter Pendulum epitaph was a *skit* or *jeu d'esprit* first printed in the year named, and borrowed by the friends of the Somersetshire watchmaker, Routledge—whose name, by the way, is not unknown in that trade? The attempt to trace the epitaph to Conway churchyard was less bold in 1802 than it would be now, when tourists can so easily ascertain whether it is actually there.

One of the vexations of epitaph literature is the coolness and carelessness with which friends appropriate any epitaph they like, and the indifference with which collectors and editors regard the question "Where is the original and which are the copies?" One of two epitaphs ascribed to Llangerrig churchyard, Montgomeryshire, is given again in p. 127 of Fairley's *Epitaphiana* as from Castell Llwdwr or Loughor churchyard, South Wales; but the various readings of the latter inscription prove it to be a copy by a clumsier hand, the former having about it, as indeed has the other from the same place, a certain smack of genuineness:—

O earth, O earth, observe this well—
That earth to earth shall come to dwell;
Then earth in earth shall close remain
Till earth from earth shall rise again.

The Montgomeryshire moralist, by the way, here produced a more thoroughly Christian epitaph than the admired Scotch one anent Earth, by James Ramsay at Melrose Abbey, which is given in *Mottos for Monuments*, p. 77. The one is instinct with the truth of a resurrection; the other soars no higher than the vanity of human hopes and aims.

One of the most natural, yet difficult, styles of epitaph is that which we may call the "catastrophic"; natural, because survivors are most impressed with the swiftness of the deceased's removal from the world; difficult, because they are so apt to reproduce this impression vulgarly. Mr. Fairley's collection is rich in pronounced specimens of this style. To pass over that on the unfortunate person who gave his friends a sudden shock "by one day falling into Sunderland Dock," or that on the New Hampshire man whose old mare, as he was leading her to drink "kick'd and kill'd him quicker 'n a wink," we may pause to notice two or three samples of the catastrophic epitaph, heroic or pathetic. In a Scotch graveyard occurs the following:—

Here lies interr'd a man of might,
His name was Malcolm Dornie;
He lost his life, as market night,
By fall'n off his powder.

Possibly this may be found in the same locality:—

John Macpherson was a remarkable person;
He stood six foot two without his shoe,
And he was slew at Waterloo.

Only the odds are against the unity of authorship, to judge by the composition. Pithos belongs to the child-epitaph, and so we call this one from New Jersey:—

She was not smart, she was not fair,
But hearts with grief for her are swellin';
All empty stands her little chair:
She died of eatin' watermelon.

Any number of like inscriptions might be gathered, we venture to say, in old-fashioned graveyards. It is not so easy—it is in fact the rare exception—to find an example of good taste in this kind. We went to Orashaw just now for an example of the play on a name. He shall supply another on the catastrophe of a newly wedded pair, dying and buried close together. Though a trifle long, it is true poetry, and in excellent taste:—

To these whom Death again did wed,
This grave's their second marriage-bed;
For though the hand of Fate would force
'Twixt soul and body a divorce,
It could not sunder man and wife,
'Cause they both lived but one life.
Peace, good reader, do not weep.
Peace, the lovers are asleep.
They, sweet turtles, folded lie
In the last knot that love could tie.
And though they lie as they were dead,
Their pillow stone, their sheets of lead;
(Pillow hard and sheets not warm)
Love made the bed; they'll take no harm;
Let them sleep; let them sleep on,
Till that stormy night be gone,
And the eternal morning dawn;
Then the curtains will be drawn
And they wake into a light,
Whose Day shall never slope in Night.

A few such perfect epitaphs as this, which is a strong contrast to the four-lined epitaph in Yate churchyard on the same topic, quoted by Mr. Fairley, would have given a more literary tone to his collection or to that of Messrs. Palliser. The speciality and recommendation of the latter is, in truth, the reproduction of Flaxman's designs. The collection itself is too uniformly sombre. The same cannot be said for *Epitaphiana*, but rather the contrary. It contains all the stock epitaphs which are periodically held up to ridicule—e.g., that on Lady O'Looney, "who was blind, passionate, deeply religious, first cousin to Lady Jones," &c., but it errs in careless citation of places; as where, for instance, it gives "Bishop Cumming's Churchyard, Wilts," for "Bishop's Canning Churchyard, Wilts." Also it fails in research. No. 5 is an epitaph said to be from a graveyard in Cheraw, South Carolina. It begins, "My name, my country, what is that to thee?" and ends "Thou know'st its use, it hides—no matter whom." If there is such a place as Cheraw, it must have deeper scholars in it than the compiler of *Epitaphiana*. One such, at all events, must have carried in his head, perhaps across the Atlantic, a version of a remarkable misanthropical epitaph by the anthologist Paulus Silentarius, by no less an English poet than Cowper.

THE WOOLING OT.*

NOVELISTS are hard put to it in these days for likely obstacles to lawful marriage. The fierce partisanship of politics is a thing of the past; even religious difficulties are daily vanishing before the easily opened door of the registrar's office; we have no family vendettas to maintain; and our latest stronghold, caste, is by no means so impregnable as it used to be. Poverty certainly still has power to forbid the bans; but, in spite of the old adage which sends love flying when poverty enters, stout hearts are daily found to brave the terrors of the unwelcome wolf, and the world is held to be "well lost" if lost for love. Still we must devise likely-looking obstacles, else our supply of the orthodox three volumes would soon come to an end; stories wherein "the wooing ot" prospers too rapidly not being held to possess sufficient interest for the sympathetic reader, who likes nothing so well as a strong complication of love and difficulty, wherein social circumstance takes the place of the old Greek Fates, and Belgravian mothers represent the Eumenides who pursue or the Aias who avenge.

Mrs. Alexander, casting about for a social barrier sufficiently potent to prevent an attachment otherwise lawful and natural, has hit upon that of family and caste, and we are bound to say that she has managed her materials with naturalness and skill. We grant that her hero, Geoffrey Trafford, is less determined and more vacillating than befits a perfect picture; but we think the study truer to life on that account, if the pleasantness and prettiness of the design suffer. A man in Geoffrey Trafford's position does not marry a girl with Maggie Grey's surroundings, even when she is as sweet and charming as she is depicted, without grave hesitation and much exercise of mind. If marriage involved nothing beyond personal union, love would be freer and caste weaker than it is; but when we remember that it includes the relatives as well as the person immediately concerned,

that uncouth cousins and vulgar aunts have the right to familiar entrance, and that social exclusiveness, the dearest privilege of the ordinary Englishman, is henceforward a thing impossible, we can understand the reluctance of a man of family to take his wife from among the pills and pestles of a little chemist's back-parlour, and we can even honour him for the courage of his final determination, how long soever it was before it came about. We extract part of the scene where Trafford makes his formal proposals to Maggie, chiefly for the naive observation at the end, which, we fancy, serves as a kind of index to the book, explanatory of more than the author cared to express in less allusive language:—

Trafford caught her hand in both of his. "I am not quite unworthy of you, dearest," he said, while his eyes lit up and a dark flush passed over his cheek. "I know well how necessary you are to me. I have suffered enough from sacrificing natural instinct to conventionality. Then, Maggie, if you believe that I am true and loyal, you will not refuse to be my wife?" he pressed her hand almost painfully, and went on hastily. "I must confess that I deeply, bitterly regret not having sought you in my comparative prosperity as my heart prompted. Now I have but broken fortunes to offer you! I do not set myself up as a hero; I am a very fallible mortal. Will you take me with all my imperfections?"

"I understand," said Maggie slowly, but leaving her hand in his. "You did not think it possible to raise me to your own level before troubles came. Well, I am a fitter helpmate for a real worker than for a fine gentleman; but—"

"I acknowledge that you would have been braver and truer had you been in my place," interrupted Trafford.

"No," replied Maggie, looking down; "I should then have been a man, and felt the force of more worldly motives."

The main action of *The Wooing Ot* is very simple; in fact, too simple for its length. Maggie Grey, the heroine, and the perfectly well-bred and charming niece of a worthy chemist afflicted with coarse and common surroundings, is the half-maid, half-companion, of a rude and vulgar Mrs. Berry. They go to Paris, where Mrs. Berry's money buys her admission into a society of speckled peaches, whereof a certain sharper, one Count de Braganoe, is conspicuous, and into which presently enters a raw boy peer, the young Earl of Torchester. This Mrs. Berry is a spiritedly drawn character. Kind-hearted but selfish, vain, and shallow, her head turned with the unexpected possession of wealth, but of an inherent vulgarity of nature which nothing can gild over, she strikes us as a portrait taken from the life, and more true than pleasant. She was originally the daughter of a lodging-house keeper, "addicted to penny romances and a *beau idéal* husband—something between a black-whiskered dummy in the window of the neighbouring hairdresser and a handsome policeman who occasionally frequented the street"; but she married old Mr. Berry, who soon obligingly died of a sore throat and left her well provided for. While her father lived her life was a burden to her by reason of his constant admonitions against fortune-hunters and the like; but she was kept out of mischief. When he died she resolved on having her fling; wherefore she engaged Maggie Grey at twelve pounds a year and her "old clothes," and set off on her adventures, which in due time culminated in Paris, speckled peaches, the Count de Braganoe, and the young Earl of Torchester.

Maggie, as only a fair-faced, ladylike girl, is nowhere among the harpies who throng round Mrs. Berry; but she soon becomes everything to the boy Earl, because she is "kind to him," as he says—that is, genial and natural, and helpful when he flounders in his shy awkward way. And she is kind to him partly because he is wholesome in nature, if just now in danger of drifting into courses neither wise nor wholesome, and partly because he reminds her of her loutish, but good-hearted, cousin John in Australia, hitherto her only friend. In the most natural manner possible the companion and the peer fall into a friendship which ends in the Earl's asking her to be his wife, and Maggie's refusing. She does not refuse him because she does not value money and position, nor yet because she is in love with any one else; but simply because she is not in love with him, and because she understands that happiness and dignity are not always to be had for money. It is the consequence of clear reason and good feeling. There is nothing overstrained in her decision, nothing stilted or unnatural. It is just what a candid and courageous girl would have done; but the charm of her action is mainly due to her manner of thought, and the purely feminine groundwork of her reasonableness. The whole character of Maggie is very tenderly touched, and very clearly conceived. In so far as she is concerned, *The Wooing Ot* has the merit of originality. She is flesh and blood, and stands out solidly, especially in the earlier chapters. Simple and self-respecting, loving and firm, she is of the best type of English girl, and one we have not met for a long time in the pages of a novel. Not a line about her is exaggerated; and Mrs. Alexander has mercifully endowed her with physical self-control, by which we are spared hysterical sobbings and faintings, and all the other signs of pathological unhappiness which always suggest the doctor and the medicine-chest. She is delightfully girlish, too; and in the midst of her greatest griefs and perplexities is woman all through as to her appearance. Without being vain, she never consents to dowdiness when by care she can make herself lovely; and while her heart is breaking for love, does not reject the right admixture of colours in her hat as a thing beneath her dignity to study.

Lord Torchester has a cousin, one Geoffrey Trafford, whom his aunt—the boy Earl's mother—sends out to Paris to investigate matters when they begin to look serious, and, if possible, to detach him from the wiles and arts of Maggie Grey, which she uncharitably, though perhaps not unreasonably, supposes to be a vulgar ad-

ventures bent on catching an earl. And the pith of the book lies in the fact that Trafford, who comes to warn, is himself caught; and that Maggie on her side falls in love with the man who meets her armed with such a panoply of suspicion and predetermined contempt. The last two volumes are taken up with the gradual progress of this love affair, interrupted now by Trafford's jealousy of Cousin John, who comes home from Australia, and now by Maggie's watchful self-control and loyalty, anxiously guarding herself from betraying feelings which may interfere with the happiness and desires of her second patroness and employer, Miss Grantham, who has destined Geoffrey for herself. The history of this love affair between Maggie and Trafford is the weak link in the chain. There is not sufficient sense of growth through these last two volumes to sustain the interest at the height to which it rises in the first. All the incidents are too trivial, too little progressive, too flat for real art. They are naturally planned and easily told, and we do not desire anything more startling or sensational than what Mrs. Alexander has given us; but they should have been more vivid, more important, with more "salt" and more definite evolution. The story drags. Half the later chapters might be cut out and leave no trace of loss; indeed the plot would gain by condensation. Things are too much on a dead level, and the fire hangs too long.

Though Miss Grantham too is drawn fairly well, she fails in the dash and spirit with which Mrs. Berry or Maggie herself, or even Mrs. Grey and the girls, are portrayed. To be sure, we hold these last to be more vulgar than was necessary either for the liveliness or the naturalness of the book; but they are more solid than Miss Grantham, who is a little too much of the wax-work type, and seems to want localizing and putting into a more determined shape. Neither a Bohemian nor a fine lady, she oscillates between the two characters in a way which gives one an odd sense of uncertainty. She acts like the one while being the other; doing unconventional things which scarcely harmonize with her position or her education as a local "princess," yet never for a moment ranking herself on the side of the Bohemians or the democrats. We question the possibility of her accepting Maggie's charming personality as a set-off against her subordinate position; and we therefore question the life-likeness of all that part of the story which makes the little brown-haired secretary her employer's favourite friend and trusted confidante, and which includes her in the grander society at the Beeches as an equal.

Nor can we endorse the picture of Cousin John as a good piece of work. He may be an individual portrait, but he is singularly unlike the typical Australian or returned colonist from any place. Cousin John is an arrogant, noisy, coarse, blustering fellow who, had he shown half the insolence abroad which he displayed so freely at home, would have been brought to his senses by some Colonel Blood or Judge Pike of the place, with his "leven-inch bowie knife" or nine-shooter. As a rule, the returned colonist, the man who has mixed with roughs and been his own lawyer, judge, and policeman, is distinguished by a reticent and observant air; seeming to be always on the defensive, but never aggressive; taking stock of all the circumstances and people by which and whom he is surrounded, but keeping himself quiet, composed, and always as if on guard. This kind of manner belongs to a society where men have to protect themselves; where they must be neither cowardly nor quarrelsome; and where the prime endeavour of each newcomer is to impress his fellows with the belief that he is as good a man as any of them, and one better not modded with. Cousin John seems to change somehow from his earlier lines; and when he returns home as the selfish, hard, insolent, and vulgar benefactor of the family, we feel that Mrs. Alexander has cheated us and given us husks for grain.

When we say that the whole story of *The Wooing Ot* would have been improved had it been more diligently wrought over; that it wants the indefinable but unmistakable evidence of care, and so slips away from us rather uncomfortably, we have indicated all the faults we care to point out. To balance these, it is a book of healthy tone and pleasant feeling; womanly, yet by no means sentimental or hawkish; indeed noticeably bright, and with an extraordinary atmosphere of good temper throughout; but a book that is evidently below its own possibilities and the powers of its author. And so far it disappoints us, while holding out the hope of something better when Mrs. Alexander shall have determined to work diligently, and not only to write easily.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and so this rule we can make no exception.

The SATURDAY REVIEW is duly registered for transmission abroad.

Nearly all the back Numbers of the SATURDAY REVIEW may be obtained through any Bookseller, or of the Publisher, at the Office, 88 Southampton Street, Strand, W.C., to whom all Communications relating to Advertisements should likewise be addressed.

The publication of the SATURDAY REVIEW takes place on Saturday Mornings, in time for the early trains; and copies may be obtained in the Country, through any Newsgent, on the day of publication.

Now ready, **VOLUME XXIV**, bound in cloth, price 18s. Cloth Cases for Binding all the Volumes, price 2s. each. Also, Reading Cases, price 2s. 6d. each. May be had at the Office, or through any Bookseller.

Copies of the SATURDAY REVIEW Bill of Contents will be forwarded every Friday Evening by post, prepaid, to any Newsgent in Town or Country on application to the Publisher.

THE SATURDAY REVIEW

POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

MINISTERS AT GUILDHALL.

WHEN the Ministers of the day take their November dinner with the new Lord Mayor there is always a faint hope that they may seize the occasion to say something that shall have some kind of interest; and as Mr. Gladstone appeared in public on Monday for the first time since the reconstruction of his Ministry, and since the tide of Ministerial defeats in the constituencies showed signs of turning, the expectations of his hearers were more than usually excited. No disappointment could have been more complete. Mr. Gladstone at the outset of his speech announced that he was going to say nothing whatever, and he kept his word. He has often been criticised for too rapid a fondness for rash utterances, for constantly obtruding crude thoughts on astonished assemblies, and for committing himself before he knows his own mind. His fiercest critics must now own that he is capable of better things, and that, if he sets himself resolutely to the task, he can go on rolling out sentence after sentence of unmeaning platitudes as well as any man in the kingdom. This is a great merit, and it is so rare that a Minister of the first rank should show himself willing to learn, that the virtue ought to be heartily acknowledged when it is discovered. Last Session Mr. Gladstone showed that he had learned to control his temper and to abandon the air of a democratic dictator. Now in the recess he has shown that he can hold his tongue while he is making a speech. That this was much the best thing he could do on Monday is obvious in many ways. Englishmen like a speaker who dares to disappoint them, and who shows his superiority by concealing his thoughts, thus persuading them that he too is a man and a brother, and not so very clever after all. If Mr. Gladstone could but get a reputation for a sort of stolid caution, he might do more to revive the popularity of his Cabinet than he could do in any other way. It is very probable that on Monday he really had nothing to say, and that this was partly the reason why he said nothing. But this was merely a happy accident. It made his task easier; but the great thing is the fact that somehow or other he managed to make a speech which, if coming from the common county member, would have been thought unnecessarily dull. For his party nothing could be more convenient, as the speeches made by some of his supporters this week show that he could not have said anything to please one section without alienating another section of the Liberal party. Mr. MUNDELL, Mr. TREVELYAN, and other ardent spirits have been working themselves up to the highest pitch of enthusiasm over the justice and beauty of the proposal to give votes to agricultural labourers, while Lord ARTHUR RUSSELL has been cautioning the electors of Tavistock that this is a question which had better be let alone. That the agricultural labourer will have his vote before long is of course certain; for it is now discredited that he is a natural philosopher, with impetuous innate shrewdness developed by constant conflict with wet fields and obstinate cows. It is true that this kind of natural philosophy has been going on for some centuries without attracting much notice; but the philosophers have lately shown themselves capable of something higher than anything with which they were credited. They have joined together and have got their votes raised; and as their intellectual level has thus proved to be up to the level of a strike, they have established, by a kind of mathematical demonstration, that they were to vote for members of Parliament. Lord ARTHUR RUSSELL, when the humble ground of objecting that all the friends of despotic Liberals were carried out, if

agricultural labourers had votes, if the representation were taken away from little towns and given to counties, and if impetuous ladies might vote just as if they were real men, the consequence would be that the government of the country would be handed over to the Tories. It is not, therefore, surprising that, with such conflicting opinions among his supporters as to the duties and interests of his party, Mr. GLADSTONE was delighted to take refuge in the agreeable impartiality of a mysterious silence.

It is, however, impossible that Mr. Gladstone should make a long speech and say nothing that invites criticism. His speech on Monday, taken as a whole, merits the highest praise for its wise manly. But there are parts of it to which exceptions may be taken. Referring tacitly to Mr. DISRAELI's famous letter, Mr. GLADSTONE enlarged on the strangeness of the fact that, if this plundering had been going on, if people of various grades and classes had been irritated or alarmed, no one should cry out, and that there should be universal contentment and peace. This seems rather hard on those who have conceived themselves injured. If they were not to break the palings of the Parks, it is not easy to see how the classes discontented with the Government could have done more than they have done to make their grievances known. The licensed victuallers, for example, were roused into hostility against the Government, not, as Liberal members are accustomed to say, on account of the early closing clauses for which the Tories voted, but because Mr. BRUCE's first Bill, although withdrawn, inspired a belief that a Government which could ever have sanctioned it was not a Government that was really alive to what was due to the interests of beer. If Mr. GLADSTONE thinks that the licensed victuallers have been slack in their hostility and contented and gentle in their behaviour, he must have taught himself to assume that every grievance-monger who falls short of the standard of Mr. BEALES is unworthy of notice. The officers of the army, too, as is well known, thought themselves seriously wronged by the terms of the Purchase Bill, and they have gone on making a noise, and giving trouble in every legitimate way, until they have succeeded in getting a Commission to examine into their case. The numerous local interests imperilled by the proposals of the Endowed Schools Commission have also done pretty well in the way of making themselves heard; and as to the famous 25th Clause, it may be said to have set half the parishes in England by the ears. In the midst of his exuberant satisfaction at a universal reign of content and approval of the Ministry, Mr. GLADSTONE may condescend to listen to a voice of warning. Lord ARTHUR RUSSELL is admirably fitted to play the part of the slave in the triumphal chariot, and he is desponding enough to make the most sanguine Consul beware of the hollowness of earthly success. He modestly thinks that the electors of Tavistock may, perhaps, once more return the brother of the Duke of BEDFORD, but he looks forward to being one of a small minority of Liberals in a new Parliament, and thinks that the Ministry and their more extreme supporters have so alienated the affections of the constituencies that the Conservatives have every prospect of a long lease of power. Probably the melancholy of Lord ARTHUR RUSSELL is as much exaggerated as the kind cheerfulness of Mr. GLADSTONE; but if Mr. Gladstone thinks that he has not made a very serious number of people discontented, he must know even less of his countrymen than we readily be accounted for by the isolation in which he delights to live. What he really meant was, we may guess, that the revenue is flourishing, and trade reasonably pro-

sperons, and that, while people are comfortably off, they are generally willing to let their discontent assume a comparatively mild form. But then their mild form of discontent is likely to be that of voting against the Government which has offended them, and they may perhaps be even more ready to show their dissatisfaction in this way when things are going well with the nation in point of money than they would be if financial embarrassment stared them in the face, and their pockets forced them to measure the relative ability and ingenuity of Mr. GLADSTONE and Mr. WARD HUNT.

Mr. GLADSTONE also took somewhat too bright a view of foreign affairs. The experience of Mr. HAMMOND ought to have established that it is always dangerous to pronounce that there is not a cloud in the bright blue sky of our relations with other countries. The papers that contained the report of Mr. GLADSTONE's speech, in which he declared that we had not a controversy with any civilized nation, also contained telegrams announcing that British troops had actually left Aden to "frighten away" a contingent of Turkish troops. This was a most unfortunate contradiction to Mr. GLADSTONE's statement, for Turkey is surely a civilized nation. Any nation has an indisputable right to call itself civilized which borrows our money to buy our ironclads; and controversy is rather a mild term to describe the despatch of a British force with orders to fight an advancing body of Turkish troops if they come on any further in the road which they have announced that they mean to take. Our engagements with all kinds of people all over the world are so numerous that probably even the oldest servant of the Foreign Office does not know their full extent; and as to the ordinary Englishman, it is as much news to him as if he were hearing of something going on in the moon that we are bound by treaty to guarantee the possessions of the Sultan of LEBEJ. Fortunately for that potentate, whose existence has now been revealed to us, he has better grounds for relying on our assistance than the terms of a treaty could give him. He is really useful to us, or even indispensable, for we must keep Aden supplied with water and food; and it is the Sultan of LEBEJ who has the only water and food available for the supply of Aden. So far as the protection of the Sultan of LEBEJ goes, the Government appears to have acted promptly enough. Without waiting for the slow action of diplomacy, it has sent troops sufficient to make the Turks understand that, if they make war on Lebej, they must also make war on England. If Lebej only is to be protected, it is difficult to see what the Government could have done more. Every one will allow that they were quite right in not letting the SULTAN be overwhelmed, and then applying to Constantinople for redress. This redress, or at least the promise of it, would have been accorded as a matter of course, for Turkey is not likely to quarrel with England for so small a matter. But, meantime, the SULTAN would have seen his territory ravaged, and perhaps his throne, if he has got one, overturned, and Aden might have run unpleasantly short of supplies. If our protection was to be worth anything, it must take the shape of arresting the evil and not of remedying it. Whether we ought to do anything more than protect Lebej, in the safety of which our interests, as well as our honour, are engaged, is only to be decided by those who are acquainted with all the facts. It is frightful to hear that we have some sort of undertakings, if not treaties, with not fewer than thirty of the petty chiefs of the Arabian coast. We may, or we may not, be bound to object to the conquest by the Turks of other petty Arabian sovereigns, and Mr. BOURKE stated in his interesting letter that Lord PALMERSTON took on himself to inform the Turks that they must not push their dominion beyond the top of the Red Sea. This was carrying matters with a very high hand, and was quite in the style of Lord PALMERSTON, who was constantly gaining the advantages of war without having to fight. But these are not the days of PALMERSTON, and the Turks are probably right in calculating that England will not fight unless a distinct danger to some assignable English interest is presented to the eyes of the British public. The Turks are said to be wholly in the wrong in their contest with the independent Arabs, but England will be slow to interfere merely because another Power is making an unjust war. The Government has decided that we are not called upon to do more than frighten the Turks away from Lebej, and until the whole facts are known, it is charitable to suppose that the Government is right; but it is just possible that the conquering Turks may not sufficiently respect the presence in Lebej

of half their number of British troops, and then there might easily be a controversy which would very seriously disturb the placid contentment of Mr. GLADSTONE.

THE AMERICAN CRISIS.

THE financial crisis in the United States still continues; and there is some danger that it may be aggravated by administrative interference. The late Secretary of the Treasury, whose financial theories are shared both by his successor and by the PRESIDENT, has lately repeated in a public address his opinion that the notes which were some time since withdrawn from circulation constituted a reserve of which the Government may dispose at pleasure for the benefit of trade or the relief of the money market. Mr. BORTWELL is consistent in a doctrine which is almost universally condemned, not only by economists, but by lawyers. Before he retired from the Cabinet he reissued a certain amount of the supposed reserve, for the purpose, as he said, of moving the crops; or, in other words, of expanding the currency in the autumn for the convenience of the Western farmers. According to the best opinions, the Treasury ought, under the Act of Congress, to have cancelled the notes as soon as they were called in; and it would seem to strangers that, if they can still be legally reissued, the Government of the day ought not to have the power of restricting the circulation. The most irrational course which can be adopted is to threaten a depreciation of the currency, and at the same time to take credit for refusing to exercise the disputed power. Another of Mr. BORTWELL's suggestions is that a large subsidy should be allowed to all iron ships in proportion to their tonnage; and he is also disposed to prohibit the payment of interest on bank deposits. The PRESIDENT has, in a published letter, adopted or anticipated two of Mr. BORTWELL's statements or proposals. He declares that the power of reissuing the so-called reserve is unquestionable, and he recommends Congress to render the payment of interest on deposits illegal. Although one country is perhaps not capable of judging of the constitutional principles of another, it seems odd that the PRESIDENT should practically exercise the power of acting on his own opinion, in direct opposition to the probable judgment of the Legislature. In the last Session of Congress the Finance Committee of the Senate reported against the proposed reissue of notes, and there is no reason to doubt that the Senate would arrive at the same conclusion. It would not be difficult to devise some method by which the legal question might be submitted to the judgment of the Supreme Court. When the PRESIDENT claims the power of increasing the national debt by nearly 9,000,000*l.*, and of depreciating the currency to the same extent, it might have been thought that the two Houses of Congress would have an opportunity of either admitting or disallowing so anomalous a prerogative.

Fortunately for the capital and trade of the United States, neither the PRESIDENT nor his Cabinet can, without the assent of Congress, either establish a novel and gigantic system of protection or put an end to a form of investment which is convenient to the community. Mr. BORTWELL has repeatedly declared that there is no science of financial or commercial legislation, and it is evident that his professions of confining himself to empirical conjecture are sincere. A subsidy to a particular trade is perhaps a less wasteful mode of maintaining a monopoly than an exclusive privilege of buying or selling; but the proposal that the American taxpayer shall contribute to the profits of shipowners is almost startling in the simplicity of its injustice. To pay several millions for a service which is at present rendered free of charge is a curious economical experiment. Mr. BORTWELL calmly proposes a bounty of 1*l.* per ton on the construction of iron steam-vessels to be employed exclusively in foreign trade; and he adds the statement that his proposal is calculated not so much to facilitate the resumption of specie payments as to form part of a great public policy for the improvement of the financial condition of the country. It certainly could not have been suspected that a bounty on iron shipping had any connexion with the nature of the currency. It is highly improbable that Congress will listen to Mr. BORTWELL's obsolete proposals, even if they are supported by the recommendation of the PRESIDENT. The supremacy which the Republicans have enjoyed for twelve or thirteen years is beginning to totter. The elections in Ohio and in New York prove that the Democrats are still

powerful; and a party in Opposition will be strongly tempted to profit by the mistaken policy which is favoured by the Administration. If the Democrats have the good sense during the next twelve years to identify their cause with sound principles of trade and finance, they will probably command the suffrage of that portion of the community which cares more for the public welfare than for party interests.

The attacks of the PRESIDENT and the ex-Secretary of the Treasury on the banking system are even more whimsical than the scheme of subsidizing a special class of ship-owners. Mr. BOUTWELL founds his proposal of prohibiting the payment of interest on deposits on the arbitrary proposition that, "as a matter of principle, a bank is established on the idea that the people organized are capitalists, and that they have money to lend, and not that they are borrowers of money." The trade of banking would not have been attractive or profitable if bankers had confined themselves to lending their own money. On the contrary, the essence of their business is that they lend the money which is entrusted to them by their customers. When, as in the case of the private bankers of London, convenience induces customers to deposit large balances, it is evidently for the advantage of the banker to invest money for which he pays no interest. The joint-stock banks, on the other hand, following the example of the Scotch banks, attract deposits by paying a lower amount of interest than the market rate. The margin between their receipts in the form of interest and their payments affords them a sufficient profit. When customers and traders are equally satisfied with a voluntary mode of conducting business, it is not easy to understand why any Legislature should interfere; but the American PRESIDENT and the authorities which he follows have a vague notion that money belongs neither to owners nor to borrowers, but to the community at large. According to Mr. BOUTWELL, a farmer who has a few hundred dollars of savings is tempted by the payment of interest to place it on deposit, when he would otherwise either keep it himself or lend it to a neighbour for the purpose of trade. The banker, again, is afraid to use the money in discounts, because it may be reclaimed by the depositor. As it is perfectly clear that the banks would come to a standstill if they wrapped up the talents on which they pay interest in napkins, the assumption that their balances are not available for the accommodation of trade is abundantly gratuitous; but farmers and traders and capitalists and bankers would give Mr. BOUTWELL the most complete answer by requesting him to attend to his own business, and to allow them to do what they will with their own. "Consider," says Mr. BOUTWELL, "how unjust this is to the substantial business interests of the country. In the summer months, when capital is abundant, the whole of the East and West is deprived of its surplus money." Both Mr. BOUTWELL and General GRANT fancy that money belongs to the East or the West, or some other abstract entity, instead of being the exclusive property of its owners, who cannot, except by their own choice, be deprived of their surplus money. If the East and the West want the money which is now placed on deposit, they have only to outbid the banks by offering higher interest with equally good security. The only effect of legislative interference with the present course of business would be to drive money out of the country, or, more probably, to promote evasion of an absurd law.

It is not surprising that politicians wholly unacquainted with financial science should fall into economic blunders; but it is strange that Presidents and Finance Ministers should think that their own crude guesses ought to be the basis of compulsory legislation. It is possible that the present commercial embarrassment might have been prevented or mitigated by the refusal of the State Legislatures to sanction the construction of railways; but it was the duty of representative bodies to promote public improvements, and not to protect capitalists by anticipation against the consequences of improvident speculation. The scarcity of money will soon be corrected by the legitimate process of selling valuable property consisting of produce and of securities. The enormous material wealth of the United States furnishes the means of encountering the gravest financial difficulties. Corn, and cotton, and railway bonds will be converted into money until a sufficient supply is obtained. The balance of trade which the PRESIDENT is anxious to maintain by artificial means is happily self-adjusting.

THE COMMITTEE OF FIFTEEN.

THE Republican party have made a good fight in the Committee on General CHANGARNIER's Bill. If this unfortunate measure had been hurried through the Assembly with the speed desired by its promoters, many deputies might have voted in ignorance of the real nature of the point in debate. No one will now be able to plead this excuse. The Bill as originally introduced, and the Bill as M. CASIMIR PERIER proposes to amend it, each embody a distinct and intelligible principle. The Right would have liked to confound the question whether Marshal MACMAHON's powers shall be prolonged with the question under what conditions they shall be prolonged. They choose to assume that prolongation in some form is indispensable to the tranquillity of the country, and that any prolongation which depends on subsequent legislation would be valueless for this purpose. There is no need to say how groundless even the first of those assumptions is. Marshal MACMAHON can only be deprived of his office by a vote of the Assembly, and in the Assembly as at present constituted there is no chance of such a vote being carried. The worst contingency, from the Conservative point of view, that can reasonably be looked for is the refusal of a future Assembly to return the Marshal as President; but if the Chamber which must some day or other be elected should entertain the wish to replace him, the fact that he has been imposed on the country for ten years will not be likely to make the relations between the Legislature and the Executive work very smoothly. A prolongation such as General CHANGARNIER proposes really means a continuance of the Provisional Government. If France were as much divided in opinion as the existing Assembly is, there would be some reason for taking this course. A Constitution cannot have much stability which is voted by a majority hardly large enough to keep a Ministry in office. But unless all the ordinary symptoms of public feeling are at fault, it is certain that the overbalance of opinion which exists in the Assembly is not in the least reproduced in the country. Thus the Conservative party has lately been guilty of a double error. It has misread the political barometer, or rather pretended to misread it, and it has acted in a way which is quite inconsistent with its own reading. It professes to believe that a Republic is impossible because the majority to which its friends lay claim does not really exist. This is tantamount to saying that the present Assembly genuinely represents the country; and taken by itself, this assertion, if it were well founded, would justify a continuance of the Provisional Government. But in this matter the Conservatives have put themselves out of court. Until a fortnight ago they were perfectly prepared to put an end to the Provisional Government and set up the Monarchy, if they could secure the single vote which technically makes a majority. If there is, as the Republican party maintain, a steady current of opinion throughout France in favour of a moderate Republic, a prolongation of the Provisional Government for ten years, or for any number of years, is simply the concession of an interval within which the Monarchists shall be free to conspire without incurring the penalties of conspiracy.

Whatever show of reason is contained in General CHANGARNIER's Bill is equally contained in M. CASIMIR PERIER's amendment of it. This latter proposal concedes, in effect, that during the passage from a provisional to a permanent order of things it is desirable that Marshal MACMAHON should retain the control of public affairs. This ought to give timid Conservatives all the comfort the situation admits of. If they are reasonable men, they will hardly deny that a state of things in which the Legislature and the Executive are constantly at issue would not be calculated to promote peace and order in a country in which political parties are extraordinarily divided, and political passions run extraordinarily high. Yet this is precisely the consummation which General CHANGARNIER asks them to work for. Either by a general election, or by a prolonged series of partial elections, the composition of the Assembly must in time be completely changed. If, when this happens, it retains the confidence which the present Assembly feels in Marshal MACMAHON, there will be no need for his powers to be secured to him by a law passed beforehand. If this confidence is no longer felt, the relations between the Assembly and Marshal MACMAHON will resemble those which subsisted between Congress and President JOHNSON. It was not found that

even in the United States, where the form of government had long been settled, and the controversy between the Legislature and the Executive turned exclusively upon the manner in which it was to be administered; and in France, with the gravest political problems still undecided, it is in the highest degree unlikely that such an antagonism could go on without civil war. What M. CASIMIR PERIER'S amendment does is to continue Marshal MACMAHON in office during the transition from the provisional to the established Republic. As we read the amendment, it amounts to this, though the text is given somewhat differently by different journals, and the interpretations put on the text are not strictly identical. Until the constitutional laws have come into operation, Marshal MACMAHON will continue to exercise his powers under the same conditions as hitherto. Within three days from the adoption of this amendment by the Assembly, a Committee is to be appointed to examine the constitutional laws, and to report on them some time in the first fortnight of January. After these laws have come into operation Marshal MACMAHON will retain the office of President under the conditions laid down in the new laws, without having to undergo a fresh election. If, that is to say, the powers of the President are lessened by the new laws, Marshal MACMAHON'S powers will be lessened to that extent. But if under the new laws the President is to be elected by a popular vote or by an electoral College, or in any way other than by a vote of the Assembly, Marshal MACMAHON'S position will not be affected. He will remain President as though he had been elected in the prescribed manner. The date at which his term of office will come to an end is the dissolution of the next Legislature. In this way the country is secured against the excitement of a Presidential election, not only during the remainder of the present Assembly's life and the period of a general election, but also through the life of the next Assembly. It may be assumed that no future Chamber will be invested with the same power of absolutely determining its own duration enjoyed by the present one, but even with this limitation the concession to the Conservatives is a very large one.

Whether this amendment will be adopted by the Assembly is altogether uncertain. The Ministers are said by the Duke of BROGLIE'S organ to be in complete agreement with the minority of the Committee, and to be resolved to adhere firmly to ten years as the term for which Marshal MACMAHON'S powers shall be extended. The precise figure will not, however, count for much in the coming debate. Ten years have perhaps been chosen because so long a period conveys a false idea of the intentions of the Royalist faction. Long before ten, or five, or even three years have passed away they hope, if the definitive establishment of the Republic can be staved off, to have restored the Monarchy in one shape or another. They look to the disturbances which will almost certainly arise under Marshal MACMAHON'S Dictatorship to provide them with the necessary pretexts for replacing the provisional Saviour of Society by a permanent Saviour, whether in the person of the Count of CHAMBORE or the Count of PARIS. M. CASIMIR PERIER'S amendment makes this manoeuvre impossible, since it associates the prolongation of Marshal MACMAHON'S powers with the establishment of the Republic. Thus it aims at conciliating the Conservative members of the majority at the expense of the Royalist members, and its fate in the Assembly will depend on the extent to which this aim can be carried out. A very small defection from the Right Centre would avail to turn the balance and to convert the Republican minority into a Republican, though still Conservative, majority. Unfortunately for France it is by no means certain, not merely that any of the Right Centre will come over to M. CASIMIR PERIER, but even whether all the Left Centre will abide by him. Some of them are not unlikely to be influenced by an undefined fear of displeasing Marshal MACMAHON, and thus precipitating a change of President. They forget that France enjoyed the same tranquillity under M. THIERS that it has enjoyed under his successor. They forget that it was a civilian, not a soldier, who put down the Commune, and punished the insurgents with a cruel severity which neither general nor king could well have surpassed. Their imaginations are excited by the gloomy predictions of the Right, and they do not see that when the Royalists prophesy confusion and civil strife, they prophesy according to their wishes rather than their expectations. The real apprehension of the Royalist party is that the Republic

will be strong enough to put down disorder, and so leave nothing for the Saviour of Society to do. It is a prospect full of terror for the Royalists, and it will be a singular triumph of political audacity if they are able to make it seem equally formidable to the Left Centre.

MR. MIALI AND THE CHURCH OF ENGLAND.

WHETHER or not Mr. MIALI'S retirement from Parliament is to be regarded as final, he will be entitled to the satisfaction of knowing that he has been sincere and consistent in his sectarian and political career. His adversaries will do him the justice of admitting that his strong antipathy to certain institutions has not degenerated into personal injustice or violence. Those who agree in his opinions are justified in respecting him as an earnest and single-minded reformer; and the friends of the Establishment have no right to complain of the mode in which he has conducted his attack, although they may reasonably hold that the agitation in any form is mistaken and mischievous. There was a time when the Church, like the State, was taken for granted as a necessary and fundamental part of the national life. The profound irony of SWIFT'S fear lest the abolition of Christianity should bring the Church into danger involves a humorous recognition of the universal faith in the Establishment. Long afterwards the framers of the Irish Act of Union, and again the promoters of Catholic Emancipation, professed, and perhaps felt, the deepest anxiety for the maintenance of that Irish branch which has since been destroyed. The modern practice of testing all institutions by the standard of utility is perhaps not so universal an improvement as it may appear to reforming politicians; but it is idle to protest against the expediency of that which can no longer be prevented. The Church of England has for some time past been the object of systematic hostility; and Mr. MIALI, who has assumed the conduct of the attack, is a typical Nonconformist. It was a proof of imperfect taste on the part of himself and some of his coadjutors to profess a desire of liberating from State control the willing victims of establishment and endowment. A half-factious affectation of sympathy with the members of a detested Church partakes too much of the discourtesy which sometimes assumes the form of praying at an adversary. Mr. MIALI and his friends well know that, with the exception of a few fanatics, neither the clergy nor the laity of the Church claim the liberation which is offered them from without. The agitators of the Land and Labour League might with equal propriety profess their intention of liberating landlords from the burden of ownership. The least rancorous of the political Dissenters would only be content to tolerate the Anglican Church on the condition that it should be reduced to the level of one of the hundred Protestant sects. It is impossible to believe that the Liberation Society is in the smallest degree actuated by the friendly motives which purport to be involved in its title. In his speech of last Session Mr. MIALI candidly avowed the secret of Dissenting hostility, when he complained of the social superiority of the established clergy to the ministers of the Nonconformist communities. Disestablishment would perhaps in a generation or two prevent the sons of gentlemen from taking orders, while the pulpits of the sects would still, as now, be recruited from the ranks of farmers and tradesmen. There is nothing especially aristocratic in the creed or the formulas of the English Church which should make it an exception to the ordinary consequences of the alienation of ecclesiastical revenues. In France, and over the greater part of the Continent, the Roman Catholic clergy have, since the French Revolution, been generally taken from the humbler ranks of society. Dissenting ministers in England belong, with few exceptions, to a respectable section of the middle class; for the simple reason that the remuneration and the circumstances of their occupation are not attractive to the sons of refined and wealthy families. They would obtain no access of profit or of precedence by the abolition of the Church Establishment; but they think that they would be happier if they were not troubled with the sight of more prosperous or more favoured rivals. Many similar devotees of equality regard with jealousy and dislike the conventional advantages which in this country attach to rank and station; but laymen would feel the absurdity of affecting an anxiety to relieve lords and baronets from the trammels of their titles.

Mr. MIALLE's zeal for the religious purification of the Church of England would be officious, if it were not obviously fictitious. If Churchmen are contented with their own spiritual condition and opportunities, it is no business of those who dissent from their doctrines to promote their improvement, except in the way of religious proselytism. As MACAULAY said of the Puritans and the bear-baiters, the objection is not that endowments injure the spiritual welfare of Churchmen, but that they give pleasure to the clergy.

In a generation which habitually pulls up its fruit-trees to see whether they are growing, the advocates of all institutions are compelled to adopt the issue of utility which is tendered by their opponents. It is not enough to criticize the motives of the Liberation Society without showing that the Establishment conduces largely to the public welfare. For the immediate purpose it would be irrelevant to contend that the doctrines of the Church of England are sound and orthodox; and it may be said, to the credit of the Non-conformists, that they rarely denounce the object of their aversion on the ground of heretical pravity. Mr. MIALLE would admit that a Churchman may be a good Christian, if only he is first disestablished and disendowed. The grace of poverty, which is not highly esteemed among Dissenters as a personal merit, is considered as the most indispensable accompaniment of clerical personages and corporations. The question whether the clergy ought to be maintained by endowments is primarily important as it determines their social position. The English incumbent is, as a general rule, a gentleman before he is a clergyman, and he possesses the qualities, and perhaps the defects, of his station. It is well known that average clerical incomes are extremely modest in amount; but the possessor of a parsonage and of a parochial income of three or four hundred a year is included in the ranks of the gentry. One consequence of the existing state of custom and opinion is that the clergy often possess by inheritance or marriage private resources of their own which practically form a part of the ecclesiastical endowments. Out of their clerical and private incomes the clergy habitually contribute to public and charitable objects a percentage which proportionally exceeds several times over the benefactions of ordinary laymen. The voluntary schools which provoke the wrath of the Birmingham League would never have overspread the country but for the self-denying generosity which, in the case of the clergy, was pardonably or laudably stimulated by professional enthusiasm. It is true that Dissenting ministers have not enjoyed equal opportunities of doing good; but the existence of more or less efficient schools in rural districts is almost exclusively due to the exertions of the clergy. Even their enemies will admit that in morality and decorum the English clergy are blameless, and even exemplary; and, apart from their strictly religious functions, they are, in the majority of parishes, the most useful and the least costly of public functionaries. The withdrawal of the clergy from the rural districts would be a sweeping change, involving much evil and no compensating advantage, except in the increased cheerfulness of the neighbouring Nonconformist preachers. The revolution in the towns, where the work of the clergy is harder and still more beneficial to society, would be less complete, because there the Church might perhaps hold its ground by voluntary support. In ordinary country parishes either there would be no clergyman, or he would be merely one among many ministers of the Dissenting type. Even if moderate incomes were forthcoming, there would be no supply of candidates for orders who had received a liberal education. The cant of requiring that a clerical career shall be adopted exclusively from religious motives scarcely needs exposure. Young men enter professions which are selected for them by their families; and although temporary asceticism is not uncommon in youth, parents never bring up their children to be martyrs. The Irish parish priest almost always rises in the world by taking orders, and the English preacher suffers no loss of social position. The English clergy of the present and the future are and will be human beings, and their fathers and mothers will be still more universally influenced by worldly motives. It is possible that in some cases Mr. MIALLE's anticipations might be confirmed by an increase of religious zeal and corporate enthusiasm among a disendowed clergy; but secular legislators may well be contented with the ecclesiastical fervour which is found compatible with establishment. The Ultramontane bigotry which now disturbs half Europe is directly traceable to the

withdrawal from the Roman Catholic clergy of temporal interests, and of the social sympathies which they involve. Gallican tendencies are almost extinct in the land of their birth, because a peasant clergy cannot continue the traditions of the pre-revolutionary Church of France.

The organization by which the English Establishment is threatened may be formidable, but it is narrow. No considerable section of the laity of the Church, and no body of secular politicians except the more revolutionary democrats, shares in the passions and prejudices of the Dissenting sects. Neither politicians nor economists are prepared to suggest a better application of Church revenues than the maintenance in every parish of a comparatively refined and educated resident of moderate means, charged with the duty of promoting the moral and temporal welfare of the inhabitants. It is, after all, not an immutable law of nature that all property should be strictly hereditary. The hundreds of income of the parson are on the average as well employed as the thousands of the squire; and even in the days when an incumbent often enjoyed a sinecure, he was as useful a member of society as his lay neighbours of the same station. Mr. MIALLE knows what he means, for, if he effected his object, he would gratify his clients by lowering the social station of their rivals. The careless amateurs who from time to time profess supercilious indifference to the question of Disestablishment are ignorant of the working of the present system and of the state of the rural districts, and they have not taken the trouble to understand the consequences which would inevitably follow from the destruction of the Church of England.

OPENING OF THE PRUSSIAN PARLIAMENT.

THE new Prussian Parliament has met at Berlin, and at the same time Prince BISMARCK has resumed the office of Prime Minister. He has every reason to be pleased with the result of the elections which have just come to a close. The issue between him and his clerical enemies has been raised with the utmost distinctness, and the answer which has been given is unmistakable. Nothing on either side was thought of but the ecclesiastical struggle. The POPE's letter had been published just in time to give animation to the combatants, and the Government had taken every means to let it be known that the only effective reply that Prussia could give to this letter was to return an unhesitating band of Ministerial supporters. The consequence is that a majority of nearly three-fourths in an Assembly of four hundred has been returned to carry out the policy of Prince BISMARCK as far as he may wish to carry it. The Ultramontanes have indeed gained some seats. They had only sixty representatives in the last Parliament, and now they will have between eighty and ninety; but then the seats they have won have been gained at the expense of those Conservatives who used in the last Parliament to vote with them on ecclesiastical questions, and who thought Protestant orthodoxy as much endangered by the new legislation as the supremacy of the POPE. These old-fashioned politicians have encountered the fate which usually overtakes those who in times of agitation halt between two opinions. They have practically ceased to exist as a Parliamentary party, and have been replaced in almost equal numbers by those who have decided views one way or the other. There are two or three features of the recent elections which are especially remarkable. In the first place, the towns throughout Prussia may be said to support the Government. Even in Westphalia there have been Ministerial gains among the town populations, and it is only in remote country districts that the Ultramontanes have shown strength. There must therefore be, in towns where the Catholic element largely preponderates, a considerable section among the Catholics themselves who, for one reason or another, choose to quarrel with their ecclesiastical rather than with their temporal superiors. In Posen the Germans appear to be able to outvote the Poles in most of the towns, and the number of Poles who have been returned, and who although returned as Poles may practically be numbered among the Ultramontanes, is remarkably small. In the next place, the very natural tendency to gratify ancient grudges, which in the early days of annexation manifested itself through the provinces gained in 1866, seems to have almost faded away under the influence of the community of feeling produced by the French war, or through a willingness to sink all minor differences in a

critical time; and in no part of Prussia have the successes of Ministerial candidates been more conspicuous than in what used to be the Kingdom of Hanover. Lastly, the Liberal party has become greatly consolidated; its various fractious have worked together at the elections, and each has forgotten to ask how far its allies are more or less advanced in other spheres of political opinion, so that it could be sure of firmness and resolution in dealing with the great question of the day.

At the same time that an instrument for the prosecution of his policy has thus been provided for Prince BISMARCK in this new Parliament, he himself comes forward to work it openly and immediately, and resumes the office of Prime Minister. During the last year he has guided the domestic policy of Prussia indirectly, and Marshal von ROON has been the ostensible head of the Cabinet. According to the traditions of the House of HOHENZOLLERN, each Minister is the servant of the King, responsible only to him, and only bound to his colleagues by the common tie of Royal service. The Ministers of WILLIAM III. held exactly the same position in England, and it was because the system was found so inconvenient that the plan of having Cabinets with all, or almost all, of its members of one political colour came into fashion. Prince BISMARCK got tired of a state of things in which he had to waste his time and his strength in persuading each of his colleagues separately to concur in the measures which, as Prime Minister, he thought necessary. The King did not like to change the habits to which long use and the traditions of his family had accustomed him; and Prince BISMARCK therefore retired for a time into comparative obscurity. But he still remained as powerful as before. There was no one else who had any policy, and Prince BISMARCK's policy is of a kind which cannot be adopted by halves, or followed with alternations of ardour and apathy. He still said what was to be done, and his advice was adopted as a matter of course. He retained in his hands the whole conduct of the policy of the Empire, as distinct from Prussia; and the subordinate statesmen who filled the chief Ministerial offices in Prussia could never escape from the necessity of letting their views of Prussian policy be coloured by what Prince BISMARCK declared to be the policy that he thought best for Germany. The natural end of such a state of things has been that Marshal von ROON has got tired of holding a post where he had the name with little of the reality of power, and the King has been brought gradually to see that it is only a pure loss of time to have a Ministry which Prince BISMARCK guides indirectly, instead of leading it directly. The Prince is therefore to be once more Premier, and is to have a convenient Vice-President to do the heavy work of explaining to the rest of the Cabinet what Prince BISMARCK wishes to have done. But the real change is that now it is understood that, if his colleagues do not like to do what he wishes, they shall go, and be replaced by successors more intelligent or submissive. In other words, a constitutional Ministry has been formed in Prussia, and although constitutionalism is at present a plant of very tender growth in that country, yet a precedent has been established in favour of Prince BISMARCK, which, although said to be merely a temporary one, and made out of special deference to him, can scarcely fail to affect the whole future history of Prussia.

It is not easy to point to any one in recent years who has been borne onwards by so rapid and persistent a tide of success as Prince BISMARCK. His good fortune has been wonderful, but so has been the promptitude and audacity with which he has taken advantage of good fortune. That Austria should have attacked Prussia single-handed, and that then only four years later France should have done the same thing, and that at the turning point of Prussian domestic policy the Pope should have taken it into his head to write a letter which roused the indignation of Germany, and made it see in Prince BISMARCK the indispensable champion of the nation, are all singular instances of the kind strokes which fortune will sometimes deal to help her favourites. But it may safely be said that the man who could take advantage of them appears only once or twice in a century, if so often. It is because he succeeds in such a great variety of ways that the Prussian Parliament is so ready to follow Prince BISMARCK. He now comes before the new Assembly not only as the author of the ecclesiastical laws which have become popular to an extent far greater than could have been anticipated, but as the promoter of a foreign policy which has added largely to the power

and position of Prussia. The German Emperor's recent visit to Vienna is only the latest and most patent sign of the new order of things in which Austria has entered into an alliance with Prussia, looks up to her, invites her protection, and seeks to settle great questions with her concurrence. Everything therefore will make the new Prussian Parliament very easy, at least at first, for the Prime Minister to guide. He will be thought to know best, and that will be enough. He has begun by letting his friends understand that they are not to go faster than he thinks proper. It was generally supposed that the Speech from the Throne would gratify the enthusiasm of those who have just come fresh from a great conflict, and that it would foreshadow new directions in which the Government desires to see the clerical party checked or defeated. On the contrary, it is reticent and prudent in the extreme on the one topic of universal interest, and merely says that, if further measures are needed, they shall be proposed; and this reticence is the more remarkable if it is true that the Government has a Bill for establishing civil marriages ready for submission to Parliament. What may be the reason of this discretion, which to many Prussian deputies has been very disappointing, is a question which few persons could pretend to answer. It may be that Prince BISMARCK sees, in the support which he has received from some Catholic towns and some influential Catholic proprietors, a ground for hoping that, if he goes to work cautiously, he may even at this late hour induce his clerical adversaries to abate the extremity of their resistance. It may be that he has to consider Germany before he can attend to Prussia, and that he wishes to feel his way, lest he should by the completeness of his triumph in Prussia provoke opposition and receive a check in Germany. At any rate one thing cannot be doubted, and that is, that a Minister who could afford to satisfy in the Speech from the Throne so few of the desires of his eager supporters must have felt his position to be a very strong one.

LORD GREY ON THE ASHANTIE WAR.

LORD GREY'S letters on the Ashantie war raise the issue between two opposite systems of policy in a distinct and convenient form. It is possible either to leave the conduct of relations with savage tribes in the hands of private adventurers, or to employ the resources of the Empire for the protection of commerce and for the encouragement of civilization. There will always be plausible reasons for the avoidance of trouble, expense, and responsibility; but Lord GREY belongs to the older school of statesmen which held that power necessarily implied liabilities and duties. The establishment of fortified settlements on the African coast rendered it impossible, according to Lord GREY's opinion, to withhold a certain amount of protection and control from the neighbouring tribes; but he thinks that the measures which have actually been adopted were in many respects erroneous and defective. Lord GREY regards with approval, and with regret for the practical failure of the project, the abortive scheme of a constitutional Federation to be formed by the Fanteo chiefs and their followers. The proposal originated with certain educated natives, who probably wished to provide for themselves offices which would enable them to tax their neighbours. The officer who at the time administered the government peremptorily warned the would-be legislators that any attempt to try their constitutional experiment would be treated as an offence against the English Government. Although the Administrative decision received but a qualified approval at home, it is at least possible that in this instance local experience may be as safe a guide as the doctrines which Lord GREY has steadily maintained, while in the course of his life Liberal opinion has overtaken him, coincided with him, and passed him. Barbarous imitations of English institutions can scarcely be regarded with confidence while so many civilized States have repeatedly failed in acclimatizing Parliamentary government. If the Fanteo Federation had been created, the more warlike tribes of the interior would not the less have invaded the coast districts when it suited their convenience. There is no reason to suppose that the educated natives would have thought of organizing a military force which would have been capable of defending their territory. The direct subordination of the chiefs to the English Government would have furnished a simpler and more effective machine.

Lord GREY would judiciously confine the possessions of England on the Gold Coast to the area which is commanded by the guns of the forts; nor is it a sufficient objection to his system that he has not strictly defined the limits or the character of the protectorate over the adjacent districts which he proposes. There are numerous degrees of reciprocal influence and dependence between the Supreme Government and the various nations and States of India. More than a hundred millions of natives acknowledge the direct sovereignty of the QUEEN, while nearly an equal number are more or less completely governed by their own native chiefs. The Marhatta princes and many other potentates maintain considerable armies, though they are strictly prohibited from diplomatic intercourse with foreign Powers, and though they would be instantly checked if they attempted to engage in war with their neighbours. Other rulers, down to the rank of feudal nobles, exercise, with or without the interference of English officers, the powers of domestic administration. As a general rule, the Government interferes only when it is necessary to repress tyranny and misgovernment; but it carefully abstains from renouncing its contingent power of control. The example of India is instructive wherever dependencies inhabited by alien races have to be governed, because the existing system has been produced, not in accordance with any theory, but as a result of detailed and practical experience. In the Dominion of Canada, in New Zealand, and at the Cape, it has been found necessary to assume sovereignty over native tribes; and although the consequences have not been uniformly satisfactory, it may be taken for granted that private adventurers would have been less scrupulous and less considerate than a regular government. The converse case of the Fiji Islands, which the English Government has hitherto refused to annex, illustrates the inconvenience of leaving English settlers without the restraint or the aid of regular authority. On the whole, Lord GREY is justified in proposing as the only admissible alternative to the establishment of some kind of protectorate, the abandonment of the forts and the discontinuance of trade. Whether it will be necessary or expedient to assert any permanent power over the Ashantes is a question which cannot be solved until the results of the pending expedition are known. It is sometimes cheaper and safer to maintain a hold over a turbulent tribe during peace than to wait for attacks which must ultimately be repelled. In such cases it is impossible to be guided by any abstract principle, except that peace and order must be preserved by the most available means. The risk and cost of the present war may be directly traced to the efforts of the English Government and its officers to keep aloof from native quarrels. The handful of troops which was withdrawn from the Coast seven or eight years ago would perhaps have sufficed to prevent the invasion which must now be punished with the aid of the most elaborate preparations. Even the Fantees might have been united in defence of themselves and their territory if there had been half-a-dozen English officers on the spot with a nucleus of an army consisting of regular soldiers.

If the judgment of some of the newspaper Correspondents may be trusted, Sir GARNET WOLSELEY might, on his arrival, have been strong enough to attack the enemy, if he could have commanded the services of the sailors and marines of the squadron on the Coast. The Commodore, who, as far as his own force is concerned, is not under the orders of the General, had before his departure prohibited his crews from landing unless the town or the forts were attacked; and consequently Sir GARNET WOLSELEY must wait for the arrival of his English regiments before he makes a forward movement. To civilians at a distance it would seem that the Commodore was possibly in the right; nor is there any reason to believe that his orders in any way conflict with the wishes of the General. As a general rule, the place of sailors is on board ship; though they are always ready, in case of need, for service on shore. To commence the campaign before the arrival of the army which is, as it may be hoped, to carry it to a successful conclusion, would seem a precipitate policy. The main reason for preventing the sailors from landing unnecessarily is probably the risk of illness, from which they are comparatively exempt at sea. The announcement that several additional regiments are under orders for the coast of Africa has caused general surprise. It might have been supposed that a small European force would have been sufficient to decide the contest; but premature criticism would only interfere with the due responsibility of the Government.

Much trouble will probably be saved if the report of the advance of the Ashantes King and his army proves to be true; but a deliberately false rumour would be, even between civilized belligerents, a justifiable stratagem; and it would not exceed the capacity of an ingenious African King. It is of course probable that the Ashantes may exaggerate to themselves their own prowess; and they entertain an excusable contempt for the tribes on the coast whom they have frequently defeated; but in their only recent conflict with an insignificant English force they were so thoroughly beaten that they have not since ventured on any offensive movement. Some of the Ashantee leaders are said to possess a certain amount of military skill, and they may perhaps hesitate before they encounter superior weapons and European discipline with a river in their rear, which they might find it difficult to recross after a reverse. If the news of the advance is confirmed, Sir GARNET WOLSELEY will not be in a hurry to stop them until they have moved as far as possible from their own territory. The great object of the campaign is to get within reach of the enemy, and it is in every way desirable that he should accomplish for himself as much as possible of the intervening distance. It may be hoped that no time will be wasted in useless diplomatic formalities. A treaty of peace, concluded in consequence of a threatened attack on Coomassie, would endure as long as there was an English army in the field ready for the expedition. If the encounter is really destined to occur on the south of the Pra, the strategy of the Ashantee leaders can only be explained by their reasonable alarm at the progress of the road by which the English army is intended to advance. One-third of the road from the coast to the banks of the river was said to have been completed before the arrival of Sir GARNET WOLSELEY, who will probably lose no time in continuing and completing an indispensable work.

MR. BRIGHT ON FREE LAND.

MR. BRIGHT'S return to office has been signalized by a multitude of not unnecessary explanations. An anonymous correspondent of the *Times* has extracted from him a curious explanation, which has, however, still to be explained, of the inaccuracies into which he had fallen in describing the conduct of his colleagues in regard to the Education Bill; and it can hardly be doubted that his own sense of justice has since led him to offer a more ample explanation, which would naturally take the form of an apology, to the VICE-PRESIDENT of the Council. Explanations, it seems, have also been exchanged between Mr. BRIGHT and the late Attorney-General. Sir JOHN COLERIDGE had gathered from the speech at Birmingham, as everybody else did, that Mr. BRIGHT thought it possible to have a compulsory system of education in which no account should be taken of the efforts of voluntary and religious bodies of any kind, and from which, as far as the State was concerned, every element of religious teaching should be rigidly excluded. Sir JOHN announces that he has just learned, "on the highest authority," that he did not correctly understand Mr. BRIGHT's meaning; but for obvious reasons he cautiously refrains from attempting "any affirmative expression" of Mr. BRIGHT's views. Mr. BRIGHT's latest explanations relate to what he calls "free land." He says, in a letter which has just been published, that he has often explained in his speeches what is intended by this term, but he is willing to explain it again. It is true that Mr. BRIGHT has frequently referred to the subject in his letters and speeches, and more particularly within the last few months; but unfortunately he has never been very explicit in his references, and it can hardly be said that the present letter furnishes a very satisfactory solution of the enigma.

Mr. BRIGHT states that "free land" means the abolition of the law of primogeniture; the limitation of entails and settlements, "so that life interests may for the most part be got rid of and a real ownership substituted for them"; and the simplification of the legal forms for the transfer of land. So far this is pretty clear. Primogeniture can of course be dealt with in a single clause, and the LORD CHANCELLOR'S Bill of last Session is a very good example of a measure for cutting down the costs and verbiage of conveyancers. It is not indeed quite clear to what extent Mr. BRIGHT thinks it necessary or possible to limit entails and settlements; but still one can imagine the sort of Bill which he would like to see on this subject. He intimates, however, that "free land"

means something more than all this. It means that "it shall be as easy to buy or sell land as to buy or sell a ship, or, at least, as easy as it is in Australia, and in many "or in all of the States of the American Union." And it means, further, "that no legal encouragement shall be given "to great estates and great farms, and that the natural "forces of accumulation and dispersion shall have free "play, as they have with regard to ships, and shares, and "machinery, and stock-in-trade, and money." Perhaps this may seem to some people very simple and plausible, but it would be interesting to know the precise terms of the legislation by which Mr. BRIGHT would make sure of producing these results. To this letter it is natural to tack the description of free land which Mr. BRIGHT gave at Birmingham. "What," he said, "the agricultural class in "this country requires is that the land should be made "absolutely free; that there should be steps by which the "best, the cleverest, the most industrious, the most "frugal of the agricultural labourers could gradu- "ally make their way to a better and higher position." As Mr. BRIGHT went on to condemn the laws which, he says, at present "keep great estates and great farms beyond the "reach of the agricultural labourers," it must be supposed that his object is to get laws passed which will bring great estates and great farms within the reach of agricultural labourers. Without inquiring how far legislation for the various objects which Mr. BRIGHT has enumerated is desirable, it would be well to know by what sort of legislation he thinks they are capable of being attained. It is just at this interesting point, however, that his explanations become conveniently dark and mysterious. Mr. BRIGHT has already proved his skill and energy as an agitator; but it has been supposed that he is now aspiring to the reputation of a statesman. Unfortunately, however the hands may be disguised, the voice betrays him. It is still the voice of the platform orator, careless of facts and without precise ideas or settled plans, whose only object is to excite popular passions by vague and violent declamation. Mr. BRIGHT has, indeed, frankly acknowledged that he does not think that what he calls the land question is ripe enough to be dealt with by the present Parliament; and it may perhaps be inferred that his declarations on the subject are merely intended to provide materials for agitation at the general election. It would thus appear that he is himself the cunning speculator whom he described in his speech at Birmingham as collecting subscriptions for a mysterious invention, the secret of which was to be divulged only when the money was all paid. After the elections perhaps Mr. BRIGHT will introduce a Bill for providing steps by which not only agricultural labourers, but all other poor labouring men, may obtain possession of great estates, great farms, great factories, and rich mines. At present they are unable to get these things, because they have no money to buy them with. How this difficulty is to be got over is Mr. BRIGHT's secret. It is an old secret with charlatans of every sort and in every age.

It is impossible to imagine a more mischievous or unscrupulous form of political agitation than that which consists in holding out to poor and ignorant people a prospect that something very grand and beneficent is going to be done for them by the Government, and that they are to wake up one fine morning out of their rags and penury to find that somehow or other they have suddenly come into possession of the squire's land or their employer's factory, and that they are henceforth to live at ease and to give their orders just as their masters used to do. Mr. BRIGHT professes to know the trick by which this can be done; he has a Bill in his head, if not in his pocket, by which labourers are to be enabled, not merely to buy little bits of land, but to acquire "great farms and great estates"; and at Birmingham he stated that this was not a mere Bill for simplifying titles and transfer, but something quite different. If Mr. BRIGHT has not such a Bill, and if he knows he has not, what shall be said of him? It is possible to test his knowledge of the subject and his sincerity by some of his other statements. Entails and settlements might no doubt be limited as he desires, but the sort of real ownership which would be substituted for them would be certain to prove in a great many cases extremely unreal. Experience has shown that a system of life tenancies affords perhaps the most effectual security that can be devised against the excessive creation of mortgages. In France land is much more heavily mortgaged than in England, and the agriculture of France, as well as of mortgaged estates in our own country, certainly does not encourage the opinion that it is better

for land to be mortgaged than to be in the hands of a tenant for life, who, after all, is just as likely as not to have the ordinary instincts of family affection. Mr. BRIGHT affects to believe that the laws of primogeniture and entail are the only cause of the creation and maintenance of great estates; but practically, as is well known, these laws operate in the majority of cases only to the extent to which landowners choose that they shall operate. Entails can almost always be broken, and a proprietor has only to make a will in order to divide his estates as freely as his personal property. In Kent, where the law is that in cases of intestacy land should go to all the sons alike, it is usually left to the eldest, as in other districts. Moreover, entails are known to have at least as much effect in preventing small properties from being absorbed into large ones as in adding to the extent of overgrown estates. In this country great estates are tolerated, but not enforced, by law; and they owe their existence simply to a natural and widely prevalent sentiment which could be controlled only by coercive legislation specially devised for the purpose, and intended not merely to provide for cases of intestacy, but to override the formal directions of testators. At present real and personal property stand on the same footing in this respect. Mr. BRIGHT's characteristic carelessness and disregard of everything except oratorical points is curiously shown by his remark that land ought to be bought or sold as easily as a ship, or at least as easily as land is bought or sold in Australia. He does not see that a ship is easily disposed of because it is something which can be handed over bodily to the purchaser, and carried away by him to a place of safe keeping, and also because it has not been the custom to make ships the basis of all sorts of family settlements and intricate pecuniary arrangements. The great difficulty in regard to the transfer of land is that a great deal of land in this country may be said to be held by little knots of persons in conjunction, and, the nominal owner is only one shareholder among many. Again, Mr. BRIGHT likens land to shares; but the analogy is obviously imperfect. A share is a specific and distinctly defined part of the whole property, whereas an interest in land is often of a contingent character, and cannot be sharply measured off in this way. So also Mr. BRIGHT forgets that England is an old country, where land has been passing from hand to hand for many generations, and where all sorts of complicated obligations and interests have grown up in connexion with it, while the ownership of land came into existence in Australia only, as it were, the day before yesterday.

It would certainly be very satisfactory to have a measure for the general registration of ownership and incumbrances of land, and for simplifying and cheapening conveyancing; but even if entails were to be limited, and the law of intestate succession to land assimilated to that relating to personalty, it would practically make very little difference; and assuredly none of these measures would enable poor men to obtain possession of "great estates and "great farms." A poor man who has scraped together some small savings is the last person in the world to be benefited by an investment which yields only two and a half or three per cent., when he might easily get five or six. But then it is Mr. BRIGHT's secret how poor men are to become landed proprietors all of a sudden merely by the passing of an Act of Parliament. "When I am King," said JACK CADR, "there shall be no money; the three-hooped pot shall have "ten hoops; all the realm shall be in common, and in "Cheapside shall my palfrey go grass."

ROMAN CATHOLIC BISHOPS AND UNIVERSITY EDUCATION.

THE Roman Catholic Bishops, whether in England or Ireland, have never shown any conspicuous zeal in the matter of the higher education. Probably it is doing them no injustice to say that the higher education, as such, holds a very secondary place in their thoughts. They are obliged to pay some attention to it from time to time, because the Roman Catholic laity want their sons to get a University degree; but if it were not for this external pressure, they would be quite ready to leave the question alone. If they would leave it alone, no better arrangement could be desired. It would then be possible to discover what the views and wishes of Roman Catholic parents really are. Unfortunately, however, the laity have interest enough in the

subject to force the bishops to take it up, but not interest enough in it to lead them to take it up for themselves. No one can say, for example, what opinion the Irish Roman Catholics would have pronounced on the University Bill of last Session if the bishops had not provided them with a ready-made condemnation of it. Irishmen are credited with a keen love of knowledge, and the most anxious parent might have been content with the safeguards provided in the proposed University for the theological soundness of his son. Yet scarcely a word of remonstrance was heard from the Catholic laity when their bishops kicked over the fabric which the Government had built up with so much pains, and left at least one more generation of Irishmen to end their education at eighteen or to pursue it in another country. Still their action in that matter has at last shamed the bishops into doing something. They have turned their minds to the Catholic University, with the view of seeing whether this languishing institution can possibly be galvanized into life.

"The Sovereign Pontiff," we are told, "has given it the 'power of granting decrees.'" In the early days of the University, when its founders were still striving to get a charter of incorporation from the Government, there was an obvious reason why the POPE should not lay claim to an authority which might seem to render a Royal charter unnecessary. After a time all talk of either asking or receiving a Royal charter came to an end. It was not to be had during Lord PALMERSTON'S life, and when Lord PALMERSTON'S Irish policy had given place to Mr. GLADSTONE'S, the ideas of the bishops had grown too ambitious to allow them to rest satisfied with a charter which did not carry an endowment with it. But the exercise of the power to which the POPE lays claim was still postponed, in order to ascertain whether money, as well as dignity, could be obtained from the Government. Now that the bishops see that an endowment is not to be had, except on condition of conceding the principle of a mixed University, it is suddenly remembered that the POPE is the true fountain of academical honour, and that, in holding its privileges from him, the Catholic University will only be in a position which nearly all the Universities of Europe have occupied at one time or another. If the Irish bishops had been in earnest, they would hardly have allowed their University to languish for so many years for want of a qualification which can so easily be supplied. If they had waited till now to set up a Catholic University in Dublin, it might have been explained on the hypothesis that they had not abandoned the hope that the necessity for founding such an institution would have been anticipated by the action of the Government. But the Catholic University in Stephen's Green was set up years ago, and it might have been expected that the bishops who thought it worth their while to go so far would have thought it worth their while to go further. A University which does not claim to give degrees is at best an anomaly, and on the Roman Catholic theory the POPE is the person from whom the authority to confer degrees is naturally derived. The Stephen's Green institution has not had a fair chance given it. If ever Dr. NEWMAN'S papers are published in their integrity, we shall probably know why this advantage was denied. It is highly unlikely that he should have thrown himself with so much energy into the infant undertaking, had he not believed that it would receive all the aid and countenance which it was possible to obtain for it. Under his guidance the Catholic University would have enjoyed far brighter prospects than any that now await it. The prestige of his name would have done much; his own high conception of what a University ought to be would have done much, and the deserved popularity which the University would have derived from these sources would have been increased by external circumstances which no longer exist. At that time tests were still maintained at Trinity College, and there was not, as there is now, a Queen's College possessing a President in every way qualified to command the confidence of Roman Catholics. The choice therefore lay between the new University and mixed education carried on under conditions not likely to recommend themselves to Irish parents. Yet, with all this in its favour, the Catholic University soon dwindled into insignificance. It is hard to believe that this failure was entirely attributable to the indifference of the Irish Roman Catholics.

By a curious coincidence Dr. NEWMAN has been condemned to witness the failure of another scheme for giving Roman Catholics the benefit of a University education without detriment to their religious principles. Some years later he pro-

posed to go up to Oxford, so as to secure to Roman Catholic students at his old University the advantage of being under the care of an orthodox theologian who was at the same time the intellectual equal of any by whom their religion was likely to be assailed or undermined. If this scheme had been carried out, it would probably have grown by degrees into a Roman Catholic College affiliated to the University; and in this shape it would have done real service to Oxford in securing the representation of an aspect of thought which is at present in danger of being undervalued, and to the Roman Catholic body in bringing them intellectually abreast of their countrymen. Dr. NEWMAN'S second effort met with even less success than his first. In Ireland he had been encouraged to make the experiment, and had, as there is good ground to suspect, been left in the lurch. In England he was not even allowed to make the attempt. The Roman Catholic authorities were resolved for their own purposes to discourage mixed education in any form, and they were not at all anxious to have it proved that it need not be attended with any danger to religious belief. If there had been no chance of Dr. NEWMAN retaining his influence over the Catholic students, the bishops might have been more willing to let him go to Oxford; what settled matters perhaps was that there was every probability of his doing so. A renegade or two might have served to point a moral, but a long list of young men who had passed through the furnace unscathed would have been a most damaging item of evidence.

Why the Roman Catholic bishops should so suddenly have awakened to a sense of their duties towards the laity of the upper and middle classes does not appear. That their change of attitude is in any way connected with a sense of the importance of University education is in the highest degree unlikely. Ecclesiastical bodies are not at all subject to instantaneous conversions, and years of comfortable and complacent neglect are by no means the usual forerunners of vigorous strivings after reformation. It may rather be supposed that the promised development of the Catholic University in Ireland, and the utterly unexpected announcement that a Catholic University is to be founded in England, have alike been called forth by the fear that Roman Catholic parents will not much longer submit to see the existing avenues to a University degree closed against their sons by the decree of the bishops, unless the bishops are prepared at the same time to open up some new avenue. The proposed schemes are hardly calculated to have the effect which the bishops desire. A conception of such magnitude as a new University can hardly be realized by so small a body as the English Roman Catholics, or by so poor a body as the Irish Roman Catholics. Mgr. CAPEL, who is spoken of as the Rector of the English University, is not known to the outside world to possess any natural gifts appropriate to the head of a University, while his practical experience has rather lain in training colleges and convent schools than in places devoted to learning or science. Both the English and the Irish Universities may occasionally secure an able teacher in this or that branch of knowledge, but unless the Continent is laid under contribution to an extent altogether inconsistent with that light-hearted indifference to the gravity of their task which at present seems the predominant feeling in all concerned, it will be impossible for them to maintain a single faculty—except perhaps theology—in a state of even nominal completeness. The day may not be far distant when the Roman Catholic Episcopate will regret the short-sighted obstinacy which has characterized their whole policy as regards University education.

POLICE RULE.

THE question between the public and the police is of so serious a character that it is important it should be clearly understood. Colonel HENDERSON has come forward to justify the conduct of his men, and we have to see what this conduct amounts to. Mr. BELT, a barrister, was lately arrested on a charge of being drunk and disorderly; but the magistrate did not believe the evidence of the police, and dismissed the case. Mr. BELT thereupon wrote to the Commissioner of Police, stating the facts; but the only satisfaction he has received is an intimation that "it is open to him to take his complaint before a magistrate." It would appear, therefore, that the Commissioner is himself satisfied with the conduct of the police on this occasion. They not only made a false charge, but peremptorily refused an application to have the charge tested by a

medical officer, which, the Commissioner assures us in his annual report, is taken in every case of doubt, "as a matter of humanity and precaution." Notwithstanding this, the Commissioner publicly expresses his approval of their conduct, or—which, under the circumstances, is the same thing—refuses to express disapproval. Nor is this all; Colonel HENDERSON, in effect, revives and repeats the charge against Mr. BELT. "I have," he says, "investigated the matter as far as I have the means of doing so, and the result of my inquiries places the matter in an entirely different light"—that is, in a light entirely different from Mr. BELT's statement and the magistrate's decision. What would he said of the editor of a newspaper who, having had a verdict against him in an action for libel, next morning reprinted the libel? Yet the police are practically in this position. The magistrate has decided that the police libelled Mr. BELT, and Colonel HENDERSON immediately repeats the libel in the most public manner, and with all the authority attaching to his position. We must say that this seems to us a very astonishing and intolerable state of things.

But Mr. BELT's case is unfortunately by no means the only case of this kind. There is the case of the officers of the First Life Guards. Here again there is a magisterial decision against the police; but the Duke of Cambridge has forbidden the officers to take legal proceedings against them, and the Commissioner apparently has no fault to find with their behaviour. We suppose, therefore, that there will be no further inquiry, unless the House of Commons takes up the matter. There is also the case of BONE, the carpenter, who, with his brother, was arrested on a charge of assaulting the police which the magistrate at Hammer-smith pronounced to be groundless. On Monday last there was a regular magisterial fusillade against the police. Mr. BAKER, at Clerkenwell, complained that the police preferred charges of drunkenness without bringing forward any evidence to support them, and that in charges of disorderly conduct they always threw in drunkenness as a matter of course, whether it was on the charge-sheet or not. He "thought it very strange that constables were not instructed to give their evidence in a straightforward and proper manner." At Marylebone GEORGE ROBINS, "respectably dressed," was charged with an assault on the police. He called evidence to show that he did not assault the constable but that it was the constable who assaulted him. Mr. MANSFIELD said he did not believe a word of the evidence in reference to an assault on the police, and discharged the defendant. At Southwark an old man of seventy-one, "of respectable appearance," was accused of being drunk and incapable. It turned out that he was very infirm, and subject to trembling, and Mr. PARTIDGE dismissed the case. Thus within a few days we have decisions against the police by the magistrates at Bow Street, Marlborough Street, Hammer-smith, Clerkenwell, Marylebone, and Southwark. Possibly the magistrates may have been mistaken in some of these cases, but that has nothing to do with the immediate question. All that the public knows is that half-a-dozen magistrates have declared that a certain number of police constables have given false evidence, and that these men, with this stigma upon them, are retained in a position in which they may continue to behave in the same outrageous manner.

Colonel HENDERSON seems to think that he concedes a great deal in allowing that it is open to persons who have been falsely accused by the police to summon them before a magistrate; and perhaps it is a great deal from his point of view. If things go on at their present rate, it is doubtful how long the public will be permitted to enjoy this indulgence, and perhaps they had better make use of it while they can. What Colonel HENDERSON appears to forget is, that the persons to whom it is open to go to a magistrate have already been before a magistrate, and have obtained, after full inquiry, a decision in their favour. It is not in the natural course of things that a suitor who has obtained a verdict should be anxious to carry the question before a court of appeal. That is usually left for the other side; and if the other side is indisposed to reopen the question, it may be inferred that it has good reasons for acquiescing in the decision which has been given against it. The Commissioner of Police has stated very distinctly the rule laid down by the Home Office in regard to complaints against the police. It is "that in all charges against members of the police force in which the evidence is conflicting, and supported on either side by witnesses who are not in the

"force, the case should be sent before a magistrate, and not decided by the Commissioner of Police." This is a very good rule. It is obvious, as Colonel HENDERSON remarks, that he has no power to hold a judicial inquiry, and that any decision at which he could arrive on *ex parte* evidence would not be satisfactory to either party. But the rule is one thing, and Colonel HENDERSON's interpretation of it is another thing. Every one will agree that these cases should be sent before a magistrate; but by whom should they be sent? Clearly, we should say, according to all justice, reason, and common sense, by the Commissioner of Police. The persons who have been acquitted by the magistrates have no reason for asking for another hearing. They are quite satisfied with the decisions which have vindicated their innocence. The Commissioner of Police is, therefore, in this position—either he must be supposed to acquiesce in the decisions against the constables, in which case he is bound to punish them, or he is anxious for further investigation, and this he can at once procure in the simplest possible way by sending the constables before a magistrate. In the navy, when a ship is lost, the officer in command is immediately placed on trial—that is to say, the burden is thrown on him of proving that it was not through any fault on his part that the ship was lost. The same rule should be applied to policemen who lose a case because their evidence is deemed unworthy of credit. The decision of the magistrate should not be a final decision, unless the police choose to accept it as such; but if there is to be a second inquiry, it should clearly be at the instance of those who have lost the verdict in the first one.

The question at issue may be very simply stated. The public has before it certain magisterial judgments against the police, together with evidence which appears to bear out those judgments in the strongest manner; and the confidence of the public in the honesty and capacity of the police has consequently been very much shaken. The only way in which this confidence can be restored is by the prompt punishment of the offenders, or by a reversal of the conclusions arrived at by another inquiry in open court. If the Commissioner does not choose to have another inquiry, he must not be surprised if the public declines to have confidence in his men. There are less than eight thousand constables for ordinary duty in the whole of the metropolitan district, which contains considerably more than three millions of people. As men must eat and sleep, there is only about half this number of policemen available for active duty at any time. It is estimated that there are more than three thousand "known thieves, depredators, and suspected persons" in the metropolitan district; and there are of course a great many more who are not known, as well as a large body of people who would be very likely to become disorderly if they were not kept in awe by the police. It is obvious, therefore, that if it came to a push, the police by themselves would be a very ineffectual protection against rapine and disorder. The strength of the police lies mainly in their character and prestige, and in the assumption that they have behind their backs the great body of honest, well-behaved, respectable citizens. Take this away, and they are no better than a cardboard battlement. The question is, how long the police will be able to reckon upon this indispensable support if they go on as they are now doing? And this is obviously a very serious question. There is some highly suggestive information bearing on this point in the Commissioner's annual Report. "The assaults on the police," we are told, "steadily increase"; every policeman is assaulted about once every two years. "The number of police charged before magistrates has increased from fourteen in 1871 to thirty-five in 1872." This shows that the police are becoming every year more unpopular, and more exposed to suspicion and distrust; and we have just seen the sort of encouragement which they receive from their chief when they bring false or reckless charges against innocent persons. On this point the testimony of various correspondents of the *Times* is fully corroborated by the cases to which we have above called attention. Last year the total number of persons apprehended by the Metropolitan police was 78,203, of whom 851 were acquitted on trial, and 22,425 discharged by magistrates. How many of the 2,455 who were convicted on trial, and of the 52,472 who were summarily convicted, were convicted on evidence of the kind of which we have just had so many painful examples, must be a matter of conjecture. Alongside of increasing charges against the police, and growing distrust of them, on the part of the public, we find that "the number

"of dismissals for misconduct, 234, in the past year shows a decrease on former years, and is the smallest number in any year since 1864, after eliminating a certain number who were re-enlisted on expressing their hearty regret for a grave dereliction of duty into which they were unwarrantably led." In other words, the conduct of the police was never so bad as it has been lately, and the number of dismissals never so few. Colonel HENDERSON thinks "this is satisfactory," but it is possible that other people may be disposed to regard it in a very different light. The flourish about the mutiny simply comes to this—that the mutineers were willing to stay in the force when they found that they were to get what they had struck for, and regretted that they had struck, since they might have saved themselves the trouble.

We have of course no desire to speak harshly or ungenerously of the police as a body. They are a very mixed body, made up of "butchers, clerks, grooms, tradesmen, agricultural labourers, sailors, discharged soldiers," and all sorts of people. It is impossible to expect a very high type of men for the wages that are offered; and a force of this kind must necessarily contain a proportion of black sheep. Whether the proportion shall be large or small, whether it shall be sufficient to taint and poison the whole body or only an insignificant speck which can be rubbed off from time to time as it shows itself, depends on the firmness with which discipline is maintained. Everybody will acknowledge the civility, good-nature, and intelligence of many, perhaps we may say of most, of the metropolitan constables. They are certainly not all bullies and perjurers, but it is difficult to resist the evidence that bullying and perjury are increasing, and that the police are in some degree becoming a danger, instead of a protection, to the public. Two great faults stand out conspicuously in the management of the police. The chiefs of the force have, on the one hand, been weak and vacillating in dealing with internal discipline; and, on the other hand, they have done incalculable mischief by importing the Continental idea of police absolutism, and encouraging the men to regard themselves as a sort of foreign power in the midst of an unfriendly population, whom it is hopeless to try to conciliate, and who must therefore be ruled by simple terrorism. A grave responsibility will rest upon Mr. Lowe if he allows this latest warning of the continuous disorganization and demoralization of the police to pass without taking measures to restore its efficiency.

FEASTING AND CHARITY.

WHILE we are still listening to the echoes of the great civic festivity, there comes to us a touching story which suggests a curious contrast. A Masonic banquet, it appears, lately took place in the City. After the mysteries of the Lodge had been duly celebrated, the members and their guests proceeded to the room where, according to custom, a sumptuous meal should have been provided. Its place, however, was taken by a plain meal of bread and cheese and ale. The visitors, we hope, had been duly prepared for this change in the programme. At any rate, whatever fleshly repinings found a place in their bosoms were sternly repressed, and the after-dinner speeches—if the sacred name of dinner may be profaned by such an association—expressed, we are informed, unequivocal satisfaction at the entertainment. The money saved, amounting to 50*l.* or 60*l.*, was given to the charity fund of the Lodge, and it was decided to continue the practice in future. These worthy Masons doubtless deserve all praise for their innovation. We cannot honestly conceal a certain misgiving as to the success of the feast in a purely convivial point of view. Can the flame of loyalty really burn with its usual brightness when stimulated by no more exciting liquor than beer? To make an after-dinner speech is a difficult task at best; and though the orator should not be drunk, he ought as a general rule to be slightly mellowed by the influence of good cheer. When a man is deliberately resolved to make a fool of himself, which is, we fear, a necessary accompaniment of most performances of the kind, it is well that he should loosen, though he should not entirely remove, the grasp of cooler reason. He who drinks beer thinks beer, and, we suppose it must be added, talks beer. Seen through the fumes which arise from the tankard, the prospects of the Church and of the army and navy would surely take an unduly sombre colouring; and the orator whose first duty is to throw a pleasantly rose-coloured tinge over the intellectual prospect would be apt to curse when he ought to bless. There is, however, little danger of the principle established by these enthusiasts being applied to the Lord Mayor's dinner. This is never likely to err on the side of asceticism. There is much more danger that the good humour of the company, and even the interests of cookery, considered as a high art, will suffer by stress than by defect. And therefore it would be an act of

childish supererogation to urge upon future Lord Mayors the duty of retaining something of that barbaric pomp which is an interesting relic of the old-fashioned drinking, roast-beef-eating habits of our gormandizing ancestors. When the art of feasting is properly understood among us, a careful study will doubtless reveal what is the diet which produces a maximum of eloquence. The final cause of a Lord Mayor's banquet is to elicit the best possible speeches from public officials. A certain degree of luxurious living will doubtless always be found necessary for that purpose; and all genuine eloquence would disappear long before the guests were reduced to the Spartan simplicity of bread and cheese.

The Masonic banquet of which we are speaking raises a question of a different kind. Before a man gives a dinner he should settle with himself what is his ultimate object. It is the great criterion of all practical success that we should never be aiming at two purposes at once. Civic conviviality has an obvious criterion; that is the best dinner which favours the best speech-making; but what is the criterion which should be observed in regard to those singular festivities of which charity is supposed to be the ultimate end? The reply, ordinarily assumed to be satisfactory, is that that dinner is the best which produces the largest subscriptions. There are certain institutions which practically regard a good dinner as the best means of providing their annual funds. If it is desired to raise money for the support of the indigent hangers-on of some profession, the ordinary method is to catch some distinguished person, a Minister, a bishop, or a celebrated author, and to advertise to the world at large that for a moderate sum they may have the pleasure of seeing the man dine, and afterwards of getting him upon his legs. The convivial board forms a galvanic battery, and the enthusiasm spreads and glows through the whole circle of guests. The consciousness that they are in some sense companions of their exalted chairman sets fire to bosoms already stimulated by a good dinner; and, like Franklin listening to the eloquence of Whitefield, they change the humble intentions which satisfied their consciences during soup to the reckless generosity of postprandial excitement. The success of such performances clearly depends upon many things besides the intrinsic merits of the charity. The records of the institutions prove that the public has been generous, not in proportion as their money was wanted, but as the orator was distinguished. And therefore, if the sole end of a charity be to get as much money as possible out of the public pocket, there can be little doubt that the managers of such performances are wise in their generation. The bread and cheese system, if it were generally introduced, would cut off this stream at its source. The eloquence of the ablest advocate would be damped. If the orator himself could speak, yet he would speak to cool and critical audiences. Half his power would be thrown away, and the charities would have to depend upon the results of an appeal to people's reasoning faculties, not to their sentimental emotions at moments of convivial relaxation.

Here, then, we come upon the ever-recurring problem. How far are the means sanctified by the end? Is it right to mix our appeals for charity with appeals to motives not exactly bad, but at least equivocal? There are, of course, a large number of people who confidently reply in the affirmative. In the controversy which has recently been raging as to the system of elections, it was obviously regarded as a primary truth that any system, not directly dishonourable, was justified if it increased the total amount of subscriptions. It was in vain to urge that a great deal of time and money was wasted upon a disproportionately small amount of good; that needless disappointment was caused to the recipients, and superfluous trouble to the bestowers, of charity. Every system, it was replied, is more or less bad; and no other system will raise so much. That was regarded as an ultimate and conclusive reply. Its natural tendency was to provoke an equally dogmatic opposition. Are we sure that the charities of which we boast so much do more good than harm? If subscriptions are thinned by the revelation of abuses, is not the thinning a desirable thing in itself? Political economists and the members of the Charitable Organization Society can supply us with abundant reasons for believing that asylums and hospitals pauperize more decidedly than they help the deserving. It is a very dangerous line of argument to say that people won't give money at all unless they are allowed to give without discrimination, or are encouraged to give by after-dinner rhetoric. It sounds very much like saying that you have no case which can be put before cool-headed people who insist upon some reasonable guarantees that their money will be well applied. Everybody is now willing to admit that much of our charity is so ill directed that it creates more evils than it cures. If we seek for a test to discriminate between good and bad charities, is there not some plausibility in making the test to consist in the power of dispensing with appeals to irrelevant considerations? Every sensible man after a little experience arrives at the conclusion that it is a mistake to mix his charity with his business. The result is pretty certain to be the injury of his business and the degradation of his charity. It is equally desirable, as a rule, to make a stern division between your charity and your pleasure. Charity should be a serious occupation, inasmuch as giving money usefully is a difficult art which requires calm consideration and constant attention. Directly you try to make it a picturesque amusement for fine ladies and gentlemen, and to get for your money, not merely the consciousness of having been useful, but the pleasure of having been flattered and coaxed, and called a munificent patron in public, the practice generally ceases to be healthy, either for yourself or for the people you profess to benefit.

This, we imagine, was the theory of our excellent friends

of the bread and cheese banquet. We cannot deny, however, that they have probably a rather hard battle still to fight. For the moment they have saved 60*l.*, and they have had a pleasant glow of natural self-complacency. The most refined good livers sometimes take a pleasure in returning for a moment to a piquant simplicity; and our Masons were no doubt amused for a time by their bread and cheese novelty. They perhaps regarded it as verging upon a practical joke; but still as a good-humoured joke, and one which served to point an excellent moral. But will they be able to keep it up in cold blood? Will not the fifth or sixth banquet on this frugal scale begin to be something of a bore, and the speeches which it provokes be somehow wanting in fire and felicity? Alas! this is the melancholy cynicism which always intrudes when one sees a bold attempt at reform. Even in the best motives there is a mixture of something earthly. The first ascetics renounce the world in all sincerity; the next generation find that asceticism is become the fashion, and play at it as they play at any popular amusement. And so this great bread and cheese movement may have its weak side. Possibly, if the prophetic spirit were granted to us, we might foresee a distant age when the bread and cheese would be still ostensibly eaten, but supplemented by luxurious fare introduced under some cunning pretence; as in times of corruption a hair-shirt may become a mere ornament worn over a comfortable substratum of inner clothing. But it is not given to us to raise the veil of the future, or to trace the seeds of decay in the fresh enthusiasm of the early reformers. The temptation will probably come when these puritan Masons discover that their subscriptions fall off, and that the saving produced by the frugality of their feast is counterbalanced by the want of stimulus to contributions. Will they be content to congratulate themselves that, if less has been received, it has been received without unworthy solicitations? or will they return to the use of the old coarser stimulants? If we could hope that the plan would succeed in both directions, that bread and cheese would be at once a cheaper and a more powerful stimulant, then indeed we should have a new hope for the future of our charities. Then we might look forward to a day when all institutions would be judged on their merits, and people would give money because money was really wanted, not because they had been agreeably warmed by wine and exhilarated by rhetorical flattery. Such a dream, we fear, is too good to be true. The great law that an Englishman is most accessible through his stomach is not to be so easily repealed; and it is to be feared that people will never be wanting to turn this truth to account. Bread and cheese are excellent articles of food; but we suspect that it is a long time before their price will be raised by a demand for the purposes of charitable banquets.

WOMEN AT SCHOOL.

A ROCHBISHOP WHATELY used to hold that there was one characteristic distinction between men and women. When men, he said, were spoken of disparagingly as a whole, they were apt to coincide; but when any particular man was attacked, they usually stood up for him, and did their best to show that he was not such a bad sort of fellow after all. On the other hand—this was Whately's theory, and we accept no responsibility for it—women were extremely sensitive as to the general character of their sex, while quite ready to join in cutting up the sisterhood in detail. It would be interesting to know what feelings will be excited in the female mind by the Report which has just been issued by the Cambridge Syndicate for the Examination of Women. The Syndicate affect to report, on the whole, very favourably of the industry and intelligence of the majority of the candidates who appeared before them at the different centres, but they take upon themselves to make some remarks which, we fear, will be thought to be offensively characteristic of the arrogance and presumption of man.

It is stated that only a few candidates, when examined in the *Horæ Pauline*, showed a knowledge of the book and a real hold on the argument, while most of them, although acquainted more or less with Paley's facts, exhibited great weakness in applying them conclusively. Most of the candidates had evidently studied the Scriptures very carefully, but "the answers to a question which asked for a careful summary of 1 Cor. xv. seemed to show that not more than two or three candidates had read the chapter so as to master its method and connexion." The ladies came out strongly in arithmetic; but in English history they are sarcastically advised to "avoid mere fluency of expression"; and in English literature "the besetting error was irrelevance." Thus, when a brief summary of the *Hydriothepia* was asked for, the result was that a great many accounts, the reverse of brief, were presented, not of the work, but of Sir Thomas Browne, the writer of it. It is remarked that it was observable that several candidates who complained of want of time had signally mispent the time allowed them. The examiner further noticed great "good will" but "a very prevalent inaccuracy." In English composition the examiner discovered a weakness for slang and a tendency to flippancy, and "too many of the writers did not sufficiently consider the meaning of the subject which they selected." One of the subjects which were set was to fix the place of the novel in modern literature; but many of the candidates started off at a tangent, and expatiated on the bad effects of reading novels. The examiner endeavours to take the edge off these home-thrusts by suggesting that, after all, he has in

his time read worse essays by men. The examiner may be a very learned man in his own way, but he clearly knows very little about women if he thinks to appease their natural indignation by a paltry concession of this kind.

We have very little doubt that women will see through the flimsy pretence of courtesy and conciliation under which the examiners endeavour to disguise this attack upon the general character of the sex, and especially on those very points on which women are known to be most sensitive. A woman will stand a good deal, but no woman with the least spirit ever submitted without an explosion to an insinuation that she was not a person of a logical turn of mind. Even the patient Griselda, who allowed her children to be taken from her one by one, would no doubt have startled her spouse by the sudden energy of her character if he had chanced to say, "My dear, it is really no use trying to argue with you, for women are always so illogical." All women are logical; and whether they are logical or not doesn't matter, for all the same they have a right to be considered so—this is the first great principle blazoned on the banner of the sex. Yet here we find a sneering examiner pointing out that only one candidate in logic showed a thorough grasp of the subject, and that he found it exceedingly "difficult to obtain a clear statement and ready application of important definitions and theorems." All this is quite of a piece with the malicious and impertinent suggestions of the examiners, that women are discursive and rambling, and that when they sit down to try to write a short account of one subject, they generally write a long account of something else. The difficulty of obtaining "a clear statement" from a lady is also a very stale bit of satire. The examiner in Latin remarks that the general impression produced on his mind by the work done was "that the knowledge shown was in most cases rather due to a retentive memory than actually assimilated with the mind and thought of the candidates." This is put in a very fine way, and perhaps the examiner may have flattered himself that there was something clever in the sonorous turn of his malignant epigram; but we can fancy we hear a female chorus crying, "So women are parrots, are they?" And it must be confessed that this is really what it comes to. The French examiner of course has his hit with the rest. He thinks it may not be amiss to warn candidates against rendering into verse passages which they are expected to render into prose. Here again is one of the old sarcasms on women, that they think the hard, plain prose of life not good enough for them, and are always wanting to soar into the region of poetry. The same spirit animates the whole of these reports. They are full of jeering allusions to all those little weaknesses reference to which is known to be peculiarly offensive to the gentler sex. It may be true that women have a relish for racy language, and there are no doubt rumours that in the highest circles this passion for colour, or perhaps we should say for something else than prose, in conversation has led to the use of a very astonishing vocabulary; but only a Cambridge examiner is capable of telling a lady to her face that she is flippant and talks slang. The passage, however, in these reports which will probably be most bitterly resented is that in which proficiency in arithmetic is ascribed to women. It will be understood at once that this is only another way of saying that, if women are fit for nothing else, at least they can keep a correct account of housekeeping expenses. It revives at least one part of the old imputation that their natural mission is "to suckle fools and chronicle small beer," although it is well known that no greater insult can nowadays be paid to a young lady than to suggest that she possesses, even in the most trifling degree and shadowy form, any of the qualities of a competent housewife.

Altogether this seems to us a very scandalous production. It has been printed by the *Times* as a genuine document, and names are appended to it which are certainly the names of gentlemen who are known in Cambridge. So we suppose it must be accepted as authentic. It will no doubt be taken up by the sex against which it is directed, and we shall hear what is thought of it. The object of the authors of this academical lampoon appears to have been to throw into an official form a consensus of the traditional fables of women, under pretence of giving the results of recent examinations. Some of them are, perhaps, married men, and they may have enjoyed a malicious but shabby satisfaction in giving vent to remarks which had occurred to them in the course of domestic conversation, but which they deemed it more prudent to suppress. "My darling, I do not dispute your facts, but you show great weakness in applying them," or "I do wish you would avoid fluency of expression," or "When you begin to say just a single word on one subject, why on earth do you start off into a thousand words upon another subject which has no possible connexion with it?" "You know, dearest, how I hate flippancy and slang," or "It's really hopeless trying to get a clear statement from a lady or expecting her to be logical"—these and other expressions in the Reports have certainly a strong flavour of conjugal controversy, and perhaps the examiners may feel relieved in having at last found an opportunity of speaking their minds freely. But after all it is surely rather hard on the innocent victims, and it is a pity they cannot have their revenge. In the old fable the lion observed that, if the picture of one of his species lying in the toils of the hunter had been painted by a lion, the man would have been on the ground and the lion on the top of him. Now that the women have been photographed by the examiners, it would be interesting to have a sketch of the examiners, as representing the male sex generally, from the point of view of the ladies who were examined. We

should probably find man described as hard, pedantic, and unimaginative; always in a fuss and hurry, and disposed to cry that time is up, although there is plenty of time to spare; and given over to a superstitious worship of mere rules and technical formalities. It would also be pointed out that man, with all his professed anxiety to make the most of time, often wasted it shamefully in asking for reasons when no reasons were necessary, and in carping at particular expressions, although all the while he knew very well what people meant; and that, with all his boasted logic, he has never mastered that elementary and most useful proposition, "It is because it is." It might further be remarked that, according to the ancient saying, Minerva had no sooner started on a journey than she arrived at her destination, and that women had no reason to be ashamed of resembling so respectable a goddess in the rapidity of their mental flight. If women are sometimes too quick, men are dreadfully slow and plodding, and women often attain by intuition to what men, with all their laborious logic, fail to reach. This would certainly be a good subject for the next exercises in English composition which are required to be written by ladies for the Cambridge Syndicate.

UNIDEAL ENGLAND.

IF our national character is not all that it ought to be, it certainly is not for want of fault-finding. Thanks to the indefatigable exertions of our own instructors, we are about the best abused people under the sun; inasmuch that, if we want to hear any good of ourselves, our best chance is to pick up what we can abroad. Now, if you take any average human being and predicate of him every vice and imperfection that can be thought of, it is highly probable, seeing that no human being is perfect, that if you only call him names enough some few of them will be true; and this chance will of course be increased if the thing is done on a larger scale; as, for example, if you extend your vituperations, according to the Oriental method, to all your enemy's ancestors and kinsfolk, or, according to the more ingenious Western method, to everybody who agrees with him or with whom he agrees. It is but one step further in the development of the principle on which the members of one considerable party cast collective obloquy on the other party, when those who are in a minority too small to constitute a party console themselves for the ill success of their projects by attributing it to a national perversity. And, since the number of persons of respectable ability who have ideas which they cannot get taken up either by the nation or by a party is very large, and their views range between all possible extremes, there is absolutely no kind of mistake, folly, or vice, of which the English people is not constantly accused with a loudness and pertinacity that must end by making some impression. Thus our great British institution of grumbling seems to have its root in our other great institution of party government, and to be inseparable from it; and this again suggests that the true reason why Parliamentary Government has not flourished in some places whither it has been attempted to transplant it may be that the princes and rulers of those lands omitted to take over as an essential part of the scheme this art and mystery of grumbling, without which it loses its vitality, and becomes no better than a cut-and-dry paper constitution. So it is, however, that we cannot play our comedy of life without an orchestra of grumbling; and we write ourselves down spendthrift and cheseparing, chimerical and pusillanimous, absurdly sensitive and stupidly indifferent, all in one morning. It would be strange if all the candid friends of their country who indite these charges did not sometimes happen to be right; but it is quite certain that several inconsistent accusations cannot be all true, and nearly certain that some of our platitudes of self-depreciation, which are commonly accepted without question, are very distinctly wrong.

One of these is the frequently and confidently repeated assertion that the English character is unimaginative, or, in a somewhat more imposing form, that the English mind is unfitted to grasp ideas. This fallacy is supported by an ambiguous use of the word practical. First, it is admitted that the English are a practical people. Then it is assumed that a practical man means a man who cannot foresee any but immediate consequences; whereas the most practical man is, in truth, he who can foresee the greatest number of the most remote and least obvious consequences of any given state of things or proposed action. Finally, it is concluded that practice is in some way opposed to ideas, and that therefore Englishmen, and especially successful Englishmen, are deficient in ideality. The injustice of this conclusion, and the confused way of thinking which it involves, have been pointed out by Mr. Herbert Spencer. Taking for his nominal theme the patriotic bias which clouds men's judgments on social questions, he has lifted up his voice against the anti-patriotic bias which leads many of us to put a bushel on our own candle; and he has shown how much of the progress of English invention and discovery during the present century has been due to the power of imagination. Professor Tyndall, too, has spoken of the necessity of imagination to science. So far as this department is concerned, we may take it that the popular fallacy is sufficiently exploded. Let us see whether it rests on any better ground as applied to the other arts of life.

Are we so much less ideal than our neighbours in politics, literature, and so forth? We think the true answer will in almost

every case be found to be the same as it is in regard to science. The work done in England is unideal only in this sense, that there is comparatively little talk about ideas; for our best ideas are fruitful, and are speedily translated into living realities. There are countries, no doubt, not very far from England, where ideas make a much more conspicuous figure in politics than they do here. But what sort of ideas? Such as remain in that form just because they have not the vital force to realize themselves. They remain barren abstractions, diverting men's minds from what can be done in the state of things which is to what might or ought to be done in some state of things which is not. We have heard, too, of making war for ideas, as if it were a new thing; but it is no such new thing for Englishmen to do, though perhaps without knowing it. Three centuries ago an idea took possession of us here that the Queen and the law of England, and not the Bishop of Rome, should bear rule in these kingdoms; and in the strength of that idea there lived and fought a generation of men whose deeds are not likely to be forgotten. But that was our heroic age, it may be said, and the national character has degenerated. During this century, then, we have pictured to ourselves in our unimaginative national mind the iniquities of the slave trade, till it has become a fixed idea with us to put it down; and so we have persisted and still persist, for the sake of that idea, in spending money and lives from one year's end to another in a thankless and obscure task, inglorious enough as warlike glory goes, but still a war against the evil thing, and a war which has its conquests, won indeed now and then with an over-high hand. And, last of all, we have done much more than make war for an idea; we have made an already historical treaty for the idea—surely speculative enough—of peace and goodwill among nations, in pursuance of which treaty, and in further promotion of which idea, we are about to pay hard money which we have always contended that in strict justice we never owed. Whether our conduct in this matter has been the wisest possible, or whether it is likely to have the results that were expected, it does not concern us now to inquire; but certainly it was not the conduct of a nation incapable of giving due weight to what are called ideal considerations in the motives of its foreign policy. And then most of our political controversies at home are controversies about ideas. Indeed the ideal part sometimes so overtops the rest that it is difficult to see what has become of the grain of fact. It is impossible that any fair-minded person can look at all the dust that has been raised about the 25th clause of the Education Act and then say that our politics are unideal.

We turn to literature. It would be absurd to waste time in showing that the best English poetry and fiction, not of any particular age, but of every age since we have had a literature at all, is eminently rich in imagination. Let us rather see if even our literary shortcomings do not point in the same direction. The manner for which English writers are generally least apt is the epigrammatic. We envy the felicitous terseness with which any French writer of average competence will give you his view of the universe in half-a-dozen lines. But is our national incapacity to bring heaven and earth within the compass of an epigram, even if we put all the exceptions out of sight, a thing to be wholly regretted? The epigrammatic faculty seems hardly compatible with a highly developed imagination. For it demands a sharply defined and limited view—that is, an unimaginative view—of the subject; it is almost the essence of an epigram to see a part of the thing and refuse to see the whole. Of course a writer of great imagination may be also an epigrammatist if he has cultivated the power of self-control in a degree corresponding to the extent of his imagination, as witness Goethe. Still the mind which cannot see detached parts without striving to see a whole, which looks before and after, and fills up the meagre outlines of present experience with pictures of the future and the past—in short, that which we call an imaginative mind—will be naturally less favourable to the development of epigram than one which is content to be comparatively discontinuous and fragmentary.

When we come to the fine arts, the case is somewhat different. We here find ourselves in presence of a considerable mass of discontented criticism, much of it proceeding from competent judges, on the besetting faults of our artists and our public. The sum and substance of the charges made is, that the public taste in matters of art is crude and unformed; that, in obedience to the demand created by such taste, there is a supply of hasty and inferior work; and that the demand and supply react on one another to keep down the general standard of artistic culture. No doubt there is truth in this; how much truth we need not now consider. But let us see what it means, if it is all true. In the first place, the mere fact of there being somebody to criticize the general standard of taste, and some superior work to hold up as an example of what average work ought to be, shows that at all events there are some members of the public, and some artists, who know better. Now it is natural for those who stand on a high level to be impatient with average culture for being below them. But one is entitled, looking at the matter broadly, to say that the average is as good as can fairly be expected of our community, things being as they are; that the existence of stirring criticism and discontent shows the existence of a good deal of exceptional merit; and that this again is the mark of an active faculty of self-development, tending on the whole to a steady improvement of the average quality, which ought to be counted as clear gain. Our very discontent with ourselves shows that we are not unideal; for discontent, in the higher sense in which everybody ought always to be discon-

tented, means having an idea of something better than the present. Again, what is the meaning of the indiscriminate demand complained of? People have not yet learnt to demand only the right sort of art; but they have learnt, or are learning, to seek art in some way, and surely that is something. Faith is there, and knowledge will come. Anyhow, it is not want of imagination that leads to imperfect work being tolerated. One might almost say it is excess of imagination, unqualified by the training which teaches both artists and public what degree of perfection can be attained and ought to be required. One of two children will be happy making a little world out of blocks of wood or scraps of paper; the same odds and ends serve at will for trees, houses, dogs, cats, or men, nay, for impossible monsters and castles in the air. The other must have model houses and elaborately dressed dolls. That is, the one is content with rougher and more primitive artistic representation than the other. Of these two which is the more imaginative? We must surely allow more imagination to the child who can carry through a whole fairy tale with its bits of wood than to the child who must have every ribbon of its doll's dress an accurate counterpart of the current fashion. For the present this last is wiser about ribbons; but we know of whom to expect most when the two are grown up. Perhaps something like this is true of the present transitional state of English education and English art.

What is amiss with our art, in short, is not that we have too little imagination, but that imagination has outrun knowledge. In the work of the greatest and most imaginative of modern painters—and he was an Englishman—we see his conceptions waxing from day to day bolder and more splendid, wrestling with his powers of expression, consummate though those were, and at last overwhelming them and losing themselves in excess of broken and unintelligible glory. In this direction, not in the direction of narrowness and poverty, lie our real dangers for the future. It is the office of criticism and education to avert them. For that end let education be accurate and criticism stringent. But let us not waste our time on mistaken self-abasement, or fancy that our ground is barren because it must be cultivated with thought and labour to bring forth good fruit.

ANCIENT VERONA.

WE spoke casually of some of the buildings of Verona when we were speaking, about two years since, of Romanesque architecture in Northern Italy. But, like all the great Italian cities, Verona may be looked at in many ways, and in truth the only way truly to master any of them is to visit them again and again, each time looking at them mainly with a view to one class of subjects. As for objects of other classes, it will be well for the time being, we will not say to shut the eyes to them altogether, but certainly to look at them only as subordinate to what for the time is the main object of study. Taking Verona as an example, there is at once the classic Verona, the Verona of Catullus and Pliny; there is the Verona of the Nibelungen, the Bern of Theodoric; there is the medieval Verona, the Verona of commonwealths and tyrants, the Verona of Ezzelino and Can Grande; and there is the Verona of later times, under Venetian, French, and Austrian bondage, the Verona of Congresses and fortifications. Verona, like Le Mans, is an Ecbatana, spreading, circle beyond circle, each range having its own history and its own monuments. Of one of these ranges it is at first disappointing to find so little to remind us. When we think of the fame of Verona in Teutonic romance—how the city and the hero have each taken the name of the other, and how they have been fused together on Teutonic lips—we are inclined to wonder that "Dietrich von Bern" should have left such slight traces of himself in his own *Dietrichsbirn*. But it is perhaps well that the surviving monuments of Theodoric and his age should be gathered together round the one spot which stands by itself in the whole world, and that the city which boasts of his church, his palace, and his tomb should not be exposed to rivalry from another city which, though it has come to bear his name, was, after all, only his occasional sojourn. It is perhaps well that, as Ravenna has no share in the earlier and later glories of other cities, as it boasts no arches or amphitheatres of heathen days, no palaces and churches of the later Christian ages, it should have its own intermediate age wholly to itself, and that neither Verona nor any other city should intrude on its special privilege as the bridge which joins together the two worlds which elsewhere are parted by so yawning a gap. Certain it is that, while Verona is so rich in remains of earlier and later times, it has not a single perfect building, nothing beyond doubtful portions of wall, which even pretends to belong to the age of Theodoric or to the ages immediately before and after him. Of his palace on the further side of the river, looking down on the city and surrounding lands, a contrast indeed to the site of his own home among the canals and marshes of Ravenna, the history can be traced down to our own century. But all traces both of the palace itself and of the many successive buildings which have succeeded it have vanished before the necessities of modern warfare and defence. As far as the great monuments of the city go, we leap from Gallienus and Diocletian to Henry the Third. The intermediate space is filled only by some fragments of wall, which, truly or falsely, bear the name of the great Charles, and by the single strange structure under the shadow of St. Zeno's minster, which calls itself the tomb of his son, the youngest Pippin, the first of the Frankish House who reigned over Italy as a separate

kingdom. The series is not an uninteresting one; Diocletian, Charles, and Henry each mark stages in the history of the Empire; each was a restorer after a time in which its power and glory had fallen. It is well that the series should be formed by them, while Theodoric, with all the splendour and happiness of his Italian reign, stands rather as a break than as a link in the Imperial series. And when we reach the reign of Henry the Third, we cannot point with certainty to any monument of his reign, except the unadorned lower stage of the great campanile of St. Zeno. All that gives that noble tower the character which is impressed on all the towers of the city for so many centuries is due to the stages which were carried up perhaps a hundred and thirty years later. Among the great buildings of Verona there is in truth a gap which spreads from the third century to the twelfth, and carries us at a bound from the amphitheatre in the days of Diocletian to the church of St. Zeno in the days of Frederick Barbarossa. To the architectural student indeed that church, the great example of what, in contrast to Pisa and Lucca, we may be tempted to call the barbaric form of Italian Romanesque, is alone worth a pilgrimage. It ranks as an example of its own style with Durham and Pisa and Speyer and St. Sernin at Toulouse. And far less stately, but hardly less interesting, is the little church of St. Stephen on Theodoric's side of the river. Its main body ruthlessly disfigured, but still keeping its central octagon, its pillared crypt, the arcades of its upper and its lower apse, and the stone chair of the bishop still in its ancient place, it is a monument of the times when St. Stephen's disputed with the vaster *Duomo* on the other side of the river its right to hold the first place among the churches of Verona, as the seat of her bishops in life and their burying-place in death.

No less full of associations in their own way are the later buildings, the tall tower of the municipality, the palaces and tombs of the tyrants, the house that sheltered Dante, the castle looking forth so proudly on the northern mountains, the broad arches of the bridge that stems the rushing Adige, the long array of domestic buildings which make Verona one of the chief schools of architecture of its own type. For the admirers of that type there is the *Duomo*—containing also parts of earlier and better work—and the more striking pile of St. Anastasia, one of those vast churches of pointed arches without appropriate detail which we should welcome at Palermo in the days of King Roger, but which we look on with less respect when we remember that, when they arose, Westminster and Köln and Amiens were already risen or rising. But for the nonce we wish to take our leap backwards to the earliest existing remains—to the Verona, not indeed of Catullus, hardly of Pliny, but to a Verona which was already beginning to be ancient when Claudian sang of it. The theatre on the left—on Theodoric's—side of the river, the theatre which had become a licensed quarry in the days of King Berengar, is so utterly shattered that we can hardly do more than judge from the noble capitals of the earlier and purer Ionic form how stately a pile it must have been in the days of its perfection. The amphitheatre all the world knows; perhaps it is less generally known how lately an Emperor sat there to behold the kind of spectacle for which the building was at first raised. Joseph the Second, who had so far forgotten who he was as to go to Rome and to come away without receiving the rite which would have enabled him to strike out the word *Erwählter* or *Electus* from his style, was reminded of his own existence by the popular voice both of Rome and of Verona. The Roman people welcomed their Emperor ("Imperatore nostro"), and when the people of Verona greeted him with a threefold clapping of hands—in our days it would doubtless be called a threefold ovation—as he beheld a bull-fight in the old arena, the magistrates duly commemorated the fact by an inscription in which "Imp. Cæs. Josephus II. P.F.A." came as naturally as if he had been Vespasian or Trajan. At first sight, while one laments the loss of nearly the whole of the outside range of arches, one is tempted to be displeased at the absolute perfection of the internal seats, and the new look of some of them. But when we find that the practice of keeping them in repair has gone on unbroken through all ages down to our own, the custom itself becomes a part of the history of the building, as well worth preserving as any other. Like all other buildings of the same class, the Veronese amphitheatre brings out in its full perfection the massive grandeur of the true Roman style of building. It is the arch, the true Roman feature, which gives the building its character. The (trick) features, which in the more enriched Roman buildings act as a mask to the real construction, are either not there or have so little prominence as not to interfere with the genuine Roman effect. They hardly count for more than the engaged shafts which surround the apses of Lucca and Speyer, or even than the pilaster buttresses of our own Norman buildings. And if we go into the vast and cavernous recesses of the building, we learn another lesson in the history of the building art. Those who have not carried their studies beyond our own island are irresistibly tempted to attribute some of the characteristic features of our earliest towers to imitation of a timber construction in stone, to what has been ingeniously called "stone carpentry." But in this respect, as in every other, our primitive Romanesque buildings are built as their founders preferred to build them; the stone carpentry, the long and short work of our primitive towers, is thoroughly Roman; it may be seen on a gigantic scale in the dark places of the amphitheatre of which we are now speaking. In short, the argument from the seeming construction of these buildings, though far more ingenious, is really of a piece with the notable argument at which we have had our laugh before now about the use of the word *timber*.

From the amphitheatre we turn to the gateways, and the great gate at Verona can hardly fail to suggest a comparison with the mighty Porta Nigra of Trier. Balancing the remains of the two cities and setting aside the basilica of Trier, Verona as much surpasses Trier in its amphitheatre as Trier surpasses Verona in its gateway. The comparison may be thought unfair, as the Trier gate is all but perfect, while the Verona gate is simply the outside shell. Still the outer face of the two may fairly be compared. Trier indeed has the advantage of outline, in the magnificent flanking towers on either side, while Verona has only a flat front on a single level. Trier too has the advantage of position, standing free from other buildings, as still being the actual entry to the city from its suburbs; while the gate at Verona suffers in architectural effect, though it really becomes more striking as an historical monument, by being no longer the entrance to anything, but spanning one of the busiest streets of a flourishing modern town. Our doctrine may sound frightful in classic ears, but to our mind the comparison between the two gateways shows how far the real art of architecture had advanced between the days of Gallienus, or the days before Gallienus, and those days after Constantine which beheld the building of the sublime pile at Trier. Between the two, in fact, architecture made its great step; the gate at Trier carries us to the days of Spalato, to the earliest days of Ravenna. In the Verona gate the Greek features are still there, masking the Roman construction; over the actual openings, over the windows above them, we get unmeaning entablatures and pediments, stone pictures, so to speak, of real entablatures and pediments, like the survivals of the old postchaise carved or painted on the modern railway-carriage. This gives the front the appearance of a confusion of Greek and Roman ideas, while at Trier, as in the amphitheatres, indeed even more thoroughly than in the amphitheatres, the remains of the columnar system, the half-columns or pilasters, have sunk into the subordinate place which they hold in Romanesque buildings. In fact, according to our heretical view that classical Roman architecture is only a transitional stage between one consistent form of construction and decoration in the shape of Greek art and another consistent form of construction and decoration in the shape of Romanesque art, one might doubt whether the Trier gateway is not entitled to be called Romanesque rather than Roman. Whether Gallienus built the whole gate at Verona, or simply repaired and raised an earlier gate, is of no importance at all in this point of view. Both parts of the gateway show the same fault, the inherent fault of the classical Roman style; both, in a word, are *pre-Spalatine*, while at Trier, though, from the nature of the buildings, no arches actually rest on columns, we see the working of the same principle, the effect of that great architectural revolution of which the hall of Diocletian was the beginning.

Still, with all this, the *Porta dei Borsari* of Verona is a striking object, the more striking, as we have already said, from those points in its position, the way in which it is hemmed in by modern buildings, which take away somewhat from its effect as a work of architecture. One wonders how it has lived through so many ages. At Trier, even if we did not know that the gateway was for nearly eight hundred years preserved by being used as a church, we do not for a moment wonder at its preservation. At Verona it is almost more striking than the preservation of the gateway itself to see the small inscribed stones which stand near it, remaining there in the crowded street untouched by the changes of sixteen hundred years. And it must always be remembered that the present gateway is simply one wall of the ancient structure; the place of its fellow may easily be marked some way back, where a small piece of the wall, which is still to be seen in the adjoining side street, marks the place where the other wall of the gateway spanned the main street.

Besides the gate of which so large a portion has been preserved, the traveller should not fail to notice a fragment of one of the other gateways known as the *Arco dei Leoni*, where one half of the gateway has been preserved through the accident of a change in the direction of the street. In this the faults of the *Porta dei Borsari* are less strongly marked, and great lightness and elegance must have been given to the highest story of all by the small detached columns with their twisted flutings, reminding us of what was to come on a vaster scale at Waltham, Durham, Dunfermline, and Lindisfarne. One only remains, but it struck us that some of its fellows had been used up again among the columns of various kinds which are to be found in the apse of St. Stephen's. We have not local knowledge enough to identify the *Triumvir Tiberius Flavius Noricus*, the son of Spurius, whose name may still clearly be read on the architrave above the surviving arch. But we certainly think that, when the building was perfect, it must have formed a finer whole than that which is still preserved to us nearly entire. Both, along with the other Roman remains of the city, form a noble beginning of that series of buildings earlier and later which gather, as round their centre, around the glorious pile of San Zeno, the greatest of them all.

BISHOPS AND CURATES.

WE congratulate the Bishop of Gloucester and Bristol; we congratulate the Church Association. We congratulate the Bishop because he has got a spiritual director to his mind; we congratulate the Church Association because they have found a bishop who is willing to obey their orders. Dr. Elliott has the

kind of soul to which it must have been difficult to fit a guide. An ordinary bishop might be content to take his chaplain; but the Bishop of Gloucester's published views about confession made it impossible for him to assign the office to a clergyman. The Chancellor of the diocese is a layman, and there is secular precedent for chancellors being keepers of confessions; but a faint flavour of canon law still hangs about the office, and the canon law is not the rule by which a Protestant ecclesiastic would wish to be judged. The Church Association has just the qualifications which the post of confessor to the Bishop of Gloucester and Bristol demands. It is mainly composed of laymen, so that the penitent may freely unburden himself without the least fear of being suspected of sacerdotal leanings. And there is a further safeguard in the fact that it is an association; so that even if it were accidentally composed entirely of priests, or if Dr. Close or Dr. Cumming should at any time decree that confession in secret, even to a layman, is unlawful, the Bishop can take refuge in numbers. There is nothing auricular about confession to a general meeting, and absolution would lose all its terrors if it were conveyed in a letter from a secretary, and began "I am directed by the Standing Committee." But the Church Association is no less fortunate than the Bishop of Gloucester. Even in these days it is something to have a bishop hanging on your words, and realizing his highest conception of the episcopal vocation in being the obedient instrument of your designs. And this blessing has been vouchsafed to the Church Association in a time of real need. They must soon have made their choice between seeing their labours go for nothing and entering on a fresh era of prosecutions. Both alternatives were unpleasant, yet unless a bishop had come to their aid there was no third course open to them. But the Church Association's necessity has been Dr. Elliott's opportunity. What was impossible without a bishop is more than possible with one. In one diocese, at least, the labours of the Church Association will not have proved unfruitful. They will bring starvation to curates and candidates for orders, and inconvenience even to the beneficed clergy. It may be objected perhaps that curates and candidates for orders are but small game to fly at; but in this respect the Church Association has never shown any unchristian pride, and their new disciple is not above his masters. If a curate is small, he is safe; if a candidate for orders is smaller still, he is also safer still.

The Bishop of Gloucester's public submission to the Church Association has been effected in this wise. In his charge to the clergy of the rural deanery of Cheltenham he has stated first his reasons for thinking that the Ritualistic, or, as he prefers to call it, the counter-Reformation, movement must be opposed, not tolerated; and, secondly, the particular measures by which he intends to oppose it. With the first of these points we are not concerned. We should certainly not think it a ground of quarrel with a bishop that he holds himself bound to fight the Ritualists. On this head his conduct must be determined by considerations which it is not within the province of a secular journal to appreciate. If, as he thinks, any section of the clergy are deliberately pursuing a mischievous or a dishonest course, he is bound to take all lawful means to prevent their pursuing it to any purpose. It is on the second point, the nature of the steps he proposes to take, that the Bishop of Gloucester comes within the range of secular criticism. The use of unlawful weapons, or the ungenerous use of lawful weapons, is as worthy of blame in a bishop as in a layman, and upon what constitutes an ungenerous use of power a layman is every whit as good a judge as a bishop. It is not a nice question to be decided by experts; it is a simple matter of fair play. To Dr. Elliott it "seems clear that the form of opposition which in the end will be found most successful, as it is certainly that which is most kindly and charitable, is the opposition which rests on moral influence and quiet persuasive moral force." This moral force is to be exerted wherever it appears to be beyond doubt that "practices which have been declared to be illegal by the final decisions of the Court of the Metropolitan" are persisted in. The form it will take in the first instance will be that of a letter to the offending clergyman. To this step, it is needless to say, no objection can be raised. The second, which is to follow upon the clergyman's disregarding the bishop's admonition, will be to place a copy of the letter in the registry of the diocese. This, again, is a matter clearly within the bishop's competence. He may flood the diocesan registry with copies of his correspondence if he so pleases; and, provided that he can raise the money, he may even build a new and special registry to contain them. While this letter remains in the registry the bishop will feel the church of that particular parish closed against him. In taking this view of the situation, the Bishop of Gloucester will be doing the very thing that his Ritualist adversary most desires. A clergyman who knows that he is going counter to the decrees of the Privy Council would rather have a mob in his church than his bishop. It is never pleasant to tell your superior officer to his face that you do not intend to obey him; besides which there is the danger, or rather the certainty, that the bishop would give scandal to the weaker members of the congregation by ordering a treacherous churchwarden to put out the candles, or by making himself an abomination of desolation for the nonce, and standing where he ought not. Up to this point, therefore, we have nothing to say against the Bishop of Gloucester's proposed policy. It comes legitimately under the definition of "moral influence," and it is likely to be as effective as moral influence usually is. Besides all this, however, the Bishop further declares that, so long as his letter remains uncancelled, it will be simply impossible for him "to

give the seal of the diocese to those documents which a bishop may give or withhold." As delivered at Cheltenham, this well-rounded sentence had the fault of not being quite intelligible, but the Bishop has since supplied the defect by a letter to the *Times*. From this latter document it appears that the meaning of his charge is that he will refuse to license curates or ordain candidates on the nomination of Ritualist incumbents. "Prosecutor," cries Dr. Ellicott, in quite a glow of moral self-approval, "I will not be, but the grave moral influence and discipline which I have briefly specified I feel myself solemnly called upon . . . sorrowfully to exercise." Translated into everyday language, the Bishop's protestation comes to this: The Ritualistic movement aims at undoing the Reformation by the introduction of usages which have been declared unlawful by the Supreme Court in matters ecclesiastical. It is my duty as a bishop to contend earnestly against this movement. But I do not intend to vindicate the law by prosecuting those who disobey it. Oh dear no, I am not such a fool. Public feeling is against prosecutions, and in these days "public feeling is an influence that cannot be disregarded by any thinking man"—certainly not by any thinking bishop. The course I propose to take will only bring me in contact with persons so insignificant that public opinion feels no interest in their fate. I shall have to turn adrift a few curates, but curates have no means of making themselves heard. I shall reject a few candidates for orders, but I am not bound to give my reasons, and no one can complain of a bishop's being careful as to whom he ordains. By steadily following out this unassuming policy, I shall live in peace, and die with a reputation from the Council of the Church Association grouped admiringly round my bed.

It seems cruel to disturb so pleasing a vision. To have all the glory of fighting the good fight, and yet to encounter no adversary who is strong enough to give you a damaging blow, is a prospect which may well fire Dr. Ellicott's imagination. Worldly men may think it mean to hit the servant because you cannot get at the master; but a bishop is bound to be unworldly, and in his notions of justice, at all events, the Bishop of Gloucester is evidently resolved to merit this praise to the utmost. There is one flaw, however, in his calculation which deserves to be pointed out. His notion is, that after he has withdrawn the licences of all the Ritualist curates in his diocese, and refused to ordain any candidates on the nomination of Ritualist incumbents, he will have nothing to do but to sit down quietly until these Ritualist incumbents die out, and the diocese has got back to that happy state in which the Bishop says he found it in 1864, when there were 104 churches in which there was no observance of Christmas Day or Good Friday. He forgets that when a bishop says to any section of his clergy, "Nothing shall induce me to prosecute you, but I will do all I can to make your lives a burden to you," he makes it very tempting for them to try whether they cannot force him to prosecute them. There are two ways in which a Ritualist clergyman might succeed in effecting this. One would be to disregard, and persuade his curate to disregard, the withdrawal of the licence, and to go on just as before. Another would be to delegate to laymen all those services and parts of services which are not specially appropriated to the priest, and to reserve all his strength for those services for which a priest is indispensable. In the Roman Church, we believe, the offices which answer to the Anglican morning and evening prayers are constantly said by laymen, and provided that a Ritualist incumbent can find ecclesiastical precedent for what he does, he may not much trouble himself about the law of the land. Supposing either of these lines to be taken in the diocese of Gloucester and Bristol, what is Dr. Ellicott to do? If he calmly allows himself to be defied, he will cease to be of any value in the eyes of the Church Association, and will run a terrible risk of having their countenance withdrawn from him. If he goes to law, he will be brought at last to do the very thing that he is determined to eschew. Whether a Ritualist incumbent is prosecuted for disobedience to "the Court of their Metropolitan," or for defying the action taken by the Bishop in consequence of this disobedience, does not much matter. To the law courts the Bishop must come at last.

It is not a point of much importance, but there is something not quite ingenuous in the phrase which Dr. Ellicott advisedly uses, "the Court of their Metropolitan." As a matter of fact, the final judgments in the Mackonochie case and in the Purchas case—to one or other of which the Bishop is plainly referring—were not given by the Court of the Archbishop of Canterbury, but by the Judicial Committee of the Privy Council. There is a sense perhaps in which the judgment of the Court of Final Appeal may be said to be the judgment of all the inferior Courts; but it has not been usual, and certainly it would not be convenient, to speak of the judgment of the Court of Queen's Bench when you really mean the judgment of the Court of Exchequer Chamber reversing the judgment of the Court of Queen's Bench. The object of the Bishop in assigning the decisions of the Judicial Committee to the Court of the Metropolitan is probably to invest them with an ecclesiastical dignity which he thinks the clergy might not be disposed to attribute to the judgment of a lay court. It is a harmless little device; but at the same time it is a little too transparent to have had even a chance of escaping detection.

CURIOUS WILLS.

THE liberty of making strange and unintelligible wills is allowed by English law to an extent that is not easily defensible. Granting that a testator may dispose as he pleases within wide limits of his property, it might at least be required that he should express his pleasure in unambiguous terms. If this be equivalent to saying that every testator ought to submit his will to an official or private lawyer, it is certainly not the lawyers who would chiefly benefit by the suggestion. The interpretation of obscure wills furnishes daily business to the Court of Chancery, where a judge and half-a-dozen counsel may be heard explaining one man's nonsense by another man's nonsense, or, in other words, endeavouring to construe a will by the light or darkness of decided cases. Where is the pale and melancholy ghost of the testator in the cause? Does he revisit earth to hear an order made for costs of all parties to be paid out of his estate? If he is doomed to expiate his other sins equally with that of making his own will, then indeed his term of purgatory suffering must be endless. We may pity those who in these dull November days are condemned to hover among the back benches of a Court of Equity and witness the dissipation of the estate which had been so painfully accumulated. The fog which pervades the court is only too exactly typical of the mental confusion produced by arguments upon the construction of a will; and after all the elaborate attempts of learned writers to educe order out of chaos, it comes nearly to this, that an astute judge may find plausible reasons for any conclusion that he thinks proper to adopt. An argument in Westminster Hall on a question of this kind assumes almost a sporting character, because there are more judges and less knowledge of testamentary law than exist at Lincoln's Inn, and therefore the number of possible views that may be taken of the case is larger.

Conditions in restraint of marriage have been the cause of perpetual litigation, and a learned writer honestly confesses that his readers may be likely to receive with some degree of jealousy his plan for "reconciling" the reported cases on this subject, since an eminent judge has expressed the opinion that they are so contradictory as to justify the Court in coming to any decision it might think proper. According to this writer, "conditions precedent to marry with consent, unaccompanied by a bequest over in default, will be held *in terrorem*," unless in certain cases which he enumerates. As ladies are interested in this branch of law, it should be explained that a condition precedent is a condition that precedes the vesting of an estate, while a condition subsequent is one of which the non-performance divests it; and a condition *in terrorem* is a sort of legal scarecrow, or dog that can bark but cannot bite. In order to explain this principle by an example, we will refer to a case where a testator inserted in his will a proviso that, if either his wife or daughter should marry a Scotchman, then his wife or daughter so marrying should forfeit all benefit under his will, and the estates given to such, his wife or daughter, as should so marry, should descend to such person or persons as would be entitled under his will in the same manner as if his wife and daughter were dead. It was held by the Court of King's Bench that such partial restraint of marriage was legal; and that the daughter having, while under age, married a Scotchman, and died, leaving a son, such son could not inherit; but that the limitation over (the testator's wife being also dead) to the two children of the testator's nephew took effect immediately on such marriage. It was argued on the one side that, though by the civil and canon laws restraints of marriage are in general discouraged and held void, yet even these laws admit of exceptions to the general rule, as, for instance, if the condition be only temporary, as not to marry before the age of twenty; or if it only exclude marriage with particular persons, as a widow, or a certain person by name, or in a particular place, as in York. But restraints of marriage have always been admitted by the law of England in devises of real estate, and a *fortiori* where there is a devise over, as in this case. Many cases establish the distinction that restrictions of marriage upon pecuniary legacies are governed by the rules of the civil and canon law, which in general repels such restrictions; but upon devises of land, or even charges on land, they follow and are upheld by the law of England. "It cannot be said, as in some former cases, that the prohibition of marriage with a Scotchman was merely *in terrorem*, for that argument has never been admitted where there is an immediate devise over." It was not necessary to contend that a devise on condition of a general restraint of marriage was good. It was enough that all the cases agreed in support of a reasonable restriction of that kind, and there is nothing unreasonable in the restriction in question. There can be nothing unlawful in restraining the object of a testator's bounty from marrying with forbidden persons by name, or with the inhabitants of such a town, even in his own country. A restraint of marrying any foreigner of a particular country is at least as reasonable as against marrying one of a different religion; and this would apply as well to Scotland, the established religion of which is different from the Church of England, and the country is governed by a different law, although united under the same crown. It was argued, on the other side, that this is a restraint extending to a whole nation, and that too forming an integral part of the kingdom. If the restraint went to every person in England, it would clearly be void upon general principles of policy. Then why should not the same principles extend to Scotland? The

fact of the testator having resided in England could not affect the question of policy. The restraints which have been supported in particular cases, such as having consent of parents or guardians, were considered more as regulations to prevent improvident marriages; but this goes to restrain marriages whether provident or improvident, which is unreasonable, and injurious to the interest of the public, which is concerned to promote provident marriages, or at least not to prohibit them. The case of restraining marriage with a person of different religion is distinguishable, not as restraint, but as regulation, of marriage. The difficulty of determining in what faith the children are to be brought up, and the domestic disputes consequent thereupon, may class this under the latter head. There may also be a distinction on the ground of public policy between prohibitions of marriage with a member of a foreign nation and with a member of a nation forming part of the kingdom.

The Court was only called upon to certify its opinion on this case without giving any reasons, so we are at liberty to conjecture how far both the will and the decision on it were influenced by the unpopularity of Scotchmen in England towards the end of the last and the beginning of the present century. The case shows that the law is or was different according as the property is real or personal; the rules as to the former being our own, while we have borrowed the rules as to the latter from the civil law. An interesting argument might be maintained upon the question whether, if marriage with a Scotchman could not, marriage with an Irishman could, be prohibited. But the Court held that marriage with a Scotchman could be prohibited, and not only was the son of the marriage excluded from the inheritance, but also the husband was not permitted to enjoy the estate for life as tenant by what is called courtesy. Thus the case in effect decides that the courtesy of England does not extend to Scotland. A case of great hardship occurred a few years ago where a testator, "providing that his daughter did not marry before she arrived at the age of twenty-eight," gave her 1,000*l*. A gentleman wrote to the testator asking his consent to the marriage of his daughter with the writer, and the testator wrote in answer that he gave his "qualified consent," but must hear from his daughter before he could make it absolute. The daughter wrote to her father that she had given her full consent. Then the father was taken ill and died, and a few months afterwards the daughter, who was then only twenty-one, married this gentleman, who claimed the legacy, insisting that the condition annexed by the will was waived by the consent given to the marriage. It was held that this was a valid and reasonable condition, that it had not been waived or discharged testamentarily, and that, if it could be waived or discharged otherwise than testamentarily, it had not been waived or discharged. The law would of course say that this lady of twenty-one might have waited till she was twenty-eight, and that if she could not wait, or the gentleman would not let her wait, they must content themselves with love, and give up the 1,000*l*. Another case decided, with more apparent reason, that a requisition to marry with consent, imposed by a testator on his daughters, then spinsters, did not apply to a daughter who afterwards married in the testator's lifetime, and was a widow at his death. The contrary construction would have produced the absurdity of obliging the legatee to marry again in order to provide for her children, if any, by her first husband. In an old case the devise was on condition that the devisee married the testator's granddaughter, and no doubt was entertained of the validity of it; but the judge thought that the granddaughter's refusal to marry the devisee was a dispensation of the condition, as it reasonably ought to be. A condition not to marry a Papist has been held valid, but a condition not to marry a man of a particular profession, or a man who is not possessed of a landed rental of 500*l*. a year, has been said to be too general to be legal. A gift during celibacy is good, but a general condition in restraint of marriage would be bad. A gift during widowhood is good, but a condition imposed by a testator on his widow not to marry again must be accompanied by a gift over in default of compliance with the condition, or it will be deemed to be *in terrorem* only, and the widow may disregard it if she has sufficient resolution to brave the vague fear of disobedience to a dead husband.

Many wives and a few husbands have desired their consorts to marry again after their own deaths. One of the best known instances of the kind was that of Queen Caroline. We have all heard what she said to King George IV., and what he answered to her, and she replied to him. Among some examples lately published by a contemporary of "curious wills" is that of a lady who expressed her earnest wish that her darling husband should marry "a nice pretty girl," a good housewife, and of a good tester. There are probably not many husbands who could display such anxiety for the filling of their own places. In a recent case, however, the departing husband earnestly advised his wife to unite herself again with some one who might deserve to enjoy the blessings of her society, and the lady has dutifully obeyed. But many husbands still entertain, though they do not always express, the feelings in which these gifts during widowhood, and conditions *in terrorem*, and all the curious and contradictory decisions thereupon, originated. It is strange that such a legal chaos should have been created, and still more strange that it should continue to exist. Our system encourages testators to make fanciful and capricious dispositions, and then encourages attempts to defeat these dispositions by litigation. Some of the wills that have been most fertile in difficult questions have been made by eminent lawyers for

themselves. Another class of intricacies have been produced by unlearned persons affecting to use technical terms which they do not understand. Testators who cannot or will not employ lawyers will do well to confine themselves to simple arrangements in plain English.

ITALY BEYOND RAILWAYS.

THOSE who know the Italy of romance by report are disposed to wonder at Italian financial difficulties. With its soil and its Southern climate, with a well-meaning constitutional Government always devising schemes of economy and inviting capital for reproductive works, why should there be a chronic deficiency in the Budget? Those who know Italy superficially by travel are inclined to participate in the astonishment. Except where their roads are over the passes of the Alps, or are carried under the bold spurs of the Apennines, they see nothing but richness all around them. Descending from the snows of the Simplon and Splügen, they look down through natural archways of rock over a wilderness of maize and trolled vines. The road of the Cornice runs under olive-yards and orange-gardens which hang on each strip of soil that has caught on the shelves of the precipices. The plains of Piedmont are waving in the season with great stretches of grain; so is the Val d'Arno, if you have turned southwards by way of Florence; and everything in it seems running to fat and fulness, like the teams of "milkwhite steers" that drag the waggon at their lumbering leisure. The rail by which you travel to Padua and Venice is taken for the most part through what look like carefully cultivated and irrigated allotment patches. Even when you go much further to the South, to the countries where despotism used to reign supreme, you are agreeably surprised by the air of well-doing in many places. The shadow of Rome falls, of course, across the desolate Campagna; and everything, except buffaloes and sickly sheep, dies in the fever-stricken Pontine marshes. But even in what used to be the Patrimony of the Church you see bits of garden ground here and there about the villages, where vegetables are grown for the market-stalls in the Piazza Navona; and vast barns scattered over the open country are eloquent of the overflowing harvests that are to be housed in them; while upon Neapolitan territory there is nothing richer than the plain that lies round sensual Capua, with the vines trailing from tree to tree over the dense vegetation beneath them, which is all the better for the shade of their foliage. Peasants and farmers grumble, and tell you that they are terribly overtaxed; you find upon inquiry that the agricultural imposts are in reality very heavy, although it seems that the farmers are very well able to pay them; and you are apt to argue that, if the rest of Italy at all resembles the parts you have seen, the Treasury should certainly show a surplus, making every allowance for its indifferent management.

Were you to extend your journeying to districts seldom visited by strangers, you would not only modify those first impressions, but would very likely be hurried to the opposite extreme. The Special Correspondent of the *Times* has just been travelling "beyond railways," as he expresses it, and he gives the result of his experiences in some interesting letters. They tell the old familiar story of the great natural capabilities of the country, and they show at the same time how very partially these capabilities have been developed hitherto, and how slow and gradual the progress must necessarily be. When Italy was constituted a kingdom, her loans were in high favour with foreigners. Piedmontese credit had been very good, and it was the Piedmontese who were to undertake the administration of the new kingdom. They offered their lenders an ample margin of security, founded chiefly on the certain promise of the future. No one questioned the existence of great material resources which had either been neglected or overtaxed. Lombardy, for example, could hardly be more highly farmed; but the Lombards had been groaning under the burdens imposed by the Austrians. As for the smaller Duchies—with the exception perhaps of Tuscany—the States of the Church, and the Kingdom of Naples, they had long languished under miserable misrule. All would be changed now; the work of regeneration would go forward apace, and the returns would be large and immediate. On the strength of expectations like these, the Italians not only borrowed money freely, but spent it more freely still. They kept up armies and fleets which were comparatively useless unless they were regarded as a speculative investment to be recouped some day by the capture of Venetia. They had their great armies of civil officials, too, which, as they said, they could not disband, except with the certainty of spreading disaffection everywhere. They went to considerable expense in making two successive changes of their capital. They spent money on railway lines, which took the shape of bills drawn on the future when the lines should have become great high roads of international commerce. All this outlay was either altogether or comparatively unremunerative, and in the meantime the general rise in their revenues was not such as to realize their sanguine expectations. In spite of the unquestionable benefits of the revolution, the country did not make the start they expected. In place of wealth accumulating almost spontaneously in the provinces under the more generous system of government and the general sense of relief, their Finance Minister had to cast about for fresh sources of taxation, some of them exceedingly unpopular.

The Correspondent of the *Times* explains in two words the cause of the disappointment. It was owing to the insecurity of life and property. Wherever the one and the other were safe, the

proprietors and occupants of the soil showed no lack of enterprise and intelligence. Districts traversed by high roads and railways, and lying within the reach of the troops and police, answered to the impulse given them by the opening of new and profitable markets. But to districts that were more out of the way, within reach of the brigand fastnesses and beyond reach of the authorities, the change of government brought little advantage. The brigands stopped the way, and, had a transaction with them been either honourable or practicable, it would have been cheap to buy them off on almost any terms. The aggregate of the ransoms they have exacted from their victims, and of the blackmail they have levied in their districts, represents an altogether insignificant proportion of the incalculable mischief they have done. It is not by his allocations alone that the holy successor of St. Peter has sought to injure his enemy the King. When he condoned the crimes of the robber bands on the score of their devotion, and connived at their seeking sanctuary in his dominions, he was injuring the credit of the sacrilegious Government of Italy, and imposing severe temporal penalties on the flock who had renounced his temporal rule. Although the route by which the *Times* Correspondent has been travelling lay beyond railways, it by no means led him into very remote districts. He was not wandering among the Apennines of Calabria towards the heel of the boot, or even in those mountains of Salerno hanging over the swamps of Lacustum, which have been infamous lately as the haunts of the most notorious brigand chiefs. He left the road that leads from Rome to Perugia at those falls of Terni so familiar to tourists, where "Vellino cleaves the wave-worn precipice"; and the journey to Aquila was only a ten hours' one even by the slow Italian post. The country is lovely. But "away from the towns, the population was sparse and scanty, the habitations being wretched and squalid beyond conception." The dress of the natives was in keeping with their dwellings. The men still cling to the cheap and very primitive costume which they have probably worn from time immemorial. Their sole garment in the warm season is a coarse hempen shirt. The attire of the women is "commonplace" and almost as simple. "The country is fruitful and not uncultivated." But the cultivation is of the most miserable kind, and it is no wonder. The people live huddled together in hamlets for mutual protection, and day after day, underfed as they are, they have to drag their weary limbs in all weathers long miles to and from their work. The roads by which they should send their produce to market are wretched, and its quality must be very inferior, thanks to their rude methods of cultivation. The vines still hang from branch to branch of the olms as they did in the days of Virgil, and the elms are not trimmed and pollarded like those we spoke of in the plain of Capua. The herds of horses are half-starved; the very pigs are lank and dissipated-looking, although there are still oak forests left for them to range in; for, in consequence no doubt of the scanty population, the forests in these parts have escaped comparatively cheaply. But the higher ridges are scoured in all directions by watercourses, and nothing has been done to bank the land against winter inundations. The explanation is that the brigands have made the country uninhabitable for any man who has anything but his life to lose. Along the whole way there was no sign of a proprietor's residence. Nay, it is evident that no farmer dare attempt to better himself; for it would be more than his life and liberty were worth to show any signs of competence. The miserable population lives from hand to mouth; the owners of domains that might yield them ample revenues are probably existing as paupers in corners of their palaces in Rome or the provincial towns, and paying next to nothing in the shape of property tax to the Government. Even at Aquila, the capital of an important province, it was unsafe only a few months ago to trust oneself five hundred yards from the gates.

We may be sure that the state of things thus described is nothing very exceptional, and that the conditions of the country between Terni and Aquila must repeat themselves in many of those rich districts to the South which have a still more infamous reputation. Brigandage has not only killed enterprise and frightened capital, but it has condemned the very labourers to lives of hopeless and abject misery. Many of the finest provinces of Italy are practically barren for the Government; probably their contributions have been more than swallowed up in attempting to collect them, to maintain the police, and to administer justice. Nothing can be more deplorable than the sketch drawn in these letters; but we are glad to say that they hold out a prospect of better days. Measures, seemingly effectual, have been taken against the brigands. Fifteen of these scourges of the neighbourhood were to be seen lately confined in one cage in the court at Aquila. We do not indeed learn whether any of them were put to death, or whether the prisons of the province have been strong enough to hold the rest of them. But the Sabina and Abruzzi are said to have been cleared of open brigandage, and they are beginning to experience an unwonted sense of security. The best proof of a marked change for the better is in the development of public-spirited enterprises undertaken in the confidence that they will prove remunerative. The *Times* Correspondent visited a large beet-root sugar manufactory at Rieti, in which a young noble of the neighbourhood is the largest shareholder, while Prince Torlonia, the famous Roman banker, has reclaimed a swampy lake from the sea, and turned it to a fertile "polder," at an estimated cost of rather more than a million sterling. It is believed that these bold ventures will prove successful; if so, there is no doubt they will be imitated; and if once capitalists begin to compete with each other in those rich fields which have so long lain fallow,

it is impossible to over-estimate the probable gain both to the population of the district and the finances of the country. But we need not expect to see a change worked by enchantment, and under the most favourable circumstances a generation may elapse before the downtrodden and brutalized peasantry can be educated into a law-abiding and industrious community.

WHAT'S IN AN ADJECTIVE?

ALL mankind have the right to call themselves by their own names; all mankind have the right to make and vend pickles and sauces, and not less so because their fathers did so before them. Such was the purport of the judgment delivered by the late Lord Justice Knight Bruce in a case of alleged trade-mark. It might be added that all Englishmen have a right to use the English language, and not less so because they happen to sell beer. A dealer in stout conceived the valuable idea of labelling it "nourishing," and he asks the Court of Chancery to protect by injunction the property which he alleges himself to have acquired in this word. He is probably correct in representing that the word is valuable to him, because the majority of mankind will believe anything that is confidently asserted. It may be also that there is no other word which so aptly describes the peculiar property of stout. It would, we should think, have been eminently applicable to stout drawn from the vat in which a negro foreman was many years ago drowned. According to the story which was embellished by the author of *Rejected Addresses*, this negro foreman mysteriously disappeared from the great brewery where he was employed, and his masters were astonished at receiving, within a short time after his death, urgent orders from their customers for further supplies of stout of the same excellent and nourishing quality as before. The cause of the superiority of this particular brewing having been discovered, the firm were obliged to announce with regret their inability to maintain the same high standard, and to explain that, the slave-trade not being allowed in England, it was beyond their power—however much they might desire to please their customers—to guarantee a regular infusion of sleek negro in their stout. It appears that the plaintiff in the present case purchased the business of Messrs. Blockey, brewers, who had been in the habit of calling their stout by their own name, apparently without producing any particular effect on the public mind. The plaintiff continued the "manufacture" of this article, but gave to it the more attractive name of "Nourishing Stout." Now tastes, we know, are various both in beer and words; and we should have doubted whether the effect of calling stout "nourishing" would be enhanced by announcing that it was "manufactured." The word would be to many minds disagreeably suggestive of recourse having been had for the ingredients to a doctor's shop, and this impression would not be removed by the plaintiff's statement that the stout had been analysed and favourably reported on by a well-known chemist. We entertain an old-fashioned, and perhaps erroneous, notion that malt and hops are the stuff to make beer. But now that port wine and champagne are manufactured, it is proper that stout should also be produced by a scientific process and submitted to a chemical analysis. The plaintiff's stout has been recommended by medical men of eminence, and the plaintiff himself alleges that it is of peculiar excellence, "very nutritive, wholesome, digestive, and well suited to invalids." The plaintiff will doubtless find his lawsuit useful as an advertisement, and if the *Alliance News* would take up the case and write a series of articles to demonstrate the wickedness of ascribing these qualities to "intoxicating liquors," his fortune would be as good as made. It will doubtless excite the pious anger of that estimable periodical to find a judge upon the Bench giving his sanction to the notion that the word "nourishing" is particularly applicable to good stout. "Many people," including, it is to be feared, the Vice-Chancellor, "would say that it was a beverage bearing that distinctive quality." We expect to see this case reported under the heading "Barrel and Bottle Trick in Chancery." One great brewer has given 100,000*l.* to restore a Protestant cathedral, and another great brewer has offered the like sum to build a Catholic cathedral in Ireland. "It is often thus," says the *Alliance News*, "that the human soul, seeking to give to God a ransom for its sins, overlooks the fact that it is offering to pay the Almighty in coin bearing quite the opposite Mint-mark." The opinion of Sir Richard Malins that stout is nourishing was only what lawyers call an *obiter dictum*, unnecessary to the decision of the case before him. But he is not less—indeed he is more—responsible on that account for recommending from the Bench poison under the name of nourishment. We may be quite sure that the Alliance will take the case into a higher Court, and it is perhaps indiscreet in a judge to apply the epithet "nourishing" to a liquor which the Legislature has declared to be "intoxicating." In this unhappy country, not only are fortunes made by brewers, but they actually regard as valuable property the right to publish what, according to the Alliance, are false and mischievous assertions. Medical men of eminence who recommend stout to their patients are even more culpable than a judge who praises it from the Bench, because they are speaking with an authority which upon such a point he does not possess. These medical men of eminence will do well to consider a description of their conduct and its results which was given in a recent number of the *Alliance News*. One of them may be called

to see a lady, the mother of a family, who will be found weak in body, depressed in mind. He prescribes a stimulant—perhaps “nourishing stout”—whenever the feeling of depression comes on, and the lady grows so fond of the prescription that she cannot leave it off. Thus misery has been introduced into a happy home, by a friend and medical adviser who has betrayed his trust.

Sir Richard Malins had suggested that “some arrangement might be come to” in the case, but the eagerness of the parties rendered that impossible. We certainly think that an arbitrator might have divided the English language fairly between the plaintiff and defendants. The plaintiff's stout is said to be “nutritive, wholesome, digestive,” as well as “nourishing.” The defendants are doubtless prepared to assert that their stout possesses in an equal or greater degree all these qualities, and they ought to be allowed to claim at least some of them. We are quite prepared to believe further that the defendants could obtain a favourable report from an analytical chemist upon their stout, and that medical men of eminence could be induced to recommend it to their patients. There are many adjectives in the English language, and the world produces a copious supply of malt, hops, and those other ingredients, if there be any other, which go to the composition of good stout. Some years ago a fortune was made by a brewer who discovered and announced to the world that he was using water of peculiar excellence for brewing. Nature usually operates on a large scale, and we incline to doubt assertions of the special quality of a small patch of ground or the water of a single spring. We think that a large quantity of good stout is brewed in London, and that there is not much to choose between the produce of several “manufacturers.” Nevertheless, if people like to be assured that the stout they drink is nourishing, even the *Alliance News* must confess that adjectives are a harmless form of stimulant. There is, of course, a semblance of foundation for the plaintiff's case. The Court of Chancery sustained the claim to a special property in the title “Eumeka” shirt, and it is difficult to see why an English word may not be appropriated equally with a Greek word. The plaintiff must have thought the property which he claimed valuable, as he went to the expense of adducing “voluminous evidence” to support it. Considering that the only question of fact was in the resemblance between two labels, which might be placed side by side on the judge's desk, it is difficult for an outsider to understand what the voluminous evidence could be. But appearances go for much, even in a Court of Equity, and if an important case were stated on a single sheet of paper, we doubt whether even a heavy fee would induce a leading counsel to believe in it. The same habit prevails everywhere. We like to see an ornamental label which assures us that our stout is nourishing; but it does not follow that only one such label is to be permitted to us. The plaintiff does not brew himself; but he alleged that stout was “expressly” brewed for him by Messrs. Truman, Hanbury, and Co. This reminds us of the announcement which appears in the advertisement by the Belgian State Railway Department of the Luxembourg Railway, that “special arrangements” have been made for passengers by the night train from Metz to breakfast at Brussels. It will be found on trial that the “special arrangements” consist of a pot of coffee and a pot of milk. It was perhaps on this point that voluminous evidence was adduced, and the result appears to be that Messrs. Truman, Hanbury, and Co. brew the same beer for the plaintiff as for their other customers. But then it was said that the quality claimed by the plaintiff for his stout was imparted to it after it came into his cellar, and of course it may be that the plaintiff finds his own sleek negro or an equivalent. The Vice-Chancellor inclined to believe that the plaintiff put into it nothing at all. He bottled it and stuck upon it a label, and doubtless he has customers who find it particularly nourishing, and think it equal to that Dublin stout, as to which, again, people believe that the world could not go on without it.

The principle on which relief is given in these cases is “that one man cannot offer his goods for sale representing them to be the manufacture of a rival trader.” This principle has been applied even to cases where the marks, when compared, were “altogether different.” The Court of Chancery has gone very far in protecting these trade names and marks, and it may reasonably hesitate to go further. It is impossible to define beforehand what degree of resemblance is necessary to induce the Court's interference. All that can be said is that no trader can adopt a trade-mark so resembling that of a rival as that ordinary purchasers using ordinary caution are likely to be misled. It would be a mistake to suppose that the resemblance must be such as would deceive persons who should see the two marks placed side by side. But when the question arises as to the degree of resemblance, comparison would, we should think, be worth any quantity of descriptive affidavits. There may be cases where a common word indicates some uncommon quality. But in the present case we may assume the truth to be that the labels were very different and the articles very much the same. It might seem absurd to protect the use of such a title as “Excelsior Stoup,” but there may have been an improvement in the manufacture of soap which was entitled to protection. If, however, we were told of improvement in the manufacture of beer, we should suspect that the alteration, if any, was for the worse. It is admitted that brewing is best on a large scale, and the genuine produce of one of the great London firms, if we could only get it, would, we think, be the most nourishing. Nevertheless, if the plaintiff can induce people to believe in the beneficial influence of his cellar or his treatment, he has by all

means have the advantage thereby secured to him. Only we think that attempts at appropriating the English language should be watched with jealousy.

LESSING AND THE BERLIN STAGE.

ONE frequently hears it asserted in England that modern life does not present the conditions of success for a high-class drama; and some little time since the *Daily Telegraph* told us that it is unreasonable to expect of a theatre-goer nowadays a taste for anything more exacting of intellectual effort than the reigning species of sensational tragedy and superficial burlesque. Such announcements naturally lead one to imagine that some occult universal law is at work, until perhaps we turn our attention to the theatre abroad. Here indeed, there are not wanting phenomena which seem to countenance the supposition. Yet even if Paris has shown of late years little relish for aught but trivial fæces or piquant immoralities, the German theatre proves on this hypothesis a rather troublesome anomaly. How it is we do not purpose to inquire, but the fact must be recognized that somehow or other in Germany, along with a host of tawdry productions (many of them being even now, a hundred years since Lessing penned his *Dramaturgie*, but feeble imitations of French pieces), the best classics in the language manage to hold their ground.

In Berlin, for instance, an Englishman who has perhaps grown weary in London of waiting for a good performance of Shakspeare will be surprised by the frequency with which the names of Schiller, Goethe, Lessing, and Shakspeare himself, figure in the daily play-bills. This “*Athens on the Spree*,” as its admirers are fond of styling it, is no doubt unfitted to be an average representative of national taste. Yet even as an extreme instance it is a valuable corrective to the hasty generalization just referred to. Old Berlin playgoers tell us that the present is by no means a flourishing period for the drama in their capital. They will deprecate with evident enthusiasm on the powers of actors who, like our own Macready, though unknown to the younger generation, live as giants and heroes in the memories of the more experienced. At the same time, in contrast to London at least, Berlin even now presents a high degree of genuine historic study and intelligent appreciation in the theatre-going public. Nothing can be more curious to a foreigner than to attend a performance of one of Schiller's favourites or Shakspeare's masterpieces at any one of the plain and homely Volkstheaters. One finds the pit packed with what appear to be the lower strata of the *bourgeois*, who sit in family knots complacently imbibing a whitish beer from a huge communistic tankard. Nothing would seem to promise less of a refined appreciation for classic poetry than such an exterior. But if you wait till the curtain rises, you will probably be surprised at the change of attitude in this heavy and prosaic-looking assemblage. Conversation suddenly ceases, and an earnest, almost comic, attention fixes every face. It is not, moreover, the very rough scenic devices which simply excite their admiration. Nor do they betray an exclusive interest in the most stirring sensational situations. The piece is a familiar classic, and the end is known from the beginning. What appears to attract and to delight these unpolished spectators must be the forcible and sympathetic rendering of some well-known line or stanza, learnt probably in the early days of the *Bürgerschule*. Energetic applause greets the impassioned deliverance of a noble sentiment or a fine moral reflection, and in the intervals of the play one may overhear some very acute criticisms on the rhetorical skill or deficiencies of the actors engaged. It is but a few years that this class of theatres have had accorded to them the privilege of playing these masterpieces of the German drama, and the frequency with which they are given augurs well for the taste of the Berlin public. Since, too, it is the exceptional thing in the German capital not to frequent the theatre, the selection of so many specimens of the higher drama is pretty certain, we may suppose, to effect a good deal in the way of general culture.

Of the popular classics on the Berlin stage, none probably speaks more distinctly for the intellectual quality of the spectators than Lessing's *Nathan der Weise*. Critics appear to agree that this dramatic poem lacks the deepest charm of a natural yet worthy plot. Many of the incidents are highly improbable, and the *dénouement*, in which an eager lover finds in his mistress a long-lost sister, is a shock to all our ordinary conceptions of a satisfactory termination. The excellence of the piece lies in its noble characters, pre-eminently that of Nathan himself, and in the moral truth, everywhere silently instilled, that religious tolerance must accompany a general sentiment of humanity. It is curious indeed that Lessing, who so jealously vindicated the freedom of dramatic art from all ulterior moral ends, displays conspicuously his own leaning to the inculcation of a lofty moral truth by the medium of the drama. There is nothing, for example, more unmistakably present in *Alles was Menschen sind*, in spite of all its bright and clever humour, than the lesson that even the whitest qualities, such as a chivalrous honour, may run to a ridiculous and even baseless excess. Nor can anybody overlook the moral truth conveyed in *Emilia Galotti*, fine though its proper tragic qualities certainly are. In the case of *Nathan der Weise*, the endeavour to present a new and exalted duty is probably felt by every thoughtful reader to restrict and enfeeble the dramatic effect. At the same time, as a fine didactic poem in dramatic dress, it possesses indisputable merits which have sufficed to raise it to the dignity of a permanent German classic. Indeed,

according to one, and by no means incompetent, authority, Adolf Stahr, this work ranks among the first of these classics, different from, yet co-ordinate with, *Faust* itself.

Lessing's admirers may note with satisfaction that the city which was so slow to recognize the young writer's genius, and which he left with a deep sense of relief, has in these latter days come to pay homage to his great powers. At the Schauspielhaus and even at the Volkstheater one may not unfrequently have the opportunity of hearing one of his famous trilogy. That a piece deriving so much of its interest as *Nathan der Weise* from the thoughts and sentiments uttered should be carefully studied, intelligently rendered with appropriate costume and scenery, and listened to with evident enjoyment by large assemblies, may be regarded as an unambiguous sign of superior aesthetic culture. Possibly in no other capital in Europe than Berlin would the representation of a work of Sophocles, with a scholarly attention to the laws of the Greek stage and the costumes of ancient Athens, prove an attractive ingredient of a repertory. No doubt it might be easy to say that such representations give less of a vivid dramatic impression than of a gratification to one's aesthetic perceptions and scholarly imagination. But, however this may be, the power of Lessing's chef-d'œuvre appears to be felt by the masses, and not simply by cultivated admirers of a past literature. At the Schauspielhaus we recently saw it rendered in the very best style, and with great effect; and a brief account of the mode of interpreting it may help perhaps to show in what the excellence of taste in the German public really consists.

The great overshadowing figure of the drama is Nathan himself, whose expansive intellect, high self-control, and breadth of moral sensibility lift him far out of the region of conventional Jewish character. This difficult part is taken by Herr Döhning, a veteran of the German stage, who proves himself a complete master of this particular character. With a calm figure, slightly inclined forwards by age, and unobtrusive gestures, above all, with the most varied and appropriate play of the facial muscles, betraying all the finest emotional shades of his dialogue, Herr Döhning manages to give an image of the ideal Jew which the spectator will pretty certainly associate henceforth with Lessing's verbal creation. The voice of the actor, moreover, capable of a rich force, yet tending to a grateful pathos and delicacy of expression, is singularly suited to elicit the subtle shades of feeling interwoven in Lessing's dialogue. Even the kindly blue eyes of the actor, however little suited to represent an Oriental physiognomy, helps to build up the impression of the wise, genial Nathan. In the few cases of vehement action, the raised figure, retiring head, flashing eye, and deep powerful voice produce a striking effect, such as is excluded from a uniformly strained mode of acting. The tremulous effect which Herr Döhning introduces into his voice when Nathan embraces Recha, his adopted daughter, after her deliverance from fire, and still more when he relates the murder of his wife and seven sons, are probably as good examples of fine histrionic realization as the modern stage, not excepting the French itself, exhibits, and might perhaps have satisfied even the exacting conditions laid down by the author himself. Even more masterly are the finely selected, yet never forced, expressional movements of face and gestures by which the actor interprets the internal processes of thought and feeling faintly shadowed forth in Nathan's monologue. The quiet composure springing from consciousness of inner worth is exhibited to great advantage by Herr Döhning in the approaches of Nathan to the brusque and surly Templar, the deliverer of Recha, who disdains the thanks of her Jewish protector, and in his interviews with the passionate and timorous Saladin.

The other parts of the play are rendered with a less masterly art. Recha, Nathan's protégée, is represented by a Fräulein Meyer, a young actress, whose somewhat excessive German sentimentality is not however inappropriate to the ardent character of the Christian Jewess. Impulsive feeling and warm imagination are the characteristics of this nature, and are very fairly expressed by the young actress's slightly gushing voice and movements. The part of the captive Templar, Recha's lover and brother, is taken by a less skilful actor, who makes the young knight needlessly awkward and repellent, though perhaps this peevish and unmanly character could scarcely be made satisfactory by the best acting. The parts of Daja, Recha's Christian nurse, and the Friar are given with a great deal of spirit, though the acting here possibly verges a little too closely on the caricature of low comedy.

The appreciation of a theatrical audience may be roughly estimated by the nature of the passages and the mode of rendering which excite the greatest applause. Accepting this test, we must confess that the Berlin public displays a very accurate knowledge of Lessing's merits, and of the finest features of his dramas. The calm, emphatic utterance by Nathan of his favourite moral truths awakens an enthusiastic response. Indeed all that is morally grand and intellectually fine appears to appeal successfully to a Berlin public. On the other hand, a stranger may notice the absence of many ingredients of a finer taste, such as one finds among the *habitués* of the French theatre. We were much struck, in witnessing a representation of *Mémo von Barnhelm* at the Schauspielhaus, by the apparent insensibility of the audience to many of the finer veins of humour and unobtrusive scintillations of wit which mark the play. So, too, one can hardly fail to notice a certain coarseness of feeling in even the more polished Berlin assemblies. We remember attending a fashionable morning performance at the Royal Opera, when between the first and second parts of the concert a lady orator came to the front of the stage, and, amid the exuberant merriment of the audience,

recited a very broad caricature of the woman's rights advocacy. Possibly the absence of all sense of congruity which permits a person to enjoy broad farce immediately after classical music may not be unconnected with a seeming moral obtuseness which shows itself not unfrequently in the Berlin theatres, in a too ready recognition of an indelicate implication in a passage, or of an undesigned ambiguity susceptible of a low interpretation. The Berlin public offers indeed a curious illustration of the fact that considerable mental culture, including even the more intellectual ingredients of aesthetic appreciation, is not incompatible with a certain bluntness of sensibility, the want of which is most conspicuous in those cases where there is a direct appeal to a fine feeling rather than to the intuitive perception of some established law of art.

REVIEWS.

M. LITTRÉ'S DICTIONARY.*

(Second Notice.)

THERE is a certain connexion between M. Littré's method in this Dictionary and the scientific principles of Positivism. He does not make the connexion salient by any emphatic announcement, but there is a phrase in the preface which shows that he is clearly aware of it. He is strongly opposed to arbitrary rules based upon abstract reasoning without reference to ascertainable fact, and believes that a Dictionary based upon the evidence supplied by the history of language will put a stop to that sort of abuse:—

Comme il consigne les faits, il remplit, quant à la langue, le rôle que remplissent les observations positives et les expériences quant aux sciences naturelles. Ces faits ainsi donnés, l'analyse, j'allais dire la raison grammaticale, s'y subordonne, et on s'y subordonnant, trouve les vraies lumières. Il faut en effet transporter le langage des sciences naturelles dans la science des mots, et dire que les matériaux qu'elle emploie sont les équivalents des faits expérimentaux, équivalents sans lesquels on ne peut procéder ni sûrement ni régulièrement. Puis intervient le rôle de la critique lexicographique et grammaticale, s'efforçant de tirer de ces faits toutes les informations qui y sont implicitement renfermées. De la sorte la raison générale se combine avec les faits particuliers, ce qui est le tout de la méthode scientifique.

Un dictionnaire ainsi fondé peut être défini un recueil d'observations positives et d'expériences disposé pour éclairer l'usage et la grammaire.

Treating language, therefore, simply as if it were one of the natural sciences, M. Littré takes the words and expressions which are used in French, and examines them in the temper of a botanical geologist who traces the connexion between a fossil flora and the flora of his own day. There is, however, this difference between the two cases, that whilst the flora of our own time is intelligible (so far as the physiology of plants is intelligible to us) without reference to fossils, no language can be scientifically apprehended without reference to words that are no longer used, and to the grammatical habits of a time when our own grammatical systems were not yet conceived or imagined. The basis of M. Littré's Dictionary is his immense and well-selected collection of examples from ancient and modern authors, and on this basis he founds his opinions and explanations:—

Mon dictionnaire à moi a pour éléments fondamentaux un choix d'exemples empruntés à l'âge classique et aux temps qui l'ont précédé, l'étymologie des mots et la classification rigoureuse des significations d'après le passage de l'acception primitive aux acceptions détournées et figurées. Si l'on considère l'ensemble et la connexion de ces éléments, on reconnaît qu'ils donnent précisément l'idée d'un dictionnaire qui, usant de la part d'histoire inhérente à toute langue, montre quels sont les fondements et les conditions de l'usage présent, et par là permet de le juger, de le rectifier, de l'assurer.

All the articles in the Dictionary are arranged on a uniform plan. After the word comes the pronunciation; then the conjugation, if it is an irregular verb; then a definition of meaning, and the different senses classed and supported by examples borrowed from authors of the seventeenth, eighteenth, and nineteenth centuries, the modern language being considered to date from the seventeenth; then come observations on spelling, on meaning, on grammatical construction, on faults to be avoided, &c., and the discussion of synonyms. All this precedes the historical portion of the article, the examples already borrowed from authors of the last three centuries having but one purpose, the elucidation of meaning; and in those examples the order of arrangement is according to sense. In the historical portion, on the contrary, which comes next after the observations, we have a collection of examples from the remotest beginnings of the language down to the end of the sixteenth century, arranged this time in chronological order. Finally we have the etymology, including, as we mentioned in our former notice, an examination of related words in Italian, Spanish, Portuguese, and Provençal, with different French patois, when they can throw any light upon the subject; and then, by the help of the light thus gained collaterally, an ascent into the languages of the past or of countries outside the Latin family. Thus M. Littré gives us a monograph of every word which is as complete in every respect as the present state of philology permits. Many of these monographs are of great length, much longer than the articles in this Journal, so that it is impossible for us to quote any of the more important ones; but we extract two short ones as etymological curiosities illustrating the utility of M. Littré's method. Had

* *Dictionnaire de la langue française.* Par E. Littré, de l'Académie française. Paris: Hachette.

he confined himself to French amongst the Romance languages, he could never have found the etymology of *abricot*, which is utterly unascertainable without the help of Spanish; and if he had omitted the historical method, he could never have guessed the origin of *galeatas*:—

ABRICOT (a-bri-ko; le t ne se lie pas; au pluriel a-bri-kô ou a-bri-ko; la prononciation varie, les uns gardant au pluriel la prononciation du singulier où l'o est bref ou ouvert, les autres allongeant l'o suivant la règle qui est que l's du pluriel rend la voyelle longue ou fermée) s.m. Fruit de l'abricotier. L'abricot est un fruit à noyau, qui a beaucoup de saveur et de parfum. Abricot-pêche, abricot dont la grosseur se rapproche de celle de la pêche. Abricot plein vent, abricot venu sur un arbre en plein vent. L'abricot plein vent est meilleur que l'abricot d'espallier.

—**RISM.** Ne dites pas comme l'Académie: abricot en espallier. L'arbre est en espallier; le fruit est d'espallier.

—**HIST.** XVI^e s. Ne pouvant sortir par la porte, elles sont contraintes de se jeter par la fenêtre, pour aller dans quelque délicieux jardin manger des abricots, *Lanoue*, 140.

—**ETYM.** Ital. *alberocca*, *albicocca*; espagnol *albaricoque*; portug. *albricoque*. Ce mot français vient de l'espagnol, l'espagnol vient de l'arabe, *albirukh*, et, avec l'article, *al birukh*; l'arabe vient du bas-grec *πριγκοκκιον*, *prinkokkion*; le bas-grec vient du Latin *præcoquum*, nom donné à l'abricot à cause de sa précocité; enfin *præcoquus* n'est pas autre chose qu'une forme de *præcox* (voy. *Præcox*). Abricot est, comme on voit, un singulier exemple de la propagation et de l'altération des mots; c'est par l'intermédiaire de l'arabe qu'un mot Latin est revenu dans les langues romanes.

GALEATAS (ga-le-tâ; l's se lie; un ga-le-tas enfumé), s.m. Logement pratiqué sous les combles. Puisque du dieu des eaux tu tires ta naissance, Loger au galeatas choque la bienséance, *BENSRADAN* dans *RICHEFLET*. Il se retire au galeatas de son palais, *LA BRUYE* XIII. § 20. Tout logement misérable. Enfin, quoique ignorante à vingt et trois karats, Elle passait pour un oracle; L'oracle était logé dedans un galeatas, *LA FONT.* Fab. vii, 15. Le cardinal de Richelieu, appliqué à découvrir tout ce qu'il y avait de mérites cachés dans les galeatas de Paris, apprit en même temps le nom, les projets, la maladie de jeune historiographe, *D'OLIVET, Hist. Acad.* t. II, p. 198, dans *POISSONNAIS*. J'examine s'il est vrai qu'il y ait un architecte, ou si cette maison, remplie de tant de beaux appartements et de vilains galeatas, s'est bâtie toute seule, *VOLT.* *Diet. phil. Dieu, deux*.

—**HIST.** XIII^e s. La une des chevaliers fu à une des torz de Constantinople, li autre furent à une ville que l'on appelle Parte: au chief de cele ville avoit une torz où li uns des chides [boute] de cele chaine [qui barrait le port de Constantinople] fu qui de Constantinople venoit. . . cele torz a nom la torz de Galathas, *Guill. de Tyr*, dans *Martene, Ampl. collectio*, t. v, col. 662. [XV^e s. Et il [le roi] fut logé es chambres et galeatois que son père le roi Jehan fist faire, *CHRIST. DE PISAN, Charles V*, III, 38. Vignes aussi et les terres arables, Moulins tournans, beaux plains a regarder, Et beaux sauloirs pour les poissons garder, Galatas grans et adrois, Et belle tour qui garde les detours, Où l'on peut se retraire à sauté, *E. DESCHAMPS, Le bois de Vincennes*. Or, sus, sus, banquet et soupper, Salliez hors de ce galathas, *Rec. de farces*, p. 411. [XVI^e s. Il lui dit qu'elle montast au galatas, *MANU. NOUV.* XXVII. On remua ces deux prisonniers en un galatas où ils estoient fort incommodément, *D'AUN.* *Hist.* II, 152.

—**ETYM.** *Galathas* a été le nom donné à une tour de Constantinople. *Galatas* ou *galathas* a été le nom d'un appartement dans la maison des templiers. Datum in domo templi et in galata (tiré d'un acte du XIII^e siècle et communiqué par M. Coston de Montellmar), et d'un appartement à la cour des comtes; 1353; datum in domo de Galathas anno domini MCCCLIII, dans une lettre du roi Jean, *Ordonn. du roi*, t. IV, 1358; per dominum regentem, in consilio suo, in camera computorum superius ad galathas, ubi erant domini de Montemorenciac, *Ord. du roi*, t. III, p. 337. *Galatas*, dans Eust. Deschamps, signifie une partie importante d'un grand château; il faut donc admettre que c'est Galata, nom d'un quartier et d'une tour de Constantinople, qui, par une suite singulière, en est venu à signifier une chambre sous les combles.

M. Littré criticizes the Dictionary of the Academy for its popular and unscientific classification of meanings. The Academy, he says, always puts the commonest meaning first, but this may be remote from the true and logical order of the ideas. Thus for the verb *commettre* the Academy gives at first the sense *faire*, whereas *commettre* means primarily *mettre avec*, and only comes to *faire* in a circuitous fashion. In the verb *débattre* the Academy gives *contester*, *discuter*; whereas the word contains *battre*, to fight, which is its primary meaning, and we only arrive at the moral sense after having understood the physical one. As M. Littré himself selects these instances of the vicious method followed by the Academy, we have had the curiosity to see how he explains the two words in his own Dictionary, and we at once recognize the superiority of his own more rational and scientific plan. After conjugating the verb *commettre*, he places at the head of his list of meanings one which is in clear accordance with the etymology—"Proprement, mettre ensemble; usité seulement, au propre, en termes de marine. Tordre ensemble plusieurs torons pour en former un cordage." Starting from this, M. Littré gives us a great number of examples—a whole column of them—in which we may follow the meaning through the most delicate gradations, till we arrive at the word *commettre* in the common sense of committing crimes. So the physical sense of the word *débattre* is placed first, in the struggles of victims before altars, &c., before we come to struggling in argument. The value of this reference to the original physical sense is also shown in the paragraph on the synonyms of the word, where the author compares *débattre* and *discuter*, showing that, as *débattre* is composed from *battre*, it implies greater violence than *discuter*. M. Littré seems to attach great importance to his order of arrangement in meanings, and he has a fair right to congratulate himself on having adopted and adhered to a method which is so precisely in accordance with the course of a philosopher's reflections; the only difference being that, whereas the thoughtful student when he meets with a word tries to trace the meaning of it upwards to the source, M. Littré traces its course downwards.

The preface contains some very interesting remarks on pronunciation. M. Littré regards writing and pronunciation as two forces in a perpetual struggle; on the one hand, there are grammatical efforts to make writing conform to pronunciation, but only with

partial results; and, on the other hand, people who learn from books have a constant tendency to force pronunciation into conformity with the written form, and to articulate letters which ought to remain mute. He gives as an instance of this the vicious but now very common habit of sounding the *s* at the end of the word *file*, which ought to be pronounced *f*, and is so still by all who respect tradition. Any one who has closely observed the pronunciation of French people, even during so short a period as the last twenty years, will at once recognize the truth of M. Littré's remarks as to its tendencies, and the changes which are gradually taking place. The tendency to make speech conform to writing is shown in the pronunciation of final letters which ancient custom dropped altogether; thus we have the word *lace* (a bond), which ought to be pronounced *ld*, and yet is now often pronounced *lak* and even *laks*. There is a constantly increasing habit of pronouncing both consonants when they are double, as in *appeler*, *sommer*, &c., which are very frequently pronounced "ap-peler," "som-met," and so on. Every one says *secret* now, sounding the *c* hard like a *k*, but the old way was to soften it like a *g*, and the word used to be *segret*. As to *reins-claude* the struggle continues, and some say *reins-claude*, hardening the *c*, whilst others remain faithful to tradition, and say *reins-glaude*, as all French people did formerly. The same change is beginning with the numeral *second*, which, according to tradition, ought to be *segond*. There was an old custom of prolonging the vowel in the plural in such words as *chat*, *ot*, &c., which were pronounced *les chât, les ôt*; and this is almost abandoned. But one of the strongest cases is the change in the observation of *liaisons*. The habit of making *liaisons* is constantly increasing; we have met with some Frenchmen in whom it was most tiresome and pedantic, men who could not say *fermer une porte* or *aimer une femme* without vibrating the *r* at the end of the verb. Yet even the least pedantic tie their words more than their forefathers were accustomed to do. Old people used to say *les États-Unis*, but all French people at the present day mark the *liaison* and say *les États-Unis*. M. Littré quotes with approbation a saying of the Abbé d'Olivet:—"La conversation des honnêtes gens est pleine d'hiatus volontaires qui sont tellement autorisés par l'usage, que si l'on parlait autrement cela serait d'un pédant ou d'un provincial." Most people in the present day are going in the direction of pedantry or provincialism. M. Guérard, a friend of M. Littré's, knew an old gentleman who during all his life had been a constant attendant at the Théâtre Français, and had observed during that time a considerable change in the pronunciation of the actors. This shows that even the best actors, who in France are looked to as models in pronunciation, in reality follow the changing habits of the public they are supposed to lead.

Besides these changes of usage in pronunciation, *liaisons*, &c., there are vicissitudes in the value and meaning of the words themselves. This is so well said by M. Littré that we prefer to quote the passage itself:—

L'emploi divers et vivant par un auteur qui à la fois pense et écrit donne lieu à des acceptions et à des nuances qui échappent quand on forme des exemples pour des cadres tout faits. Sous les doigts qui le manient impérieusement, le mot s'échappe tantôt vers une signification, tantôt vers une autre; et sans qu'il perde rien de sa valeur propre et de son vrai caractère on y voit apparaître des propriétés qu'on n'aurait pas soupçonnées. L'on sent que le mot qui paraît le plus simple et, si je puis parler ainsi, le plus homogène, renferme en soi des affinités multiples que les contacts mettent en jeu et dont la langue profite.

This is one of the chief reasons why M. Littré has collected so many examples. It is only by the study of examples that we see the effects that may be produced by words, or rather by literary artists who have the mastery of words. Voltaire understood this, and said that a Dictionary without quotations was a skeleton. If the French nomenclature is a skeleton, M. Littré says that it is easy to give it the fulness of flesh by the help of extracts from a literature so rich as that of France. Here is a very pretty example of the use of quotation. If you look in the Dictionary of the Academy for the expression *sans date*, you will find *lettre sans date* as the illustration, and may possibly go away with the idea that *sans date* has only this prosaic and trivial signification. But M. Littré quotes two verses of Lamartine in which *sans date* occurs exactly in the sense of our own word *immemorial*, as when a poet speaks of "immemorial elms":—

Ce furent ces forêts, ces ténérêts, cette onde

Et ces arbres sans date et ces rocs immortels. . .

An especially interesting portion of M. Littré's labour, though comparatively a brief one, has been what he calls his "Remarks," by which he means critical observations on the use and abuse of the language, on odd expressions, and passages of doubtful grammar which custom has either in some degree sanctioned or else rendered positively authoritative. There are a great number of expressions in French in which the implied metaphor is either not strictly applicable, or else we have the vice of mixed metaphors. M. Littré mentions a few of these cases in his preface, but discusses many more in the body of the work. For example, there are his remarks on the common expression *imprimer un mouvement*. Having given many authoritative instances, M. Littré observes:—

Malgré l'autorité de l'Académie et des exemples ci-dessus rapportés, la locution *imprimer un mouvement* n'appartient pas à un style correct et exact; elle contient une métaphore furtive et incohérente. Imprimer, c'est d'abord et proprement, presser sur, puis faire une empreinte, faire une impression; ce rien de cela ne s'applique au mouvement. Quant au premier sens, qui est presser sur, on dit que le mouvement résulte, entre autres, d'une pression, et qu'imprimer le mouvement, c'est donner le mouvement au moyen d'une pression; mais cette explication ne justifie pas la locution, qui, prise en ce sens, ne dit pas: presser sur l'objet, mais qui dit: presser sur le mouvement, ce qui est inacceptable; l'objet est pressé, et le mouvement en résulte, mais

le mouvement n'est pas pressé; et à ce point de vue on ne peut pas plus dire imprimer le mouvement que déchauffer le mouvement, frotter le mouvement, parce qu'on donne le mouvement au moyen de la chaleur ou du frottement. Quant à l'autre point de vue et au second sens, qui est faire empreinte, faire impression, et qui est celui qu'on a eu véritablement dans l'idée, quand on a fait la locution, car c'est le seul qui implique la communication de quelque chose, l'incohérence de la métaphore est palpable à cause de la ressemblance qu'elle établit entre un mouvement et une impression.

In the course of the same remarks M. Littré observes that "en fait de métaphore, l'usage ne peut guère prescrire contre la logique," and he recommends the reader to avoid the vicious expression. Yet in the preface, when speaking of the atrocious barbarism *le lierre* (in which the article is repeated), which custom has authorized, he argues that the barbarism must be continued because we do not feel it to be a barbarism so long as we are used to it; but if we ceased to be used to it, then all the verses of the classic poets in which it occurs would become insupportable to modern ears. But if usage is not to prescribe against logic, why should it be permitted to prescribe against grammar and etymology? We should imagine that any educated person, even though he wore a Frenchman who had been accustomed to hear such things all his life, would feel a secret desire to get rid of two such abominations as *Antichrist* (for antichrist) and *antedater* (for antedate); yet no French lexicographer, not even M. Littré, who is much above the average in audacity, has the courage to suggest a reform of these old errors which shock the ears of every educated man. When we reflect that every one who lived B.C. was an antechrist, and that *antedater* can scarcely apply to any one but a chronologist quarrelling about a date, it is impossible not to become a little impatient with a nation which has the highest imaginable pretensions to culture and yet perpetuates blunders like these that originated in the vulgarisms of the uneducated. Besides the desirableness of such a reform on etymological grounds, it might be grounded on the authority of some writer in the past: for example, Rabelais wrote correctly *Antichrist*. We are the more surprised at M. Littré's indulgence for faults of this kind because he is so careful to warn his reader against all errors of phraseology, and at the same time is such a thorough etymologist. Many readers, even at the present day, have very little faith in etymology, and are disposed to consider it rather a good subject for joking than a serious intellectual pursuit having the characteristics of a positive science. On this point M. Littré has some observations that are well worth commending:—

Mais l'étymologie est-elle une science à laquelle on puisse se fier, et dépense-t-elle jamais le caractère de conjectures plus ou moins ingénieuses et plausibles? Cette appréhension subsiste encore chez de bons esprits restés sous l'impression des aberrations étymologiques et des querelles qu'elle suscite. L'étymologie fut à ses débuts dans la condition de toutes les recherches scientifiques, c'est-à-dire sans règle, sans méthode, sans expérience. La règle, la méthode, l'expérience, ne naissent que par la comparaison des langues, et la comparaison des langues est une application toute nouvelle de l'esprit de recherche et d'observation. Les savants qui les premiers s'occupèrent d'étymologie, ne pouvant consulter que la signification et la forme apparente des mots, ne réussaient que dans les cas simples: ils n'avaient aucun moyen de traiter les cas complexes et difficiles sinon par la conjecture et l'imagination; et dès lors les aberrations étaient sans limites, parce qu'il ne s'agissait que de satisfaire tellement quellement au sens et à la forme.

M. Littré has a great respect for the different patois still spoken by the French peasantry, which he justly considers as old forms of language quite independent of modern French, and not, as the vulgar imagine, a corruption of it. The patois are the heirs of the old French dialects which in their day were, though different in form, equally authoritative and of equal purity. The Dictionary before us abounds in proofs of the great utility of studying patois with reference to etymology, which it often helps most efficiently. Here are two very pretty instances of this:—

Dans notre mot *ornière*, si l'on prend en considération le commencement *or*... et le sens, on sera très-porté à y trouver un dérivé du Latin *orbita*, *ovata* (l'ornière étant la trace d'une roue) par l'intermédiaire d'une forme non latine *orbitaria*, mais qu'on peut supposer. Cependant, des scrupules étymologiques persistent, et la présence de l'*n* au lieu du *b* entretient des doutes; car *orbita* par l'intermédiaire d'*orbitaria* aurait dû donner *ornière*, non *ornière*. Si *orbita* était quelque part il éclaircirait *ornière*, qui ne pourrait pas en être séparé. Il est en effet quelque part; le wallon a *ornière*, qui signifie ornière, et de la sorte le chaînon nécessaire est trouvé. Prenons le verbe *rouger*: comparé à *songer* qui vient de *sonnare*, rompre viendrait de *rumiare*, dit, par l'épenthèse très-commune d'un *i*, pour *rumare*; de sorte que *rouger* est proprement *rumier*. Cette deduction, que la théorie soutient pour assurée, est vérifiée de fait par les patois, qui disent en effet *rouger* pour *rumier*.

M. Littré compares his own etymological method to the drawing-plate used by wire-makers. In his own *filière* an etymology is not accepted as trustworthy merely because it answers to the French condition of the word; for when the word is common to all the Romance languages, or to many of them, it must answer to the Italian condition, the Spanish condition, the Provençal condition. We cannot conclude this notice better than by an extract showing the utility of these tests:—

La particule préfixative *mes* (mésestimer, méseuer, mesprier, etc.) est un des exemples où ressort particulièrement la nécessité de la filière. A première vue on croirait qu'elle représente la particule allemande *miss* (en anglais *miss*), qui a même sens et même forme; avec le français seul et surtout avec l'italien qui dit *mis*, il serait impossible d'échapper à cette conclusion. Mais allons plus loin, et poussons jusqu'au bout la filière: *mes* ou *mis* devient dans les mots parallèles, en provençal *mens*, en espagnol (mesprezar, mensprezar, on mespreziar), en portugais *menos* (menospreziar, mespreziar, on menospreziar). Ce n'est donc pas à la particule allemande *miss* qu'on a

affaires; elle ne donnerait ni mens ni menos, ni mesprez, c'est à l'italienne, latin, moins moins, qui donne menos, menos, mens, et par là s'expliquent non seulement la nasale devant l'*s*, mais, puis, par altération de la voyelle, mis en italien.

HOLLAND HOUSE.*

THE Princess Marie Liechtenstein, who has written an account of Holland House, is well known in London society as the adopted child of the last Lord Holland and his wife, now his widow; and she speaks of her acquired parents with a filial affection which the public, allowing for natural exaggeration, will regard with pleasure as the innocent outpouring of a gentle heart. Judging the Princess by her book, we should say that she is diffident and modest, and quite conscious of her inadequacy to do justice to the literary and historic theme which she has chosen; and that, her ambition having been confined to merely producing something which would amuse her in the doing and please a partial private circle in the result, she must be infinitely surprised at the extravagant praise which has been lavished upon a slight and superficial performance. In the preface she has herself given us her own estimate of the work:—

Proceeding with the work, and gaining a deeper insight into the subject of it, a conviction has increasingly grown upon me that I was rendering but little justice to my theme. More than once have I felt tempted to lay aside the work—not from idleness, but from a sense of unworthiness. But then, encouraged by the love I bear the old house, and also by the notion that *some thing* is better than *no thing*, I laboured on; and I now place the result tremulously before the public. From my friends, I hopefully expect to receive indulgence.

May I not then be forgiven for having endeavoured to disinter some of the past, and to relate what I could gather of interest about the house in which I grew up under the care of her to whom I owe so much? In my endeavour, it is true, I have often fallen short, and perhaps oftener failed entirely. But I crave forgiveness still.

This is unaffected modesty, and shows a correct perception of the truth. It was natural enough for the Princess to conceive a desire to tell the story of an historic house which had been her home. Her acquired parents had lived much in Italy, where she gained a taste for art and some knowledge of it, which qualified her sufficiently for the compilation of an unambitious catalogue—to which she would have done well to confine herself—of the art treasures of Holland House. In her more ambitious task she has been aided by friends clearly incompetent to advise her, or to do her good service. Of Holland House in its famous days she herself has no personal knowledge. She never even saw—she is too young to have done so—that charming and brilliant Lord Holland, husband of the clever, eccentric, disagreeable, yet, in her way, kind-hearted lady who had been previously Lady Webster, who made Holland House a temple of Whig politics, and a cosmopolitan Exchange of literature, art, science, wit, and genius. Sir James Mackintosh made notes for a history of Holland House, which he could have worthily executed. The Princess speaks of these notes as if she had used them much; but her precise references to them are singularly few and uninteresting, and we should doubt from her actual use of them whether they have any great value. Lord Macaulay has left a brilliant miniature sketch of the Holland House library drawing-room in its days of literary glory. The Princess should never have touched this subject. Feeble as is throughout the literary execution of this work, there is perhaps no part of it so feeble and jejune as the list of celebrated guests who swelled the reputation of Holland House in those forty palmy years. The list was given by the last Lady Holland to Sir James Mackintosh. How much could not he or Macaulay have made of it! We have now a dull series of platitudes, and even worse. We are really sorry for the Princess, who has evidently been badly advised and assisted. Here are some of her notices:—

Sheridan, the wit, the genius, whose faults have been described as almost all of a poetical character—the excesses of generous virtues.

Sir Philip Francis, whose supposed authorship of "Junius" places him in historical interest on a level with the wearer of the iron mask.

George Ellis, of the *Anti-Jacobin*, the writer who changed his politics, and was right for what he did, if conviction guided him.

Lord Jeffrey of the *Edinburgh Review*.

Lewis, called after his famous book, *Monk Lewis*.

Lord Aberdeen:

"The travell'd Thane, Athenian Aberdeen."

Mr. Frere (the Right Honourable John Hookham Frere), for some time, during the early part of the present century, British Minister in Spain. Like his host, he was an accomplished translator of Spanish. But his most popular claim to literary renown will probably be his joint authorship with Canning of "The Needy Knife-grinder," more so than his character of Whistlecraft, Lord Byron's confessed immediate model for "Beppo."

The Duke of Richmond, a very Conservative name in a very Whig circle.

Charles James Fox, of course.

Whishaw, whose sense made his opinions valuable to have, and also difficult to obtain.

But enough, and more than enough, of this poor prosiness. The story of Frere's joint authorship with Canning of the *Needy Knife-grinder* may be true, but it requires confirmation; and the allusion to the character of Whistlecraft is utterly unintelligible to the general reader, because the Princess herself apparently does not understand what she is writing about. Frere published a burlesque poem by two pretended Whistlecrafts in the metre which Byron afterwards

* *Holland House*. By Princess Marie Liechtenstein. With numerous Illustrations. 2 vols. London: Macmillan & Co. 1874.

selected for *Byron* and for *Don Juan*; the "character of Whitbread" was no model for *Byron*. There has other claims upon the remembrance of scholars and cultivated men. The Duke of Richmond was a Cabinet Minister in Lord Grey's Reform Government. The original descriptions of George Ellis and Whistler are in a style which unfortunately abounds in the Princess's writing.

The historical part of this book is mere cram, poorly executed, and interspersed, we cannot say relieved, by some pointless attempts at wit and rapid meditations. The heiress of Sir Walter Cope, an early lord of the manor of Kensington, who built Cope Castle on the site of Holland House, married Sir Henry Rich, who was created Earl of Holland in 1624. This is all; a simple unromantic marriage, which the Princess inappropriately introduces by a stale reference to detective strategy. "But it may be time now to say with *Vidocq*, *Trouvez-moi la femme*." Sir Stephen Fox was the father of Henry Fox, the first Lord Holland; no relation of the Riches, but a subsequent owner by purchase of Holland House, whence his title. It appears that one of the armorial bearings of the Riches, a *fleur de lis* in a canton, had been given to Sir Stephen Fox in the mysterious disposition of Royal honours by Charles II. The Princess remarks, and we are utterly at a loss to catch her meaning:—"Perhaps, indeed, the person who traced the original heraldic employment of ermine to the coats of skins given by the Croator to our first parents would have found more than a mere coincidence in this fact." The daughter of Addison, who died in Holland House, is brought in as showing great eagerness to be married; and the Princess tells us that, "like many another poor gentlewoman, she died a spinster; and like many another poor spinster, she was one against her will." Miss Addison had shown much disposition to take a gentleman whose person was disagreeable to her, but the affair came to nothing, and the Princess moralizes:—"What a pity that so much valour should have remained unrewarded; what a pity that so much similar valour in the present day remains unrewarded still!" Sir Stephen Fox was, we are told, in 1679 "constituted" a Lord Commissioner of the Treasury. There is in the chapter on Sir Stephen Fox a very quaint little gem from the Holland House MSS., an account by his son Henry, the first Lord Holland, of the death of his widow and her excellent advice to her children. This is one of very few extracts from the Holland House MSS. that give any interest to this book; indeed there is only one more of much value, an epistolary curiosity in the shape of a letter from Voltaire to Henry, Lord Holland, giving a notice of a visit he had received from Lord Holland's son, Charles James Fox. A few letters relating to the same Lord Holland, from the MSS., are apparently not appreciated by the Princess (Vol. I., pp. 45-50). She begins by stating that Henry Fox was in 1755 appointed Secretary of State, the Duke of Newcastle being First Lord of the Treasury. "But they disagreed," she says, "and Fox asked the King's permission to resign, which he was allowed to do." Then she prints letters to "show that it was not intended he should have the actual management of affairs in the House of Commons." The first of these letters bears date March 14, 1734, and is from Fox to the Duke of Newcastle, declining the Secretaryship of State without the lead of the House of Commons; this was fifteen months before Fox became Secretary of State. The second letter is one from Fox to the King, delivered by Lord Waldegrave, dated December 10, 1754, accepting admission to the Cabinet, without the Secretaryship of State. Then in September 1755 Fox was appointed Secretary of State, with the lead of the House of Commons, which in March 1754 had been refused him; and it was thirteen months after this—in October 1756—that, dissatisfied with Newcastle, the Premier, he asked leave of the King to resign, and was permitted to do so. His resignation broke up Newcastle's Ministry. The third letter printed by the Princess, to "Friend Pater" [Collinson], is written after this resignation and the break-up of the Ministry. The Princess makes no attempt to explain the letters. The resignation had nothing to do with the original question between Fox and Newcastle as to whether Fox should or should not have the lead of the House of Commons, with the Secretaryship of the State. The *Quarterly Review* makes it a reproach against Fox that he broke off the treaty with Newcastle because they could not come to terms touching the secret service money to be employed in bribery. The question was the lead of the House of Commons, and the control of the secret service money was in those days a necessary part of the "lead." Secret service money for bribery was not personal to Fox; it was part of the system. Pitt afterwards, when consulted by Newcastle, reproached him for not having given Fox the lead of the House of Commons. When Fox was made Secretary of State in September 1755, the lead was given him, with control of secret service money.

In the chapter on Charles James Fox there is nothing ostensibly new; and the general result is poor enough. Here again we sigh for Mackintosh or Macaulay. It occurs to us that two or three statements, which are here made without specific authority, or of which at least the authority is unknown to us, may be made by the Princess from family hearsay not necessarily correct. A statement about the poet Wordsworth surprises us:—

The man who revelled in Dante's "Divine Comedy" could hardly be expected to have a taste for the school to which Wordsworth belonged, and he did not form any such taste even when he came in contact with the poet himself. Seeing him at a ball given by Mrs. Fox, he expressed pleasure at making his acquaintance, but expressed no admiration of his works. Said he, "I am very glad to see you, Mr. Wordsworth, though I am not of your faction."

Wordsworth sent Fox a copy of his *Lyrical Ballads* with a charming

letter which must have touched the statesman's heart. Fox's reply has been published with Wordsworth's letter in the *Edinburgh Review* of Lincoln's life of the poet; it does not bear out the Princess's statement. This correspondence was within five years of Fox's death. This is the beginning of Fox's letter, dated St. James's Hill, May 25, 1801:—"I owe you many apologies for having so long deferred thanking you for your poems and your obliging letter accompanying them. The poems have given me the greatest pleasure, and if I were obliged to choose out of them, I do not know whether I should not say that 'Harry Gill,' 'We are Seven,' 'The Mad Mother,' and 'The Idiot,' are my favourites." He goes on to say, with reference to other poems in the volume, that he is "no great friend to blank verse for subjects which are to be treated of with simplicity." He adds, "You will excuse my stating my opinion to you so freely, which I should not do if I did not really admire many of the poems in the collection, and many parts even of those in blank verse." And he concludes by noticing with favour Coleridge's poem on the Nightingale, in the same volume, as if his sympathy extended beyond Wordsworth to another chief member of "the faction." There can be little doubt that Fox, with his deep sensibility and poetic nature, the lover of Virgil and Theocritus, would have been an ardent admirer of Wordsworth. He knew only the poet's beginnings, and picked out for his favourites some of his most characteristic simple tales of the human heart.

The enterprise of the publishers or the wealth of the authoress has clothed the book in a splendid exterior; the paper and print are superlative, and the engravings and woodcuts exquisite. It is indeed a thousand pities that the Princess did not confine herself to the publication of the beautiful specimens of art which the volumes contain, accompanied by strictly illustrative letterpress. This would have been a choice memento for the Holland House circle, and would have given pleasure without alloy to others. Even as a guide through the house and grounds, the Princess continually spoils her work by unintelligible meditations. We should be disposed to give a liberal prize to whoever can interpret the following musings on the "Green Lane," to which an old ghost story, told in Aubrey's "Miscellanies," is attached:—

Nor do we doubt that if we knew all the stories of the Green Lane, if we could see all the visions it has witnessed that past us, we would learn a moral from each little romance, and find it difficult to quit the spot without many a serious thought, many an inquiring return upon our own hearts. For, contrary to the usual rendering of an oft-used proverb, should not charity begin at our neighbour's, and improvement at home? And, after all, the work of self-improvement ought to be as easy as well as profitable, inasmuch as vicinity enables us to command an advantage over our own premises which we cannot reckon upon with respect to our neighbour's!

The Princess's book is almost entirely wanting in stories of the remarkable and eccentric Lady Holland who was wife of the great literary Meccenas. One thing she tells us, which is, we believe, new, and which we take for granted is true, that when Charles James Fox expired, "Lady Holland appeared to those who were waiting near the chamber of death, and answered their breathless inquiries by walking through the room with her apron thrown over her head!" This was only eccentricity. The notices of this book which have appeared in the *Quarterly Review* and the *Times* are full of good stories of her. But "good" stories proverbially require sifting. Is it likely to be true, for example, that the imperious lady took Drumm into the railway carriage with her on one occasion, and made him slacken the pace of a Great Western express train twenty miles an hour, in spite of the protestations of the passengers? Another story, told by the writer in the *Times*, deserves careful examination:—

Allen was called her "pet Atheist," and she showed no extraordinary reverence for the Church ritual when she caused the Burial Service to be performed by a benighted clergyman (who, we hope, was not privy to the secret) over the body of a kid, having first given out that the funeral was that of a daughter by her first husband, whom his family had threatened to take from her. That daughter grew up to be a charming woman; and, till her death in 1849, was familiarly known as the "kid" among her friends.

This seems to us a very serious story indeed. If there be truth in it, Lady Holland's offence was not lessened by her having deceived the clergyman. It is right to say that the Princess Marie Liechtenstein makes no allusion to this story, which gravely affects the reputation of Lady Holland and of all that distinguished and brilliant circle who are represented as having known and enjoyed the joke. A highly respectable living nobleman has ventured, with what might be thought by some fastidious severity, to criticize Sydney Smith's intimate connexion with Holland House:—"He frequented and extolled with unqualified praise a society to which not only a moral objection existed, such as is usually recognized in England, but of which some of the leading members were, according to universal report, not only infidels, but atheists, and in which religion never could be mentioned" (Lord Lyttelton's *Ephemera*, First Series, p. 282). Lord Houghton, on the other hand, has lately made a serious contention that Sydney Smith was unjustly treated because he was not made a bishop. If it is really true that Lady Holland inveigled a clergyman into reading the funeral service over a dead kid, to throw dust in the eyes of her first husband's family who were seeking protection of his daughter, and that the profane imposture was a cherished joke at Holland House, Lord Lyttelton must be allowed to have some justification for his remarks.

DR. E. SMITH ON FOODS.*

WE have had within the last few years many works upon the subject of foods and dietaries, but none approaching in breadth or comprehensiveness that of Dr. Edward Smith. He has gone so far as to include within the scope of his treatment both water and air, as matters intimately bound up with alimentary substances, so as to form a section by themselves as "gaseous foods" supplementary to the universally received solid and liquid foods; and consequently commanding great attention, as well from the point of view of nutrition as from their sanitary aspect. Whilst aiming at the production of a work which should include all generally recognized and some less well-known foods, and should embody the latest and most correct scientific knowledge concerning them, he has judged it best to reserve for a future occasion the subject of diets and dietaries, including whatever gains to science have accrued since the issue of his *Practical Dietary*, restricting himself for the present to what concerns the origin, the chemical composition, the preparation, and the physiological effects of food. In his introduction Dr. Smith qualifies to some extent the definition of food broadly and popularly laid down as that of a substance which, when introduced into the body, "supplies such material as renews some structure or maintains some vital process," differing from a medicine, which, while modifying vital action, does not itself supply the material which sustains such action. This definition may be correct as far as relates to the substances classed by the Germans as *Nahrungsmittel*, which supply nearly all our nourishment. But there are, he adds, certain so-called foods known as *Genuasmittel*, which seem to form a connecting link, in that they increase vital action in a degree far beyond the amount of nutritive material which they supply, resembling certain medicines in their mode of action, while, in respect to the proportion of nutrition which they afford, ranking as food. It is of the essence of a food that it should support or increase vital action, whilst medicines as a rule lessen, though in some instances they increase, it. Various as foods may be classified, into simple and compound, into vegetable and animal, into those which peculiarly besit this or that climate, age, or season, or those which influence exceptionally this or that portion of the organism, the ultimate elements of all foods, in however different proportions they may combine, are found invariable. The vegetable draws water and minerals from the soil, whilst it incorporates the air in its own growth, and, when eaten by animals, enters into and sustains their life, the animal thus gaining the substances which the vegetable first acquired. Completing the circle, the vegetable receives back the air which the animal throws out in respiration, its excreta and final products of dissolution, the same elementary substances sustaining in turn or being animated by so many successive organisms, the young Phoenix, so to say, rising from the ashes of its parent.

There are, broadly speaking, two principal effects for which food is required by the body—the generation of heat and the maintenance or growth of the bodily structures. Not that this distinction, which we owe to Liebig, is to be taken as incisively correct; the flesh-forming food engendering at the same time a certain degree of heat, and the food which generates heat contributing to form an amount of flesh in the form of fat. Still, associated as they are in their vital work, the two processes are widely enough apart in their primary characteristics to form the best practical basis which we possess for the classification of foods. Recent experiments have resulted in our obtaining expressions for the equivalent of heat which enable us to test with accuracy the effects produced upon the body by foods of different kinds. A table borrowed by Dr. Smith from Dr. Letheby, based upon experiments made by Dr. Frankland, shows the amount of heat generated from ten grains of various foods during the process of combustion in the body, and the force which forms the equivalent to that amount of heat. For unsentimental readers this table is fitted to form a very suitable introduction to the study of the heat-generating properties of food. Thus ten grains of dry lean meat, if completely burnt in the body, would produce heat sufficient to raise 13 lbs. of water 1° Fahrenheit, or to lift 10·128 lbs. in weight one foot high. The same amount of albumen would raise to 1° Fahrenheit 12·85 lbs. of water, or lift 9·920 lbs. one foot. Lump-sugar of the same quantity would impart the equivalent heat to no more than 8·61 lbs. of water, or raise by one foot no more than 6·647 lbs. of matter; while butter would yield heat in the proportion of 18·68, and beef fat in that of 20·91 lbs., which is equivalent to raising by one foot 14·421 and 16·142 lbs. respectively. For the production of heat within the body, precisely as coal and wood supply fuel for fire without the body, there is needed the combustion of the chemical elements of oxygen, hydrogen, and carbon in certain combinations, supplied in the shape of fat, sugar, starch, or other digestible food into which those substances enter.

The structures of the body being in a state of continual change, a corresponding process of renewal has to be kept up by means of the assimilation of substances equivalent in kind and quantity to the matter wasted. Hence it is important to gain a general idea of what are the substances composing our bodies. A popular notion of the mysterious elements out of which our living organism is so fearfully and wonderfully made is perhaps best gained from a glimpse at the array of thirty or so glass and

earthenware vessels of various capacities which are to be seen at the South Kensington Museum. Next to this Dr. Smith's enumeration of the materials of which are composed the bodily structures or tissues—varying as they do in the case of the flesh, blood, bone, cartilage, the brain, the liver, the lungs, and the bile—will be found to supply as clear and full an idea as can well be given in so narrow a compass. The practical problem presented to the mind is how to provide the body with the necessary salts of potash, soda, lime, magnesia, sulphur, iron, and manganese, as well as with sulphuric, hydrochloric, phosphoric, and fluoric acids and water, and with the fat which it consumes daily, and all the nitrogenous substances that it requires, which are closely allied in composition, and are all but identical in vegetable and animal tissues, such as albumen, fibrin, gelatin, casein, and chondrin. It is difficult to say how far any of these multifarious substances are absolutely indispensable to the persistence of the powers of life, or whether the four primary elements at all events must enter in some proportion into the habitual modicum of food. Two points have, however, been sufficiently shown by experiment—first, that no animal can subsist for any length of time upon food from which nitrogen is wanting; secondly, that a certain mixture of elements is absolutely necessary to healthy food. No animal fed exclusively with starch or sugar or albumen or jelly can continue in health; but let these substances be properly mixed, and the animal thrives, and fattens. Nor, again, can any substance be fit for food which has not undergone the process of organization needful for its conversion into protoplasm and its assimilation into the tissues of the body. No combination of oxygen, nitrogen, hydrogen, and carbon artificially made can constitute food. Nor would it be possible, without the wondrous provision which we have in the processes of nature, for animal life to exist. The primary appetites and instincts, aided by the accumulation of experience, have enabled mankind, in anticipation of scientific knowledge, to select and blend those products which nature has prepared to hand both in the vegetable and animal kingdoms. And few things are more interesting than to trace how the tests and appliances of science harmonize with and vindicate those lessons which the voice of nature has for ages, inarticulately it may be, spoken in the ear of man.

Before passing to the special enumeration and analysis of the various constituents of food, Dr. Smith illustrates by the aid of diagrams the vital changes due to sudden and marked alterations of temperature, of bodily exertion, or of diet, as shown by the rate of pulsation and respiration, or that of the evolution of carbonic acid in the expired air. The cursive lines in which the use of the sphygmograph enables the variations of the pulse in health and disease, or in youth or age, while sleeping or awake, to be set before the eye, are of great use to the reader; as are also the various diagrams in which the effects of the starch series of foods and fats (95), the sugars (100), milk (124), tea (133), and alcohol (136) are shown in relation to respiration and the emission of carbonic acid. Highly abstract or theoretical as those tables may appear at first sight, the reader will soon see with gratitude in how many ways the physiologist can make them directly applicable to practice. They are of not less immediate or tangible value in the kitchen, the nursery, or the sick-room than in the laboratory of the chemist. What, for example, can be more practical than the experiments which, in treating sago and arrowroot, to take an instance among the non-nitrogenous series, Dr. Smith has made upon himself, and embodied in the first of these tables? Eaten alone, and upon an empty stomach, arrowroot gave no sense of satisfaction; but, on the contrary, there was a sense of sinking or *malaise* in the stomach and bowels in about an hour. The effect upon the respiratory and other vital functions was very slight. After eating 500 grains well cooked in water, the average increase in the emission of carbonic acid was only 0·154 grains a minute, whilst there was a subsidence in the rate of pulsation and respiration. When the same quantity was taken after a perfect fast of twenty-four hours, the effect was still very small, though greater than when eaten under ordinary circumstances; the maximum increase of carbonic acid being only 0·45 grains a minute. The addition of one ounce of fresh butter only brought up the increase to 0·4 grains at the most, the respiration being slightly lessened, and the pulsation increased four beats a second. When 250 grains of sugar were added to the arrowroot, as in the preparation of pudding, the carbonic acid evolved was raised by one grain, and the quantity of air inspired increased by 20 cubic inches a minute, the rate of pulsation being again somewhat lessened, and that of respiration increased. The sense of satisfaction was greatly increased by the addition of sugar and butter. When starch was obtained by washing wheat flour, or as commercial starch, the increase, both of carbonic acid evolved and of the rate of pulsation and respiration, varied with the amount of gluten retained after washing. Hence Dr. Smith infers there can be no doubt that starch, to be used as a nutriment, should not be entirely free from gluten or other nitrogenous matters.

Of nitrogenous or flesh-forming foods, the most important has been found by long experience to be wheat flour and its preparations. The scientific grounds for this preference, in comparison with the allied cereals such as barley, oats, rye, and maize or Indian corn, may be readily gathered from Dr. Smith's analyses and explanations. This portion of his book is instructively as well as amusingly diversified by a selection of receipts from a quaint and somewhat rare volume called *Chury*, compiled from the MS. records of the master-cook of Richard II. A table of the prices of live stock in the reign of Edward II. will have no less interest either

* *Foods*. By Edward Smith, M.D., LL.B., F.R.S., Inspector and Assistant Medical Officer for Poor Law Purposes of the Local Government Board, &c. London: Henry S. King & Co. 1873.

for the curious in antiquarian lore or for those whose tastes lie in the direction of domestic and political economy. The assize of bread under the seal of "Wilkes Mayor," June 27, 1775, will remind the reader how late the notion of fixing by authority the prices of articles of food still lingered in the mind and in the statute-book of the country. These references will at the same time serve to show the width and variety of the materials of which Dr. Smith's book is made up. We should despair of doing justice, by any number of extracts compatible with our space, to the multiplicity of details with which it abounds, or to the skill with which the technicalities of the subject are made clear to the popular intelligence. The professional student might call for a more profound and elaborate treatise. But for the use of the comparatively unlearned, and within anything like its proportionate bulk, it would be difficult to produce a more instructive and serviceable manual.

CAMP NOTES.*

MR. BOYLE would hardly object, we presume, to be called a Bohemian. He does not belong indeed to the city variety of the species, but prefers to wander on the border-lands where civilization melts into barbarism. He has travelled far and wide, and seen many strange sights; but his favourite haunts, if we may judge from this book, are in Borneo and Central America. Rajah Brooke is the chief object of his hero-worship, but he has also a considerable sympathy for the filibuster Walker. Any region, however, in which there are tigers, crocodiles, poisonous snakes, savages, and half-civilized enemies of savages, would appear to have charms for him. The cultivated world enlarges its borders with painful rapidity, and the romance of the wilderness dies out before it. The old collections of voyages and travels which used to be the delight of our infancy are growing painfully obsolete. Eldorado and Prester John have disappeared, or, as we shall see, almost disappeared, before the inquiries of the Geographical Societies. Yet all along the frontier line of civilization a man may still put his life in danger, and be rewarded by sights which to some minds afford a pleasant relief after the monotony of European culture. Unluckily it must be added that even these regions are far from having their old picturesque charm. The backwoodsman has got rid of his leather stockings, and dresses himself from stores in the Broadway. The most desperate rowdy of the South-West used to appear, before a rifle bullet put an end to his distinguished career, in a black dress-coat, black trousers, and a velvet waistcoat. And it is still more lamentable that the modern representatives of the old buccaneers have learnt (if we may trust Mr. Boyle's reports) to talk a peculiar dialect, which is not only stuffed, as of old, with profane oaths, but seeks a new graco from the adoption of the phraseology used for padding magazines. Thus, for example, we find Mr. Boyle on the Mosquito coast camping out with a Yankee, an Americanized Englishman, and a wild Missourian. They are fine specimens of the gambling, gold-digging, froe-and-easy persons whom a squeamish coequey might possibly describe as ruffians, but who, as we are assured, are provided with excellent hearts under a rough exterior. They are full of legends about the exploits of Walker, and mysterious discoveries of gold in the heart of the Central American forests. And yet these gentlemen talk just as if they were dictating fragments of thrilling novels for serial publication. One of them in the course of a solitary expedition through the woods becomes convinced that some creature is on his track. How could he know this when he had seen nothing? "Perhaps," he replied to the supposed sceptic, "I'd seen the waving of the bushes when no wind stirred in the hollow wood; perhaps I'd thought to hear the crack of broken sticks as a heavy foot pressed on them; perhaps through my shut eyes at night I'd seen great green lamps glaring on my face, and awakening in the black stillness had heard a stealthy rustle of undergrowth." A vein of poetical sentiment occasionally crops out in a still more surprising way from the rough talk of these unsophisticated persons. An ex-filibuster, describing his experiences, observes that the church defended by a small garrison for nineteen days looked "like a Chicago pig-yard at slaughter-day." And then he breaks out, "Ah, boys, they're beautiful, these tropical lands! Gay and fragrant and full of flowers is their soil, dazzling bright the air, and shot with all colours the birds, the flies, and insects! But death waits everywhere, hidden beneath the brightness and the beauty," and so on. We were never personally acquainted with any human being who talked in sentences like these, and, if they are faithfully reported, we should say that some of these gentlemen might as well drop their revolvers and take to lecturing at Christian Young Men's Associations. Their sentiments, if rather obvious, are pathetic enough to draw tears from a crowded room. If, however, as we are inclined to suspect, Mr. Boyle has added a touch or two of his own to bring the talk of his friends into harmony with the magazines for which his sketches were probably originally intended, we can only say that he has rather damaged the local colouring. It is indeed a fault in the whole book that we are left to find out for ourselves what is and what is not authentic. We would not be so pedantic as to insist upon a traveller confusing himself to the strict unadulterated reality. We will allow him to soar occasionally from mere matter of fact into the regions of pure imagination, and at least to repeat stories which, if not credible in themselves, are interesting illustrations of the state of mind of the narrator. But we confess that we should prefer a rather more distinct intimation of what is to be taken for fiction. Some of the stories, which would be really curious if taken as accurately reported, become utterly uninteresting if they are simply specimens of Mr. Boyle's skill in polishing up old materials. After making these deductions, however, we may admit that Mr. Boyle's book may take a very respectable rank in the class to which it belongs. He is not so dull as most writers upon sport; and if we can hardly call him a good observer, he can yet accomplish respectable bits of what is called graphic description.

We will notice an anecdote or two in illustration of the general nature of his book. From one story, for example, we learn that the old notion of an Indian country free from the encroachments of white men, where gold is to be had for the gathering, and where the ancient superstitious rites are still practised, passes current amongst the adventurers in Central America. The scene of this country is laid on the river Frio, which flows into the Lake of Nicaragua; and the discoverer is a filibuster making his way across country after a defeat of Walker's forces. He and a companion travel by night along well-trodden paths, avoiding the villages; and in one place they come across a great temple in the forest, where they hear the priests beating upon their drums, and see human sacrifices suspended from the trees. Mr. Boyle feels it necessary to "give his authorities for this story": and he mentions two anonymous persons and various other indefinite persons, though he does not care to tell us how far they confirm this singular narrative. If anybody wants to find a remnant of the old native government, he has only to ascend the Frio and to take care that he is not converted into a victim. The Indian race however has, according to Mr. Boyle, a clearer prospect of turning the tables upon the descendants of its conquerors. The "Greasers," as the men of Spanish descent are called in that part of the world, are already a small minority of the population, and are rapidly dying out. If immigration were stopped, there would not, says one of his informants, be a Greaser left alive in the land thirty years hence. If they were once dead, the descendants of the old caciques would quietly step into the places of their forefathers; the idols, which are still sometimes found covered with flowers in a morning, would again become the objects of the old worship; and, in short, Christianity and European civilization drop off the Indians "like water off a stone."

These and some other remarks about various savage tribes are not without interest; though they would be all the better if Mr. Boyle would condescend to give us his views with less literary embroidery. Perhaps, however, most of his readers will be better pleased with the sporting stories, which are sometimes told with a good deal of spirit. There is, for example, a fight with a big serpent which is enough to make anybody feel uncomfortable who lives within a mile of the Zoological Gardens. There is a thrilling interview with a pack of the American wolves or coyotes. These interesting creatures have not the courage to attack a man, although they show an intelligence in hunting their game which is enough to gladden the heart of Mr. Darwin. They displayed their cunning very unpleasantly in the case of an unlucky Indian who was camping out alone. A ring of coyotes gathered round his fire in the darkness, and sat gazing upon him within a few feet. He threw a stick at one of them, and they ran off, but immediately returned and gazed more fixedly than before. He pretended to sleep, and watched them. They gazed for ten minutes, and then one crept a few inches nearer, and the others noiselessly followed his example. The hunter seized his gun, and shot one of them. They dispersed, and he fell asleep, but only to wake and find the eyes gazing from a shorter distance than ever. How long these interesting creatures would have confined themselves to gazing can never be known, though the hunter was nearly driven to despair, and unable to find a tree of refuge. A jaguar luckily came upon the scene, and the coyotes took themselves off to gaze upon something else. We have two or three anecdotes showing how, under the influence of similar scenes of extreme terror, men have been seized with the strange frenzy which is called "amok" amongst the Malays. We cannot say that they strike us as very much to the purpose, inasmuch as in neither of the cases related did the panic-stricken man attempt to relieve his feelings after the Malay fashion by massacring his neighbours.

There is, however, a thrilling account of a genuine case of the frenzy—though we do not know how far it is meant to be taken as matter of fact—where a Malay, being forbidden to kill an Englishman in revenge for the death of his brother, suddenly went mad, and, dashing into a surrounding crowd, slew four women and three men outright, besides wounding fourteen more. It is some satisfaction to anybody who may meet one of these amoks, that they generally run away when boldly confronted, and in this case a chief rushed at the murderer and stopped his career by a sabre-blow through the skull. Mr. Boyle discusses the question whether an amok ought to be acquitted on the ground of temporary insanity, and we are glad to say that he decides that a gentleman who indulges in this kind of excitement may be rightfully called to account for his proceedings.

We will not, however, accompany Mr. Boyle any further. There are a good many amusing passages in his book; whilst perhaps the worst is an elaborate bit of facetiousness apparently intended to illustrate personal vanity, by showing that savage beauties are as much given to painting and otherwise artificially improving them-

* *Camp Notes.* By Frederick Boyle. London: Chapman & Hall. 1874

selves as their civilized cousins. If Mr. Boyle had given less scope to his literary ambition, we suspect that he might have written a more really interesting book; but something must be forgiven to a writer who has before his eyes a constant dread of boring a hasty public.

THE WAR OFFICE GUIDE TO TACTICS.*

THOSE who have studied the last utterance of our War Department on the subject of tactics, and observed with amazement how completely General Macdougall fails to appreciate the advance of the science with which his name is connected, will be little disposed beforehand to welcome a more elaborate work from the same bureau. Is there, in truth, some fatal necessity that prevents those able men who cluster round the War Office from turning the full strength of modern daylight on our own shortcomings? We ask this question because it seems to be generally felt that there must be some impenetrable obstacle hidden from the public, some personal prejudice, or some tradition born of Peninsular veterans and hardened in the Crimean blunders, which stands in the way of the progress of our army. We have lately seen a distinguished writer who was once in the van of reform begin a War Office essay on the new arms with arguments against all recent experience, to end it with idle compliments to the Volunteers which the weakest members of that force would hardly swallow, and aiming his main efforts apparently to prove that Englishmen are exempt from the modern laws of war. And now that the Essay is succeeded by an Official Guide, the work is confined to, or its design is masked under the form of, a study of Continental tactics exclusively; as though our own were either beyond or above improvement. Surely, if it be well to call a spade a spade, it is well also to admit that breechloaders are breechloaders, even when held by or against Englishmen. It seems to us that this truth, which the chief of his department has missed, has been constantly present to Major Home, though reasons of State forbid his uttering it. Read in this light, his work becomes a prolonged satire on the backwardness of our own tactical system, if that is to be called a system which in truth is no better than a bundle of relics, made up of scraps of old Frederick's drill-book, mixed with bits of pedantry from the Dundas school of 1800, and here and there a fragment or two of the Algerian rags which the French army is discarding under the stern teaching of defeat. Each page of the more important parts of his *Précis*, in revealing the strength of others, carries with it this hidden lesson of our own weakness; and it is scarcely possible that so very able and modest a writer as Major Home clearly is should be unconscious of the tendency of his studies of recent Continental events, and his criticisms of recent Continental writers, to fix attention on domestic needs.

That ability and modesty are the characteristics of the work all candid readers will admit. There is modesty in the form chosen by the author, which consists chiefly in "collecting the opinions of others, and avoiding as much as possible putting forward his own." And ability is shown at every step in the execution of this design, and in the clear and vigorous remarks which bind his extracts into a harmonious whole. The mere mention of such a method will suggest that the work might be intolerably tedious, discursive, and unsatisfactory, if there were not sound judgment used in making the necessary excerpts, and intelligence in putting them together. Such judgment and intelligence are conspicuous in the result; and it will suffice to say, by way of preface, that there has nowhere yet appeared so masterly a compilation of the tactical science recently developed in Continental warfare as is to be found in this unpretending volume. Regarded in an abstract way, as simply a review of what has been done by our neighbours, it reflects credit alike on the author and on the Office under which he labours.

The book is not wholly tactical. Indeed, to have limited it strictly to a tactical character would have been hardly consistent with its official purpose, which is avowedly to "be useful to students of the military art who are not near good libraries, and who do not possess the number of volumes that are written on military subjects." The intention is wide, and could not be fulfilled, it is clear, without giving at least one explanatory chapter to army organization. With such a part accordingly the work opens; and here the writer is probably on even more delicate ground than in his later portion, for the reticence which is the quality of his Office is very apparent. He has here the task, too, of speaking of ourselves, since the book "has been prepared to aid officers in the examinations they must pass for promotion"; and it is necessary, therefore, in expounding the way in which armies are built up, to tell them something of the particular machine of which they form part. The task cannot have been very pleasant to one who knows the inside of the matter, as Major Home's recital shows us that he does thoroughly. For he has to speak of the uses of a Chief of Staff to us who, for inscrutable reasons, are allowed no such personage; to describe what a single harmonious Staff may be to officers who serve under the double-headed and clumsy system of adjutant and quarter-master-general, exploded throughout the rest of the world; to tell us formally of the duties of a Control system which he doubtless knows to be modelled on the worst vices of the fatal exercise which the French army is only now getting rid of, after being helped by it on the road to ruin; to give the proper

official strength of "an English Army Corps," whilst well aware that England has not in fact any Army Corps at all; nor any other organization worth serious mention; and that her army is, in plain truth, merely what it was before Crimean days, a roll of battalions gathered here or scattered there, as chance may direct them. We pity Major Home this part of his labours, and hurry on to that wherein the more real purpose of the *Précis* is to be found.

Of the five chapters devoted to tactics, the first is purely historical. No part of this will be found uninteresting even to the general reader. Major Home has a happy knack of digging out of the driest old authors the readable portions and shrewd remarks which would escape a careless observer; and the gradual development of modern tactics has seldom been so perfectly traced. Few readers will be prepared to find, for example, that the famous Company Column of modern France was advocated by the old technical author Mesnil Durand, whose views guided on most points the teaching of military schools when Napoleon was a cadet at Brienne. Yet here is but one of numerous points of interest brought out in this chapter. There is a study, to give another example, of Desaix's memorable charge at Marengo—which, more than even Kellerman's boasted swoop with his horse, "put the crown on the head of General Buonaparte"—that is as neat a bit of military antiquarianism in its way as the student could find in the whole library of which Major Home supposes him to be deprived. But we must pass on with our author from history to the discussion of tactics as they are.

At first sight it seems hard to quote from Major Home so as to do him full justice; for, following out his modest plan, he usually yields the more important portions of his ground to the authors whose opinions it is his business to collate. Here and there, however, he is compelled, as it were, to commit himself, and the clearness and thoroughness of his remarks prove how completely he has mastered the subject which he is employed to review. Not one of the German tacticians, for instance, who are travelling the same road has hit more perfectly the exact truth as regards the relative gain which the offensive has made by means of the breech-loader. We shall cite his opinion in full, as a masterly summary of what is really proved in a matter which is yet much under debate, and as an example of the thorough building up of theory on good groundwork:—

It is requisite here [he begins] to consider what the peculiar nature of the breech-loader is, as distinguished from the muzzle-loader, assuming it to possess equal accuracy and range. It can be loaded with greater ease and rapidity, hence its defensive power is greater than that of the muzzle-loader; but if the position of mere advancing to an attack be considered, it will be found that the breech-loader (from the very great ease with which it may be loaded) enables a well-sustained, well-directed fire to be kept up from troops advancing in extended order, the operation of loading being performed when lying down, or in confined places, with much greater ease than with the muzzle-loader. Hence the *offensive* power of the breech-loader is very much greater than that of the muzzle-loader. The defensive has gained greatly, but the offensive has, relatively speaking, gained still more; or, in other words, the *superiority of the defence over the attack is not now so marked as it was with muzzle-loader rifles*.

We have italicized the last few words of this thoughtful paragraph, because we believe they contain the whole pith of the question. How far this gain extends may be open to dispute; but that the gain is there, we suppose no one doubts who uses with unbiassed mind the means offered to our study by the results of the late wars on the Continent. And although Major Home proceeds to fortify his statements by quoting largely from Scherff's recent essay on the same subject, we find it unnecessary to follow him here, having convinced ourselves, from closely studying both writers, that in this exposition at least our nation is under no disadvantage whatever as compared with her victorious neighbour, and that the English writer is more luminous than the German, if he is not perhaps quite as eloquent.

To take a passage on a very different topic, the use of cavalry in modern war for reconnaissance, we have nowhere met the same grasp of the subject combined with the same power of setting it forth easily, as is shown by this unpretending writer. Let the reader judge for himself, and in weighing what is said he will not fail to observe how the science of war has developed with the developing resources of civilization:—

The action of cavalry in spreading a curtain round an army, hiding its movements and seeking to obtain information of the enemy's, is not the consequence so much of improved armies as it is a consequence of railways, telegraphs, improved roads, increased cultivation, and large armies. To develop the full power of railroads and telegraphs an army must be a large one operating over a large area. A small army of from 30,000 to 60,000 will by no means reap the same advantages from rapid means of communication as an army of from 300,000 to 400,000 men. But such an army cannot operate at all unless it operates over a large area; an area, again, which is not proportionate to the size of the army, but increases at a rate much greater than the size of the army. Now our troops using railways for supplies can be considered safe if these railways are subject to destruction by small bodies getting to the rear; consequently troops must be used to cover the whole front and close the openings. Cavalry, from their rapid means of locomotion, are the troops to whom this duty must fall, and the telegraph has given them a new power of being useful by enabling them to receive orders or send information more rapidly than formerly. Their object when thus employed is not to fight, but to watch and report.

It would be hardly possible to give in one brief paragraph a more thorough analysis of the philosophy of the question as viewed in the practical light of the great campaign of 1870.

We must not, however, leave the reader under the impression that our author is one of those who have carried German notions to extremes, and forgotten the first principles of discipline

* *A Précis of Modern Tactics, compiled from the Works of recent Continental Writers.* By Major Robert Home, R.E. Stationery Office.

in their haste to improve on the new tactics. It is right to state that while in this work there will (for the first time, we believe, in this country) be found the original General Order in which William of Prussia condemned the solidity of the columns (not company columns, as the Duke of Wurtemberg fancied, but battalion columns) exposed to slaughter at Gravelotte, Major Home is very careful to point out that "there is no counselling of loose formation, no urging of wild swarms of skirmishers out of hand." For, as he well adds, if officers think and speak only of loose order of fighting, the bonds of union that hold an armed body together may become relaxed, and the machine incapable of putting out its force when called on. "Modern fighting is not loose, though it may be individual."

We part from this work with some pride in the thought that our army possesses students thus capable of learning the lessons of their age. The hopes built on the new Office of the Intelligence Department, which were lately chilled by the published opinions of its chief, will revive when men see of what sound stuff are the subordinates who fill it. The roughness of Major Home's style here and there, and the want of complete punctuation which is a common sign of an author's haste to complete his task, remind us that he is one of the small band of thoughtful officers who have gone out willingly to support Sir Garnet Wolseley in his arduous task. May they be spared to carry out their work, and return safely to more congenial duties! We are assured that the country which has sent them forth will find her scientific soldiers, if fairly supported, as able to overcome new difficulties as they have shown themselves ready to face them.

MR. CARINGTON.*

THE author of this novel describes himself on the title-page as Robert Turner Cotton. He must, we suppose, be a better judge of his own name than we can possibly be. Otherwise we should have had no hesitation in saying that he is under some wonderful delusion, and that his real name is Mortimer Collins. Since the days of the *Comedy of Errors* there has been seen no such likeness between two men, and Mr. Collins might well say to Mr. Cotton, just as Mr. Cotton might equally well say to Mr. Collins—

Methinks you are my glass and not my brother;
I see by you I am a sweet-faced youth.

It is not merely in the outrageous extravagance of the plot, with its secret societies, its murders, and its hidden treasures, that the resemblance lies; Mr. Henry Kingsley has been equally extravagant. There are a hundred minor points of resemblance besides. Every one who is familiar with Mr. Mortimer Collins's writings knows how exact he is in recording on each occasion the fact that his hero had lighted or thrown away a cigar. Mr. Cotton—for we took the trouble to keep a rough account of such important matters—at least twenty-eight times, likely enough a good many times more, sings of tobacco, whether as smoked in the pipe, the cigarette, the cigar, the "big regalia," or the "huge chibouque." A friend of the hero's, by the way—Arthur Conyers—who "was of the F. O. and the C. C.," was also "the best maker of a cigarette out of Asia." Exact as Mr. Collins is in his records of smoking, still more exact is he in his records of eating and drinking. Mr. Cotton in his turn tells us at least thirty-times what was eaten or drunk. No scullion who by his genius alone had made himself a chef could be prouder of his knowledge of the science and art of cookery than is Mr. Collins. But no less proud is Mr. Cotton. Mr. Collins's heroes have a vast relish for devilled thighs of turkeys; Mr. Cotton's heroes enjoy them at least four times in the course of his story. Mr. Collins himself has more than once gloried in his Homeric appetite for beef; Mr. Cotton can "feel quite happy after a couple of pounds of rump steak with a hundred oysters melted into the sauce." Mr. Collins delights in fine words; Mr. Cotton gives us, among a host of others, such words and phrases as macilent, mental retina, sartorial wrappings, sporadic servants, snow hypnotizes, subacid smile, curves mathematic osculate curves metaphysic, decussate, hypæthral tetragon, and, last but not least (here we have an old favourite of Mr. Collins's), semihiant. Mr. Collins is not always over-delicate, and Mr. Cotton sometimes gets rather near to being indecent. They are both proud of their knowledge of the classics and mathematics. Mr. Cotton indeed goes so far as to give some definitions in geometry so as "to supersede that dreadful old bore, Euclid," and moreover boldly differs from Pericles as to the conduct that befits a great man. They are both as fond of introducing French words as their heroes are of lighting cigars. Mr. Cotton especially delights in "agaceries," introducing it several times with as much satisfaction as a child who has picked up a new phrase. They both introduce a great many verses of their own composition, and they both have the frankness to own that they find in them no small degree of merit. But nevertheless Mr. Cotton says "My name is Cotton," and Mr. Cotton therefore we must allow him to be. He boasts that among his "intimate friends are three of the five Englishmen who can write English." Mr. Froude, we have no doubt, is one of the five, Mr. Henry Kingsley a second, and Mr. Mortimer Collins a third. If a man can be rightly described as his own intimate friend, Mr. Cotton must be the fourth in this goodly company. Who the fifth can be we shall not venture to assert. Possibly it may be the author of the *New Magdalen*. We would venture to urge Mr. Cotton to save

himself from his friends, and above all, from Mr. Mortimer Collins, if he has any ambition one day to arrive at working English and at writing sense.

It is somewhat difficult within reasonable compass to give our readers any clear notion of a story which begins in the last century with a respectable old merchant of Salisbury, a staunch Hanoverian, and ends with the exile of the Emperor Napoleon, the Number One in a Secret Society of Assassins, and which gives the history of the marriage, not only of the hero, but also of the hero's father, grandfather, and even of his great-grandfather. The only one who could have held the clue to such a story was "Lawyer Pinniger," who was so fortunate in retaining life and the confidence of the family that he was consulted by the great-grandson scarcely less—if our estimate is correct—than seventy years after he had been consulted by the great-grandfather. The hero, Frank Noel, is the son of a man who had been shot in a duel by the Honourable Charles Delamere, his confederate in certain very questionable gambling transactions. On the father's death the boy's interests are looked after by Mr. Carington, who was "the most biting wit and best dressed man in London." As for his clothes, we are quite ready to take our author's word, though perhaps it would have been better evidence if he had adorned his volume with a picture of some portion of this gentleman's clothing, as the railway stations are adorned with a picture of the Sydenham trowers. But the bitingness of his wit is scarcely borne out by the specimens that Mr. Cotton gives. Our expectation is indeed raised, but when the wit, after this introduction of him, first opens his mouth, it is merely to say, "Going to bed at a fixed time is one of the causes of social decay." Mr. Collins, by the way, is very strong on the great advantages of turning night into day, and might almost himself, though he does not claim to be the most biting wit in London, have said an equally good thing. Later on Mr. Carington does succeed a little better, for when Frank Noel knocked down a Russian Prince, he wittily remarked, "The result as to his nose is—well, I fear, 'The Nose have it.'" But we must return to our hero in his younger days. At school, where he was thought a dull boy, he displayed so original a mind that at an examination in arithmetic "he sent up the result logarithmically," though he had never been taught logarithms. Mr. Cotton does well in printing the question and Frank's working. Mr. Collins, we believe, never introduced a logarithmic result into any of his stories, and so far Mr. Cotton can claim to be original. From school Frank goes to Oxford, and enters at "Maudlin (sic) College," the Alma Mater of his uncle the Canon. We have noticed before this that authors who wish to be thought Oxford men commonly send their heroes to "Maudlin College," as they write it. To spell Magdalen Maudlin has, they think, quite as much the true Oxford air as to call the University the "Varsity." Meanwhile the Honourable Charles Delamere had become the Earl of Delamere, the owner of an ancient hall and a vast estate in Cumberland. He asks Frank Noel to visit him, full of remorse at having shot his father in the duel. He does everything that a penitent nobleman can do to atone for so awkward a mishap. He sends "a snug omnibus with four horses" to meet him at Carlisle station. "The attentive footman showed Frank where to find a box of cigars and a stand of liquors." When he alighted at the stately portico, "several servants with lights were standing" there. In the great hall "a groom of the chamber received him respectfully," while Frank "sank into the cosiest of chairs, and took with great satisfaction some well-cooked game and dry Sillery." Even when bedtime came the Earl's penitence was not exhausted, for though he was not well enough himself to do the honours of the house, yet "a footman in waiting threw open" the door of Frank's bedroom, while through the night "a servant had come in and replenished his fire at intervals." Not content with what was so liberally offered, he next morning rang the bell and ordered a warm bath, and it was not till eleven o'clock that at breakfast "he was enjoying his devilled game and mocha." Breakfasting so late he scarcely needed lunch, and "at seven he dined—a good dinner and many servants. He drank a quiet pint of aged port and was in bed by midnight." Did space allow we should like to follow the hero through his meals, from his grand dinners, which take a whole page to describe, to his lunch on "Tokay and Presburg biscuits."

The Earl's cook, by the way, was an exiled French duke and late Number Seventeen in the Secret Society. And yet we might just as well go on describing the meals that every one eats as try to give any analysis of the plot, of which we have indeed ourselves but the most hazy conception. Frank's part in it is not so hard to follow. In the first volume he goes out for a ride in the snow over the Cumberland fells, and losing his way reaches a cottage where, alone with two old servants, was living a young lady, who has no surname, but who in the end turns out to be the Earl's granddaughter. He falls in love with her and she with him. He saves her from two robbers, to whom "he gave two sudden sharp strokes, close to their respective temples, and they dropped like oxen scientifically slain." He loses heart when he finds out her high birth and considers his small fortune; but happily at the end of the third volume Lawyer Pinniger, in an old cabinet of Frank's, which got completely dislocated, "found twenty sheets—and each sheet was a bank of England note for a thousand pounds." The Earl gives his daughter 50,000*l.*, and so the young folks can marry. Meanwhile her father had suddenly turned up, who was thought to have been drowned years before, and, despising the French duke's "*rogmons, homards, pigeonneaux, hûîtres*, breakfasted on a mighty junk of Canterbury brawn and a tankard of his favourite ale." In the hall there happened to be staying the Marchioness Rafflesia

* Mr. Carington. *A Tale of Love and Conspiracy*. By Robert Turner Cotton. 3 vols. London: Henry S. King & Co. 1873.

Ravioli, who had been Number Two in the Secret Society, but who now, like the Ducal cook, was sick of it, and, like him too, was in hiding. She still wore, by the way, in a sheath fastened to her garter, "a bright thin blade of steel." She at once recognizes the Earl's son, whose name is Rollo, as her long-lost Leo, and before long they are married. Besides the Marchesa there was also staying at the Hall the Russian Prince, who, having outraged a peasant girl in Russia, was in dread of the vengeance of the Secret Society of the Silent Sisters, and had come over to England as the place of the greatest safety. He was a dangerous man to deal with. Some one had once horsewhipped him, and "was found in the Morgue next day." The peasant girl had become Number Six in the Society, and had been sent over to England to try to entrap him. She drives in a low carriage and a pair of ponies, and, being beautiful in herself and wearing abundant lace and jewelry, caused no slight sensation. The Count fell into the trap and soon found himself a prisoner in the cellar of the Silent Sisters' house at Wandsworth. Among the Sisters was one who "was supposed to have been blessed by Robespierre as he passed to his fate on the 28th of July, 1794," and she, and indeed all the rest, would have liked to kill him off. But an order comes on a scrap of paper from Number Two that the Prince should marry Number Six. There is no help for it. The Prince, when the ceremony is over, sets out with the Princess on a bridal trip in his yacht. Meanwhile Number Six, the bride, had first, under strict orders, tried to kill off Mr. Carington, first by offering him some poisoned wine to drink, and next a poisoned flower to smell. As the Prince's yacht passed the Straits of Gibraltar, a gunboat, evidently sent by Number One, the Emperor Napoleon, "shot out from the African shore." The Prince and Princess are arrested. He is sent to the Emperor of Russia, who packs him off to Siberia for life. As some consolation for the loss that society sustained we read, "It has been asserted that these events greatly tended to accelerate the Emancipation of the Serfs." Of the Princess nothing is heard till a letter written in Russian was addressed to the Chief of the Police in London, telling him to go to the Red House at Wandsworth. "A detachment of intelligent officers" visited it, and found the following state of affairs:—

The only steadfast sight there was the ghastliest of all. On the table lay the corpse of a woman, clothed only in a nightdress, bound with cords, a long sharp foreign dagger struck so strongly through her left breast that it penetrated the board beneath. On her bosom lay a square of paper, with these words in Russian—

"Paulovna Oistravieff,
Princess and traitress."

She, too, had been killed by Napoleon; for, as the author observes, "the melodramatic method of that death showed the rough hoof of the caltiff-crowned conspirator." Later on the Princess's first lover—a Russian peasant—burning to revenge her death, tries to assassinate the Emperor, but is himself shot in the attempt. The Earl of Dolomere, when he hears of his death, pronounces that he is a hero, and says "he shall have a cenotaph of marble in this hall." If only Mr. Cotton, and his two great masters in the art of writing spasmodic nonsense, Mr. Mortimer Collins and Mr. Henry Kingsley, would join a Society of Silent Brothers, and would leave off writing, they would have done something towards deserving cenotaphs of marble for themselves.

THE SIMANCAS RECORDS.*

WE resume our account of the Calendars of Spanish Papers after an interval of more than five years. The death of Mr. Bergenroth has been felt as a very serious drawback, and probably there was scarcely any person fitted to succeed to his place but his friend Don Pascual de Gayangos, to whom we are indebted for this first instalment of a third volume. At first sight we must admit that we experienced a feeling of disappointment at finding so huge a volume, the contents of which run over a period of only two years. We had fondly hoped that Mr. Brewer's volumes, the Venetian despatches, and the Spanish documents, as they had all reached the same period, would proceed *pari passu*; whereas, on the contrary, the Venetian papers are so scanty that the last volume carries us over twenty years into the reign of Mary, leaving Mr. Brewer far behind; whilst the present volume only just reaches the commencement of the period occupied by Mr. Brewer's last publication. The slow progress of this Calendar is in part accounted for by the enlargement of the sphere of labour, as Don Pascual de Gayangos has had access to the muniments at Vienna, as well as to other sources which were not accessible to his predecessor, or at least which were not used by Mr. Bergenroth; and we notice that much of the more valuable part of the correspondence analysed in this volume is from documents at Vienna. We may observe that Don Pascual has not the same command of English which Mr. Bergenroth possessed; but, on the other hand, he is perhaps more free from that prejudice against the Court of Rome which we have had occasion to notice; neither do we find indications of the credulity which induced Mr. Bergenroth to believe that the mad Queen of Castile was persecuted for her Protestantism.

As regards the general appearance of the volume, it is not a reviewer's part to object to the handsome type and the readable

appearance of the pages. Nevertheless, a great deal of space is wasted by the ample margins; and upon comparing it with Mr. Brewer's Calendar, we should suppose that a page scarcely contains as much as two-thirds of one of his pages. But what is pleasant to a reviewer may be, owing to the increase in the number of volumes, very cumbersome to future investigators of knotty points of history.

The editor in his introduction, which is somewhat shorter than usual, has prudently not attempted to present us with a general view of the papers which comprise so short a period as two years; but after giving a brief account of the sources from which the documents are derived, devotes the greater part of his prefatory remarks to a very concise biography of the principal writers in the correspondence—beginning with Louis de Praet, the Emperor's Ambassador in England at the commencement of the period, and ending with a much less known character, whose reports are, as Don Pascual observes, a model of prudence and discretion—namely, Hernando Marin, Abbot of Santa Maria de Najera. To a reader ignorant of the history of the period we commend the introduction as likely to make the documents more easy and interesting. And indeed it may be truly said that a person almost entirely ignorant of the history of the period—that is to say, knowing little more than the names of the sovereigns and the countries over which they ruled—would gain from the reading of this correspondence of two years a greater insight into the characters and motives of the different agents than could be acquired from the study of most historical works. The reading is much facilitated by the constant repetition within brackets of the name of the person mentioned in any document. Thus, if the Viceroy of Naples, for instance, is referred to, Don Pascual has almost always added the words [Charles de Lannoy], and similarly with regard to the Queen Mother, the Duchess of Alençon, &c., &c. The volume a little overlaps Bergenroth's last published volume, which reached to the end of February 1525. It begins with January of that year. And whilst the documents of these two months in the previous editor's volume are comprised in less than twenty pages, the letters of the same period in the present work extend over three times the space. From this the reader may judge how much the field of research has been enlarged by access to the libraries of Vienna, Brussels, and Paris.

Nevertheless, whilst we are describing what may be called the framework of this volume, we must not omit to notice that there appears to us a notable deficiency as regards certain documents at Vienna. A very select few of these papers had been published by Bradford in 1850, in his valuable work on the "Correspondence of the Emperor Charles V.," and upon referring to this volume for documents of the year 1525, we were surprised to find several of first-rate importance of which no notice has been taken by Don Pascual de Gayangos. Upon turning to Mr. Brewer's Calendar, we found them duly chronicled and abridged. Don Pascual has had both works before him, and he may have designedly omitted them on the very ground of their having appeared previously among the English papers printed by Mr. Brewer. But the number of Viennese documents analysed in the volume is suspiciously small, and, after reading the twelve interesting and important letters of Louis de Praet which are printed at the beginning of the volume, we are not disposed to acquiesce contentedly in the editor's promise "to give at the end of Part II. of this volume a summary and abstract of such letters and papers from 1519 to 1525 as may increase the historical evidence already brought to light."

We do not desire to impute any fault to Don Pascual de Gayangos, but simply to call attention to the fact of want of hands to do the work required. An additional Calendarer is evidently required at Vienna, to supplement the inquiries that are being so successfully made at Simancas and Venice. Again, we shall not find fault with the editor; but we think the Master of the Rolls might reasonably complain of the number of documents reproduced from printed sources. They add greatly to the interest of the volume; and amongst them we may specify the important reply addressed by the Emperor to the Pope, Sept. 17, 1526, which contains the history of the last two years, as seen of course through Imperial spectacles. It is calendared in Mr. Brewer's volume, and, contrary to Mr. Brewer's custom, no attempt to analyse it has been made. There was therefore all the more need of its appearing here; and we may notice that the Pope's Brevé, to which it is an answer, bearing date June 23, 1526, does not appear here at all, and has unfortunately been very briefly analysed by Mr. Brewer. It may be seen at length in *Reynaldus*, but that is a work not accessible to ordinary readers. Still there appears to have been a great want of system in deciding what papers shall be inserted and what omitted. And we are quite at a loss to understand the admission of several letters from so common a book as the *Lettere di Principi*, especially as they have nearly all appeared before in Mr. Brewer's collection, where they have a kind of right to appear, as it is understood that this editor is not under the same restrictions with which other editors are fettered. Equally at a loss are we to understand on what principle the letters from these three volumes have been selected. Lastly, there is a great deal of space wasted in presenting a full analysis of many other papers which have been fully epitomized before by Mr. Brewer. It is true that Mr. Brewer has taken them from printed copies which alone were accessible to him, and the present editor gives them from the originals; but it would have been sufficient to refer to the volume of English State Papers and to notice any variations in the MS. on additional matters of importance.

* *Calendar of Letters, Despatches, and State Papers, relating to the Negotiations between England and Spain, preserved in the Archives at Simancas and elsewhere.* Vol. III. Part I. Henry VIII. 1525-1526. Edited by Pascual de Gayangos. Published by the authority of the Lords Commissioners of Her Majesty's Treasury, under the direction of the Master of the Rolls. London: Longmans & Co. 1873.

As regards the historical information contained in this volume, we can only express our high gratification at the light that is shed on the fears and hopes, the motives and actions, of the leading sovereigns and statesmen of Europe. The different sources from which the papers have been derived enable the reader to see clearly the attitude of almost every nation in Europe, and the policy of every leader in the race for victory or struggle for existence, as the case may be. The volume stops at a point a few months short of the sack of Rome in 1527; but it may be briefly described as giving the diplomatic transactions consequent upon the defeat of Francis at Pavia, February 24, 1525, down to the beginning of Bourbon's march from Milan to invade the Papal territories. Our utter inability to give any adequate account of the papers analysed in the volume must plead our excuse for referring our readers back to three reviews of Mr. Brewer's Fourth Volume, Parts I. and II., in the *Saturday Review* for August 26, 1871, May 24, and June 21, 1873, which refer to nearly the same period of time, beginning a little earlier, and ending a little later. In those reviews we confined our attention mostly to the relations of England and France. We will here direct attention to the attitude of the Emperor towards the King of England and his all-powerful Minister, the Cardinal of York.

It is a mistake to suppose that Wolsey had ever entertained much hope of succeeding to the Papal throne, or that he was much disappointed when the election fell on Clement VII. on the 19th of November, 1523. He knew perfectly well how much confidence to place in the Emperor, and understood whose interest had been exerted on the election of the Cardinal of Tortosa, in 1522, as well as how it was that the Cardinal de Medici had succeeded him. In an interesting letter dated from Granada, September 18, 1526, the Emperor reminds the Pope how it was through his intercession and help he was raised to the Pontificate. But if Wolsey understood the Emperor, so had Charles also and his Ministers some insight into the intentions and views of the English Cardinal. Giberto, writing to Uberto di Gambara, the Papal Nuncio in England, describes Wolsey's attitude after the battle of Pavia with equal truth and wit. He says he

recollects when he was last in England at the time of the rupture between Henry and Francis, that the Cardinal of York said to him that the wings of so insolent a cock as the French King ought to be well clipped so as to prevent him in future disturbing Christianity. Now that the cock is chastised, and has been replaced by an eagle—much more powerful and dangerous—it will appear to his most Reverend Lordship no less glorious an act to have the talons of the said eagle cut in such manner that it may rest contented with the greatness and power which God has given it.—P. 736.

We may observe, in passing, that the letter has been by an error of the press attributed to Lope de Soria, the Imperial Ambassador at Genoa. The mistake could mislead no one, as it has the right signature at the end, with the address Rome.

At the beginning of the volume the Emperor stood under an engagement to marry the Princess Mary of England; but even before the battle of Pavia Charles began to suspect that there were negotiations for marrying her in Scotland or in France, and accordingly, in order to feel the pulse of the King and the Cardinal of England, his Ambassador was instructed to ask as a favour that the young Princess, not yet eleven years old, might be sent into Spain under pretext of becoming acquainted with Spanish life and customs. Charles was already considerably in Henry's debt, yet he does not scruple to ask that with the Princess should be sent a large sum of money, in addition to her dowry, to enable him to prosecute war with France, in conjunction with the King of England. This failing, the Ambassador is directed, if he can do no better, to obtain an additional loan of 400,000 ducats, in order that by the dismemberment of France the Emperor and the King of England might recover such provinces as by right belonged to them respectively. The Emperor could scarcely have expected his overtures to be seriously entertained; nevertheless, if he could have got the money, he would have been quite content to take the Princess; yet at the very time he was meditating and actually in treaty about his marriage with Isabella of Portugal, which took place about nine months afterwards. And this was the meaning of the speech made by Margaret of Savoy, the Governess of the Netherlands, to Sir Robert Wingfield, that, "If the King of England, your master, does not make up his mind to assist the Emperor with money and men, he, rather than give up and abandon his favourite idea, will be obliged to seek an alliance in the furthest part of the world." Accordingly, on the 12th of August of this year, the Emperor, of course knowing that Henry and Wolsey were quite aware of his intentions, writes the King of England a most polite letter, the very first words of which must have informed his correspondent of the proposition which was going to be made. He dwells upon the pleasure which an alliance with the King of England would have given him; but the circumstances of the Christian world in general, and of the Empire in particular, require an appropriate remedy. And as the Princess cannot be sent into Spain according to the ardent desire of his Castilian subjects, nor her dowry be paid in advance, he thinks it wise to marry in another quarter where the marriage can be speedily consummated, and the payment of the new Empress's dowry be made at once.

Such a proposal might be thought cool, not to say impudent, in the nineteenth century; but Royal alliances three centuries ago were such mere matters of convenience that the Emperor anticipates that his communications will be received in a friendly spirit, and neither Henry nor Wolsey cared to show any resentment for what was meant and was taken for a simple matter of

policy. Not many days later it was currently believed that peace between the Emperor and Francis was nearly arranged, and that it would be immediately followed by the marriage of Charles with the Princess Isabella of Portugal, of Francis with Eleanor, the Emperor's eldest sister and dowager of Portugal; and, lastly, of Bourbon with the Duchess of Alençon, the sister of the French King. But peace was not so near as was expected, and two only of the marriages were destined to take place. On the 20th of October the ceremony of affiancing Charles and Isabella *per verba de futuro* was gone through, and it was then discovered that the Breve of Dispensation was not sufficiently explicit. The Breve which was granted on the 8th of September seems ample enough, as, without mentioning any names, it gives the Emperor liberty to marry any one excepting a person allied to him in the first degree of affinity. But the Princess of Portugal was first cousin to Charles, being children respectively of Juana and Maria, daughters of Ferdinand and Isabella; and there was a double connexion, as her father Emanuel, King of Portugal, had married for his third wife the Emperor's sister, who was therefore her stepmother; and there had been a further complication in the family, owing to the fact that her father had married two sisters, one of whom had previously married Alfonso, the brother of Emanuel. Neither of these complications at all affected the case in reality, yet it was thought worth while to procure a fuller dispensation, owing, as the Emperor expressed it to his Ambassador at Rome, to the "several degrees of affinity and consanguinity that exist between us." The Pope therefore gave a second dispensation mentioning the affinity that existed in the second, third, and fourth degrees. This was dated November 13, and we commend it to Mr. Froude's attention. He will see, if he compares it with the celebrated dispensation asked for Anne Boleyn, what are the official terms of such a document, and what are the special provisions for the individual case. The marriage took place in the following year, and the Emperor secured the money that he wanted to carry on the war with.

We have been obliged to confine our attention to a few points, but must not conclude without recommending the reader, before he begins the regular reading of this volume, to look at the Pope's Breve of June 23, 1526, which may be found in *Raynaldus*, and then to proceed to the Emperor's reply to it as containing a good outline of the state of affairs in Europe in 1525.

(To be continued.)

OWEN'S BRISTOL PORCELAIN.*

THERE would seem to be an inevitable romance in the personal narrative connected with pottery and porcelain. The story of the misadventures of Palissy is too well known to need repetition, but the account here given by Mr. Owen of the difficulties and discouragements in the making of "true porcelain" in the old city of Bristol carries the reader over some untrodden ground. It may be well in a few words to state the nature of the problem which the early experimentalists set themselves to solve; the question simply was whether "the Chinese China might be made in Britain." Mr. Owen truly states that "the last century was a busy one in the ceramic history of Europe. The superior excellence of Oriental porcelain, the high price it commanded, and the ready market it had obtained from an unknown period, rendered every potter ambitious to imitate its peculiar merit." The Chinese had held their secret for eighteen centuries; so greatly, too, did they value the manufacture of the best periods that the prices were higher in the Celestial Empire than in Europe, and every effort was made to prevent exportation. And when, with difficulty, the materials essential to the fabric had been obtained in China and were brought to Europe, the conviction seemed to be strengthened that in the geologic strata of the Western World the needful clay and stone could not be found. By one of those happy chances which from time to time have brought about unforeseen revolutions in the arts, it was discovered that a white tenacious earth dug up in Saxony, and used extensively throughout Germany as hair-powder, contained the long-sought elements of "true porcelain." Thereupon was established the royal manufactory at Meissen near Dresden, which continues in operation down to the present day. So great was the value set upon the discovered mystery that "the workmen were sworn to inviolable secrecy, and the precious earth, in sealed packages, was carried to the factory under military escort."

France, ever jealous of any advantage gained by her rival Germany, set her chemists to find out the Chinese secret, and so clever were they that, though denied the essential ingredients of "true porcelain" or "hard paste," they succeeded in compounding a beautiful material, the "soft paste," known as the "pâte tendre" of Sévres. This porcelain, though highly prized, and indeed never surpassed for delicacy of fabric, skill in enamel-painting, and rare beauty and brilliance in colour, became superseded when a clay was found on French soil which more nearly approached the Oriental manufacture. Soft paste, which is so tender as to be

* *Two Centuries of Ceramic Art in Bristol; being a History of the Manufacture of "the True Porcelain,"* by Richard Champion, with a Biography compiled from Private Correspondence, Journals, and Family Papers; containing unpublished Letters of Edmund Burke, Richard and William Burke, the Duke of Portland, the Marquis of Rockingham, and others; with an account of the Delft, Earthenware, and Enamel Glass Works, from original sources, by Hugh Owen, F.R.S. Illustrated with 160 Engravings. London: Bell & Daldy. 1873.

injured by the friction of a silver spoon, gave place to a harder paste, which at its hardest cannot be scratched by any metal save the keenest steel. It would thus appear that "soft paste," whatever be its exclusive beauty, was but a spurious porcelain.

England, in the latter half of the last century, passed through like experiences with Germany and France; the success of her neighbours naturally moved her to envy and incited her to emulation, and the consequent efforts made in the South-West of England to produce a veritable "Chinese China" obtain in the pages before us a full and faithful record. At first, from want of the needful clay and stone, the English factories, like those in France, were reduced to work with artificial compounds. But at length, about the year 1755, Cookworthy of Plymouth "found the coveted Kaolin in the burrows of an old mine, near Helstone in Cornwall." This "Kaolin" answers to what "the Chinese call the bones of china." But it still remained to discover the "Petunse," paradoxically "described in China as the flesh," necessary for "firmness, lustre, and transparency." This last material, indispensable for transmitting the opacity of earthenware into the transparency of porcelain, was at length found in a stone near St. Austell in Cornwall, and thereupon Mr. Cookworthy was enabled to take out "his famous patent for making porcelain." By a kind provision of nature the two elementary ingredients of "Kaolin" and "Petunse" are seldom widely discovered; like iron and coal in a later geological stratum, they are usually placed in proximity. Mr. Cookworthy, writing about the year 1775, gives a graphic sketch of "the natural history of the materials" employed under his patent. "It is now," he says, "near twenty years since I discovered that the ingredients used by the Chinese in the composition of their porcelain were to be got in immense quantities in the county of Cornwall." The clay and the stone being thus ready to hand, it appears that a kiln for the burning was "the only desideratum wanting to the bringing of the manufacture of porcelain, equal to any in the world, to perfection in England." We fear that it must be admitted that the narrative of good Mr. Cookworthy belongs to the period of empiricism rather than of science. To state the case plainly, it would seem that the true porcelain needs two ingredients—the one a clay which furnishes alumina, the other a stone which supplies silica. The clay alone yields an opaque ware; the addition of the silica gives transparency. Each is a product of granite under disintegration; the alumina is the felspar, the silica the quartz; the mica, the remaining ingredient in granite, being for porcelain purposes a superfluity. Accordingly, as might have been anticipated, the discoveries in Europe already recounted of the materials suited to porcelain were in localities identical in geological conditions; thus the neighbourhood of Meissen and Dresden, the district of Limoges and the counties of Devon and Cornwall, are alike known for granite formations. As true porcelain seems to need nothing more than disintegrated granite, the physical conditions essential to the manufacture are not so rare as this narrative would lead the reader to suppose. It is admitted, however, that porcelain clay was found during the last century in South Carolina. Thus in three quarters of the globe it would seem possible to produce "true porcelain."

This "true porcelain" process, though patented as we have seen by Mr. Cookworthy, did not succeed commercially at Plymouth, its first place of trial. Yet collectors are known to set great store on the Plymouth fabric, and Mr. Owen cites "a pair of vases with the Plymouth mark, fine in form and well decorated," though "of coarser paste than any Bristol ware known." The accounts which follow of the transfer of the patent rights of Mr. Cookworthy to Mr. Champion, and of the subsequent establishment of the Bristol works, are encumbered with prolix personal narratives which have no immediate bearing on the question in hand. Yet Bristolians at least will feel an interest in trustworthy pedigrees of old local families, and people in general may not object to hear how Alexander Selkirk was picked up by a Bristol privateer, how he became a well-known character in the old city, how he "placed his papers in Defoe's hands," and thus furnished the materials, and indeed served as the original model, for Robinson Crusoe.

The Bristol porcelain manufactory, like its predecessor at Plymouth, met with no financial success. One Bristolian contributed 1,000*l.*, another 1,500*l.* to help on the concern, and the money, we have always understood, was lost. Yet every effort seems to have been made to drive a trade; Oriental China, and especially Dresden China, was imitated; cheaper wares were also produced. Nevertheless in the year 1772 appears, in Sarah Farley's Journal, an advertisement which reads suspiciously of "a sale by auction" "without reserve" of "useful and ornamental China, the produce of the Bristol manufactory." Three months later we find in Felix Farley's Journal (Felix was brother of the above-mentioned Sarah) another advertisement which may be worth reading:—

CHINA.

[At the Manufactory in Castle Green, Bristol, are sold various kinds of The True Porcelain, both useful and ornamental, Consisting of a new Assortment.

The Figures, Vases, Jars, and Beakers are very elegant, and the useful Ware exceedingly good.

As this Manufactory is not at the present sufficiently known, it may not be improper to remark that this Porcelain is wholly free from the Imperfections in Wareing which the English China, usually has, and that its composition is equal in Fineness to the East Indian, and will wear as well. The Enamelled Ware, which is rendered nearly as cheap as the English Blue and White, comes very near, and in some Pieces equal to Dresden, which this work more particularly imitates.

N.B. There is some of the old Stock, which will be sold very cheap. Two or three careful Boys are wanted.

This advertisement of "very cheap" contrasts strongly with the fabulous prices recently paid. Old Bristol China is now quite the rage; collectors compete more keenly for this porcelain than for any other. "Three fine Vases," described as "of great rarity and extreme beauty," exhibited last season at the Burlington Fine Arts Club, are valued at above 1,000*l.* And some pieces of "the most elaborately ornamented tea-service known," presented by Mr. and Mrs. Champion to the wife of Edmund Burke on his return as member for Bristol, have realized thrice the value of their weight in pure gold. Mr. Burke's country residence was at Passenousfield, an estate which has since given a title to Mrs. Disraeli. The tea-service is dispersed. Nevertheless Mr. Disraeli, by a curious conjunction of circumstances, drank tea out of one of the Burke cups on the occasion of a Conservative demonstration in Manchester. He was then the guest of Mr. Romain Calender, who had purchased the teapot at the cost of 220*l.*, and the cup and saucer at the price of 90*l.* It is not stated how much these prices were raised when the leader of the Opposition partook of "the cup that cheers but not inebriates." China, like a picture, may boast a noble pedigree; and it is nowadays more easy than ever to understand how Charles Lamb should have made the confession that when he went to see any great house he first inquired for the China closet, and next for the Picture Gallery.

Bristol porcelain is, as we have seen, emphatically "hard paste"; it is burnt in the kiln at a higher temperature than other porcelain, and the extra amount of heat required to render the materials vitreous is a measure of its hardness and a guarantee of its "wearing." We have already seen that this "true porcelain" was advertised to wear well. Unfortunately the difficulties of manufacture proved proportionate to the perfections of the body and of the glaze. The exceptionally high temperature within the kiln not only called for additional fuel, but made the process of firing doubly hazardous. The problem was how to adjust the heat to chemical constituents which were apt to vary; if the fire became excessive, the paste grew semi-fluid, and bent and sank under its own weight. Even in the birthplace of the art the dilemma is an admitted difficulty; thus we learn that the manufacture in China has been precarious "from the want of some precise method of ascertaining and regulating the heat within the furnaces, in consequence of which the whole contents are baked sometimes into one solid mass."

Since Mr. Owen's book was published the comparative claims of competing factories to the production of "true porcelain" have been put to a proof as unexpected as it is painful. Unhappily in the Alexandra Palace there had been collected several thousand rare specimens of English ceramics. When the fire came the Palace was literally as the furnace wherein each work had been originally baked; and just as we have seen that in China or Europe, when the heat in the furnace was too fierce, "the whole contents are baked into one solid mass," so after the fire in the Alexandra Palace the porcelain of Bow, Chelsea, and Worcester was reduced to a molten mass, and came out from the debris in a state of chaos. The owners when they went to search for their treasures found nought in form or in colour that was distinguishable as their own. But, in contrast, the Bristol porcelain, being of "hard paste," and having consequently been subject to the utmost heat in the furnace, issued from the fiery ordeal comparatively unscathed. We have in Bristol seen a superb series of "the four seasons" since they were rescued from the ruins; they are smashed into pieces and ground into powder by the falling roof; they are in parts encrusted with glass, which the flames had melted; and yet the fashion of the figures, and even the painted surface decoration, remain all but intact. Thus this crucial experiment proves, though at a painful sacrifice, that the Bristol manufacture is, as it claims to be, "the true porcelain."

GERMAN LITERATURE.

THE prodigious industry of the veteran historian Von Ranke is displayed in yet another laborious work, the reconstruction of the first book of his standard "History of Prussia," and its expansion into four books, embracing the period from the Teutonic conquest of Brandenburg to the accession of Frederick William I. The principal reason assigned for the undertaking is the new light thrown on the early history of Brandenburg by the researches of scholars since the original publication of Ranke's labours in 1847. At the bottom of it, however, probably lies the feeling that the history of so powerful a State should no longer be treated as comparatively a thing of yesterday. Such a sentiment can best be justified by an impartial review of the Prussian annals, which exhibit a regular development, an unbroken sequence, and a prevailing unity of idea. The boast of Napoleon III., liable to heavy deductions in its original application to France, may be almost literally applied to Prussia—it has been her wisdom or good fortune to be, as a rule, on the side of justice and civilization. At its foundation Brandenburg represented the mission of European culture to subdue Slavonic barbarism; at a later period she served as a barrier against the hordes of the Mongols; later still she powerfully contributed to the triumph of the Reformation. If her part in the Thirty Years' War was less brilliant than it should have been, the Great Elector made ample

* *Geschichte des Preussischen Staates. Vier Bücher Preussischer Geschichte.* Von Leopold von Ranke. Leipzig: Daucker & Humblot. London: Williams & Norgate.

amends by his courageous resistance to Louis XIV.; in ensuring the definite preponderance of German Protestantism, Frederick the Great contributed one of the most powerful factors to European civilization; of the exploits of the War of Liberation it is needless to speak; and we have just beheld the aspiration of every German heart realized by a Brandenburg squire. The manner of these great achievements, it must be owned, has been unfortunate; few histories are more disagreeably characterized than the Prussian by harshness, rapacity, and general unamiability; but nevertheless the fact stands out palpably and incontestably that Prussia has never yet been engaged in any considerable contest where defeat would not have been a misfortune to the world. Without any undue parade of this flattering circumstance, Von Ranke shows himself fully conscious of it, and the perception imparts dramatic unity to a history necessarily much engrossed in its earlier stages with particulars of an apparently trivial and uninteresting character. It would, in fact, be beyond the power of the greatest historian to elevate the details comprised in the present volume beyond the rank of provincial history; an historical classic, like the classical drama, requires dignified actors and a spacious field. Nor is the cool, penetrating, judicious, but matter-of-fact, historian of Courts and Cabinets the man to exalt and transfigure an ordinary theme. In his own department he is an unsurpassed model, and he especially deserves study for his combination of the two divergent, but by no means incompatible, merits of fulness and conciseness. The neglect of the latter will prove ruinous to the fame of most contemporary English historians, who may or may not have sufficient imagination to reconstruct the past, but obviously have not enough to place themselves in the position of the reader of the future.

The history of Finland is until a very recent period virtually the history of Sweden, and to narrate it is merely to tell the history of the latter country, with the omission of some of its most interesting features. Finnish national feeling nevertheless demands a national history, and the task has been ably performed by Professor Koskinen*, who, while necessarily interweaving into his narrative the picturesque and dramatic vicissitudes of one of the most eventful of European chronicles, does not forget that his business is properly with a district which has only attained political importance in so far as it has been the subject of contention between powerful neighbours. The first mention of a Ugrian occupation of Finland refers to about 100 A.D., from which period everything is obscure until the beginning of the Christian era in 1157, at the instigation, as is believed, of the English Pope Adrian IV., then legate in Sweden, and which was subsequently revived (1220) by another Englishman, Thomas, the first Bishop of Finland. The conquest of Finland was completed about the middle of the thirteenth century. From this period the people seem to have been thoroughly attached to Sweden until their loyalty was shaken by the disastrous wars of Charles XII.'s reign, the Russian occupation of the country, and the complete disorganization which ensued. A quarter of a century of incessant misfortune seems to have destroyed the prestige of Sweden, and to have had much influence in reconciling the inhabitants to the second and final Russian conquest in 1809. Up to this time Finnish nationality seems to have been respected, and Professor Koskinen is able to point with pride to the patriotic feeling of his countrymen, their zealous and successful cultivation of their native speech, and their contributions to literature and general knowledge in other languages. If all the eminent Finns had written Finnish, the wealth of the language, even in imaginative literature, would have been far from inconsiderable. In such a case, however, Runenberg and Topelius would hardly have found translators as yet, even in all-translating Germany.

The homely, but by no means uninteresting, little archipelago on the western shore of the Cimbric peninsula forms the subject of a neat volume by G. Weigelt†, who has rendered full justice to the bracing and stirring influences of seas and gales that seem to inspire the dull landscape with something of their own animation, and to the spirit of seafaring adventure that instils an element of poetry into the daily life of the hardy but prosaic people. One of the most interesting circumstances connected with these islands is their condition as wrecks of a peninsula partially overwhelmed by a succession of devastating floods from the middle of the thirteenth to the middle of the fifteenth century. A restoration of the submerged district is attempted in a map.

Herr Ratzel‡ should have explained that his zoological epistles from the Mediterranean relate almost exclusively to the lowest orders of marine animal life. Those readers, accordingly, whose interest in natural history is confined to picturesque details of the habits of animals will find little to interest them in a book which, though strictly popular, will nevertheless be attractive to students of the minute operations of nature, and in particular of the metamorphoses and embryonic stages which allow the course of her evolutions to be traced or surmised. Some of the essays are especially devoted to this latter subject, and deserve the praise of pre-

senting in a clear and agreeable manner the results of much intelligent study, though not perhaps of much original research.

The vividness of local colouring in Herr Oscar Flex's account of Assam* attests the fact of his residence in the country, and we can only trust that the details of a planter's life conveyed in his pages may be equally authentic, both on account of the testimony they bear to the undeveloped resources of the region, and from their graphic illustration of the numerous ways in which an energetic and philanthropic European has it in his power to benefit the aborigines. The author appears in the character of the Crusoe of the second and less known part of Defoe's immortal work, ruling with a firm yet gentle hand over a rude and primitive but well-disposed people, aiding them in their troubles and arbitrating in their disputes, protecting them against the oppression and imposition of the more intelligent among themselves, and, while enforcing the due performance of their tasks, gradually accustoming them to a higher standard of culture and morality. He informs us that he was engaged as manager of a minor tea-plantation from 1864 to 1867, at which latter date he became general manager of the estates of the East India Tea Company. The volume leaves him meditating projects of still more extensive usefulness, commensurate with the responsibility of his new situation. We are not informed whether these took effect, or, since he appears to have resigned his post, what may have led to the termination of his engagement. One of these projects, the importation of native converts from a distance to work on the plantations, seems of questionable justice towards the aborigines, and of still more dubious expediency. The pictures of life in the country are highly spirited, and those of the frank social intercourse of the English settlers are very pleasing. The clearness of the style suggests that the writer is accustomed to think in English, and so far corroborates the truth of his narrative. The description of the resources of Assam confirms the wisdom of the resolution at which the Indian Government is stated to have recently arrived, of erecting it into an independent government with a view to their more effectual development. Coal, salt, sulphur, gold, and petroleum abound; tea, cotton, tobacco, and rice may be raised in any quantity; every cottage has its mulberry-tree and silkworms; the variety of the animal creation—especially, it must be owned, of the noxious part of it—is inexhaustible; while, if our traveller may be credited, Assam possesses a wonder unmatched by any other land in the shape of herds of domestic rhinoceroses.

Paul Wurm's Historical Manual of the Religion of India† is distinguished by the clear and practical arrangement of its vast theme, and still more eminently by an impartiality rare indeed in works prepared from a missionary point of view. The author, it is true, gives no proof of ability to apprehend the ideas that are at the foundation of the Indian religions, which in fact would have hardly been compatible with the object of his treatise. If, however, the breathing spirit is absent, the anatomy of the corporeal framework is complete. The students of the Basel Missionary College will gain a clear conception of the origin of the national religion of India in polytheistic nature-worship, its successive concentration into Monotheism, expansion into Pantheism, and resolution, as regards its more spiritual elements, into a subtle metaphysic, while the grosser hardened into a lifeless mass of oppressive ceremonial observances, provoking the religious democracy of Buddha into existence as a protest, and ultimately triumphing by means analogous to those at present employed by the Catholic hierarchy on the Continent of Europe. Herr Wurm thinks that the peculiar form of nature-worship expressed in the ritual of Siva was borrowed from the non-Aryan races of India; it may be so, but the affinity to the religion of Babylon is very striking. The chief omission in the work seems to be the want of adequate notice of that remarkable series of religious reformers, followers of Vishnu, described in Mr. Hunter's work on Orissa, who carried liberality so far as to seek to merge the Hindoo and Mohammedan creeds in a common mysticism, and whose spirit is manifest at this day in the peculiar mildness of the worship of Vishnu under the form of Jugernaut, and the fraternal union of all classes at his festival.

Professor Immer's manual of New Testament interpretation‡ is a most satisfactory volume, admirable alike on the score of erudition, lucidity, conciseness, impartiality, and good sense. The author's object is simply to lay down, explain, and illustrate the principles by which the expositor of the New Testament should be guided; which, if not differing in principle from those observed in the interpretation of profane authors, are nevertheless far more complicated in detail from peculiarities of language, the presence of a supernatural element, and the intimate relation to an earlier, non-Hellenic literature. The treatise is divided into sections, respectively referring to the textual, philological, historical, and other branches of the subject; and the clear and judicious rules of interpretation laid down are illustrated by pertinent examples of their application to passages of acknowledged difficulty.

The title of Dr. Lange's "Contributions to the Psychological Element in Theology"§ may induce the reader to expect a more

profound and elaborate treatise than he will find. The work is as desultory as is usually the case with a group of essays not originally intended for collective publication, and the success of the treatment is usually in inverse ratio to the importance of the subject. The "nature and development of the Papacy," for example, is hardly a subject to be discussed in sixteen pages; but eighteen pages is very fair measure for "the deaths of the mediæval Popes," and on such comparatively minor themes as this Dr. Lange writes agreeably enough.

An interesting and suggestive little volume, by Philipp Spiller*, propounds what the author seems to consider a new, but what is in fact a very old, philosophy of the universe. Herr Spiller is in effect a materialist, but is not an adherent of the purely mechanical system of materialism chiefly in vogue in the present age of physical research. Some more subtle agency seems to him required to work the machinery by which ordinary physical processes are carried on, and to superintend the evolution of mental force. This he finds in an all-pervading ether, the existence of which, though unrecognizable by our senses, he, in common with most other natural philosophers, considers sufficiently established by the propagation of light, the retardation of the planetary motions, and other well-known phenomena. The theory is worked out with much ingenuity, but the writer never seems to suspect the absolute identity of his ether with the first principle, material in its constitution, and intellectual in its attributes, postulated by the ancient Stoics, who would have thanked him heartily for his scientific confirmation of the conceptions they had attained by *a priori* reasoning.

The Stoic, the Epicurean, and all other forms of materialism down to the time of Kant will be found ably and dispassionately treated in the first volume of Lange's "History of Materialism"†, republished with considerable modifications in a second edition. The most remarkable characteristic of the work on a first view is its extreme impartiality. It would be difficult to assign the author's own relation to the controversy on which he treats. We only gather from an announcement of the forthcoming volumes that his ultimate endeavour will be to indicate a way out of and beyond a philosophy of sensation, but nothing can be more candid, and in many cases more appreciative, than his account of its most eminent representatives. He offers, for example, a cogent vindication of the deified La Mettrie, and justly remarks that in the worst days of the Roman Empire no system had so little influence as the Epicurean. The most interesting chapters of an extremely interesting book are perhaps the analyses of the poem of Lucretius and the materialistic *vade mecum* of La Mettrie, and the sketch of the influence of Arabic philosophy in Europe during the middle ages. The next volume is to be principally devoted to recent discoveries and theories in natural science, and their influence on metaphysical speculation.

The *jus regale*‡ denotes the right of a sovereign, according to mediæval law, to administer to the revenues of bishoprics and royal abbeys during a vacancy, exercising simultaneously the rights of patronage connected with them. Under such circumstances it was manifestly to the sovereign's interest to keep the appointment as long open as possible, and abuses of the privilege led to continual conflicts with the Church. The history of these, as they relate to the history of France, and the investigation of the much disputed question of the origin of the custom itself, form the subject of Dr. Phillips's very readable volume. It appears to us that jurists have given themselves much needless trouble to deduce from principle what originated solely in expediency.

Under the title of "Studies in Archæic Latin," Herr W. Stadenmund§ is to edit a series of essays treating of points connected with the early Latin writers; more particularly, for excellent reasons, Plautus and Terence. The first number contains three essays—one by A. Luchs on metrical questions, another by L. Reinhardt on interpolations and mutilations in the text of Plautus, and a third by E. Becker on some peculiarities of Plautine syntax. Being written in Latin, these essays will be generally intelligible to foreign scholars.

A. Schæffer's|| recension of the sources for Greek history up to the time of Polybius comprises a compendious notice of all historians extant and lost, including in the case of the latter the quotation of ancient testimonies concerning them. The term "historian," receives a liberal interpretation so as to include orators, biographers, chronologists, and in fine all writers whose works contain information respecting public affairs.

Paul and Braune's "Contributions to the Philological and Literary History of Germany"¶ will assume the form of a

periodical publication with essays by various hands. All the Germanic languages will come within the scope of the work; and one of the most important contributions to the first number relates to the chief literary monuments of early English.

We must let Professor Sigwart* speak for himself as to the object of his work on Logic, and define it as the treatment of the subject "from a methodological point of view." He acknowledges his special obligations to Mill, Ueberweg, and Trendelenburg, all of whom have died during the prosecution of his labours.

An unpretending little biography of Goldsmith is compiled with taste and skill.† The writer has restricted his account of Goldsmith's life to such essential particulars as may be fairly expected to possess interest for readers of every country, and has completed the portrait of the man by a judicious selection of well-rendered passages from his writings.

Jacob Falke's "Art in the Dwelling"‡ consists of a series of lectures principally delivered in the South Kensington Museum of Vienna, and corresponds pretty accurately to the same class of æsthetic literature in England. Its object may be defined as the reconciliation, as far as possible, of the modern demand for comfort with the love of beauty predominant in more artistic ages. The inevitable result is an eclectic style of decoration, approximating in sentiment to the Renaissance. Herr Falke is a man of taste and culture.

The text of M. Schalekamp's magnificent publication, *Les quatre derniers siècles*,§, is by a French critic, the illustrations are by a Belgian artist, and the work is published in Holland. We must nevertheless be allowed to ignore the frontier of Holland and Germany on the present occasion, for the sake of rendering justice to the most spirited artistic enterprise ever undertaken by a Dutch publisher, and quite an original conception in some respects. The kernel of the work is to be composed of the fourteen grand designs of M. Madou, representing the changes in manners and the external aspects of society from the commencement of the fifteenth century to the present day, in a series of drawings reproduced in photography by a permanent process. Judging from the two already published, these designs promise to form a series of admirable works, full of movement and animation. The subjects selected for the first number are the portal of a Flemish Mansion of the date 1400 and an Interior of 1460. The accompanying letterpress, describing the modifications which art has undergone during the period embraced by the illustrations, is lively and readable, and paper and print are in the highest degree creditable to the country of the Elzevirs.

MR. DISRAELI AT GLASGOW.

THE ceremony of his installation as Lord Rector, and the evening banquet which followed, afforded Mr. DISRAELI an opportunity of making at Glasgow two speeches which had the attraction of some novelty, the charm of personal memories and peculiar thoughts, and the fascination of the highest degree of cultivated ease and epigrammatic polish. It was impossible that the novelist should compose more in the style of his novels, or the politician better represent the vein of his orations. There was scarcely a sentence that was not telling, and it may be added that there was scarcely a thought that was not fanciful. He spoke of the preparation of the young for the combat of life, and, although the sermon was full of interest, it was practically as useful or as useless as the dissertations of *Coningsby* or *Sybil*. He lectured merchants on the dangers and destinies of commerce; and if what he said was true, it was now in the manner, not in the matter, of the lecture. Where he was on firm ground was in those parts of his speeches which gave passages of his own past history, traced the thoughts that had most deeply moved him in his own astonishing career, or appealed to the familiar prejudices or passions of his hearers. It is the business of an orator to embellish his pictures with plenty of local colouring, and Scotchmen may naturally have been delighted with the adroitness with which Mr. DISRAELI managed to make a denunciation of the Commune lead his hearers to take note that the flame of Scotch patriotism burns with equal brightness on the banks of the Clyde and of the Ganges. But it was not a matter of merely Scotch interest to hear the story of the reception given him when he was almost a boy by the Laird of Abbotsford. Sir WALTER SCOTT was kind to the son of the elder DISRAELI, not because such kindness might be a key to posthumous fame, but because it was in his nature to be kind to every one, because he was young enough in his old age to cherish the hopes of the young, and because he had a profound respect for kinds of intellectual excellence alien to his own. It was a happy accident that Mr. DISRAELI could thus, in speaking to a Scotch audience, add from his own recollections one more stone to the pillar of SCOTT's unpretending greatness. Nor could anything have at once awakened the higher political interest of his hearers, and yet complied with the rule prohibiting political discussion, more successfully than Mr. DISRAELI's reference to his long connexion with the Conservative party. That this party has often distrusted, and sometimes wished to be rid of him, was for years a matter of gossip, and perhaps of not ill-founded rumour; until the discovery that his followers were prepared, not only to be educated by him to accept the Reform Bill of 1867, but to look on him as its master, in the paths of subsequent tuition, dispelled the notion that his supremacy could be successfully disputed. Mr. DISRAELI now records that he has always been willing to resign his leadership, but that every manifestation of his willingness to do so has been met with fresh expressions of kindness and indulgence toward him. What, with the generosity of romance, he ascribes to the whole party is incontestably true of a few of its chiefs, and especially of the late Lord DABRY; and it may be said, to the credit of the whole party, that, under the guidance of those in whom they most trusted, they have gradually recognised that in a critical period, and before an adverse public, they wanted something more than the simple wisdom of a good honest Conservative to steer their course.

The two scenes of instruction which Mr. Disraeli com-

municated to the youthful students who had elected him were that they should commune with their own hearts and study the spirit of the age. How, he asked, is a young man to find out what he is fit for, and what he can practically do? He cannot learn this from his tutors; for, except ISOCRATES and the earlier Jesuits, no tutors have been capable of giving an answer to such a question. He cannot learn it at home, for the blind fondness or neglect of parents makes them habitually see swans in their geese, and geese in their swans. He cannot learn it from his companions, for they will admire in him the wrong qualities, and at best their admiration will be too extravagant to be just. What he must do is to try, to fail, and to analyse his failures. Emulating the fashionable poet of the day, he must write poems which no one will read. As a rival of the most practised orators, he must make speeches to which no one will listen; or, striving to tread in the path of a great general, he must order men only to discover that he cannot influence the conduct of a single individual. Then, instead of being disheartened, he must patiently and impartially examine himself, profit by his experience, and resolutely proceed in the direction in which the whisperings of hope or genius prompt him still to think he may succeed. Who does not see that in all this it is RASSELAS who is telling the history of the Prince of Abyssinia? Mr. DISRAELI was not really guiding ordinary Scotch students into the way that would lead them to distinction; he was telling them the tale of his youth and rehearsing a chapter of his Autobiography. He was relating how he had in his early days tried, failed, analysed his failures, and prepared himself for success. The usual boy would learn nothing from the process of such a self-examination even were he not, happily, entirely incapable of it. He would soon get weary of the comedy of looking into the blank of his own mind, and indolence and the sense of duty would rapidly bring him back to the humble task of seeing how he could best take advantage of such opportunities as his parents or friends might be able to assure him. But if we permit ourselves to forget the fictitious Scotch lads whom Mr. DISRAELI was nominally addressing, and look only at the actual career of the speaker himself, the memory of which lay at the bottom of what he said, nothing in it is more deserving of notice than that Mr. DISRAELI has attained a wonderful success in spite, not only of extraordinary obstacles, but of extraordinary failures. He has in his life been not only untried but ridiculous; and, few as there are who can surmount the want of friends and position, there are still fewer who can survive ridicule. Mr. DISRAELI has written poetry and spoken speeches which were in his history what the eagle of Bonlogue was in the history of NAPOLEON III. Among the writers of bad poetry and the speakers of speeches that fall flat, among conspirators capable of landing at a seaport with half-stolen followers and a tame bird, there is one in an innumerable number of thousands who has it in him to lead an English party or govern a Continental nation. This one possibly, imaginable, undiscoverable being was the real hearer whom Mr. DISRAELI addressed. Whether, as a matter of fact, he was present at the Kibble is a mystery as yet lost in the womb of time.

The wise youth who has completed the process of introspection is next called to study the spirit of the age. Having, to use Mr. DISRAELI's daring image, traversed wild tracts and mountain gorges and ridges and ranges, he will stand like a soldier of XENOPHON, with the sea before him, and recognize that, on the boundless ocean of life he is to be guided by the compass with which the knowledge

of this great secret will furnish him. Fortunately even commonplace people, with minds inadequate to improve themselves by ambitious failures, may profit as well as their cleverer rivals by studying the spirit of the age; for if the most vulgar good sense failed to teach the lesson, this study would teach them, it appears, not to adopt professions that are obsolete, or venture their capital in countries where trading is carried on at a loss. For greater minds the spirit or knowledge of the age will do far more. Mr. DISRAELI most goodnaturedly told his Scotch friends what the spirit of the age is, and announced that it is the spirit of equality. In England we have got the right sort of equality; in France there is set up the wrong sort of equality; and Mr. DISRAELI owned that it was not getting very far if an Englishman merely recognized the superiority of English over French institutions. But there is another sort of equality which promises to be soon the spirit of the age in England and elsewhere, and that is the equality of Cosmopolitan Communism. Here the use of understanding the spirit of the age is to learn to combat it. If part of the preparation for combat consists in accurately apprehending the character and designs of the enemy, Mr. DISRAELI did not perhaps do much to help his hearers. Mischievous and absurd in most respects as are the dreams of Communism, it is obviously a false view to regard them as only pointing in the direction of material prosperity. The aims of Communists are futile, and the conditions they demand are impracticable, but nothing would astonish them so much as to hear that, when they have given a man a good bellyful, they propose to let him alone. But if young Scotchmen require to be warned against the attractions of Communism, and if they can be warned as easily against them as against adopting professions from which they will not get a farthing and commercial ventures in which they are sure to lose all they possess, by the simple process of calling the pursuit of obvious reflections the apprehension of the spirit of the age, Mr. DISRAELI has been a kind friend in giving them the recipe. That they really need this recipe is, however, so unlikely that here again we must see an illustration of Mr. DISRAELI's personal history rather than any attempt to tell Scotch students profitable truths. It has been one of the secrets of Mr. DISRAELI's success that he has been able to cheer himself in the task of playing a political part in many respects antipathetic to his tastes and intellectual ambition by his singular power of inventing a romantic mist through which he views humble duties and ordinary aims. Having partly, at least, through accident thrown in his lot with the Conservative party, he has successfully striven to make Conservatism poetical to his mind with a poetry specially his own. He had fancies, prejudices, or beliefs in abundance, which readily served the purpose, and although it is always hard to say where, in what he says or writes, belief ends and irony begins, yet it would be most unjust not to recognize that, on the whole, he naturally discloses, rather than insincerely invents, what he says for the satisfaction of himself and his readers. He has been, as a politician, in a position not unlike that of a person who, having got hold of a picture which he does not admire, and being obliged to have it always in his dining-room, comforts himself by setting it in a magnificent frame; and this ornate discourse at Glasgow about the spirit of the age may be regarded as one more scroll or boss in the gilding.

THE SANTIAGO EXECUTIONS.

THE execution of a large number of prisoners at Santiago in Cuba will probably lead to serious consequences. It is remarkable that a Spanish Prime Minister lately resigned office because he was irrevocably opposed to the infliction of capital punishment. The authorities who have put to death without necessity a large number of their captive enemies are Spaniards who for the most part were born in the mother-country. It seems that there was at one time some exaggeration in the number of the alleged victims; but there can be no doubt that the executions were painfully numerous. No account which has yet been published furnishes sufficient materials for a confident judgment on the legal right of the Colonial Government to treat the crew and passengers of the *Virginian* as rebels. It was already known that in the civil war which has now smouldered for three or four years no quarter was given on either side. The Volunteers not long since perpetrated a

judicial murder of the most barbarous kind on a number of students who were merely accused of desecrating a burial-ground in which a monument had been erected to a Loyalist. The savage cruelty of the Volunteers excited general reprobation, but it gave foreign Powers no ground of interference; nor would they be able to control the violence of the equally merciless insurgents. Indignation which is likely to have practical results has been excited by the execution of a number of English subjects and American citizens. The *Virginian* appears to have been engaged, in some undefined character, in the service of the insurgents. The ship can scarcely have been a privateer, for there is no rebel Government in Cuba to issue letters of marque; nor is it stated that any attempts had been made to search for or capture Spanish vessels. The term "blockade-runner" is inapplicable, because there is no blockade on the coast of Cuba; and, on the whole, it must be supposed that the *Virginian* was employed as a transport and a store ship. Among the passengers on board was a son of the rebel chief; and it is said that the cargo consisted of munitions of war. On previous occasions the *Virginian* had been protected by American naval officers from capture by the Spanish cruisers; and the irritation which ultimately found vent in the executions at Santiago may perhaps have been aggravated by the connivance of the American navy with the rebellion. If the seizure had been effected in Spanish waters, it would have been an ordinary warlike operation; and even on the high seas an enemy's ship would be a lawful prize. The question whether the *Virginian* is entitled to claim American nationality is of the highest importance. The recent precedent of the *Deerhound*, which was voluntarily released by the Spanish Government though the vessel had been engaged in carrying munitions of war for the use of the Carlists, proves that in time of peace a Government has no right in any case to make prize of a foreign ship.

If it should be found that the capture was legally unobjectionable, the cruelty of the colonial authorities may nevertheless furnish reasonable ground for remonstrance. It is true that foreigners have no right to take part in domestic contests; but a Government which is unable during three or four years to suppress a rebellion is morally bound so far to treat the insurgents as belligerents as to give quarter to insurgents. The Englishmen who were put to death appear to have been sailors who were probably tempted by high wages to pursue their occupation in the rebel cruiser without inquiring too curiously into the nature of her employment. They would have had little ground for complaint if they had been detained as prisoners of war, but they could never have conjectured that they incurred the risk of capital punishment. The Americans on board may perhaps have been more directly engaged in hostile operations, but they also were entitled to the ordinary treatment of prisoners of war. The American adventurers who several years ago took part in the enterprise of LOPEZ were executed by the Cuban authorities as soon as they were taken, but they had landed for the purpose of organizing an insurrection, and they had undoubtedly incurred the penalties of treason. The existence of a chronic civil war introduces new elements into the question. Even if it can be shown that no actual violation of the law has been perpetrated, the ruling faction in Cuba cannot be allowed to persist in its blood-thirsty course. In the probable contingency of a legal irregularity in the proceedings, there will be more conclusive reason for interference. There can be little doubt that the Government of Madrid will willingly offer any reparation in its power; but orders for the punishment of the offenders would be disregarded in Cuba, and one of the remonstrating Governments may not improbably prefer an unredressed grievance to any form of satisfaction.

Popular opinion in the United States is, as might be expected, strongly excited; and the Government takes advantage of the opportunity to stimulate the clamour for intervention in Cuba. The naval authorities are fitting out ships, and recruiting to the utmost extent allowed by law; and the organs of the PRESIDENT take credit for his determination to wait for the decision of Congress. As the Constitution prohibits the PRESIDENT from declaring war at his own discretion, his present moderation is scarcely voluntary. On the meeting of Congress in the first week of December the PRESIDENT will disclose his opinions in his Message; and in the meantime his recommendations may be confidently anticipated. A year ago, when there was no apparent occasion for discussing the question, the PRESIDENT urged upon Congress the expediency of profiting by every

opportunity to extend the national territory. His obstinate and perhaps successful persistence in the project of annexing San Domingo proves that he excludes neither tropical countries nor alien races from his ambitious designs. It is fortunate that a short delay is interposed between the transaction of Santiago and the meeting of Congress. The outrage which has been perpetrated, and the probable failure to obtain redress, will furnish a plausible pretext for hostile measures; but prudent American politicians will hesitate before they sanction an enterprise which may lead to unforeseen results. An invasion of Cuba would in the end be almost certainly successful, but it might involve heavy sacrifices of life and money. The numbers of the American standing army are scarcely sufficient for ordinary service in time of peace; and although volunteer regiments may be raised, the proposed conquest of Cuba would not excite the patriotic enthusiasm which filled the Federal ranks during the war with the Southern Confederacy. In spite of all difficulties, the power of the United States is sufficient to ensure the annexation or the independence of Cuba; but the objections which proved fatal to General GRANT's first project of occupying San Domingo will apply far more forcibly to the annexation of Cuba. Neither the white nor the black inhabitants of the island would be a desirable addition to the number of American citizens; and, without a fundamental change in the Constitution, it would be difficult to manage a large dependency with two millions of alien subjects. Any scruple which might be felt as to the dismemberment of the territory of a friendly Republic would probably not be shared by the PRESIDENT; but it is doubtful whether he will obtain a majority in the Senate for the policy which he will probably recommend.

Another alternative, which is more likely to be adopted, would consist in a declaration of the independence of Cuba, and of the abolition of slavery. The dominant faction in Cuba pays no attention to the measures of the Spanish Government or Legislature for the emancipation of the negroes; but with the aid of an American fleet and army, the Creoles would assume a superiority over the white planters; and the negroes, though they are at present neutral, would naturally accept the boon of freedom. The chief difficulties of such a policy would perhaps disclose themselves when the original enterprise was successfully accomplished. The native or immigrant Spaniards govern Cuba because they are more vigorous and more warlike than their adversaries; and they would either leave the island in a body, or they would not submit after the withdrawal of the American troops to the supremacy of the Creoles. If the slaveholders were disinclined to remain in Cuba after emancipation, the residue of the population would be incapable of organizing and maintaining a free Republic. The island would be impoverished by the discontinuance of labour by the negroes; and the inhabitants at the best would not maintain themselves above the level of the South American Republics. CESPEDES or some other adventurer would become Dictator under the title of President, until he was overthrown by a rival of his own class; and the negroes would have no part in political life until they became numerous enough to establish another Hayti in Cuba. At some stage in the downward movement the United States would have again to interfere; and perhaps annexation might become necessary when degeneracy had already made considerable progress. If the Senate is wise, the present quarrel will be hushed up on any terms which may not be inconsistent with the national honour; and the excusable excitement of popular feeling will gradually subside.

FRENCH PROSPECTS.

IF Versailles and the Assembly that meets in it could in any way be got rid of, the prospects of France would be more satisfactory than they have been for a very long time. The elections of Sunday last confirm all that has been said about the steady growth of a genuine political opinion. The voting took place in the very middle of a political crisis. The electors had been warned that the return of a Republican candidate would be tantamount to inviting murder, robbery, and arson to do their worst. The Government, we may be sure, had made full use of all the local strength at its command, and at the last moment the Assembly had thrown its weight into the same scale by voting urgency for a Bill to disqualify officers on active

service from sitting as deputies. Yet, notwithstanding this extraordinary combination of hostile influences, the Republican candidates were returned by large majorities. The manufacturers of Rouen, the ship-owners of Havre, the shopkeepers of Troyes, the peasants of the villages round were all of one mind. Under the circumstances a different result might not have had much significance. The return of Conservative candidates for Aube and the Lower Seine would only have shown that the Republican feeling in the country was not confirmed enough to resist the unusual pressure brought to bear upon it. But that two important and representative departments should have given so certain a sound at a moment of unexampled trial is conclusive evidence of what France really desires.

It is only when we turn to the nominal Legislature of the country that there is real ground for anxiety. There, each fresh manifestation of Republican conviction seems only to harden the heart of the majority. The pretence of representing France has been abandoned, and the Assembly avowedly sets its face against a dissolution because it hates the institutions which a dissolution would certainly establish. In May the majority thought that their purpose would be answered by making Marshal MACMAHON President in the room of M. THIESS. They have now discovered that this expedient has had no effect on the constituencies, and that, if they wish the next Assembly to emulate the virtues of its predecessor, they must get rid of the majority of the electors. Under a free Government this manoeuvre might be difficult to execute; but in Marshal MACMAHON they have the happiness to possess a leader who is willing to rule either on constitutional or on autocratic principles, as best pleases his friends. His deference to their wishes is the more graceful that in the recess they did their best to get rid of him. But Marshal MACMAHON is above any petty irritation. Though he was employed to keep the throne for the Count of CHAMBORD all through the vacation, he is still ready to sit on it himself. He has no objection to being nominated dictator; his only stipulation on that point has been that, if he is to be dictator, he shall be a dictator with plenary powers, and shall enter at once into his inheritance. Such a ruler is exactly suited to meet the various wants of the majority in the Assembly. The Right are favourable to him because he will allow them to scheme for HENRY V. The weak-kneed members of the Left Centre are favourable to him because he will prevent the Left from scheming for a Republic. The Bonapartists are not actively hostile to him because they want time to develop their plans. In short, Marshal MACMAHON has not a single enemy except those who care for the freedom and dignity of France, and in the existing Chamber they are in a hopeless minority. The crowd of intriguers to whom an unkind fortune has committed the affairs of France will now be free to pass what, with the humour natural to successful plotters, they will call Constitutional laws. What the nature of these laws will be it is not difficult to guess. At present the Marshal is absolute ruler over a large part of France by virtue of a state of siege. He is naturally anxious that there should be no invidious distinction between one part of his territory and another; and though there is nothing to prevent the actual master of the army from making a state of siege universal, he modestly prefers to exercise his powers under another title. Bishop TAYLOR somewhere says that a virtuous Christian will rather increase his ordinary devotions than add special devotions. This is precisely Marshal MACMAHON's view of his office. As it is, he can do pretty much what he chooses in an emergency, but he wishes to be able to do what he chooses without an emergency. It is difficult to proclaim a state of siege in a department which has given no other sign of disaffection than a disposition to return an Opposition candidate; and even if it were proclaimed, the general in command might be puzzled how to apply it to voters who took refuge in discreet silence, or still more discreet lying. Only a Constitutional law can meet such a case as this, because only a Constitutional law can provide that no ill-disposed or enthusiastic person shall enjoy the franchise, or that votes given on the wrong side shall count as though they were given on the right side.

It seems likely, therefore, that the really critical moment for France has not yet arrived. Supposing that the electoral law remained unaltered, the vote of Wednesday would be comparatively unimportant. The partial elections would go on in their present course, and by degrees the majority of the Assembly would come to represent with some ap-

proach to accuracy the majority in the country. There would come a time therefore when the Legislature and the Dictator would find themselves in a position of antagonism from which there would be no escape except by the retreat of one or other. In such a dilemma as this the surrender would probably come from Marshal MACMAHON. He would hardly have the resolution to send the Assembly to prison; or, popular as he is with the army, he is not the heir of NAPOLEON I. The Right are not far-sighted politicians, but they have the wits to see that their chances of keeping France under their feet are inextricably associated with the success of a new electoral law; and it is when this comes to be debated on that the Liberal party will find themselves in presence of their greatest danger. It is quite conceivable that by that time some attack will have been made on the inviolability of deputies, and that M. BUFFET will have been armed with the power of ordering into arrest any member who uses language which the majority may think derogatory to their sovereignty. It may be that it is to guard against a possibility of this kind that M. THIERS has maintained unexpected silence throughout his debate on the extension of the President's powers. There may be some reason for not weakening the force of his supreme effort by showing that his arguments are powerless to influence votes, and he may think it prudent to reserve his supreme effort for an occasion on which orators of smaller mark may be less able to speak their mind with impunity. If that effort is made, and fails, if the majority in the Assembly do not shrink from confessing that France must be gagged, as the only means of bringing her into even seeming agreement with the representatives who have betrayed her, the question presented for the decision of the Liberal party will be one of extreme difficulty. That they would consider themselves justified in resisting a law reducing the constituencies to manageable dimensions is more than probable. Such a change would, in fact, be not the less a usurpation because it was effected by constitutional forms. The essence of usurpation is the imposition of a government by armed force, and the adoption of such an electoral law as the Right would wish to pass would exactly answer to this description. So long as this extreme measure is not taken, the triumph of the Republican party is only a matter of time. They have evidently the country with them, and every new election loses its part towards bringing the Assembly into harmony with the country. But if the machinery by which alone his process can be peaceably effected is destroyed, if the majority in the Assembly secure themselves against being displaced by depriving the country of its right to genuine representatives, the conditions of the question will be altogether altered. Those, however, who may be disposed to resort to extreme and exceptional measures will have to consider whether open resistance could be attempted with any chance of success. If the army were prepared to support Marshal MACMAHON, resistance to the majority in the Assembly could, and probably would, be put down with unscrupulous force. Whether a French army will be found to act against the French nation, whether the new Republican convictions will stand the test of imminent civil war, whether generals whose names are associated with incidents in the late war more readily creditable to France than any with which Marshal MACMAHON has been connected, can succeed in rivalling him in the affections of the troops—these are the problems with which M. THIERS and M. GAMBETTA may possibly be confronted in a week or two. For the present their thoughts are probably too much taken up with devising how to keep their followers from moving prematurely to leave them any time to spare for considering whether they can move to any advantage hereafter.

THE NEW GOVERNMENT APPOINTMENTS.

THE two appointments which were announced last week will add strength to the Government. Mr. VERNON HARCOURT had been generally regarded as the probable successor to the office of Solicitor-General; but the selection of Dr. LYON PLAYFAIR as Postmaster-General caused a certain amount of surprise, though not of disapproval. Although the retirement of Mr. MONSELL seemed to have become less urgently necessary when Mr. LOWE ceased to be Chancellor of the Exchequer, he has shown good sense and self-respect by resigning his nominal presidency over a department which, by his own admission, he was unable to control. An active and able subordinate had entirely set

aside the authority of the POSTMASTER-GENERAL; and the Treasury had actually corresponded with a Secretary, on the assumption that the Parliamentary chief of the Post Office had subsided into the position of a constitutional sovereign. Mr. MONSELL, who had neither resented the encroachments of Mr. SCUDAMORE nor the contumelious treatment which he received from Mr. LOWE, rightly thought that, after the public exposure of his relations to the Post Office and the Treasury, he would consult his own personal dignity and the public interest by resignation. Mr. MONSELL is popular in the House of Commons, and he will be regretted by the majority of his colleagues; but it happens by a casual coincidence that, while his resignation arises from administrative miscarriages, the causes to which he probably owed his appointment have for the present ceased to operate. Dr. PLAYFAIR has shown in the comparatively humble capacity of an Exhibition Commissioner a faculty of managing details which renders it probable that he may become an efficient administrator; and his general vigour and ability afford a security that he will never allow any office which he may hold to become a sinecure in his hands. Having entered Parliament in middle life, he has in the course of five years acquired in the House of Commons a respectable position as a thoughtful, if not an eloquent, speaker, who always contributes information on subjects which he thinks it convenient to discuss. Scientific culture, though it may be less immediately valuable to a politician or debater than literary accomplishments, adds to the weight of his authority through the well-founded impression that he possesses a reserve of intellectual power. A constituency of far more than average competency which made Dr. PLAYFAIR its first choice when it had acquired the Parliamentary franchise, will be gratified by Mr. GLADSTONE'S recognition of his character and ability. The Conservatives of the Universities of Edinburgh and St. Andrews will certainly not adopt the ungenerous innovation of contesting a seat which has, to the credit of the constituency, been vacated by the acceptance of office.

The appointment of Dr. PLAYFAIR to succeed Mr. MONSELL probably indicates a change in the Irish policy of the Government. When Mr. GLADSTONE formed his Administration, it was thought that the Roman Catholic hierarchy would be conciliated by the promotion of a respectable convert to their faith. It is not known how far Mr. MONSELL enjoyed the confidence of any portion of the episcopal body; but it was generally believed that he was habitually consulted by Mr. GLADSTONE during the preparation of the Irish University Bill. If Mr. MONSELL expressed an opinion that the concessions included in the measure would be accepted with gratitude, he is certainly not to be blamed for failing to anticipate the unwise rejection of a boldly liberal offer. It is highly probable that the majority of the Roman Catholic bishops themselves were unaware of the course which would be adopted until they received instructions from Rome through the representative of the Holy See. After the denunciation of the University Bill by the bishops, it must have become evident to Mr. GLADSTONE that no political advantage could any longer be derived from the presence in the ante-chamber of the Cabinet of a Roman Catholic member who was not trusted by the heads of his Church. When it became expedient on other grounds that Mr. MONSELL should retire from office, there was a certain show of defiance of episcopal dictation in the appointment of a successor who had actively opposed the University Bill on directly opposite grounds to the objections proffered by the Roman Catholic bishops. Of the many sections of the community to which Mr. GLADSTONE'S proposals were distasteful, none were more zealous or more indignant than the Professors of the Scotch Universities, who complained that the Bill was a violation of that which they described as academic freedom. They anticipated that, if the Bill were passed, the new University would in a few years fall under the control of the Roman Catholic bishops; and that it would consequently be administered in the interests of orthodoxy rather than for the promotion of learning and science. Dr. PLAYFAIR fully shared and strongly expressed the opinion of his friends and constituents. It was a proof of spirit and independence to offer active opposition to a measure which the PRIME MINISTER was strongly bent on carrying, and on which he had staked the existence of his Government. It is creditable to Mr. GLADSTONE that he should not have been induced by his disappointment to forget that one of its authors was on other questions one of his most

meritorious supporters. Nevertheless it can hardly be supposed that the appointment of Dr. PLAYFAIR would have been made if all schemes of attempting to effect an understanding with the Irish Roman Catholic bishops had not finally been abandoned. The project of the constitution of a University by Papal licence is perhaps not without reason regarded as the signal of a final rupture.

Mr. HARCOURT, in the exercise of a judgment which was certainly not biased by habits of excessive subserviency to Ministerial dictation, expressed his intention of voting for the University Bill, in a speech which contained much criticism of its principle and details; yet he is well known to be as hostile as Dr. PLAYFAIR to the pretensions of the Roman Catholic hierarchy. In Great Britain Ultramontane doctrines are at present almost as unpopular as in Germany; and it is only by the exercise of statesmanlike calmness that politicians will be likely to remember that an influence, whether useful or pernicious, which is dominant over some millions of the QUEEN'S subjects must be dealt with as one of the conditions of the government of the Empire. There is no reason to suppose that any opinions which Mr. HARCOURT may hold on conflicts of secular and ecclesiastical policy had anything to do with his promotion. Mr. GLADSTONE properly held that his choice ought to be determined by considerations of professional and Parliamentary eminence. He could perhaps scarcely have been blamed if he had remembered the numerous occasions on which Mr. HARCOURT has led malcontent Liberals below the gangway in isolated attacks on the Government; but little is to be hoped from the services of an ally who has not the power of making himself a troublesome critic. In legislation and in debate the SOLICITOR-GENERAL will be able to give valuable assistance to the Government; and even if he at any time dissents from parts of Mr. GLADSTONE'S policy, official discipline will justify and require acquiescence in the decisions of the Cabinet. With the details of Common Law practice Mr. HARCOURT is less familiar than some of his competitors, because he earned his professional rank at the Parliamentary Bar; but when his official duties require his appearance in Westminster Hall, there can be little doubt that he will prove himself a sound lawyer as well as a brilliant advocate. No other member of the Bar in the House of Commons has devoted equally long and systematic study to those doctrines of international law which have lately acquired novel importance. In the very crisis of the American war he commenced his well-known series of letters under the name of "HISTORICUS" with a defence of the strict principles of non-intervention, which were at that time represented in a divided Cabinet by Mr. HARCOURT'S friend and connexion, Sir GEORGE LEWIS. As the subject of controversy changed with the circumstances of the war, and with the increasing exigency of the American Government, Mr. HARCOURT'S letters were characterized by still clearer apprehension of the points of issue, and by the results of constantly extending research. His writings, together with the valuable work of Mr. MOUNTAGUE BERNARD, and with the Geneva Judgment of the LORD CHIEF JUSTICE, form an exhaustive apology for the conduct of the English Government and nation, and a conclusive proof that the Washington Treaty, with the untoward Arbitration which followed, could be justified only by supposed considerations of political expediency. For some years past Mr. HARCOURT has been engaged, as the first incumbent of the new Professorship at Cambridge, in studying and teaching the general principles of international jurisprudence. While the ATTORNEY-GENERAL will bring to the consideration of such questions an acute intellect well furnished with legal learning, his colleague will possess the special aptitude which arises from familiarity with all historical and legal precedents. The complication of international controversies seems to be constantly increasing. In the last generation wars were rare, and they were conducted by definite belligerents in the midst of recognized neutrals. There are now recognized and unrecognized belligerents, and benevolent or malevolent neutrals, and it becomes more and more difficult in such cases as those of Carthage and Cuba to distinguish patriots from pirates. It is highly desirable that in all such cases the English Government should have the best advice, though, after all, it will in the future, as in the past, be generally vituperated by all parties. On official and Parliamentary grounds, the appointment of Mr. HARCOURT was probably the best that could have been made.

THE COMMITTEE OF FIFTEEN AND THE ASSEMBLY.

THE form in which M. CASIMIR PERIER'S amendment was finally adopted by the Committee of Fifteen differed from the form of which we spoke last week in one material particular. As originally drafted, it extended the powers of the PRESIDENT of the Republic until the close of the next Assembly; as it appeared in M. LABOULAYE'S report, the term prescribed was five years from the meeting of the next Assembly. The change has already ceased to be important, but, had the Bill introduced by the majority of the Committee been adopted, it would have proved a change for the worse. If the Marshal's powers had come to an end with the life of the next Assembly, it would have been in the power of the majority to depose him by hurrying on a dissolution. If he had been President for five years certain, there would have been no security against a succession of conflicts between the Legislature and the Executive. The change was no doubt made to catch the votes of the more timid members of the Left Centre. There are some of them who dread nothing so much as finding themselves under the Republic which they profess to wish to see established, and it is some consolation to them amid their terrors that, whatever the Government of France may be called, it will be administered by a soldier for a fixed term of years. If they must put up with freedom when that term is over, it is still a gain to have something very like a despotism secured to them in the interval. It is difficult to blame the majority of the Committee for making such a concession, because it was probably their last chance of carrying their project in the Assembly, and politicians who have to get a straight vote out of such uncertain politicians as the Conservative wing of the Left Centre must accept much which they would gladly repudiate. It was to this same element in the Left Centre that Marshal MACMAHON'S second Message was addressed. The effect produced by the consent of the majority in the Committee to give him a five years' lease of power had to be done away with. The mere reduction of the term from ten years to five he might have assented to; but the majority of the Committee had made the extension of the PRESIDENT'S powers depend on the passing of the Constitutional laws; and not even to secure five years of Marshal MACMAHON'S rule would his advisers submit to be instrumental in setting up the Republic. The necessary contingent from the Left Centre had, therefore, to be detached somehow; and the fact that the majority of the Committee had thought it necessary to tempt them by a proposal to keep Marshal MACMAHON at the head of affairs for five years may have suggested to the Ministry that the way to win them was to let them know that this proposal would certainly be declined. If, said the Marshal, you give me a power the extent of which is to be determined by laws to be passed by and by, the question professedly decided this week may be reopened next week. It does not suit me to retain office "under reserves and suspensory conditions." My powers must be extended for a given term of years without the law which extends them being made in any way dependent for its constitutional validity on the passing of other laws. If I do not have my way upon this point, I cannot accept the charge the Committee propose to lay upon me.

From the moment that this Message had been read, the result of the division ceased to be doubtful. The thought of Marshal MACMAHON'S resignation was unendurable to a section of the Left Centre on two grounds. They were alarmed for France; they were still more alarmed for themselves. They were alarmed for France because they distrusted M. THIERS'S ability to maintain order. They were still more alarmed for themselves because they distrusted the willingness of their constituents to send them again to Versailles. It is admitted on all hands that, if Marshal MACMAHON were to retire, a dissolution would be unavoidable. There is no one else for whom a majority could be obtained in the existing Assembly, and it would be necessary to get a new Chamber as the first step towards getting a new President. There was some talk of securing wavering votes by a promise on the part of the editors of Republican newspapers to support the re-election of every deputy who voted for the Committee's Bill. But there must be some members of the Left Centre whose estimate of their own deserts is too modest to allow them to believe that such a promise would be kept. At all events they now have the bird in their hand, and

why should they let it go on the chance at most of getting another equally good? Even if they came back to the Assembly after a dissolution, they would come back laden with all manner of inconvenient pledges; whereas their present seat never cost them a promise, except the promise, long since honourably redeemed, to make peace with Germany at any price.

A debate conducted under these conditions might have been languid and uninteresting. But the Republican speakers felt that they were addressing a public larger than that which filled the benches and galleries of the Assembly. Marshal MACMAHON's Message furnished M. JULES SIMON with an excellent text. It is in vain that the Marshal assures the Assembly that he holds office simply to carry out its will. Why, if this be so, is he so anxious to be made independent of it? The difference between the Bill introduced by the majority of the Committee and the Bill introduced by the minority is only this, that the former does not invest the provision extending the PRESIDENT's powers with a "constitutional character" until after the Constitutional laws have been voted, while the latter makes no mention of this restriction. What is understood in France by investing a law with a constitutional character it would be hard to say; but, so far as such a phrase can have any meaning, it must imply that the law extending Marshal MACMAHON's powers for a term of years is more irrevocable, now that it has been voted in the form proposed by the minority of the Committee, than it would have been if it had been voted in the form proposed by the majority. This conclusion follows directly from the Marshal's own words. He refused to retain power if his tenure of it were associated with the passing of the Constitutional laws. What is this but a warning that he does not intend to recognize any future decision of the Assembly, supposing that in his judgment it conflicts with the decision just arrived at? This single sentence is the measure of the Marshal's honesty of purpose. He has dealt fairly with the Assembly in that he has not allowed it to remain ignorant of the interpretation he intends to put upon its vote. He has declared that he will only accept power on condition that his possession of it shall not hereafter be called in question by the authority which conferred it. It is true that the Bill introduced by the minority of the Committee says that the PRESIDENT's powers are to be exercised under the restrictions now existing, until these restrictions have been modified by the Constitutional laws. But who is to ensure that the Marshal, being irrevocably President for seven years, will regard these modifications as binding upon him? There is no sense in making such a point of getting the duration of the power agreed to before the conditions under which it is to be used are agreed to, unless the holder of power foresees that the conditions when imposed may be distasteful to him, and is consequently resolved to be well settled in his seat before the time for manifesting his distaste has come.

M. JULES SIMON had no difficulty in demonstrating that the proposal of the minority of the Committee was a proposal to hand France over to an autocrat who has neither the genius of NAPOLEON I. nor the prestige of HENRY V. But his proofs were wasted on men who had made up their minds to run any risks rather than see themselves sent back to their natural obscurity. By a majority of 66 Marshal MACMAHON has been made dictator of France, and every possible precaution has been taken to give the Constitutional laws the reactionary character which can alone secure the re-election of certain deputies of the Left Centre. It seems a small object for which to throw away liberty, but it is as large a one as either the intellect or the patriotism of the deserters from the Liberal party is able to embrace.

INDEPENDENT LIBERALS.

THE ranks of the independent Liberals in the House of Commons have lately been thinned so rapidly by promotion that the utterances and conduct of those who remain possess more than usual interest. Mr. BOUVIER is in the first rank of the few who are left, and he has lately been affording his constituents at Kilmarnock an opportunity of clearly understanding what an independent Liberal is like. He is an independent Liberal all round, independent of his constituents, independent of his party, and independent of the Government. It must be owned that an independent Liberal is very trying to his constituents. If they put up with him, and return him in spite of his inde-

pendence, they do themselves very great credit, raise the standard of electors and elected, and render the nation a great service. But they would be more than human if they were not always on the verge of quarrelling with him. What makes an independent Liberal of the BOUVIER type so especially aggravating is that he makes things unpleasant when it appears so natural and easy for him to make them pleasant. Instead of offering his friends outbursts of genial enthusiasm, taking refuge in vague panegyrics of the Liberal party, and professing that, though not quite convinced, he sees much that is good and true in the most ridiculous proposals, he tortures them by thrusting on their attention the deliberate judgments of a man who thinks before he speaks, and says exactly what he thinks. The electors of Kilmarnock who met Mr. BOUVIER on Monday night had not the satisfaction of getting him to adopt a single reform of which he did not approve, to hesitate on a single subject on which he had made up his mind, or to refrain from stating a single argument that had determined his opinion. When Home Rule was the subject of discussion, he told his hearers, not that if the Irish wished for it they should have it, but that it would break up the Empire, and was not a thing to be thought of for an instant, although he condescended to human weakness so far as to show, by the way, that it would also bring ruin on Ireland in the long run, and meantime burden it with increased taxation. In speaking of the 25th Clause he disclaimed to consider the sympathies of Scotch Presbyterians with English Nonconformists, and candidly explained that, although he should be glad to mitigate if possible the irritation which the clause has produced, yet he thought the principle on which it was founded quite right, and that he had never heard of any practical proposal to amend it. The Permissive Bill, for which he owned that he knew many of his hearers had a fancy, he summarily dismissed by saying that he was an upholder of civil liberty, of which the Bill would be a direct infraction. When his questioners came nearer home, and asked whether he would support a measure compelling landlords holding land near a "great town like Kilmarnock" to lease building land at moderate rents, he simply replied that he could not sanction any attacks on private property. Perhaps, however, he was still more irritating when he invited his hearers to suspend their judgments on points which discussion, in or out of Parliament, has not yet made ripe for settlement. He took as an instance the issue of the Ashantee war, and said that he was inclined to think that the best thing to do would be to abandon our possessions on the Gold Coast when we had defeated the Ashantees; but that he saw such forcible objections to that course that he must wait till further discussion and a better knowledge of the facts had made him see his way clearer, and he entreated his hearers to do the same. It was bad enough to have a member who had not got a cut-and-dried opinion about everything, and one fortunately in harmony with that prevailing among his constituents; but it was little short of an outrage when he suggested that they themselves should go grinding away at facts, and seeking to see questions on various sides, before they arrived at an opinion on any vexed point of current politics.

But, independently of his general way of thinking and talking, his constituents had a special ground of quarrel with Mr. BOUVIER; and this was that he had voted against his party on the Irish University Bill, and thus helped to turn Mr. GLADSTONE out of office. We may be sure that there was not a single man in the room who approved of the Bill, because we know that there was no one in the kingdom, out of the Cabinet, who approved of the Bill as originally drawn, while the Cabinet offered during the debate to reconstruct the Bill altogether. But as the vote was turned into a strictly party vote, intended to decide whether the Government should go out of office or not, the Kilmarnock electors considered that Mr. BOUVIER ought to have thought more of the fate of Mr. GLADSTONE than of the demerits of the Bill. How far an honest man is at liberty to vote on a critical occasion with his party for a Bill which he thinks radically mischievous is the most difficult problem of political life. There is much to be said in favour of party fidelity, and even obstinacy; and it must be owned that the passionate attachment of the Scotch constituencies to their party is one of the elements of strength which give the Liberal party a compactness in which, in many respects, it is sadly deficient. Nor is it possible to accept Mr. BOUVIER's theory as to the duties of a Ministry, and to hold that no Ministry is entitled to make a question one of confidence, to go

out of office, and then to resume office without reviving the question. It is the peculiar circumstances of each case by which the conduct of a Ministry is to be judged, and Mr. BOUVIER was unable to find any parallel in Parliamentary history to the course taken by Mr. GLADSTONE, merely because the circumstances under which Mr. GLADSTONE had to act were without precedent. Mr. GLADSTONE resigned because he was beaten; he came into office again, much against his own will, because there was no other way of getting the Government of the Crown carried on decently; and he did not revive his Bill because the whole ground of the Bill, as an endeavour to please the Irish, had been cut away by the Irish opposition to it. It was not, however, merely his vote on the Irish Bill that Mr. BOUVIER's constituents objected to. They had taken it into their heads that he was an habitual opponent of the Government, and a malicious local pamphleteer had spread the rumour that Mr. BOUVIER's hostility to the Government sprang from his irritation at being neglected by it. Mr. BOUVIER met this accusation by comparing his conduct with that of Scotch members for adjacent constituencies, and he quoted figures to show that he had not voted against the Government so often as Mr. FINNIS or Mr. CRUM-ELWING or Mr. CRAWFORD. Mr. BOUVIER did not do himself justice. He can reason forcibly and speak with weight and fluency, and therefore when he opposes the Government he damages it, whereas the mild and unnoticed opposition of minor Scotch members does not hurt the Government at all. An independent Liberal member of ability and courage is very often disagreeable to the Government. He has a power which he uses, and which he makes the leaders of his party feel, and no statistics from *Hansard* can dispel the conviction that the Government may often wish Mr. BOUVIER out of the House, while they are perfectly indifferent whether Mr. FINNIS is in it or not.

It is, however, not so much by occasionally forsaking his party that Mr. BOUVIER hurts Ministerial feelings as by the attitude he assumes to Ministers individually. He insists upon not worshipping them. When they are wrong he does not think they are such great men as not to be told they are wrong; and if, as members of the present Cabinet have been in the habit of doing, they reply that men so great cannot be wrong, he criticizes and ridicules them. He especially referred to Mr. LOWE, and said that what irritated him and others who felt with him was not the gross blunders in which Mr. LOWE had been detected, but the serene unconsciousness with which Mr. LOWE ignored these blunders, and always assumed an air as if he were the only human being capable of understanding the questions in the solution of which he had been proved to be grievously mistaken. Mr. BOUVIER openly congratulated himself on having done his best to give Mr. LOWE a check, and was delighted that he had been successful to a great extent, and forced Mr. LOWE out of the office to which Mr. LOWE asserted a sort of super-human claim. The electors of Kilmarnock probably neither know nor care much about these personal struggles in the House of Commons. Mr. BOUVIER may help to make the Cabinet shift about and undergo any number of transmutations without Scotch voters thanking him for his pains or grudging him his little victories. But Parliament receives real help every now and then from Ministers being subjected to such criticism as that which Mr. BOUVIER freely offers, and those who are nearer the scene of action than the inhabitants of Kilmarnock can see that the Government itself has greatly benefited by having its arrogance considerably diminished under the pressure put on it by some of its own supporters. If the electors of Kilmarnock can but pardon what they object to in him, they may be assured that in Mr. BOUVIER they contribute a very valuable member to the House. Of the independent Liberals generally it has often been said, and it may be said quite truly, that, if there were many of them, a strong Government would be almost impossible; and if there were none of them, the House would become much duller, poorer, and weaker than it is. Some constituencies must make a sacrifice of prejudices and feelings if such members are to be returned, and the number of independent Liberals in the House of any distinction is now so small, and is likely to be so small in the next Parliament, that Kilmarnock, if it is wavering as to whether it will make such a sacrifice again, has at least the motive for making it that the sacrifice, if made, is likely to be especially useful.

MR. STEPHEN ON POPULAR GOVERNMENT.

MR. FITZJAMES STEPHEN concluded the second of two lectures on Popular Government, which he lately delivered at Edinburgh, with the expression of a hope that he had rendered himself intelligible. The most adverse critic would never impute to Mr. STEPHEN the defect of failing to make his meaning understood. In political discussion perfect clearness is a quality of substance as well as of style. A chimera, either in a primary or a secondary sense, must always remain unintelligible, because the ideal State described by dreamers such as MAZZINI, or by rhetoricians like CASTELAR, is as inconsistent, and therefore as inconceivable, a monster as the Homeric combination of a lion, a serpent, and a goat. Only a small part of Mr. STEPHEN's lectures is devoted to the suggestion of partial remedies for the numerous drawbacks which he discerns in the existing system of Parliamentary government. He strictly confines himself, not to changes which might be theoretically desirable, but to modifications of the actual practice which might possibly obtain the assent of the country and of Parliament. His principal object is to convince those whom he addresses that Parliamentary government is in some respects defective, although he fully admits that it is in itself, for the present, an ultimate and indisputable fact. His interpretation of the English Constitution as it now exists nearly coincides with the results of Mr. BACON's able analysis; but Mr. STEPHEN further remarks that the Constitution would probably have been less democratic if it had been deliberately framed on a democratic principle. In the United States the President is, during his term of office, in some respects independent of Congress, though his patronage and foreign policy are controlled by the Senate, while his financial proposals require the sanction of the House of Representatives. Nevertheless it is doubtful whether Mr. STEPHEN is right in his opinion that the power of the President and his Ministers is greater than that of an English King and his Cabinet. In both countries the Executive Government would be helpless against popular feeling; and in England, in imaginable circumstances, a favourite Minister might draw on a latent hoard of prerogative which is more ample than the constitutional powers of the President. Mr. ANDREW JOHNSON could neither conclude a treaty nor regulate the policy which was adopted towards the conquered Southern States; and his recommendation that the National Debt should be repudiated was not adopted by Congress, although a similar proposal had been previously approved by a great majority of the House of Representatives. Mr. STEPHEN is, as far as the ordinary conduct of affairs is considered, fully justified in saying that the Royal power, and other forces which were formerly operative, have been paralysed or have shrivelled into fictions; but it is not certain that half the women in England, including nearly the whole of those of the poorest class, are not at this moment persuaded that the country is absolutely governed by the QUEEN. On three occasions at least, within living memory, politicians have proposed or tried a revival of obsolete prerogative; and in one case the attempt has succeeded. Every constitutional lawyer would have known, if he had considered the subject, that the purchase of commissions in the army, which had been practised for several generations with the approval or connivance of the Government, was legally dependent on the continued sanction of the Crown; but until Mr. GLADSTONE and Mr. CARDWELL abolished the practice by Royal Warrant, no officer and no civilian had supposed that some millions of private property could be summarily confiscated at the discretion of a Minister. It was theoretically possible that the House of Commons might have refused to vote to the officers a shilling of compensation; but the Warrant which forbade the future sale of commissions would have been not less valid because it might have caused the most flagrant injustice. It would be not only possible, but probable, that in a similar case a House of Commons elected after the pattern which is proposed by Mr. TERVELYAN or Sir C. DILKE would refuse compensation to a class of persons which might be regarded as aristocratic. The still more audacious attempt of Lord PALMERSTON and Lord CRANWORTH to revive after an intermission of four hundred years the prerogative of creating life peers was happily defeated by the firmness of the House of Lords. The advantages of the proposal, whatever they may have been, were utterly insignificant in comparison with the danger of a Ministerial usurpation, which was nevertheless not unpopular. At the time of the first Reform

Bill many extreme politicians had urged on Lord GREY's Government the similar scheme of rendering the intervention of Parliament unnecessary by issuing writs to boroughs which were then not represented in the House of Commons. If Lord GREY and his colleagues had been equally unscrupulous with their advisers, they would have been supported by an overwhelming majority of the people in a fatal attack by legal methods on Parliamentary government.

After making allowance for possible and occasional exceptions, there is no reason to dispute Mr. STEPHEN's proposition that "the majority of the House of Commons, governing through a Committee of Ministers absolutely dependent on its favour, is the absolute master of every institution in the country, and of the lives and fortunes of all its inhabitants." Mr. STEPHEN would not deny that extraordinary popularity, such as that of Lord PALMERSTON in 1857, or of Mr. GLADSTONE in 1869, inverts the relations of the Minister with a House which he can dissolve with the certainty that mutinous followers will lose their seats. It is infinitely better that supreme power should rest with a Parliament than with the majority of the population. As Mr. STEPHEN truly says, moral and social checks offer valuable impediments to the abuse of power by a limited Assembly, while they would be almost wholly ineffective against the mob. It is difficult to attach too much historical and political importance to the remarkable fact that, of all modern Legislatures, the English Parliament alone has succeeded in acquiring and retaining sovereign power. When its constitution has become permanently and exclusively democratic, it is at least possible that, through the necessity of the case, but by some unforeseen process, Parliament may cease to be supreme. Men of rank and men of wealth have the invaluable quality of being non-conductors of popular violence and caprice; and even when gentlemen think it expedient to become demagogues and revolutionary reformers, they are almost unconsciously restrained by many invisible ties. When Mr. GLADSTONE expressed his approval of the principle of universal suffrage, he tacitly assumed that the powers which it would confer would be administered by himself or his equals. These are not the questions which Mr. STEPHEN thinks it profitable for his immediate purpose to discuss. He prefers to explain in detail, with perspicuity and force, the defects which seem to him inherent in all large deliberative assemblies. The necessary division into parties undoubtedly aggravates the inconvenience which is otherwise inseparable from legislation by numerous bodies. On the other hand, it provides the only security which can be devised for strict and severe criticism of political or administrative measures; and the cases in which the traditions of party warfare have been suspended illustrate the convenience of the ordinary practice. The absurdities of Mr. GLADSTONE's mission to the Ionian Islands were wholly exempt from Parliamentary examination because he was at that time wavering between the Conservatives who had hoped to purchase his support, and the Liberals who feared to alienate their former ally and recent opponent. The Opposition allowed the Washington Treaty to pass without comment because one of their leading members had been irregularly made a Commissioner. A conflict of competent advocates has been found by experience to be the best possible mode of determining an issue of fact or of law. Each party contributes half the truth, and it is for the judge to combine their proofs and arguments into a whole. A Minister and an Opposition leader perform the functions of the counsel on either side, and, if the tribunal is not impartial, it has at least the materials for judgment before it.

It may be admitted that, as Mr. STEPHEN contends, Parliament is but an awkward machine for constructing Acts of Parliament. He has on many former occasions recommended the appointment of skilled legislators, who should, on their own responsibility, give effect to the decisions which Parliament might form on the principles of measure. His arguments are so vigorously expressed that it would be undesirable to attempt either to reproduce or to compress them. In his Edinburgh lectures he extends his criticisms of the present system and his proposals of improvement to the conduct of the great departments of State. He considers that the permanent Civil Servants ought to occupy a higher and more conspicuous position; and he makes the judicious suggestion that they should occasionally be transferred from one office to another. Sixteen Prime Ministers have, according to his calculation, held office since 1830; but the true number is only nine, as some of them have had more than one term of office. It may be added that

at least three of the number have been by universal consent regarded as the ablest men in the country; and the other six—Lord GREY, Lord MELBOURNE, Lord ABERDEEN, Lord RUSSELL, Lord DERBY, and Mr. DISRAELI—approached to the highest rank, though they may not have attained the pre-eminence of the first three, consisting of Sir ROBERT PEEL, Lord PALMERSTON, and Mr. GLADSTONE. Among many eminent and useful members of the Civil Service, scarcely one would claim equality with any Prime Minister of their time. It seems more useful to treat Mr. STEPHEN's lectures as a text for comments on some of the matters which he discusses than either to adopt or dispute his opinions. One of his remarks may serve as a specimen of his frequent combination of truth with approximate novelty. By far the greater part of the business which comes before Parliament properly lies beyond the domain of party politics. There is nothing Conservative or Liberal about the Ashantee war or the drainage of towns.

SIR E. WATKIN AT EXETER.

SIR E. WATKIN has offered himself, "not without diffidence," as the Liberal candidate at Exeter; and has informed the electors that he appears before them "rather in the character of a man of business than in that of a party politician." Sir EDWARD certainly does not appear to have been very successful in making a clear and definite statement of his political opinions; but they are supposed to be summed up in a general expression of devotion to "the Great Minister" at the head of the Government. Reckoning in his father and grandfather, he calculates that he is identified with a century of political reform, and he also takes credit for the future on account of hisson having been elected a member of the Reform Club. He goes rather further back, however, for imputations on his opponent; for we find him making some very severe remarks on the Conservative candidate in connexion with an old law, which was passed by the barons in the reign of HENRY VII. Sir EDWARD has of course been put to the test by the licensed victuallers and the Permissive Bill people, and has intimated that he is on the whole very much in favour of both parties. His enthusiasm for the objects of the Alliance is only equalled by his respect for the publicans and his affectionate solicitude for their material interests; and he is probably surprised that his impartial desire to do equal justice to both sides has not afforded much satisfaction to either. He has said that he thinks the agitation of the Alliance very injurious to the property of the licensed victuallers, and also to public opinion, inasmuch as it leads people to look to legislation to do for them what they should do for themselves. Yet he sees no inconsistency in doing his best to encourage this mischievous agitation by proposing that the House of Commons should so far give it countenance as to send the Permissive Bill to be reported on by a Select Committee. It is, however, to be a condition of this concession that the Bill shall contain a clause for compensation which shall be satisfactory to all classes of licensed victuallers. It is not perhaps very surprising that both the lecturers and the publicans should alike resent the too obvious imputation of imbecility which is involved in the idea that they were likely to be satisfied by such a ridiculous subterfuge. Sir E. WATKIN professes to desire that the question should be referred to the judgment of the House of Commons, and he also asks that he should be made a member of the assembly which is to pass this judgment; yet at the same time he acknowledges that he is incapable of forming an opinion on the subject.

Sir EDWARD, it may be observed, "as a man of business," does not forget to say that "he never laid hold of a horny hand—and he had shaken hundreds, and he might say thousands, of them since he had been in Exeter—without feeling that he was in the presence of a useful and superior being entitled to honour and happiness." England, he added, was "divided into two classes; men and women who worked and those who did not work, and the latter—of whom, unfortunately, a great many were connected with statesmanship—wished to be maintained at the expense of the country." It was his ambition, he told the working classes, that he might go to Parliament as their representative, "in order that he might elevate the substratum of society, and find them better employment and better homes." Sir E. WATKIN, it seems, had a little misfortune in the course of his political youth. His name has occupied a conspicuous place in the notorious history

of Yarmouth, and the Commissioners who were appointed to inquire into the matter found it necessary to report that he "largely contributed to the corruption of 1859," and "must take his share of the responsibility which belongs to all concerned in the degradation of the constituency in 1865." He assured the Commissioners, as he now assures the electors of Exeter, that he had really no idea of the use that was being made of his money by incautious friends; but the Commissioners replied that they "would be doing injustice to Mr. WATKIN's obvious abilities if they supposed him incapable of reasoning, even in the heat of a contested election." Sir E. WATKIN now proposes to enrich the working classes of Exeter; but we presume that the higher wages and better employment which are held out to them as a reward for returning him to Parliament are intended to be provided at the expense of the State. One of his supporters has described him as a philanthropist by nature; but art has also been called into play, for Sir EDWARD mentions that he is a member of a Political Economy Club at Oxford.

As Sir E. WATKIN has presented himself at Exeter as a man of business, he has no reason to complain that this aspect of his character should be particularly examined. He is indeed a well-known and successful man of business, and his business is that of a railway director. Mr. FORBES, who was anxious to get the people of Dover to send him to Parliament because time hung so heavily on his hands, had only a couple of railways to look after; but Sir E. WATKIN has three. He is the Chairman of the South-Eastern, the Manchester, Sheffield, and Lincolnshire, and the Metropolitan Railway Companies; and he exercises, it may be presumed, directly or indirectly, considerable influence on the general management of the railway system of the country. If he is returned to Parliament he will represent there not only the constituency of Exeter, but three Railway Companies, and the common interests and objects of railway directors. It may perhaps be doubted whether at the present moment these interests and objects are exactly coincident with those of the public at large. The incessant accidents of the last few months are in the recollection of every one. It was hoped that the slaughter of August and September would be abated as the excursion season drew to a close; but the disasters of October were scarcely less numerous and destructive than those of the previous months, and even at the present time scarcely a day passes without its tale of so-called accidents. Sir E. WATKIN pleads that on the lines with which he is personally connected bad accidents are comparatively rare; but when carriages are thrown off the rails by imperfect facing-points, or two trains are sent dashing into each other, the directors are not entitled to take credit to themselves if no lives are lost. It is really only an accident, in the true sense of the word, that the injuries which may be inflicted are not fatal; and in this respect some Companies are more lucky than others. The South-Eastern has always been—as railways go—a well-managed line, and the peculiar nature of the Metropolitan Railway reduces the risk of accidents. We find, however, that in Captain TYLER's Report for 1872, the Manchester, Sheffield, and Lincolnshire Railway stands sixth in the list of railways on which train accidents occurred in that year; but, in point of fact, it should rank among the foremost offenders, seeing that, taking mileage into account, it had a larger number of accidents than the London and North-Western and the North-Eastern, which were certainly not behindhand in their sorry work. The accidents on this line have doubled since 1871; and this week there was a collision on it in which several people have been seriously injured. It was, of course, only a chance that they were not killed.

We have no intention, however, of discussing the comparative statistics of homicidal competition between different railways. It is more important to look at broad results. Last year 246 accidents on railways formed the subject of inquiry by officers of the Board of Trade, being 75 more than in the previous year, or an increase of 44 per cent.; and this year the increase will probably be greater still. The total number of persons reported to have been killed was 1,145, and the number of injured 3,038; but a considerable proportion of these cases are alleged to have been due to misconduct or want of attention. However that may be, the aggregate figures are certainly under the actual number; first, because accidents to railway servants are often concealed, and also because injuries are sometimes not discovered at the time, and occasionally result in deaths which are not reported. Colonel TYLER repeats the familiar remark that a dangerous

or defective mode of working is frequently carried on for a great length of time without disastrous consequences; and it is apparently in reliance on this chance that railway directors and managers continue to neglect the necessary precautions against accident. Of 238 train accidents, nearly five-eighths of the whole were cases of collision; while 10 per cent. were from passenger trains being wrongly turned into sidings, or otherwise, through facing-points; 9 per cent. were from engines or vehicles meeting with or leaving the rails, in connexion with defects or obstructions in the permanent way; 7 per cent. were from failures of axles or tyres, or from other defects in rolling-stock; and nearly 4 per cent. were on inclines. No amount of human care or foresight will absolutely put a stop to accidents, but it is obvious that the chief causes of accidents are to a great extent under the control of the Companies. For defective construction and maintenance of roads, works, and rolling-stock; for insufficient or defective accommodation for the requirements of traffic; for insufficient establishments, long hours, and inexperienced servants; for insufficient brake-power; for defective arrangement of signals and points; for insufficient or inadequately enforced regulations; for neglect of arrangements to secure intervals between trains; for excessive speed, having regard to engine, road, or other circumstances—the Companies are distinctly responsible; and these are the causes of the majority of accidents. "The above 238 accidents," says Captain TYLER, "were all of a more or less preventable character; the means of prevention were well known, and have often been urged." If the Companies neglect or refuse to take the natural and obvious precautions to ensure the safety of travellers, it must be assumed that they deliberately prefer to introduce unnecessary risks into railway travelling rather than bear the expense of making their lines safe.

These are the circumstances under which Sir E. WATKIN, the Chairman of three Railway Companies, asks to be sent to the House of Commons, in order to add to the strength—already excessive—of the railway interest in that assembly. Experience has shown that the only means of influencing the Companies is by making them amenable to heavy penalties for killing and maiming their passengers; and the PRESIDENT of the BOARD of TRADE has acknowledged the necessity of providing the public with more summary and stringent means of redress. Sir E. WATKIN may be trusted to do his best, if he is returned to Parliament, to resist any measure of this kind, and to support the interest with which he is connected in endeavouring to limit and curtail the claims of the victims for compensation.

A WANT OF THE AGE.

THERE is one deficiency in our day, one remarkable want, to which we do not find the public painfully alive, but from which it will surely suffer some time. We mean the want of pre-eminent men—men universally acknowledged as such, at whom all the world would be glad to have a stare, so as to be able to say fifty years hence "I saw him." Who looks at a man now, thinking "I can tell my grandchild I have seen him"? What will the octogenarians of the future have to talk about which shall constitute them links with the historical past? What men do people run after to-day in any walk of greatness or distinction? Who is notorious out of his own set or following? We are not requiring an heroic greatness; the prevailing furore need not be a wise one to answer our demand. We ask for pre-eminence of any kind, the elevation that puts a man at the top of his calling beyond all rivalry, and makes him as such an object of universal interest. Now what captain, orator, or preacher, what author, poet, novelist, painter, what talker, wit, actor, singer, fiddler, dancer, answers to this test, or awakens that thrill of common consent which persuades us without or against reason that what we see, hear, or read is new, unmatched, unprecedented, altogether best of its kind? Of every one of these eminences a past more or less recent furnishes examples to our point. The judgment may have been run away with, the head may have been turned by a wave of enthusiasm; but while men saw or heard, they thought themselves the better, felt themselves to be somebody for assisting at the spectacle. It is but a little while since there were old men who had heard Wesley preach, and the mere fact invested them with a quaint venerableness. There are men still who have seen Nelson and Bonaparte, and derive importance from this visual contact with great men. It is some persons' intellectual distinction to have heard Coleridge talk or lecture. Dr. Routh of Magdalen could remember seeing Dr. Johnson, and a light from the past was reflected on him as he told his impressions. A writer in the *Pall Mall* has lately very naturally valued himself on having breakfasted with an old lady who remembered Robespierre, informing him in a cautious

whisper that he was suspected of being *reactionnaire*. Charles Lamb relates how he was accosted in London streets by an unknown artisan to point out to him Walter Scott passing on the other side. Now what parallels does our generation offer wherewith to store the memory? We do not ask what talker we have like Dr. Johnson, of whom, when he died, it was said he left no one to be called even second to Johnson; or what actor like Garrick, whose death eclipsed the gaiety of nations; but who values himself on sharing conversations such as distinguished Holland House? What modern wit has the wide fame of Sydney Smith? What modern actor will it be a distinction to have seen, like Mrs. Siddons? Who provokes the social circle to laughter, who charms them to smiles and tears, like Theodore Hook extemporizing verses, or Tom Moore singing his own songs? What dilettantism like Horace Walpole's, what eloquence like Burke's or Sheridan's, what humour like Charles Lamb's, what talking like Madame de Staël's, what beauty like the Gunnings, or Madame Récamier? We do not say that none of these have their equals with us, but we ask for celebrities. Such as we have are most of them on the shady side of sixty; the breed seems dying out. We cannot even put forward a fop, or a rogue, or a villain to match past greatness—no Beau Nash, no Beaumont, "the very glass of fashion, whom everybody from the highest to the lowest conspired to spoil, who could decide the fate of a young man just launched into the world, whose dress was the general model, who struck out new ideas, and smiled to see them gradually descend from the highest class to the lowest." To be celebrated demands no doubt a will to celebrate, which does not perhaps prevail in our time; but have we not got out of the way of such homage from a dearth of exactly the right material?

The answer to our sentimental regrets lies perhaps in the fact that science stands foremost now; and science, though it can do many things, cannot create popular celebrities. The scientific discoverer can only get a niche in the popular mind by allowing it to transpire that he deals in the black art, or by the good luck of persecution. Only by these means does he become an object outside his special subject and aims. It was not for finding out that the earth went round the sun, but for being persecuted for saying it, that Galileo was popularly eminent. To shut yourself up in a dissecting-room or in a laboratory is not the way to general notoriety or to the universal memory. People may distinctly remember the first gaslight, the first steam-engine, the first telegram, the first operation under chloroform, without thinking of their inventors or caring to ask their names. Science as it now stands has an ardent, but numerically small, following. Its leaders are not celebrities of the sort we mean; people don't value themselves for having seen them—don't go in crowds to see and hear them; and for the reason that science is an impersonal thing, dissociated from flesh and blood. It does not appeal to feeling and emotion, and therefore does not excite the impressionable part of our nature. People cannot think of a battle without simultaneously recalling who fought it, who won or lost it; but they may be awe-struck by a star shower, or may hear of new-found worlds, without caring to know who calculated or foretold them, when once it is conceded that the supernatural has no share in it. Geographical discoverers we may allow to have a foremost man in the popular sense—Livingstone is a rival to Cook. But the exception proves the rule, for here the personal element comes in.

It must be granted that common fame is capricious and unjust towards merit. It often distinguishes unworthy objects, and sets up very trumpety idols. But the reason, we think, why the absence of celebrities is a real want is that the dawning imagination of our generation seems thereby to miss a very important aliment. To impress a child's fancy there must be a central figure—a hero; and what colossal central figure does any department present just now, if we except "the Claimant," who will leave traces of himself behind him, we do not doubt, in innumerable plots of novels and romances, just as Beau Brummel formed the school of the fashionable novels of forty years ago. "Lord Wellington" was the central figure to the Brontë family, which no doubt told on their notions of manliness—though we detect no family likeness—and imparted something of that vigour which is so rare in woman's writings. The Pretender was still a hero in Scotland during Walter Scott's childhood, and perhaps determined his course of romantic thought. As we look further back still, every department of life and action shows its central figure in a way which we cannot parallel now; nor do we think that posterity reviewing our own particular period will see what we do not see. Our social life does not encourage personages of this kind; people shut themselves up much more than they did. Every tolerably educated youth could get near the celebrities of the last century. Pope at twelve years old saw Dryden, and anybody who liked might stand outside his immediate circle at Will's, hear what he had to say, and even perhaps put in his own word in reply. Addison spent eight hours a day at Button's Coffee House, where he held a sort of court. Reverence for intellect was of a more simple, implicit sort then than now; people were glad to listen and accept. Sir Joshua Reynolds when a boy at an auction had his skill in physiognomy quickened by the sight of Pope. "Mr. Pope! Mr. Pope!" was whispered through the room; all hands were held out to touch him as he passed. The boy eagerly thrust forth his hand under an elbow in the front row, and was allowed to shake the hand that had penned the *Rape of the Lock*. Such encounters are suggestive. To have touched a poet, believing him to be the

greatest poet of his time, is of the nature of an inspiration. A good many persons like Mr. Browning's poetry better than Pope's, but this preference does not give the prominence which attached to the genius of the eighteenth century, which not only lived more in public, but succeeded in impressing itself on the notice and respect of the commonality; a respect (whether sour grapes or not) rather disdained by the choicer spirits of our time. Warburton travelled in stage-coaches, and gave such an impression of his cleverness that he was described by one who had heard him talk as an "old orator whom you may read about in the almanacs," the very ideal of fame. The ladies of our day, solicitous as some are of a prominent place in the world's regard, do not attain to the notoriety once willingly and graciously accorded to exceptional beauty or learning. Mrs. Elizabeth Carter stood out as the representative of all knowledge to her poor neighbours. "It will be dreadful winter," said one, "and a great scarcity of corn; the famous Miss Carter has foretold it"; they also spread it so confidently abroad that she was going to be a member of Parliament, that her sister at a distance wrote to ask her if it was true. Undoubtedly society is far less inclined to constitute celebrities than it was in those simple times, and is much more sensible of its own power to make and unmake reputations. There is a union of the aggregate intelligence against pretenders to particular renown. It treats them after the manner of that Czar who pronounced nobody to be distinguished in Russia "except the man whom I speak to, and him only so long as I speak to him." Critics and arbiters are enemies to popular celebrities.

And yet is there not something in our common human nature which craves for pre-eminence, a deep-seated desire to attach ourselves to something memorable, to some name and fame on which we can pin our insignificance, and so hold on to our age by some imagined connexion? We do not expect to be remembered long on our own account; but it is something to live in the era, to be one of the same generation with a great man whose name we believe the world will not let die, to go down the stream of future time in the same boat with him as his compatriot, as having pronounced his name, prophesied his fame, been familiar with his words and deeds, as having seen him, or perhaps shaken hands with him. There are degrees of oblivion; to have been one of an age of which not one name or one act is remembered, which has left no trace of itself, strikes with a more icy sense of isolation than to have lived when the Zamzummids fought with the children of Anak and lost. A word is all that remains to them, but that word connects ages together. Every one that accords fame helps to establish it. We have "assisted," as the French idiom has it, and something of the acts is reflected back upon ourselves. Reason tells us how vain is the effort and the longing, and how mistaken often our award.

Oh fond attempt to give a deathless lot
To names ignoble born to be forgot.

So when a child, as playful children use,
Has burnt to cinder a stale last year's news,
The flame extinct, he views the roving fire—
There goes my lady, and there goes the squire,
There goes the parson—O illustrious spark!
And there, scarce less illustrious, goes the clerk!

Time, no doubt, makes short work with many a hero of his day, but not the less is it rather a dull feature of an age, unsurpassed in wonders of its own, to have no central figures, and to miss—if nothing else—at least a sensation, a thrill of universal consent and exultant approval.

MR. TROLLOPE ON NOVELS.

MR. TROLLOPE has lately delivered an address to some youthful students upon a subject which he has some right to consider as his own. He discoursed upon the morality of novels. Although we have unfortunately a very imperfect report of his observations, we hope that we can understand his general line of argument. It is characteristic and amusing. French critics have found fault with the eternal moralizing of English writers; preaching, they urge, may be a very good thing in its time and place, but it should be confined to the pulpit, or at least kept out of artistic work. Mr. Trollope accepts with perfect simplicity the theory which is thus condemned. Novels, he tells us, are the sermons of the present day; and novelists have more eager and attentive audiences than those who make a profession of preaching. If this theory be true, it perhaps explains why so many novelists are intolerably dull. Mr. Trollope indeed is an honourable exception. Though he preaches, and preaches at considerable length, he preserves himself with surprising skill from the dangers which most easily beset the pulpit. If we do not find his doctrine very exciting, it never sends us to sleep. And we will venture to add that one reason is that the didactic tendency is so skilfully kept in the background that we scarcely suspect its existence. Had not Mr. Trollope asserted that all novelists preach, we should have supposed him to be entirely unconscious that any definite moral could be extracted from his pages. Mr. Trollope, however, proceeded to explain by examples the sense in which he understands the proposition that all novels are sermons; and, in days when we hear so much of the immoral tendency of a good deal of our fictitious literature, it may be well to learn from an eminent master of the art how his colleagues inculcate virtuous precepts. Scott, he tells us, has drawn many

villains; but he never taught anybody to be a villain. Thackeray has dissected the meanness of many men and women, but nobody was ever made mean by Thackeray's teaching. Dickens, again, has drawn deep designing usurers and vicious young men; but nobody ever became a usurer or a Lord Frederick Verisopht in consequence of Dickens's teaching. On this ground it is indeed pretty plain that few novelists have taught anything which they ought not to teach. Schiller's *Robbers* was said to have sent some students to the highway; and a similar charge was made against the *Beggar's Opera*. The accusation was probably silly enough in both cases; but at any rate few novelists have ever in plain terms advised their readers to be thieves or murderers. Yet that is hardly sufficient to prove that their writings have a good moral tendency. Nor could we acquit Scott, Thackeray, or Dickens, if anybody was inclined to attack them, on the simple ground that they did not commend the vices which they satirized. We quite agree with Mr. Trollope that nobody would take Lord Frederick Verisopht or Jonas Chuzzlewit or Bill Sykes or Mrs. Gamp for a model on the strength of their portraits. Some people, however, have thought that this mode of preaching was liable to very grave objections. It is merely an expansion of the method adopted in countless religious tracts. The truant from a Sunday-school falls into a stream and is drowned; the fast young man is shot by his companion in a duel. The reader is edified till he finds that many truants escape from drowning and many fast young men from shooting; and then he begins to laugh at the bugbears set up by these well-meaning moralists, and thinks that they have founded their exhortations upon a gross misrepresentation of the facts. There are very good artistic reasons for distributing poetical justice at the end of a novel; but if novels were really sermons, the practice would be highly objectionable. It would amount to saying, Be virtuous and you shall have a coach and six; whereas the purpose of all lofty teaching is to inculcate a love of virtue without regard to personal profit. We in fact justify the practice of novelists in general, and of Mr. Trollope in particular, on the ground that we want to be amused and do not want to have *Æsop's Fables* converted into modern language. That novels should introduce us to a healthy moral atmosphere is highly desirable; that they should force little moral commonplaces down our throats would be as bad in an artistic as in a moral sense.

Let us endeavour to put a rather more rational interpretation upon Mr. Trollope's theory. He may perhaps be interpreted as meaning that from Scott we learn to love manliness, that from Thackeray we learn to despise meanness, and from Dickens to hate cruelty and frivolity. In this there is no doubt some truth. Scott revealed a type of character at once pure and manly, which was an admirable relief from the coarseness and the false sentimentality of the earlier school of English novelists. Thackeray opened many people's eyes to the meanness which results from an artificial state of society; and a large class of readers learnt from Dickens to look with greater tolerance and kindness upon the most helpless classes. So far, their teaching was good, but the fact that a man has taught some good lessons does not prove that his morality is unimpeachable. So much may indeed be said for everybody who is not an unmitigated scoundrel. If Brigham Young has preached some very degrading doctrines, he has also taught the advantages of industry and sobriety, or he would never have attained a commanding position. Before we can pronounce the teaching of Dickens, for example, to be good, we must inquire into the justice of the accusations sometimes made against him; we must ask whether he does not encourage an effeminate sentimentalism, and a conviction that the cure for all human evils is to be found in a plentiful effusion of genial twaddle. If this criticism were well founded, it would not be fairly met by the statement that he disliked usurers and youthful rascals. An obvious retort would be open in that case to the unbelievers. If Dickens never induced anybody to be a debauched youth, we may ask whether the portrait of Verisopht ever saved a young man from debauchery. If so, the task of keeping youthful passions under sound restrictions must be very much easier than is commonly supposed.

The real question, therefore, still remains open, in spite of Mr. Trollope's simple-minded advocacy. There are novels to which we may attribute a certain direct practical influence. Dickens, for example, called attention to the abuses of certain private schools; and Mr. Charles Reade has endeavoured on various occasions to expose the malpractices of various classes of his countrymen. A novel of this kind, whatever its merits in an artistic point of view, is a political pamphlet in disguise. It is a picturesque statement of the existence of certain grievances; and it may be useful, if it attacks a real evil, though a certain unfairness is always inherent in this method of argument. We will not now inquire whether such writing comes within the legitimate scope of the novelist's art, for such novels are still the rare exception, and, as dealing with a special set of concrete facts rather than with general principles, cannot be said to be moral or the reverse. Their tendency must be judged by the merits of each particular case. The wider question which Mr. Trollope has raised must be answered on different principles. In what way do modern novels generally supply the place of sermons? That novel which is neither a pamphlet nor a religious tract may undoubtedly exercise a considerable moral influence by virtue of a very simple principle. In reading a novel you are really putting yourself into close connexion with the novelist; you are for the time looking at the world through his eyes, and imperceptibly you transfer some of his prejudices, and are infected by his general temper. For example, if

has enjoyed Mr. Trollope's novels—and the class includes all who enjoy healthy literature—has the same kind of effect produced upon him which would be produced by personal association with the author. He learns, perhaps, that the world is full of fresh, healthy, pure-minded country girls, and of solid and hard-working persons, whose little foibles make us love them all the better, whilst there is a certain sprinkling of selfish and designing people whom we rather dislike than actively hate. But few readers are so simple as to take Mr. Trollope's statements of fact for granted. They have their own experience of mankind, which naturally impresses them more forcibly than the picture drawn for their amusement at leisure hours. The effect upon them is more subtle than any acceptance of a definite number of statistical propositions. They have been for the time in company with a shrewd, sensible, and kindly human being, and it is their own fault if they are not the better for it. Possibly they have missed a power of abstract speculation, and have not been introduced to an ideal much loftier than their own; but they have enjoyed a thoroughly innocent amusement, and have generally, we may hope, caught the contagion of good sense and good nature. Unluckily there are other novelists besides Mr. Trollope. There are, or there have been, writers with whom it is not good for any one to associate. To be intimate with some people, even for a time and on paper, is to feel as if you had been at a police-court or in the smoking-room of a sporting club. Such intimacies do no good to anybody, and help to spread morbid and distorted views of life. To make any general statement about the good or bad influence of novels, we should therefore have to inquire whether novelists, as a class, are better or worse than the average of their neighbours. To that inquiry it would be difficult to give any summary reply. The novelists of the present day are, for the most part, realists; and altogether renounce the attempt to hold up before us any loftier conceptions of society than those which we may read in every newspaper, and hear in every commonplace conversation. Perhaps it would be safest to say that their influence is, on the whole, neutral; that they do about as much harm as good; and that Mr. Trollope would therefore have been better employed in discovering some criterion by which to distinguish the good from the bad, than in attempting to approve or condemn in one mass influences of so diversified a character.

One question, indeed, remains. It is possible to maintain that this mode of preaching is of an essentially demoralizing kind. Nobody can look upon the stream of fiction which is constantly poured forth upon the public without some doubts as to the intellectual habits which it fosters. Every day brings forth some new aspirant to the pulpit. If we could believe, which indeed would be a rather rash assumption, that they all succeed in obtaining some kind of hearing, we should be awestruck by the revelation of the waste of human energy. It is bad enough that so many people should write such trash, that so many printers should waste so much paper in circulating it, and that so many critics should be doomed to give it at least a cursory glance. It would be still more lamentable if we could believe that a large class of readers derives its chief intellectual sustenance from these monotonous reproductions of old materials. How can standard literature—or, not to use a term which has unfortunately become associated with much that is wearisome, how can the thoughts of men who have really had something to say about the world—receive a due share of attention when swamped and overwhelmed in this torrent of vapid literature? Nobody, of course, would be puritanical enough to deny to hard-worked men and women the right of unbending their minds over innocent, if insipid, literature at odd moments. We cannot all fill up the interstices of our lives with metaphysical or scientific or historical researches. But certainly it is a natural impression that the habit of endless story-telling and endless story-reading is hardly likely to encourage strenuous thought. If not demoralizing in the sense of actually encouraging vice, it is perhaps demoralizing in the sense of softening the intellectual fibre. A man raised upon rice-pudding and water-gruel would not have strong bones and firm muscles; and a mind nourished by modern novels would hardly be fitted for vigorous intellectual labour. In spite of the outcry about sensationalism, the bulk of our novel literature is dull and colourless enough in all conscience. The objection to it is not that it is vicious, but that it is enervating; and when Mr. Trollope was delivering an address to youths who had won prizes in some kind of intellectual competition, he would perhaps have spoken more to the purpose if, instead of proving that Dickens does not teach us to be misers and debauchers, he had shown under what conditions Dickens and other modern writers may be used for purposes of rational relaxation without crushing the loftier imaginative or reasoning faculties under a weight of commonplace moralizing and indolent representations of everyday life.

GENERAL WOLSELEY AND THE ASHANTES.

THE news from Cape Coast Castle is encouraging as far as it goes, but it would of course be unwise to make too much of it. It brings out very clearly the sort of difficulties which the expedition will have to encounter, but it also shows that there is no reason to anticipate that our countrymen will be unable to overcome them. General Wolseley, falling by surprise on a number of villages occupied by hostile tribes in league with the Ashantes, met with only partial resistance, and quickly drove off the natives

and destroyed their settlements. A fortnight afterwards Colonel Festing took the Ashantees themselves by surprise near Dunquah; "two volleys and a rush," the Ashantees were dispersed, and their camp burned. Exploits of this kind cannot be regarded as very wonderful. What has happened is just what might have been expected to happen, and would hardly call for remark, were it not for the strange tone of hopelessness and despondency in which some of our contemporaries invariably speak of this war, and the affectation of gratified surprise with which they have received the news that our forces have actually not been beaten by savages. That it will possibly be a troublesome, disagreeable, and not particularly glorious war, is clear enough to everybody; but there is something positively childish in the pictures which have been drawn of its supposed difficulties and dangers, as if nothing of the kind had ever before been faced in any part of the world. The Ashantee expedition is, after all, a very modest effort compared with the Khivan expedition of the Russians, and English troops have frequently been engaged in much more hazardous enterprises. Cassius complained that the Romans of his day had terrors and sinews like their ancestors but that they were governed by their mothers' spirits, and a similar observation is suggested by a good deal of the criticism on the Ashantee war. Indeed one is almost tempted to think that our grandmothers' spirits must have had something to do with recent articles on the subject in the *Times* and *Pall Mall Gazette*. The peril which white men especially require to guard against in a conflict with an uncivilized enemy is excessive confidence in their own superiority, and contempt for their adversaries; and it is well no doubt that it should not be assumed that the conquest of the Ashantees will be a very simple and easy affair. This is a wholesome frame of mind to cultivate, and it is satisfactory to observe that General Wolseley and the Government appear to be disposed to fall in with it. Arrangements have been made to provide for every possible contingency, and the Ashantees are to be subdued with all the honours of scientific warfare. Oddly enough, however, the very critics who are so anxious to impress upon us the appalling difficulties of the campaign never lose an opportunity of blaming and deriding the Government for the prudent scale of its preparations. Whatever may be thought of the origin of the war, or of the measures which should be taken when it is over, it is obvious at least that it must in the meantime be fought out; and the natural and manly course would surely be to accept it as a piece of work which must be done, and to try to make the best of it, instead of conjuring up imaginary perils and improbable disasters.

Sir G. Wolseley's despatches, together with the letters in the newspapers, particularly those from the Special Correspondent of the *Daily News*, present a very clear view of the operations in which he has been engaged. On arriving in the country he saw that no time was to be lost in making a clearance of the hostile tribes in the neighbourhood of Elmina. They not only kept the Ashantee camp at Mampon supplied with stores and ammunition from the coast, but they were also a constant menace to the English garrison. Officers could not go a mile or two away from Elmina without being insulted and threatened with attack, and on one occasion some of them were fired upon. Moreover, the audacity of these tribes had a bad effect on others who were hesitating which side they should take, and encouraged the idea that the English were afraid of them, or at least of the Ashantees who protected them. It was necessary to remove this impression, but the English commander first summoned before him the chiefs of the tribes around Elmina in order to give them an opportunity of returning to their former allegiance. He learned that the chiefs had sent to the Ashantee camp for instructions, and had been told not to be afraid of the English, as they would be sure not to venture into the bush, and, if they did, the Ashantees would know how to deal with them. A Correspondent of the *Daily News* mentions that their replies were characteristic of their degree of confidence in the inaccessibility of their towns. Amquana sent word that the chief had the smallpox, but would come next day. Essaman cried jeeringly, "Come on." Ampenee cut off the head of a native known to be friendly to the English. Mafero Bakkinen, being a small village on the plain, came in and told the usual amount of lies. General Wolseley accepted these answers as a challenge, and at once resolved to convince the enemy that he was able to do what they said he dared not attempt. Having first spread a report that the English at Cape Coast Castle were about to send a force to Addah in the east, he suddenly, on the night of the 13th of October, took ship westwards for Elmina, with a detachment of the 2nd West India Regiment, and a body of marines; picking up some more troops there, he marched next morning upon Essaman, a village surrounded by thick bush, four or five miles inland, which was held as an important outpost and depot by the Ashantees. The inhabitants met them on the road, but after a short action were driven back, and then dislodged from the village by shells and rockets. The whole place was burnt to the ground. A large quantity of powder was found here, as well as many guns. It was now about ten o'clock in the morning, and soon after noon the column reached Amquana, a village on the coast which had already been deserted, and which was destroyed without resistance. Uasting the main body of the troops here, General Wolseley pushed on with a detachment, first to Akimfoo, and next to Ampenee. These villages were also found to be deserted, and were treated like the rest. While Ampenee was in flames, the troops were fired upon from the neighbouring bush, but the enemy was soon silenced by the fire of the blue-jackets and a few rockets. This was the day's work. Part of the column

went back to Cape Coast Castle with its chief, and the rest to Elmina.

Nearly a fortnight elapsed before another movement was attempted. On the 26th General Wolseley, taking with him 250 blue jackets and marines, started in a northerly direction with a view to cut off the retreat which the Ashantees were supposed to be making towards the Prai. At the same time Colonel Festing moved from the camp at Dunquah, where the native levies had been collected, in order to attack an Ashantee encampment a few miles off. It had been intended that the two parties should co-operate, but as it happened, Colonel Festing, with some six hundred friendly natives and fifty West India soldiers, had alone to bear the brunt of the fighting. He marched stealthily by a tract through the forest, known as the Haunted Road, which is in some way sacred to fetish customs, and is consequently shunned by the Africans. A stray Ashantee was caught, and compelled to act as guide. The camp was soon reached, and the inmates fled without even attempting resistance. The camp was burnt, and everything in it destroyed. So far all was easy; but the return was a different matter. The foe was now safely in the bush, while the English levies were almost in the open, and subjected to a galling fire. It was impossible to remain in such a situation, and Colonel Festing saw nothing for it but to fight his way back to Dunquah, which he did, but not without loss, for he had to contest every inch of road. It was resolved that General Wolseley and Colonel Festing should next morning operate in conjunction in order to hem in the Ashantees who had been dispersed on the previous day; but Colonel Festing's native levies had had enough of it for the present, and refused to stir. And here for the present the story breaks off. General Wolseley has issued a spirited proclamation to the natives, in which he warns them that now or never they must show that they are men, and that he will regard as enemies all who are not active friends. He has also stirred up the women to use their influence on his side; and we have an amusing picture of the women turning out, and "with gentle whips of masses of single threads stuck into bamboo handles, attacking with derisive and contemptuous gestures every man who had not gone out to fight, and who ought to have done so."

From a military point of view these skirmishes are not of much consequence. At Elmina everything was in favour of the troops. The weather was good, the surf not too high for landing, the troops were fresh, and the enemy were completely taken by surprise. It is impossible to say what sort of resistance the enemy might have offered if they had been prepared for the attack; but Colonel Festing's experience near Dunquah is suggestive on this point. On the road to Essaman the track led "through swamp knee-deep, and at times through high bush." General Wolseley also tells us that "the nature of the bush renders all estimate either of the enemy's numbers or losses so conjectural that I prefer to make no attempt to define them"; in other words, that it was impossible to see the enemy in the bush, or to know where they were, except from their fire. The Correspondent of the *Standard* gives a similar account. "The bush," he says, "was so thick on either side that we could not see a foot from the narrow path, so matted were the shrubs, so dense the coating of creepers of all kinds." Describing the first skirmish in the bush the same writer says:—"All this time I had not seen a single native, and had it not been that in the centre of our position lay one Houssa, mortally wounded, with four slugs in his body, and that the doctors were at work taking out slugs which had wounded two or three others, I should have been inclined to imagine that the whole thing had been a false alarm. The enemy was in considerable force, though it was impossible to say how great that force was." It is obvious from these accounts, that the natives, if they were on their guard, and had time to form plans, might take great advantage of the bush; but on the other hand it may be observed that the vegetation affords impartial cover to either side, and that the natives do not seem to be able to hold out very long in their shelter under a brisk musketry fire, especially when it is supplemented by a few shells or rockets.

Any importance which can be attached to these exploits is moral and political rather than military. The Ashantees declared that the white man would not dare to come into the bush as far as Essaman; but now he has dared, and Essaman, Amquana, Akimfoo, and Ampenee have been swept away, and the Ashantees have also been burned out of one of their own camps. Even if this does not produce much effect on the Ashantees themselves, it can hardly fail to suggest reflections to such of their allies as happen to be within reach of the white man's arm. It will confirm the friendly tribes, and bring over the wavering ones, and frighten those which are hostile into keeping very quiet. This at least is what is anticipated, and the anticipation seems reasonable enough. It is said to be scarcely possible to give an adequate idea of the way in which every little bit of the country is divided and subdivided among small tribes, apparently interlaced with one another in an almost inextricable territorial confusion; and petty tribes of this kind naturally huddle together like sheep in a storm, and try to get shelter under the biggest wall they can find. Their fickleness is merely a sense of their own feebleness, and a desire for protection. It was indispensable that the English should establish their authority decisively at least in the neighbourhood of their own forts; but it will probably be more important to persuade the natives of the coast and of the borderland to maintain what Prince Bismarck would call a benevolent neutrality, especially with regard to information, than to join our forces in the field. Sir G. Wolseley does not appear to be disposed to overrate

the benefit of native aid. He has learned, he says, from his recent experience, how little reliance can be placed on even the best native troops in bush-fighting, where it is impossible to keep them under the immediate control of European officers. "The Houssas showed undeniable courage and spirit; but their uncontrollable wildness, the way in which they fired volley after volley in the air, or at imaginary foes in the bush, expending all their ammunition, shows how little use they are for the work we have in hand." He hopes they may improve, but he does not expect to make them a thoroughly disciplined body; and experience of the Houssas at Dunquah is to the same effect. In compliance with his request, the Government has decided to send out two battalions from England at once, and a third will be held in readiness in case it should be required; and it will therefore probably not be necessary to entrust much real military work to the natives.

General Wolseley and his associates have exhibited the qualities which are essential to success in the sort of warfare in which they are engaged. The secrecy and rapidity of their movements, the sudden arrival of the troops, their equally sudden departure, and the promptitude and completeness with which they did their work, must have added very much to the moral effect of the chastisement which has been inflicted on the natives. On the whole, the news just received leaves the general prospects of the campaign pretty much as they were. There never was any reason for melancholy forebodings as to the result of the expedition, nor is there now any reason for assuming that its success is assured.

ARIMINUM.

THE towns of Romagna lie thickly set along one of the main roads of the world, but we fancy that they lie also out of the ordinary tourist range. After a diligent study of Mr. Cook's programmes, we could find no provision for them; Mr. Cook indeed does not give tickets for Ravenna itself. All this is perhaps so much the better for the real traveller; but it is curious as throwing light on the tourist mind. Most of those, we fancy, who make the modern "iter ad Brundisium" have the best possible reasons for getting over the ground as fast as they can; people stop at Bologna because they must stop somewhere, but it does not come into their heads to stop at Pesaro or Fano. A most interesting line of country is therefore left pretty well undisturbed. No part of the world brings more thoroughly home to us one side both of ancient and mediæval history. At no time, save during the short dominion of Ravenna, has the Adriatic coast of Italy (Venice is not Italy) held the same position as the Etruscan, Latin, and Campanian coast. Neither in the days before the establishment of the Roman dominion in the peninsula, nor in the days after that dominion had fallen to pieces, did any of the cities of that side of the peninsula hold the same place as the great cities of the other side. It was withal less purely Italian than some other districts. We must remember how far down the Gaulish occupation reached; that even in Cæsar's day Ravenna, like Lucca on the other side, was still within his Gaulish province, and that, in the third century before Christ, the Sena on the Adriatic coast still deserved the epithet of *Gallica*, which it has kept in its corrupted form of Sinigaglia. Greek colonists too were believed to have settled on this coast in early times; various legends were told of the origin of Ravenna, as of Spina, and Ancona has not yet forgotten the days when it claimed to be the Dorian Ankon. But none of these real or pretended Greek settlements ever reached anything like the greatness of the famous Greek cities of the South of Italy. In later times too the cities which played a great part in mediæval history lie either further to the North, in the old Gaulish land, like Milan and her Lombard sisters, or else, like Genoa, Pisa, and Florence, to say nothing of Rome herself, they lie on the Western side of the Apennines. It is by a kind of irony of fortune that the Roman name was doomed to cleave in an especial way to this comparatively obscure district of Italy, and that it should owe its name of Romagna, not to any special connexion with the Old Rome, but to its being the dwelling-place of the Exarchs who represented in Italy the majesty of the New. Yet it is perhaps in some measure owing to this very lack of cities of great and historic fame that the upper coast of the Adriatic has been enabled to show forth the characteristics of Italian history in an almost exaggerated form. The passenger by the railway which has become one of the great roads of Europe has his car greeted at almost every station by the names of towns which, if they never ranked alongside of Milan and Florence and Genoa, still had each one its history, each one its revolutions, each one its short-lived commonwealth and its often short-lived tyranny. Nowhere is that state of things more forcibly brought home to us in which it was the first principle of political life that every town, whether commonwealth or principality, should form an independent State, enjoying the same attributes of sovereignty as those great cities which might rank as the peers of kingdoms. Among these towns one stands out as having somewhat more pretension to have played a part in the general history of the world than most of its fellows. The name of Rimini will to most minds first suggest the most pathetic passage in the whole range of the *Inferno* of Dante; but, whether as classic Ariminum or as mediæval Rimini, the city has higher historic claims to notice than to have been the birth-place of the erring Francesca. The first strictly Italian city where Cæsar appeared in arms after crossing the borders of his own province, the

city which was the scene of the Council after which the world was said to have mourned and wondered to find itself Arian, certainly stands out in historic importance above its neighbours. Its later tyrants, too, of the House of Malatesta bear a more famous name than most of their neighbours, whom we chiefly remember, if we remember them at all, as falling into the common gulf of ecclesiastical dominion, either in the days of the Borgia or in the earlier days when Robert of Geneva, the future anti-Pope, wrought the great slaughter of Cesena. In the Forum of Ariminum we may see the stone which marks the spot where, according to local belief, Cæsar addressed his soldiers; but the inscription speaks of the oration as having been made "*superato Rubicone*"—a phrase which savours rather of the rhetoric of Lucan than of the simple narrative of the great rebel himself, who did not think the crossing of the border streamlet worth recording. The momentary triumph of Arianism at Ariminum has left its memory in the name of the neighbouring La Cattolica, a spot which legend points out as the place of dwelling or shelter of the Orthodox minority in the famous Synod. In the general course of events there may seem to be a certain kind of propriety in the formal promulgation of the heretical faith in this particular district, as a kind of foreshadowing of the coming rule of the Arian Goth in not far distant Ravenna. As for the tyrants, one at least among them has taken care that neither himself nor his wife shall be forgotten by any visitor to Rimini. Sigismund and Isotta appear on church and fortress as the chief later adorners of the city; and in the nomenclature of the modern streets, while the Dictator himself claims the great square of the ancient Forum, other and lowlier portions of the city bear the names of the most famous of the House of Malatesta.

If it be true that the voices of the sea and of the mountains are two voices which call men to freedom, Rimini ought never to have fallen under the power of tyrants. The Adriatic has gone back from Rimini as it has gone back from Ravenna, but it has not left the city so utterly stranded. It still keeps up somewhat of a seafaring character, both in the form of a haven, and in the more modern form of a watering-place. But both port and watering-place lie beyond the walls, both of the ancient and the mediæval city; the city itself, like Chester, has at some points spread beyond the walls, and at others shrunk up within them. As we enter from the sea, from the port, or from the station, a wall crosses the modern street, while at other points, as at Rome and Soest, large tracts of cultivated ground are found within the walls even of the sixteenth century. And while there is the sea on one side, there are the mountains on the other. Some of the noblest peaks of the Apennines rise in the distant view; and almost every child in the street is ready to point out to the passers-by the site of the Commonwealth of San Marino, the last surviving Italian commonwealth, the sharer in the ancient freedom of Andorra and of Uri. It is something to look out on this abiding stronghold of freedom, whether it be from the bridge of Tiberius, from the castle of the Malatesta, or from the walls of Pope Paul the Fifth. If we add to these the arch of Augustus and the church of St. Francis, the later *duomo*, we shall have gone through the list of the chief antiquities of Rimini; a list scanty certainly as compared with the wealth of many other Italian cities, but which, it will be seen, is spread over nearly the whole range of Italian history. Where there is a gap at Rimini, it is the same gap which we see at Rome itself, the gap which at Verona is so nobly filled by St. Zeno, and at Venice by St. Mark's and the range of Romanesque palaces by the Grand Canal. We leap from the days of the Cæsars—in this case from the Julian House itself—to works of the fourteenth and fifteenth centuries.

The two works of the early Imperial age which remain at Rimini are both striking in their grand simplicity. The bridge is specially so; in a structure of that kind there was hardly any scope for the ever-recurring fault of Roman architecture, the masking of a body built according to the native Italian arched construction with a veil borrowed from the entablature system of the Greeks. The stream is spanned by bold and simple arches of the best Roman masonry, with but little attempt at ornament. The general preservation is wonderful, though more than one of the arches has been partly patched, if not set up afresh. And to more than one of the piers it has been thought needful at some later time to add buttresses of brickwork, to which a mediæval architect might perhaps point with some triumph as a sign that his system of construction was after all better than that of the ancient engineers. The inscription on the bridge is not quite perfect; but it is striking, when crossing a thickly crowded thoroughfare between two parts of a modern city, to light on letters still plainly commemorating the names and offices of Augustus and his stepson. In Rome itself we soon cease to be startled as we stumble on fragments of this kind at every step. Their presence, or rather their abundance, is in truth what makes Rome Rome. But elsewhere, even in Italy, every fragment has a distinct being, and makes a distinct impression of its own. From the bridge we follow the main street of the town, passing through the square which bears the name of Cæsar, and at the further end of Rimini, hard by one of the gates of the Papal fortifications, we pass under the arch of Augustus. Spanning the street as it now does, it needs a slight effort to keep in mind that it is not the gate of the city, but simply a commemorative arch, which, like all others of the class, was in its original object simply commemorative, which served no practical purpose, and never fulfilled the purpose of a gateway by being furnished with a gate. Later ages, however, turned the arch of Rimini, as they turned the arches of Rome, to their own purposes, and a mass of brickwork on each side and above the arch, crowned

with a double row of the so-called Scala battlement, shows that the arch raised in the seventh consulship of Augustus to commemorate no warlike triumph, but the peaceful work of mending the roads, was found convenient for the purposes of a fortress. We will mark in passing that this is part of the history of the building and of the city, and we trust that no reformer or restorer will ever wipe out this small page in Italian history by pulling down the mediæval crest of the Roman arch. The arch itself, as we have said, is wide, and spans the street, and the arch itself takes up nearly the whole width of the building, leaving room only for a single Corinthian column on each side. It has therefore little in common in point of effect with its neighbour at Ancona; but it has still less likeness to such massive structures as the later arches of Severus and Constantine. It exhibits the usual faults of Roman architecture in columns which support nothing except the projecting bits of entablature upon them, and in a sham pediment which not only ends no real roof, but does not even pretend to rest upon the columns. Above this pediment is the inscription which records the date and object of the monument. These confusions of the constructive and decorative system must be taken for granted in every Roman building, till in the days of Diocletian men learned that the Roman arch answered to the Greek entablature, and that the column, used first as a support for the entablature, was equally fitted to become the support of the arch. Still the arch of Rimini is a simple, stately, and noble structure, all the better for standing out boldly in the simple dignity of its main architectural features, the arch itself and its attendant column, and not being overloaded with sculpture or with exaggerated detail of any kind.

The visitor who reaches the arch can hardly fail to turn one way or the other along the fortifications of Pope Paul. On the side nearest the sea a hand set up by authority of the Senate of Ariminum points to the spot where he is to see the remains of an amphitheatre within the Papal walls; but doubtless, as we believe is the case everywhere but in Rome itself, outside the gates of the ancient city. We will not dispute a fact stated on such authority, but we will only say that, to make out the extent, or even the position, of the Amphitheatre of Ariminum must be the work of some one to whom Jupiter or Mars, or whoever presides over such buildings, has given a keener sight than we can pretend to. The fortifications of Pope Paul are well preserved through a great part of their extent; they jut in and out so as to form a most irregular outline; and, reaching in many parts far beyond the extent of the modern town, they form a walk commanding fine points of view both towards the mountains and towards the sea. The huge brick castle of Sigismund Malatesta looks mountainwards; the great church which owes its present form to him bears locally the name of the Temple of the Malatesta. Its date is 1450, a few years before the building of the castle. It is remarkable as a case in which infinite pains have been taken to turn a church of the Italian Gothic, with windows better deserving the name of Gothic than most which are to be found in Italy, into a building of the Renaissance. The effect is strange, but it is striking in its way; the initials of Sigismund and Isotta appear everywhere, so does the Malatesta badge of the elephant, and the huge earth-shaking beast is everywhere shown of the African species, with the vast ears, an abiding remembrance, it may be, of the Gæstulian beast of Hannibal. The other churches of Rimini are of no great moment, and there is nothing very striking in its domestic architecture, though, as in every Italian city except Rome, graceful fragments are here and there scattered up and down its streets. Altogether, while neither in its history nor its architecture can Rimini at all claim to be a city of the first rank, it is a spot well worth turning aside to visit, and one, it may not be out of place to add, where better quarters may be had, and at lower cost, than in some cities of greater fame.

THE BIRMINGHAM SCHOOL OF THOUGHT.

EVERY one is familiar with the heavy and consequential bore of private life who secures for himself a certain influence in the management of affairs by a noisy self-assertion which he calls force of character. All bores are, in their way, rulers of men; but there are bores whose yoke is borne with patient submission, and there are bores whose yoke galls beyond endurance, and provokes a sullen resentment which only does not break out into active retaliation because nothing of the kind would be of the least use. The bore of the Ancient Mariner type pours into your ear in a monotonous flood the story of some interminable grievance, and you listen to him with feelings such as are excited by a bluebottle caught in a cobweb at church. He will go on for ever; but within some definite time you will get out of hearing of him, and meanwhile he is not actively irritating. He is an affliction to a certain extent; but not to the same extent, nor even of the same kind, as the man who gets on in life, and advances his position by a steady application of Thackeray's cynical rule, "If your neighbour's foot is in your way, stamp on it. Do you think he will not take it out of your way then?" In domestic and social life there is usually some escape from this tyrant. He cannot sit down at a dinner-table without being invited, and he cannot follow you into the recesses of your study, or invade your wife's drawing-room, unless you choose. In associated or corporate action there is no such escape, and in Committees or on Boards, in Vestries, Petty Sessions, and the like he is in his element, rides rough-

shod over wiser and better men who have the misfortune to be modest and quiet, and carries things with a high hand in his own way.

Individual character is apt to be represented on a larger scale in the life of towns and societies, and a domestic or social nuisance may have its type on a wider field, as Plato puts it, in national or international affairs. The self-constituted dictator of the hearth-rug or the board-room is the political blusterer of the platform and the deputation, who speaks "in the name of the vast and important commercial interest which has its headquarters in our midst," or the pompous diplomatist of the Congress who represents a power bounded only by limits unknown to terrestrial geography. A community of this type, like its representative in private life, will usually be very big, very prosperous, somewhat new, and not very highly educated. The consequential bore who stamps his opinions into his neighbourhood with his boot-heel is generally a rich man. He, or his immediate ancestry at least, is probably self-made, and he compares himself, not to his own disadvantage, with the common run of men who are simply as God made them. Accordingly he is not without energy, nor was his father before him. He is not by any means a fool. In his own line he has a right to attention and respect. Only he will not keep within his own line. He has most likely in the course of his life had a grievance to be redressed and an uphill fight to win, which he has carried through, or which the course of events has carried through for him, to a triumphant issue. From the local eminence which he has thus attained it becomes his whole duty to crow for the remainder of his life, and he considers it the whole duty of all the rest of mankind to listen to him.

From the days when—to go no further back—Mr. Thomas Attwood is said to have made an offer to Lord Grey to march up to Birmingham from London with two hundred thousand men at his back, in order to compel the House of Lords to pass the Reform Bill, the busy metropolis of the midland counties has assumed to itself much such a position in the political world as we have described. It is simply as an interesting phenomenon in public affairs that we direct attention to the fact. There is no more possibility that in the sphere of political thought Birmingham will ever condescend to come down from its smoky throne, and to place itself on the level of ordinary humanity, than that it will descend from its physical heights to rest in the lowly valley of the Severn or of the Trent. The Birmingham man of centuries to come, as he takes his business correspondent home to luncheon at his West-end villa at Edgbaston, will still complacently point to his door-scraper with the remark, "This, Sir, is on a level with the top of the cross on St. Paul's." There is no doubt that Birmingham is very big. Its population is at least as great as that of the Tower Hamlets, now that Bethnal Green has been subtracted from that constituency. Nor is there any question as to the energy and enterprise or the prosperity of the town. Even Chicago itself has not as yet risen on its pedestal of pigs and timber to so conspicuous a rank in the commercial world as that which the "toy-trade" of Birmingham, with its later outgrowths, has conferred on the Warwickshire borough. Whether an assemblage of three hundred thousand or so of manufacturers and mechanics may stand any higher in inches on the central table-land of England than a similar crowd on the banks of the Thames may perhaps be a matter known to recruiting-sergeants. Generally it may be taken for granted that a crowd, however big, is not anywhere more than six feet high. It is therefore a curious psychological problem to ascertain by what authority and on what grounds a right is claimed for Birmingham ideas on politics, education, religion, and other matters not exclusively connected with the hardware trade, to dominate national thought. The claim itself is conspicuous to every one who has watched the course of events during the present generation from a point within the Birmingham horizon; and it can easily be recognized at any time by the most casual glance at the local papers. A Birmingham audience must be addressed cap in hand and "lounging low." Even so distinguished a public man as Mr. Bright is obliged to remember that, like the Athenian democracy, Birmingham expects every orator to approach its stately presence with a respectful and finely-tuned compliment. To hint so much as a faint doubt of its majestic omniscience lets loose a torrent of indignant contempt, even if nothing worse comes of it. Where lies the secret of this awful dignity, to which no parallel can be found in Liverpool or Manchester, in Leeds or Bristol? Birmingham is, as we have remarked, very big. It was very big more than forty years ago, when it had a proportionately big grievance in being unrepresented. It lifted up its voice, just as other big places with similar grievances did, much in the same way, only a little more loudly perhaps than the rest. Its voice was manly and sensible in the main, though it talked nonsense at times, as in the case of the President of its Political Union, who might have found the discipline and commissariat of his marching regiments rather an obstacle to his plans. But Birmingham gained its members, and on the score of its old grievance the nation is quits with it. It has not been behindhand in progress. It built a very big Town Hall, when other big places had not begun to build big town halls. It was fully in its rights. If it liked to hear itself talk, it was a very proper thing to build a place to talk in. Then it put a very big organ in the Town Hall; for Birmingham had set up a music meeting long before on its own account, when no other manufacturing centre had done anything of the kind, and the meeting had deservedly outgrown the capacity of St. Philip's Church. But while we must give due honour to the modern

Orpheus, we can scarcely admit his right, on the strength of his music alone, to lead all mankind by the nose wherever it may please him to take them. We must look deeper for the credentials of Birmingham sovereignty than this. In the domain of art the town has long enjoyed a distinction peculiarly its own. Its very name has become a descriptive adjective of distinct and well-known meaning, following indeed in pronunciation the local use, which suggests to some critics that "Birmingham" is a corruption of the true name of a place lying between East and West Bromwich, and originally known as Bromwich-ham. It has been our own good fortune to inspect very closely a collection of specimens of Birmingham art of a date some seventy years since, described as having been produced "for use among the Indians." They were marvellously inexpensive; and, being such ingenious imitations of the spade guineas and half-guineas then current that many Englishmen might have failed to detect the difference, they must have been of very great "use to the Indians" indeed. In fact, the art which could supply coinage for "use" and idols for devotion, indifferently to the heathen world has deserved to be immortalized by a name of its own; and possibly it is on the strength of the Birmingham guineas of one period and the Birmingham idols of another having been found productive of such lasting benefits to the human race that Birmingham political theories and Birmingham educational crotchets are so confidently offered in our own day for universal and reverential acceptance.

At any rate, those who go to Birmingham must do as Birmingham does, and think as Birmingham thinks; or they must take the consequences. It is on record that upon the occasion of some check in the progress of the first Reform Bill, it seemed good to the Political Unionists of the town to mark their displeasure at the event by hoisting a black flag on one of the church steeples. The curate in charge, observing the decoration, and conceiving perhaps that it hardly came within the scope of the "ornaments" rubric, ventured mildly to remonstrate. Birmingham, as the most convincing way of showing that in this case, as always, it was in the right, hustled the curate, knocked him down, and broke his arm. After that, he became no doubt very tolerant in the matter of black flags. It appears from the local papers that in the course of the late School Board election proceedings a clergyman of the town has given a similar, or perhaps even stronger, cause of offence. He has ventured to doubt the infallibility of Birmingham theorists in matters of education, and he has been promptly taken in hand by them for reformation of life and manners; although happily, up to the latest advices, he had not required the care of the surgeons. He had ventured to express some jocular alarm lest "blazing principles" lighted up in the big Town Hall should result in the "gutting" of that crowning triumph of midland architecture, organ and all. The speaker forgot that he was in Birmingham. The whole force of the "Liberal Eight" was upon him in a moment, and his innocent rhetoric re-appeared everywhere on their platforms, in the form of a prophecy that the day of the Liberal victory in the School Board contest would see the Town Hall "guttled" by the fires of Communism. It would have seemed anywhere else perfectly needless to disclaim an interpretation of his words so obviously absurd, but Mr. Lea has actually been at the trouble of doing so, with no better result than to bring forth the grand reply of a genuine Birmingham logician, "We also have read French history." The incident is only worth quoting as a specimen of the shallowness and intolerance which mark any attempt to dispute the dicta of the typical Birmingham agitator. He is a very windy personage; but he and his like have managed to get themselves taken as representatives of opinion for a large manufacturing population, and there is no doubt that the claim has been widely accepted both in the press and by the public.

One comfort remains. Noisy and obtrusive as Birmingham is in its capacity of consequential political bore, it might have been a good deal worse. In the early days of the railway system the town became, and seemed likely to remain, the centre of communication in England, the very axle of the wheel of commerce. To what heights of unapproachable infallibility its inhabitants might by this time have arrived had this position been maintained, we will not attempt to conjecture. A grateful posterity in the midland counties and throughout England generally will have reason to record among the occasions on which the late Sir Robert Peel eminently deserved well of his country the day when he turned the first sod of the Trent Valley Railway, and shunted Birmingham into a siding.

THE PECULIAR PEOPLE.

SOME months ago we took occasion to comment on a suggestion emanating from a highly Liberal and cultivated quarter, which to persons of less finished culture seemed to stand in rather awkward relations to the sixth Commandment. This latest outcome of the religion of sweetness and light received from its literary godfathers the musical name of "Euthanasia," but was stigmatized by the coarser criticism of a bigoted and unappreciative public with the ugly appellation of murder. Its advocates did not indeed deny that killing was involved in their recommendation, for their special aim was to explain by what means, and under what circumstances their victims could be conveniently disposed of; but they argued that there are cases where killing is no murder, and that this was one of them. The Spartans used to expose deformed children in the interests of the

State, and the apostles of modern culture would get rid of incurable patients both for the public convenience and their own. The formality of asking the invalid's consent before the fatal dose was administered might be observed, at least for the present, in condescension to vulgar prejudices, and the presence of the parson and the doctor might be required at the closing ceremony. But if nature did not yield with sufficient promptitude to the pressure of disease, there could be no use in prolonging an existence which had become a burden to the living, and whose extinction would be a benefit to the dying. That this short and easy method of dealing with sickness was open, at best, to the most obvious and inevitable abuse in practice we ventured to point out at the time, while it was enough to hint at the still more fundamental objections on moral and religious grounds which its advocates did not so much answer as ignore. Some sort of Pagan precedent they might be able to plead, though the greatest of heathen philosophers had condemned their theory as opposed to the first principles of Theism; but to Christian authority they did not even profess to appeal. It was, in fact, against a popular Christian superstition that this new code of philanthropy was expressly directed. The religion of culture, if it claims to be a phase of Christianity, is at least a very Broad Church phase of it, and is apt to curse the people which knoweth not anything better than the law and the prophets. There is no lack of self-assertion in the preachers of the gospel of Euthanasia; but they scarcely care to assert its identity with the Gospel of St. John. But the old proverb that extremes meet is constantly being verified by some fresh experience, and the doctrine of the latest apostles of modern enlightenment is curiously confirmed by the fanatics of a sect which aspires to the most literal fulfilment of the letter of Scripture. The Peculiar People do not, indeed, curtail the sufferings of their dying relatives by stifling or poisoning, and so far they fall short of the new programme of Euthanasia; but then their method of procedure, if less drastic, is quite as effective, and it is by no means reserved for cases of apparently incurable illness. Death by starvation is quite as sure as death by fire or sword, and in numberless cases of sickness the refusal of medicine is practically equivalent to the refusal of food. An event which occurred the other day at Plaistow in Essex, and which has suggested these observations, serves to illustrate the point.

There exists in that favoured county a small sect of religionists who have carried the Protestant principle of private judgment to the rather suicidal extent of absolutely surrendering all exercise of their own judgment on matters where they suppose the letter of Scripture to be explicit. On what particular texts their treatment of the various ills which flesh is heir to, whether in infancy or in mature age, is based we are not informed. A literal interpretation of the command to take no thought for the morrow would prove more than they seem prepared to accept, and where the precise line is to be drawn between a lawful supply of bodily wants and an unlawful remedy of bodily ailments does not clearly appear. There is a censure pronounced no doubt on a King of Judah who sought the physicians instead of seeking the Lord in his sickness; but the context of the history has generally been understood to imply that his fault lay rather in what he left undone than in what he did. Be the reason, however, what it may, the Peculiar People consider the medical art, like the black art, a wicked and diabolical invention, entirely repugnant to the word of God, and forbidden to the faithful under all circumstances. One remedy and one alone is to be used in sickness, and that is—tell it not at Exeter Hall and proclaim it not to the *Record*—the administration of extreme unction by the elders of the sect. And here we may pause to note in passing that this casual deflection into Popery is very much like the revival of one of the least pleasing peculiarities of a mediæval sect which Rome stamped out with a vigour that the Essex magistrates would probably scruple to emulate. Dr. Maitland has shown that the Albigenes, among other anti-social practices, used to administer to the sick a sacrament of "heretication," after which they were not allowed to touch either food or medicine, but were left to die. Our English sectaries may surely be acquitted of all knowledge of the very name of their mediæval prototypes, but the resemblance is certainly a curious one. On the occasion already referred to a certain Mrs. Benton of Plaistow was attacked with erysipelas in the face, from which she suffered agonies for some days. At length an elder, of the name of Tunsley, was called in, who anointed her several times, without any beneficial effect on her bodily condition; but no doctor was summoned, and after ten days the unfortunate woman died of inflammation on the brain. It came out on the inquest that her husband had never suggested calling in medical advice, and did not wish it, though he said he would not have refused to comply with her own desires for such aid, had she expressed any. But she did not desire it; "she put her trust in the Lord" and in Daniel Tunsley's unction, and so succumbed to an attack which a little ordinary care would pretty certainly have subdued. The conduct of those concerned is strange enough, but it is not the first time we have heard of this very "peculiar" community, and they may plead the excuse—whatever it be worth—of consistent adherence to their stupid and fanatical creed. It is not equally easy to explain—still less excuse—the still stranger conduct of the jury, who returned a verdict of "death from natural causes." In one sense, of course, a prisoner who was starved to death would die from natural causes, but his gaoler would be held guilty of manslaughter, if not of murder. And the Coroner did go so far as to remind Mr. Benton that he was morally, though not legally, responsible for the death

of his wife. But why not legally? The jury indeed added a sort of explanatory rider to their verdict, which stands itself in still sorer need of explanation, expressing their regret that "there were no means of punishing these Peculiar People for their disregard of human life." On previous occasions of the same kind a more rational verdict has been recorded, but it has been accompanied with one of those perverse recommendations to mercy which are so terribly unmerciful to every one except the criminal. The Plaistow jury seem to labour under some confused impression that freedom of conscience includes freedom to violate any legal or moral obligations which happen to conflict with the professed creed of the culprit. If a community of Thugs were to take up their abode in some remote corner of Essex, it would be interesting to know whether a Coroner's jury, pronouncing on the death of one of their victims, would feel bound to content themselves with an expression of regret that the principle of religious liberty embodied in the laws of England precluded them from inflicting any punishment on the murderers. Yet the Thugs are a religious sect, and homicide is the first of their religious duties; it is also, under certain constantly recurring conditions, a religious duty of the Peculiar People, only they do not use deadly weapons.

There is something about the whole affair very humiliating to our modern boast of civilization and enlightenment. A good deal has been said lately about "the principles of the Reformation." It is one of those cuckoo cries which are always most frequent on the lips of those who are least capable of attaching any definite meaning to their words. But if we were to press for an explanation of the cabalistic formula, probably the first answer elicited would be a reference to the principle of private judgment, and the next an appeal to the principle of religious liberty. Well, the Peculiar People have just given us a wonderful travesty of the first, and the Plaistow jury of the second. We have not forgotten Chillingworth's classical definition of the Protestant religion; but if for private judgment we substitute "the Bible and the Bible only," the cap will fit only the more closely. That is precisely what those miso-medical fanatics profess to act upon, and, like all other fanatics, they can put their finger on texts which give a plausible sanction to their claim. It was an old saying of we forget what mediæval author, *Scriptura est sensus Scriptura*, and it would really be a great advantage if some of our modern zealots for Scriptural education would take more pains than they do to teach, not simply the letter of the Bible—which nine-tenths of their pupils are wholly incapable of applying, to any purpose, for themselves—but the religion of the Bible, which is liable to be so cruelly misinterpreted. Until this is done we can hardly wonder that one sect finds authority for child-murder and wife-murder in the condemnation of Asa for trusting to the physicians, while a second pleads the example of the whole line of Patriarchs in favour of another "peculiar institution," which is happily not as yet permitted to become domesticated among us. Meanwhile we would commend the instructive analogy of the Thugs and the Mormons to the Plaistow jury, in case they should again be called upon to decide on any death arising from the same "natural causes" as that of Emma Beuton.

A PET MURDERER.

IT is announced by telegraph that on Wednesday William M. Tweed was convicted of embezzlement in connexion with the New York Tammany frauds. The jury were out all night considering their verdict, and it was probably only at the last moment that they agreed to it. A previous jury which had tried the case in January last disagreed, and it was reported, and apparently believed by many in New York, that they had been bought up by the prisoner. Mr. Tweed and his friends are probably not in the least dismayed by the formality which has just been transacted; and there is no reason to suppose that the conviction, even if it should fail to be quashed by some process of law, will ever be followed by any kind of punishment. It is now nearly two years since Fisk, Tweed's more notorious confederate in the gigantic frauds and robberies of the Tammany ring, was shot down like a dog in open day on the stairs of his hotel by a man whom he had crossed both in love and business. Stokes, the assassin, is at the present moment alive and in excellent spirits, and apparently an object of affectionate interest to all classes of the American public. On his first trial the jury disagreed; an interval elapsed and then there was another trial, and this time the jury found him guilty. There had never of course been the slightest doubt as to his guilt. He was taken red-handed within a few feet of his victim. The only question with the juries seems to have been whether ridding the world of such a scoundrel as Fisk should technically be regarded as murder, and whether, instead of a verdict of guilty, they should not return a vote of thanks. There is no reason to believe that, if Tweed had been shot instead of Fisk, his loss would have been regretted or his murderer hanged; but he has the consolation of knowing that an equally lenient view will be taken of his own crimes. Stokes, instead of being carried to the gallows, was sentenced to four years' imprisonment in Sing-Sing, and it would be an interesting historical event if, by any chance, Tweed should meet him there. Even the mild sentence of four years will probably be reduced by half a year as a reward for good conduct.

Stokes's removal from the Tombs to Sing-Sing gives one a curious idea of the position of criminals in the United States, and the affectionate and fraternal relations which subsist between them and the officers who have charge of them. Reporters of course accompanied Stokes on his journey, which might perhaps be called a progress. The Deputy-Sheriff, whose duty it was to convey him to his new quarters, was familiarly addressed as Bill, and called his prisoner Ed. It has often been remarked that our own institutions are rapidly becoming Americanized, and there was a case the other day in which the magistrates had to subscribe sixpence among them in order to provide a birch for whipping a little boy, no provision having been made by the State for such an extravagance. In the United States the administration of criminal justice is conducted in the most economical manner, and the Deputy-Sheriff, with Stokes and another prisoner, went to the railway in a tramway car as part of the general public. The expense of a cab would no doubt have been disallowed by the authorities. When Stokes first stepped out of his cell he was pale and nervous. He had on—for everything is minutely chronicled—his old dark-checked suit, a white shirt, and a black and white silk necktie, which he wore at the trial. He also wore a black soft hat. Stokes's companion was Couse, a clerk who had pleaded guilty to embezzlement, and had been sentenced to imprisonment for two years and a half; he was "well attired and wore a fashionable overcoat." Stokes stood by the stove and smoked a cigar, and, having murdered a man in cold blood, seems to have thought himself superior to Couse, who was only a thief. When a pair of handcuffs was produced Stokes looked surprised, but he had to go through the form of being manacled to Couse. In the car Stokes expressed great commiseration for himself, and suggested that the District Attorney ought really to prosecute the witnesses against him for perjury. His remarks on the weather, on his health—it seems he does not like confinement—on the architecture of the streets, are all recorded with reverent care. At first he was not recognized in the car; but before he left it to go to the railway the crowd gathered round him, and everybody wanted to ride in the same vehicle. The Deputy-Sheriff placed his prisoners in the smoking-car of the train, and here again the public rushed in. "Men were standing on the seats, and the aisle was packed." We are also told that "police officers laid aside their dignity, elderly ladies and gentlemen forgot their anxiety to obtain seats, employes forgot their work, and all joined the newsboys in the rush to see him." Many clung to the platform of the carriage, and had to be plucked away by force. When the train started a solemn, elderly gentleman, wearing a silk hat, approached Stokes and took his hand, saying, "Ed, I am sorry to see you here, it's terrible. Be a man when you come out. Ed, be a man." As this sort of admonition appeared to be offensive to Stokes, the Deputy-Sheriff benevolently interfered. Then an Irish friend introduced himself, and Stokes denounced the rascality of the man he had murdered. At Tarrytown Couse struck in a word. He had been offered a situation there, and was sorry he had not taken it. "But, then, you know," he added, "the salary was only three thousand dollars, and the people here are high-toned, so I couldn't have lived on that and been one of them." He probably intended to convey that the high tone of the people of Tarrytown led him into embezzlement. When the train stopped at the Sing-Sing station, the party went to an hotel, and ordered a bottle of wine, which was all drunk. "Ed," said the Deputy-Sheriff to his prisoner, "I thought you'd like a drink before going inside." In front of the prison the mob, perhaps from an affectionate recollection of Fisk, used insulting language to Stokes. "Shoot him!" cried one. When Mr. Hubbard, the Warden of the prison, appeared, Stokes gave him a letter from Mr. Tremaine, his counsel, and the Warden promised to do what he could to make him comfortable. "We'll take good care of you here," he said; "you'll like this place better than the Tombs. Here you have a change of scenery and an occupation." The clerk of the prison then put the usual questions to him, and "every time the clerk asked a question a broad grin overspread his countenance, and Stokes, in answering, smiled." All the associations connected with Stokes seem to have been regarded as gay and comical. He had only shot a man whom he did not like, and who, though good fun in a sort of way while he lived, was no great loss. Couse was in excellent spirits, and could not help laughing outright when he heard that he was at once to be appointed chaplain's clerk. But the prison clerk did not laugh at Couse; there is no humour in mere embezzlement compared with murder. The next thing was that Stokes and his companion had to exchange their ordinary clothes for the prison uniform. It is satisfactory to know that "they were in excellent humour." The public would have been sorry, no doubt, if a swindler and an assassin had been at all put out by the formalities of criminal justice. When Stokes had put on his new suit, "he indulged in a little pleasantry," remarking that he had worn something like it "when playing at base-ball." When he pulled on the trousers he said, "Who wants a better pair than that? A little too tight round the waist, that's all." But he was surprised to find that there were no pockets. "What, not a pistol pocket?" he exclaimed; and the delicate humour of the allusion was fully appreciated. Stokes was then weighed. He had been snivelling about his sufferings in the Tombs and loss of weight, and was annoyed to be told that he had been getting fat. After so many marks of genial and kindly interest, he seems to have felt rather disappointed that the upshot was to be life in a cell. Couse was talking glibly to the reporters, until a keeper said, "Stand over there; you're a convict now and must not talk." Couse, we are

told, looked appealingly at the reporters, and then wept like a child. "He felt that he was indeed a convict." While attended by a suite of eager and respectful reporters, all waiting with sharpened pencils and big note-books to take down everything he said, and observe how he looked, he had, perhaps not been quite sure as to his real position. Stokes's voice also trembled, and the hero applied a handkerchief which a keeper gave him to his eyes. This must indeed have been an affecting moment, and it does not seem to have occurred to any one that Stokes, who was only about to undergo a mild punishment, ought by rights to have been hanged last year. It has been arranged that he is to be shipping clerk in the cigar manufactory of the prison, "a very easy and comfortable position"; but as he had a bad cold in the head, it was believed that he would "be allowed to remain in the hospital for a time in order to gain strength."

It must be admitted that the gentle and tender treatment of the murderer of Fisk affords every encouragement to somebody to shoot Tweed, and this would probably relieve the people of New York of a good deal of embarrassment. We have to apologize to our readers for transcribing so much of this sickly and nonsensical rubbish, but it may perhaps serve as a warning to some of our own journals of what they will come to if they do not impose some restraint on their passion for morbid gossip and sensational description. It must be remarked that this sort of writing about criminals is not merely a reflex of a debased public opinion, but that it has had a great deal to do with debasing and corrupting opinions. The newspapers make heroes of rogues and villains, and hold them up as objects of public interest, watching them from house to house, and recording every particular concerning them as if it were of the utmost importance; and the public, having been entertained by this minute biographical and psycho-physiological record, begin to look upon the criminals thus presented to them as if they were somehow old friends whose errors cannot very well be condoned, but who ought, on account of the amusement they have furnished, to be treated as kindly as possible. The moral is that justice can never be satisfactorily administered as long as a fuss is made about malefactors. They should be locked up out of the way or hanged, as the case may be, with the least possible amount of publicity and ceremony.

RAILWAY PARCELS.

SEVERAL carmen have been tried and convicted on charges of stealing goods entrusted to their care. When the system of collecting parcels in London is described, the wonder is, not that thefts occur, but that any valuable property travels safely. A firm of jewellers sent two gold watches to a firm at Liverpool in a parcel which was sealed with a seal bearing the name of the firm. It was delivered at a Receiving House in Oxford Street, where it was taken in a cart to the railway station at Euston Square. A detective officer employed there noticed a parcel sealed in a very clumsy and suspicious manner, not with a proper seal, but with the pressure of a finger. This parcel was addressed to the same firm at Liverpool as the parcel which had contained the two gold watches, and it is not, we believe, disputed that the two parcels were the same. But when the parcel was opened at Liverpool it contained nothing but hay and straw. The cart employed to collect these parcels was in charge of a man and a boy. According to the evidence of the boy, who was admitted as an "approver," the parcel was opened by an accomplice, who got into the cart; the watches were taken out, and the parcel was re-sealed at a public-house at which they stopped for the purpose. If this story is not true, it might be true; and it may excite surprise by showing that these carmen have almost been invited to plunder the valuable property which passes through their hands. Railway Companies make efforts, more or less effectual, to ensure the safety of goods carried upon their lines; but it seems that goods in process of collection have been allowed to take their chance. A jeweller's parcel might, we should think, deserve to be treated with special care. It might be placed in a locked receptacle, instead of being thrown promiscuously into a cart. But if it is not worth while to take such precautions, robberies must inevitably occur. The jury found the carman guilty, but acquitted the alleged accomplice, so that they did not altogether believe the boy's story. This, however, for our purpose matters little. The jury believed that the watches were stolen between the Receiving Office and the railway station, and they could only be stolen by opening the parcel and re-sealing it. In another case a parcel of gold chains was made up in London for Liverpool, and this also was opened by the carman, and some of the chains were taken out. In this case the carman confessed his guilt. In another case a shoemaker was convicted of receiving gold chains knowing them to have been stolen from a parcel under similar circumstances. He had been tried previously on a charge of receiving a silver flask, and acquitted. It is stated that fifteen or twenty tradesmen of Chelsea and Brompton gave this man an excellent character for honesty extending over twenty years, and of course it was convenient to the thieves to have such a respectable associate. In another case, jewelry of the value of upwards of 1,000*l.* was stolen. The parcel containing this jewelry was sent from London to Liverpool, and on arrival was found to have been opened, and part of its contents abstracted. When we arrive at such a sum as this, it seems incredible that greater care should not be taken. The prisoner told his boy to drive, and got inside himself. On arriving at Euston Square, he told the boy to unload the van, while he went away to get his book signed. It would

hardly be believed, if it had not been proved in Court, that parcels worth 1,000*l.* each could be dealt with in this loose way. It is not a new thing to send valuable property by public conveyance, but the quantities now sent are enormous, and commercial men will not endure to be fettered in their operations.

We may learn from the law reports how parcels are managed upon railways. Thus in a case which came before the Court of Common Pleas, it was stated by a witness that, if a parcel had been insured, it would have been specially taken care of; but, brought as an ordinary parcel, "it would be chucked down in the London corner." The parcel in that case was worth 40*l.*, and it was not insured. The same witness stated that the parcels are thrown down; they are left to take care of themselves. There are two guards of the mail train. They lock the parcels in the compartment in which they ride, or the next compartment. "If," said a witness, "I had been told the parcel was of great value, the guard could have taken it with him in his pocket or in the box he rides in." A parcel arrived late, and the guard not being at hand, a porter unlocked his box, and took out the waybill, and entered the parcel in it. Other persons have keys that open the box. A good many workmen in the Company's service who repair carriages have keys which open the parcel-box, and passengers also have keys. This was on the Great Western Railway some years ago. A guard stated in that case that he had never lost a parcel before or since that night, and he had carried hundreds of thousands of parcels. According to this report, the difference between insured and uninsured parcels is merely this, that the former ride in the guard's box and the latter in the box next to it. Perhaps if this be so, it is hardly worth while to insure parcels, and we may conjecture that some of the parcels lately lost in London were not insured. It is rather difficult to see how the man and boy who manage a collecting cart could devise and carry out different modes of treatment for insured and uninsured parcels; and if their treatment be the same, it is hardly worth while to pay the higher rate for carriage.

It is to be feared that, although heavy sentences may produce a momentary impression upon the class of carmen, yet the existence of the temptation will ensure the renewal of the offence. Trade requires great facility of transmitting goods; and perhaps occasional losses are balanced by everyday convenience. We might ask, however, whether it would not be desirable that Railway Companies should make special arrangements for the carriage of watches and jewelry, and charge an extra rate in consideration of extra care. The Carriers' Act, which was passed before the establishment of railways, enables carriers to give notice that they will not be liable for valuable articles unless declared and paid for accordingly. The object of this enactment may be supposed to be to give opportunity to carriers of making special arrangements for the safety of property thus declared. We believe that on some railways small parcels are placed in a locked receptacle; and when once the parcel gets upon the railway it is easy to take some such precaution for its safety. But carts which traverse the streets of London with such deviations and stoppages as their drivers please, afford dangerous facilities for robbery. We are tolerably outspoken in our complaints of losses on foreign railways, but it would be difficult to find any worse cases than those which have lately occurred in London.

The Judge addressed the prisoners in the usual style in passing sentence. "To your care," says he, "a large amount of valuable property has been entrusted, and it is a matter of necessity that carmen should be so trusted." We may perhaps question the necessity which is here assumed; but we may admit that the arrangement is convenient. It might be required that jewellers and other dealers in valuable goods should send them direct to the railway stations, or that special collections, with additional precautions against thieves, should be made a few times a day. It hardly seems necessary that in the conduct of daily business such strong temptations should be offered to dishonesty. No doubt all precautions are inconvenient; but some precautions are necessary in all trades. The plans of the prisoners were so skilfully laid that for a long time they succeeded in avoiding detection, and at last it was only through the information of accomplices that the offences were proved and convictions secured. From this the Judge trusts that other criminals will learn that they are never secure against being betrayed by their partners in guilt, and that there is no safety for them whatever their skill and caution. Unhappily these lessons have been taught by criminal trials for many generations, but the temptation of valuable property easily accessible has proved too strong to be resisted. It is, says the Judge, absolutely essential for the protection of the public who are compelled to entrust their property to carriers and railways, and for the protection of carriers and Railway Companies from the depredations of their servants, that when detection is made it shall be followed by exemplary punishment. This, of course, nobody denies. But unhappily it has been said and acted upon many times before; and after it has been acted upon up to a certain point, reaction is sure to follow. Horses and cattle are very much exposed in fields, and formerly it was thought desirable for the protection of this valuable property to hang those who stole it. Lately, however, we have come to consider life more important than property; and by an extension of the same principle we might arrive at the conclusion that it would be better to offer fewer facilities for crime, even by the abridgment of some of the convenience of railway traffic. The question whether these prisoners should be respectively sentenced to penal servitude for seven or ten years is principally interesting

to the prisoner himself, for we are unable to persuade ourselves that the security of jewellers' parcels during the next few years will greatly depend upon the precise apportionment of punishment. However, it is to be hoped that the Judge is well satisfied both with his own speech and with the sentences which he pronounced. The receiver was told that it is such as he who make thieves, and that he could not fail to know that the valuable property which he bought of a carman had been part of that entrusted to him by his employers. All these remarks are as old as sin and suffering; but it is pleasant to observe that a judge can derive satisfaction from enunciating them.

THE THEATRES.

MISS BRADDON perhaps intended a satire on modern wives when she wrote the drama *Griselda*. Certainly the character she has drawn is as different as possible from the energetic ladies who sit upon School Boards and agitate for Woman's Rights, and it is to be feared that *Griselda*'s virtue both on the stage and at home must be insipid. The experiment of producing such a play was bold, and we wish we could add that it is likely to be successful. In point of art it is highly commendable, but its popularity can hardly be more than moderate. We shall not attract many visitors to the Princess's Theatre by the statement that this play is exceedingly well written, and contains some passages of great power and beauty. This merely literary merit is almost unmarketable, and as the play contains only two characters besides the lady, there is not much scope for acting, even if the company at the Princess's Theatre were strong, which it certainly is not. All depends on Mrs. Rousby, who both looks and acts the patient wife satisfactorily. We do not think a better representative of the character could be found; but then it would be possible to reconcile oneself to the character not being represented at all. Modern dramatists labour under the difficulty that Shakespeare thought of the same things before them, and we cannot blame Miss Braddon if some of her lines recall the memory of him who

Like the base Judean, threw a pearl away
Richer than all his tribe.

Nobody can object to the reproduction in a slightly altered form of *Othello* and *Ishlemon*; but it will, we think, be generally felt that one *Iago* either on the stage or in the closet is enough. An imitation almost approaching to burlesque of the looks and tones appropriated by theatrical tradition to *Iago* fails to render the character of *Cosmo* interesting, while it is necessarily disagreeable. We had almost forgotten to mention that Miss Braddon has redeemed her *Griselda* from impossible and intolerable completeness of virtue by making her spend her husband's money, like a heroine of one of Miss Braddon's own novels who orders her lover to build her a few conservatories in the London house which they are to occupy after marriage. The ruling passion for millinery and upholstery shows itself in the bills which *Gualtiero*'s steward brings to his master after he has been three months married. Fine dresses and jewels cost nothing in a novel, and are a profitable outlay upon a play. Everything has been done by scenic ornamentation and magnificent costume to render this play attractive; but if it stood simply upon this, it would have to contend with formidable rivals, and we fear that the merit of Miss Braddon in writing, and of Mrs. Rousby in acting, the character of *Griselda* will be less appreciated than it deserves. There are not enough people in London who care for this kind of thing; and some of these people are too indolent or too fastidious to contribute by their presence to a success which nevertheless they would be glad to hear of. If we compare this play with that in which Mrs. Rousby first became known in London, we shall perceive how far it is deficient in the elements of durable popularity. It has obtained what would be called in Paris a *succès d'estime*, and that is all that can be expected from it. We hope, however, that the author will not be discouraged from further effort. If she would turn her talent in this direction, the public would gain in two ways—by getting more good plays and fewer of those novels which, although undeniably clever, have become monotonous. We should be glad if she could produce another equally good part for Mrs. Rousby, and contrive to set the jewel more attractively. We can hardly say that it is worth while to go and see this lady in *Griselda*, although she does very well in it. The public always resent being drawn to a theatre on false pretences, and it is better therefore to say honestly that Miss Braddon will not, we think, succeed in making a very barren tree fruitful. People who have nothing else to do may listen to almost anything, but there is a wide difference between busy Londoners and lazy loitering Italians. A party of English people under the circumstances of the *Decameron* would certainly not tell one another stories. Women would take to fancy-work, and men would smoke or play at cards or billiards. The story of *Griselda* might be interesting to those who had heard a great many other stories, and had exhausted all the more violent emotions capable of being produced by narrative. Even in modern English life, which moves so much faster than that of mediæval Italy, we are grateful to Miss Braddon for occasionally giving us a novel without a murder. To speak more plainly than politely, the play of *Griselda* is "slow." We do not imagine this as a fault; indeed it is almost a virtue. But it is a quality in a play which theatrical managers most dislike, and unless

Miss Braddon can infuse other qualities into her plays, they will exhibit only that kind of merit which is unprofitable. The contempt which women feel for the character of *Griselda* is probably very far beyond that of men for her husband. Yet almost the only point of sympathy which we can discover for *Gualtiero* is that he goes into a passion when the steward brings under his inspection his wife's bills. He is not a party to the abduction of the child, which is managed entirely by the wicked cousin; and indeed if the idea of testing his wife's docility had been much obtruded, the play would be intolerable. The obedience of Catherine exemplifies the taming of the shrew, but we doubt whether men or women would be pleased to see her pull off her cap and throw it under foot, if she did this in the first act. *Griselda* says that she owes everything to her husband, and that he may, if he pleases, take away that which he has given. This, however, is nearly the limit of her patience. She utters eloquent protests against her husband's supposed project of divorce, and when her child is abducted, she becomes a mild reproduction, first of *Constance*, and afterwards of *Ophelia*. We do not suggest that Miss Braddon has plagiarized a single thought or word, and yet neither she nor other authors can help remembering what they have read in Shakespeare.

There appears to be no reason why Mr. Charles Reade should not succeed on the stage equally with other authors, when he adopts the same methods to obtain success. The *Wandering Heir* is founded on a real story of the last century, which is well adapted to enlist the sympathy of pit and galleries, and it must be allowed in the author's and manager's favour that that sympathy is abundantly displayed. This story has been taken from a volume of Howells's *State Trials*, and we are happy to think that Mr. Reade has opened a vein of incident and character which may supply him with materials for novels and plays during the remainder of his career. We do not indeed think that Mr. Reade's drama can have a fair chance on the London stage unless it be more expensively got up. It is quite true that the cows and trees in one scene are only too conspicuously new; but other scenes are rather disagreeably old. It may be the fault of the tailor or of the wearer when clothes look as if they had been thrown upon the person with a pitchfork; but a manager who produces a drama of the last century must fulfil two requisites—first, to supply a number of characters with the clothes of gentlemen of the period; and, secondly, to make these characters look like gentlemen when they are dressed.

Two trials are reported in a single volume, and the defendant in the first becomes plaintiff in the second. To prevent disappointment, we may mention that neither judge nor counsel in the trial which forms the last act of the *Wandering Heir* are got up in imitation of celebrities of Westminster Hall, and we may add that Mr. Reade has agreeably varied the ordinary procedure of English courts by causing the witnesses in the trial of his hero for murder to be called alternately by the prosecution and defence. It has been suggested as an improvement in the procedure of the Tichborne case to try each issue separately; and the only difficulty in doing this appears to be to settle how many issues there are, and where each begins and ends. But it would be quite simple and intelligible to propose to call the witnesses alternately, and it would be a great deal more lively. The hero of the play was kidnapped as a boy by a contrivance of his uncle, and transported to a plantation in Pennsylvania. Returning as a man, he claims his father's title and estates; and, while litigation is pending, he accidentally shoots a poacher. The uncle, who is in possession, seizes the opportunity thus presented to get his nephew hanged. He suborns witnesses, who swear that the shooting was deliberate; but other witnesses expose the character and motives of these witnesses, and ultimately the Crown counsel throws up his brief, and the virtuous characters of the play fall upon each other's breasts, while the wicked uncle and his accomplices fold their arms and scowl. The second trial, which was a civil action to recover the estates, is not included in the drama, which is certainly a pity, as we should have liked to see a representation of that remarkable device of the Irish judges, who caused all the witnesses on both sides to stand upon the same table and look one another in the face. If each witness were provided with a shillelagh, and if the band would strike up a lively tune, we think the effect would be so good as almost to cause us to regret the omission of this scene from the play. But as a matter of constructive art, Mr. Reade was doubtless correct in stopping where he did, and the spectators easily suppose that which actually did occur—namely, that the hero obtained a verdict. The best part of the play is that which passes in America. It exhibits a condition of things now entirely departed. Transportation has been abolished in Australia, and although one of the Australian colonies did agree, or even request, to be supplied with convicts, yet the colonists are careful to explain that they stipulated only for convicts of good character. But in the last century "white slaves," as they may be called, worked upon American plantations just as in the first half of this century they worked upon Australian roads and farms. Many of them were faithful and valuable servants, and contributed to make the fortunes of their masters and frequently made their own. Cases of free and honest men or boys being kidnapped and sold or bound to planters were not uncommon, and there is at once reality and novelty in the picture which this play presents of its hero working on a plantation in Pennsylvania. The owner of the next plantation is a Scotchman, and his countrymen have the credit of having made the hardest "drivers," while the owner is a planter of Yankee type. A gentler régime may be supposed to be maintained

by the Quaker master of the herd, but the neighbouring owner and "driver" come upon his plantation and crack whips, and make the negroes tremble in the most real and delightful manner. The hero, wearing an elegant and unsoiled shirt, draws a truck of groceries across the stage, and of course his master's daughter, and at least one more young lady, are in love with him. It is a pity that rather more pains were not taken in producing a play which has considerable elements of popularity.

REVIEWS.

MORLEY'S STRUGGLE FOR NATIONAL EDUCATION.*

MR. MORLEY'S articles on Education in the *Fortnightly Review* have become, as they well deserve to become, the text-book and manual of those who object to the Education Act on Nonconformist or Secularist grounds. They form incomparably the best statement of their case that has appeared—the most thorough in its treatment of the subject, and the most far-reaching in its educational and political aims. As such his volume merits a detailed review, notwithstanding that its character and purpose are political rather than literary.

Mr. Morley opens with a plea which strikes us as irrelevant. Whether the Church or Dissent has the better political antecedents would be an important question if we were left to estimate the arguments for and against the Education Act by purely *a priori* considerations. As a matter of fact we are not so left. The case for the Government and the case for the Education League are perfectly intelligible on their own merits. In Mr. Morley's hands neither of these cases is made to rest, in any considerable degree, on the terrible 25th Clause. That clause is mainly important, he frankly admits, as "the key to a position." It is the vulnerable point in a large system, and it is for this reason that it is singled out for attack. Mr. Morley's own estimate of its real significance may perhaps be judged from the fact that he takes no notice of the principal argument that has been urged in its defence. The League has been repeatedly challenged to show why it is worse to buy instruction in reading and writing from a Denominational teacher than to buy instruction in higher subjects. Mr. Chamberlain himself would not object to send his daughter to learn drawing or music at a Roman Catholic school, provided that he was satisfied that she would be subjected to no proselytizing influences while there. He would simply inquire whether this was the most convenient way of getting the particular lessons he wanted for her. A School Board which pays the fee for a child attending a Denominational school is in a similar position, with the difference that, as the parent is presumably himself of the denomination to which the school belongs, proselytism is more entirely impossible than it ever could be in the case supposed. The objection to the agitation against the 25th Clause is not that it is a small matter—that, we agree with Mr. Morley, might be nothing to the point; the objection is that it is a matter which does not really concern the controversy between Denominationalism and Secularism. It is not a case of the Nonconformist refusing to pay 2½d. for Conformist teaching—there Mr. Morley's parallels of Hougmont and Hampden might apply. It is the case of the Nonconformist refusing to buy rudimentary instruction in the cheapest market, because that market happens to be kept by Conformists.

The essential part, however, of Mr. Morley's argument is concerned with much larger questions than the maintenance or repeal of the 25th Clause. He condemns the Education Act on two grounds; first, because it perpetuates a system which commits the work of elementary education to the clergy; secondly, because the elementary education thus obtained is bad in quality. Mr. Morley devotes many pages to the first of these points, but he ends by making an admission which virtually absolves us from criticizing them. Objectionable as he thinks the plan of giving State aid to Denominational schools, he would acquiesce in it—if we understand him rightly—provided that it secured a sound secular education. We shall not maintain that the Denominational system as at present administered does secure this, though Mr. Fitch has shown in the current number of the *Fortnightly Review* that it comes nearer doing so than Mr. Morley, following Mr. Joseph Payne, had supposed. We shall only contend, first, that the shortcomings, whatever they are, of elementary education in England are due to causes lying outside the Denominational system; and, secondly, that Mr. Morley and those who think and act with him are the main obstacles to the development of a really effective system.

It may be conceded therefore, at all events for the purposes of the present argument, that the quality of the secular education given in Denominational schools is as bad as Mr. Morley represents it. Let us now examine the causes to which he ascribes this badness. These causes are mainly two—the sectarian aims of school managers and the inefficiency of the teachers. "Denominational schools," says Mr. Morley, "can never make the provision of good secular instruction their main object, for the excellent reason that the provision of good secular instruction is a secondary object with those who work them." If this is meant to be anything more than a barren truism, it must rest on the assumption that secondary objects can never be perfectly attained.

It cannot be necessary to prove that this assumption is false. The Jews did not care for education for its own sake, but when they thought that religious influences over the young would be best exerted by those who had the care of them for secular training, they made their schools famous throughout Europe. In this case the motive which ensured the attainment of the secondary object was the desire to convince parents that, whatever faults might be as regards another world, they were the best possible hands at preparing boys to play their part well in this world. The case of Denominational school-managers is precisely similar, except that the authorities of the Education Department take the place of parents as the persons to be convinced. Mr. Morley quotes from a circular of the National Society a statement that the object at which the managers of Church schools ought uniformly to aim is "the training of the young Christian for full communion with the Church; and, as a preliminary to that, a training for Confirmation. The whole school time of a child should lead up to this." He then adds, "of course, therefore, secular instruction goes to the wall." Where is the *acquitur*? Even if we grant that secular instruction would certainly go to the wall if it were left to Denominational school-managers to assign it its proper place, that is no reason why it should go to the wall when its place has to be assigned, not by the managers, but by a Department which holds the purse-strings, and consequently has the power of saying to the managers, "If you do not make the whole school time of a child lead up to something besides 'this,' you shall not have the opportunity of making it lead up to 'this.'" Some of the writers in the National Society's *Monthly Paper* say such inconceivably foolish things that we are tempted to suspect that they must have been suborned by the Secularists to discredit their own professed principles. But their folly does not affect the question so long as the managers for whose benefit they write have sense enough to see that, however much they decry secular education, they must give as much of it as the Education Office demands, or lose their share of the Parliamentary grant. And even if they have not the sense to see this, it does not affect the question, because in that event the grant will certainly be withdrawn.

The second reason why Denominational schools are bad, according to Mr. Morley, is the badness of the teachers, and this he attributes to their having been brought up in Denominational training schools. We will again assume, for the sake of argument, that the teachers in Denominational schools are as inefficient as Mr. Morley says. But where is the evidence that this inefficiency is the fault of the training schools? Mr. Morley quotes several passages from Inspectors' Reports setting out the subjects in which the students of this or that college have fallen below a fair standard of proficiency. But he forgets that before a student in a training college can become a certificated teacher he must pass an examination conducted by officers of the Education Department, and must after that, as a teacher continuously engaged in the same school, obtain two favourable reports from an Inspector, with an interval of a year between them. It follows from this that, if the Education Department and the Inspectors do their duty, the low standard of proficiency to which Mr. Morley takes exception is only evidence that a large proportion of the students in these training schools will not succeed in becoming teachers. Again, it is only fair to the training schools to take into account the character of the material on which they have to work. Mr. Morley quotes Dr. Lyon Playfair to the effect that in Scotland "the teachers of elementary schools are University-bred men, and they bridge over the chasm between the lower and upper schools by their learning and zeal," and then he says, by way of comment, "Obtrude men of such a training and such a temper with the corresponding class in England." There is a double fallacy in this comparison. The condition to which Mr. Morley attributes the badness of English teachers is equally present in Scotland, and the condition to which Dr. Playfair attributes the goodness of Scotch teachers is wanting in England. Scotland has Denominational schools and Denominational training colleges, yet it provides good teachers. England has no means of giving a higher education to poor students at all analogous to the Scotch Universities, and consequently she fails to provide teachers of equal excellence. In the Scotch Code there is a clause to the effect that candidates admissible to be examined for certificates must be, besides students in training schools and acting teachers, "graduates in arts or science of any University in the United Kingdom." In the English Code such a clause would have no meaning, and it is because it has no meaning in the Scotch Code that Scotch elementary teaching is superior to English. The standard of attainments prescribed to students of training colleges is identical in the two countries, and there is nothing in Dr. Playfair's statement, as given by Mr. Morley, to show that Scotch pupil-teachers who are not "University-bred men" make any better schoolmasters than English pupil-teachers.

We think it has been shown that the badness of our existing elementary instruction is not due to the Denominational system. We shall now endeavour to show to what it is attributable. Elementary instruction is bad, because the Education Department prescribes a very low standard; and the Education Department prescribes a very low standard because, until children can be got to come to school more regularly and for a longer time, it would be merely a mockery to prescribe a higher standard. We have no controversy with Mr. Morley as to the insufficiency of the "superb attainments of the Third Standard" regarded as an educational provision for life. That the Education Department are no more contented with the present state of things than other people may be seen from a comparison of the standards of examination prescribed by the Scotch

* *The Struggle for National Education*. By John Morley. London: Chapman & Hall, 1873.

Code of 1873 with the standards prescribed in the English Code of the same year. We give what is required for a pass in reading and writing in the two highest standards:—

READING.

STANDARD V.

English Code.

Reading a short ordinary paragraph in a newspaper or other modern narrative.

Scotch Code.

Reading with expression a short passage of prose, or a short piece of poetry, from the highest class-book used in the school, with explanation, grammar, and elementary analysis of sentences.

STANDARD VI.

To read with fluency and expression.

Reading with improved expression, explanation, and grammatical analysis, of passages selected by the Inspector.

WRITING.

STANDARD V.

English Code.

A short paragraph in a newspaper or ten lines of verse slowly dictated once by a few words at a time.

Scotch Code.

A short letter on a subject to be prescribed by the Inspector. The form of composition, spelling, grammar, and handwriting to be considered.

STANDARD VI.

A short theme or letter or an easy paraphrase.

Writing from memory the substance of a short story or narrative read out twice by the Inspector; spelling, grammar, and handwriting to be considered.

This is only one of the points in which the Scotch Code makes larger demands on the intelligence of the children than the English Code; and the reason why it is able to do so is not certainly that the Scotch are an undenominational people, but, in the first instance, that Scotch parents care much more about education than English parents, and consequently send them to school much more regularly, and next, that in Scotland any shortcomings in this respect are now supplemented by a law which makes attendance at school compulsory. Pass a similar law for England, and the standards might be raised in successive years to the Scotch or any other reasonable level. It may be asked, why not raise the level at once, without waiting for compulsory attendance to be made universal? Because to do this, though it would save a great deal of public money, would do nothing to advance education. If Denominational school-managers were simply unwilling to give good secular instruction, as Mr. Morley seems to suppose, the course of the Education Department would be easy enough. The managers would be offered the alternative, either improve your schools, or forfeit the grant. But so long as children leave school at ten, or do not come to school until they are ten, and in either case come very irregularly during the time that they are nominally attending school, the most willing school-managers are powerless. They may do the best they can—employ a good teacher, urge him to bring the children forward, aim at presenting the largest possible percentage of scholars in the highest standard—and be beaten after all by the irresistible strength of absence and irregularity. Without compulsion, Secularism would find itself as much at a loss how to improve the quality of elementary education as Denominationalism is now. With compulsion, the main difficulty of the problem would disappear, and ardent Denominationalists would necessarily become as anxious as ardent Secularists to make their schools thoroughly efficient. If they did not make them so, they would not only lose their share of the grant, but would have to submit to see attendance at their schools not counted as attendance recognized by law.

(To be continued.)

MURRAY'S HANDBOOK FOR ALGERIA.*

MR. MURRAY, it will be seen, still continues his career of annexation. The red calico of Albemarle Street now floats, figuratively speaking, over Algeria; and it is, no doubt, only a question of time how soon it will be floating over Japan and Polynesia—over an empire, in short, on which the sun will never set, and in which, at any given moment of the twenty-four hours, a Briton may be found somewhere absorbed in the study of the national "Handbook." We might, indeed, have expected an Algerian Handbook before this, for Algeria is a country which is likely to attract, and already to some extent does attract, English travellers. As a health resort, Algiers seems to be growing in favour; and probably, except Madeira, no place offers the same combination of climate and comfort. But of course it is rather to the vacation tourist than to the invalid that a Handbook of this sort addresses itself, and for this class there is an unusual variety of attractions within easy reach in French Africa. There is mountain scenery which, if it does not reach the grandeur of the Alps or the boldness of the Pyrenees, is still grand and bold enough to make it well worth exploration. There are few countries more interesting to the antiquarian or historical traveller, and in Roman remains there is no country so rich except Italy. But, after all, the main attraction of Algeria is that it is not Europe. There are many parts of Southern Europe—the country between Alicante and Murcia, for instance—which are

far more like the ideal Africa than the environs of Algiers or Bona. But, semi-tropical as they may look, there is no getting over the fact that they are still Europe, and consequently nearer home and more homely than the most Europeanized spot in Algeria, Mustapha Supérieur, or the Place du Gouvernement itself, with all its commonplace of French architecture, and shops, and cafés. And then, for a plunge into the genuine, unadulterated Africa, there is no place which offers such advantages as Algeria. Any one upon whom European travel and civilization have begun to pall, and who, like the author of *Lothian*, longs to see the low black tents of the Bedouin, may within a week from London, *vis* Algiers, find himself beneath one, with his fingers in a bowl of koussous at an Arab table-d'hôte.

Possibly travellers of this kind may not be sufficiently numerous to make a guide-book a desideratum; nor indeed are they likely to be the sort of travellers who stand in absolute need of such assistance—feeble, helpless "Cook's Tourist" sort of creatures, who dare not trust themselves with as much freedom of action as lies in the purchase of a railway-ticket or the payment of an hotel-bill, lest they should make a mess of it somehow. Possibly, therefore, it was not worth while to produce a very elaborate Handbook for Algeria. We incline, however, to a belief in the principle that, if a thing is worth doing at all, it is worth doing well, and we regret to say that we cannot describe this Handbook as in any way well done. We regret it especially because of its time-honoured title. Every one, even of the most rudimentary conservatism, must feel a kind of reverential affection for that now venerable institution "Murray's Handbook," the trusty counsellor of our youthful travels, and the guide, philosopher, and friend of many a pleasant holiday ramble, and will be sorry to see anything published under that name which does not fully maintain the reputation of the series. It is neither possible nor necessary that the "Handbook" should try to compete with all its rivals. It has a line of its own, and does well to adhere to it. In some respects "Murray" belongs rather to the post-chaise period than to the railway age; and this is the reason why his treatment of a country sometimes seems wanting in perspective to the tourist rushing over the beaten tracks at express pace, who cannot comprehend why places which appear quite out of the way, like Ravenna or Ferrara or Cuernavaca or Merida, should occupy as much space comparatively as Milan or Seville. But for this very reason "Murray," though he may not suit the hasty traveller following the railway line and "doing" a dozen towns per week, is invaluable and indispensable to him who goes further a-field and penetrates into remote districts.

Algeria may be considered as completely new ground, and it offered a fair opening for a Handbook of the old stamp. Of French guide-books there are several, some good as far as their limits go, and that of M. Piesse particularly so; but all of them adapted more especially to the necessities of the Parisian tourist, who wants to make what, in his own magniloquent style he calls the "tour d'Afrique," in as short a time and with as little discomfort as possible. We cannot perceive that the author of the volume before us has made any improvement on these. He might just as well, for all we can see, have translated some one of them bodily, or made a compilation of the available matter of all of them. He tells us in the preface that "this Handbook has been compiled chiefly from notes made on the spot by the author during a recent residence at Algiers and journey through Algeria," and we need not say that we entirely accept the strict and literal truth of the assertion. But we do say that, for all the use he has made of his personal observation and experience, he might just as well have compiled it, with the help of a few French guides and a dictionary, without ever leaving London. Picturesque or graphic writing is not required in a guide-book; indeed it is generally rather an impertinence, if not very sparingly indulged in. It is not of the absence of this that we complain, but of the total want of a certain indefinable local colour which will always show in the work of a writer who, however much he may be beholden to the observation of others, sees with his own eyes also. His journeys, too, in Algeria seem to have been anything but extensive, and as unenterprising as if he had been a Cook's excursionist. He follows slavishly the beaten tracks laid down in the French guide-books, never venturing to diverge right or left, and stopping where they stop. An example will illustrate better the nature of the shortcomings with which the book is to be charged. Every one who has looked into a work on Algeria knows that, not far from Algiers, there is a region called by the French La Grande Kabylie, which is sometimes described as the Switzerland of North Africa; and not inaptly, for the scenery, if not strictly Alpine in character, is sufficiently so to justify the comparison, and the district was, and to some extent still remains, a kind of Federal Republic, resembling the Swiss in its institutions in many points. It is in some respects the most interesting part of Algeria. Its mountains and valleys and villages and Berber inhabitants are all, to a European eye, wild, striking, and picturesque in the extreme; and it is moreover readily accessible, being within a day's journey of Algiers. A more inviting field for tourists who don't mind roughing it for a few days could scarcely be found, and we might reasonably have expected that a book intended expressly for English tourists would contain some hints and suggestions about the things to be seen, and the best ways of seeing them. But the few French tourists who venture on an excursion into the Kabyle country content themselves with the journey to Fort Napoleon—for the present called Fort National—and the view, a

* A Handbook for Travellers in Algeria. London: John Murray. 1873.

magnificent one certainly, which it commands; and with this our author rests satisfied also. Even if he was unable to give the results of personal explorations or inquiries, he might at least have mentioned some two or three well-known and perfectly practicable routes across the mountains leading to Bougie, Setif, and Aumale, by which the traveller is saved the necessity of retracing his footsteps to Algiers, and at the same time gets an insight into the grand scenery of the Djurjura range, as well as into the village life of one of the most interesting and original of the peoples of Africa. But he seems sometimes to be ignorant even of the geography of the country through which he undertakes to guide his reader. He tells him, for example, that "there is a road from Aumale to Bougie across the Djurjura mountains, which is practicable for carriages." This is exactly like saying that there is a road from Bordeaux to Toulouse across the Pyrenees. We cannot conceive how, with any personal knowledge of the country, or indeed even of the map, the author could have forgotten that Aumale and Bougie lie on the same side of the Djurjura range, and that the road he means (which, it is quite true, does pass through "scenery very grand and striking") runs, not across a mountain chain, but down the broad and deep valley of the Wad Sahel.

After this we have no right to be surprised that our author has never contemplated the possibility of his readers feeling any curiosity to explore the more remote mountain region of the Aures, to which there is no road at all, and into which hardly any Europeans, except a few French engineers and Bureau-Arabe officials, have ever penetrated. But a guide who had the interests of his clients at heart should, we think, have been at some pains to ascertain to what extent and how a tract of country so historically interesting might be best explored. Again, although travellers of the stamp of Mr. Tristram, who plunge into the depths of the southern Sahara, may be safely trusted to take care of themselves, and though they may always rely on the advice and assistance of the French authorities, still they have a right to look for more information than they will find here from an author who professes to write a Guide to Algeria for the use of English travellers. The shortcomings we have mentioned, to be sure, only affect the more adventurous sort of tourists, who are, in proportion, a small body; but English tourists of any sort who go as far as Eastern Algeria will in all probability push on to Tunis and Carthage, and would no doubt be thankful for the latest information as to conveyances, accommodation, and such matters. The probability, however, does not suggest itself to our author; possibly because the French guides hardly ever condescend to mention Tunis.

The historical sketches which are inserted are, on the whole, concisely and clearly written, but the preliminary matter generally is meagre and not always accurate. The author does his best to perpetuate the old notion that the Atlas is composed of three parallel continuous mountain ranges, a Greater, Middle, and Lesser Atlas, stretching along between the Sahara and the Mediterranean. We need scarcely say that this description is an entirely misleading one, and conveys an altogether erroneous idea of the physical geography of the country; the Atlas mountains being in fact nothing more than a disconnected series of ridges cropping up here and there out of a great elevated tract (very similar to the opposite plateau of Spain) which divides the Sahara from the Mediterranean. Some of these ridges rise on the verge of the Sahara, like the Jebel Amour and the Aures, some near the coast, like the Djurjura; but, except so far as they spring from a common base of elevation, they cannot be described as in any way constituting a chain or chains, such as the Pyrenees for example.

The antiquities, too, are but lightly touched on, considering the wealth of Algeria in this respect. The author mentions the chief ruins and objects of interest at places like Lambessa and Tebessa, but of the abundant traces of Roman colonization scattered over the face of the country, especially in its Eastern portion, he takes little note. He makes no use whatever of Berbrugger's researches, and it will scarcely be credited by any one acquainted with the bibliography of North Africa that he does not seem to be aware that one Dr. Shaw a hundred and fifty years ago, when Barbary was far more difficult travelling ground than Abyssinia is now, thoroughly explored the whole country from the Morocco frontier to the Gulf of Gabes, and afterwards published the result of his travels in a volume which leaves scarcely a river, mountain, village, or ruin undescribed. If not minded to follow the example of the painstaking Oxford Don, he might, had he been aware of it, have borrowed with advantage from the book, and thus made the one before us infinitely more acceptable to the majority of English travellers. As it is, we cannot see any reason why those who can read French should prefer it to the existing guides in that language. In one respect, indeed, we must admit it deserves the preference. It does not give an Arab vocabulary, with phrases and dialogues, for intercourse with the "indigènes," as the French guides are fond of doing. The compilers of things of this sort, it may be remarked, have in general a curious knack of selecting the most useless words and conceiving the most unlikely situations; so that the traveller who merely wants his supper and bed finds nothing more germane to the matter than an imaginary conversation, "At a gas-litter's," or "Of buying a grand piano," or something else equally inconsistent with his requirements and circumstances. Most of the conversations we have seen in the French manuals are no exception to this rule, and they are usually rendered still more un-serviceable by desperate struggles to represent the Arab pronunciation by French sounds. The author has abstained from following

the French guides in this matter, and this is fortunate for his readers, for French Arabic delivered by the inflexible British organs of speech would be indeed confusion worse confounded.

QUAKERISM.

THE Quakers have lately held a Conference in London for the purpose of considering the present condition of their body, and whether anything can be done to check its apparently continuous and confirmed decay. Some brave and faithful spirits among them appear to be also endeavouring to reinstate Quakerism in public opinion, but their efforts, though exerted in a better cause, remind us a little of the despairing struggles of Julian and Zola on behalf of old Paganism in an age which was fast becoming Christian. We are quite sure that Charles Lamb would have entered Friend Smith's *Bibliotheca Anti-Quakeriana* in his whimsical catalogue of *biblia abiblia*—books that are no books—as a fit companion for almanacks, pocket diaries, and draughtboards bound and lettered at the back. It is hard to imagine any rational purpose which this volume can possibly answer. It is not a mere list of publications which may be bought at his own shop in Whitechapel, though he tells us incidentally that "he has many of them constantly on sale"; still less is it a *catalogue raisonné* of the literary controversy between his Society and its adversaries; for the alphabetical arrangement which he has adopted necessarily sets both chronology and logical order at defiance. Yet it is hard to assign any other purpose which the compiler could have proposed to himself in a work which he fondly hopes "may prove one means of opening the eyes of some." Certain it is that a reader who was previously ignorant of the peculiar doctrines of the people called Quakers would never gather the most indistinct notion of them from glancing over these pages; he would carry away with him mainly one idea—namely, that those who wrote the most vigorously, not to say passionately, against the sect were, in their respective generations, the very salt of the earth. For this conclusion, which we are far from maintaining as indisputably true, he would be indebted to Joseph Smith's almost ludicrous candour, who, "having no desire to misrepresent any of the authors whose names appear in this book, though holding views differing from his own, has taken the short sketches or biographical accounts mostly from sources furnished by their own bodies or favourable to them." Sometimes indeed the agreeable impression would be effectually removed by the very titles of the books he cites. What can we think of the temper of men who could not conduct a grave discussion on the most important of all subjects without proclaiming on the frontispiece the bitter malice of their hearts? And this charge may be made good, not only against such persons as the fanatic Lodowick Muggleton, of unsavoury memory, whose "Answer to William Penn" professes to prove him to be "an ignorant spate-brained Quaker, who knows no more what the true God is, nor His secret decrees, than one of his own coach-horses, nor so much," but against men of a wholly different stamp, some of whom had suffered sharply for their principles, and might thus have learned to be tolerant to others. Such were Nathaniel Morton, Secretary to the Court of Jurisdiction at New Plymouth, who in his "New England's Memorial" of the Divine mercies manifested to that plantation, "published for the use and benefit of the present and future generations" (1669), must needs go out of his way to tell how "the Quakers (that cursed sect) arrive at Plymouth in 1657," and "their damnable opinions are vented up and down the country" a year or two later. Our author cannot help noting in his preface that the greatest enemies his Society had to contend with in early days were Nonconformist ministers, not the clergy of the Church of England, covetous hirelings and diviners for money though they were called. John Faldo's book, with the promising heading "Quakerism no Christianity," received the countenance of Thomas Manton and of Richard Baxter, the latter (whose habitual incoherence of speech all that have been edified by his writings would be glad to forget if they could) carrying on the war upon his own account in a pamphlet called "The Quaker's Catechism . . . published for the sake of those who have not yet sinned unto Death" (1655). But, in truth, this whole volume is full of matter which cannot fail to grieve and shock those who would fain hold the Christian faith in quietness and charity. Reproaches the most unworthy, ribaldry the most profane, abuse of Scripture language hardly less than blasphemous, are here reprinted for no possible object that we can detect, with the sure consequence of bringing holy things into contempt, and of reviving evil passions long since at rest. It is with positive shame that we note the venerable name of Charles Leslie, the brilliant scholar, the cogent logician ("a reasoner who was not to be reasoned against," as Dr. Johnson characterized him), one of the few great men the Irish Church has produced, annexed to such a work as the following:—"The Snake in the Grass; or, Satan Transformed into an Angel of Light, Discovering the Deep and Unsuspected Subtlety which is couched under the Pretended Simplicity of many of the Principal Leaders of those People called Quakers" (1696). Of *Bibliotheca Anti-Quakeriana* we have probably said enough to convince the reader that its pages are not likely either to instruct or to amuse him, and we shall only point

* *Bibliotheca Anti-Quakeriana*; or, a Catalogue of Books adverse to the Society of Friends. Alphabetically arranged, with Biographical Notices of the Authors, together with the Answers which have been given to some of them by Friends and others. By Joseph Smith, Author of "A Descriptive Catalogue of Friends' Books." 2 vols. London: Joseph Smith, 5 Oxford Street, Whitechapel. 1872.

out one blunder, which cannot be imputed to the printer, inasmuch as it occurs twice or three times over in the book. Instead of "Francis Duke, of Westminster," the author of a treatise on the "Fulness and Freedom of Grace," considered with a view to predestination, we are introduced to "Francis, Duke of Westminster." Friends are not quite at home with titles of honour, but Joseph Smith might have known that a Duke of Shoreditch has been heard of, a Duke of Westminster never.

We have before us, among other little books written in the same tone, and evidently intended for general circulation, *A Memoir of the Life, Travels, and Gospel Labours of George Fox, an eminent Minister of the Society of Friends*, issued in 1867 from the Friends' Book and Tract Depository in Bishopsgate Without, and thus comprising, though anonymous, what as closely approximates to an authorized exposition of their creed and practice as this strange communion has ever submitted to the outward world. George Fox (1624-1690), whom the Memoir terms nothing more than "an eminent minister" of the Society, is well known to have been its originator; the first minister, "himself excepted" (Memoir, p. 91), being a woman, Elizabeth Hooton. An interesting parallel might be instituted between Quakerism and Methodism in their rise and progress, only that the former has fully entered upon its period of decadence, which in the latter is only just commencing. Between the two men, George Fox and John Wesley, there is no small likeness, set off by sharp and striking points of contrast; indeed, as we read many pages together of the Memoir we are forcibly reminded of Mr. Tyerman's *Life of Wesley*, only that the Friends write the better English, and in a milder and more restrained spirit. Wesley was the son of an eminent clergyman, poor indeed but not ill benefited, himself well read rather than learned, possessed of more than average culture in a not very polished era. Fox's father was a humble weaver, known by the honourable name of "Righteous Christer" (Christopher), in consequence of the strictness of his life. Yet the Society instituted by the Oxford Fellow has never been able to assimilate itself to the tastes of any class much above that of small shopkeepers, until within the last few years, and even now only to a very limited extent; the weaver's son won over early, and retained to the last, the zealous affection of Robert Barclay the Apologist, and of that gallant and true gentleman, William Penn. The consequence is that, while glorious John stands forth among the Methodists as their only great man, the reputation of Fox has been thrown comparatively into the shade, and Friends, as in this Memoir, are ready to withhold from him the name of Founder, which, as an historical fact, they are forced to concede to him. Be this as it may, that solid respectability which has ever cleaved to the Quakers in popular estimation is not more decidedly characteristic of this people than the far more intrinsically valuable qualities of simple refinement and intellectual curiosity, which none who have had much intercourse with them can fail to have been impressed with; a title of which has been repeatedly found to be an infallible recipe for severing any lay Methodist who may possess them from a connexion wherein they can find no fit place.

William Penn's answer to the natural question "What is Quakerism?" was a very simple one; it was, he said, "a new nickname for old Christianity," or "Primitive Christianity revived." Since we outsiders can hardly be expected to acquiesce in a definition which assumes against us the whole point at issue, we must needs look a little further into the matter, drawing our information, as in justice we are bound to do, mainly from the statements of those who profess that faith. "The perceptible influences of the Holy Spirit in the mind of man," says our Memoir of George Fox, "was a fundamental doctrine with him; and it is only by a belief in the same doctrine, and a humble submission to its operations in the soul, that we of the present day can sincerely embrace and practically maintain those religious principles which, through the faithfulness and sufferings of our worthy forefathers, have been transmitted to us" (p. 89). Here again the Methodist line of thought coincides for a brief space with that of the mystic Quaker, before it is diverted elsewhere by the healthful common sense of Wesley. Every follower of the latter, when admitted into full connexion, is bound to believe that conversion from the dominion of sin to the spiritual life is an act or state of feeling usually instantaneous, always sensible to the inward experience of the receiver of the mighty gift. But what with the disciple of John Wesley is a theoretical article of his belief, held languidly and loosely enough by the ordinary members of the body, comprises the very sum and substance of a Friend's Christianity, and the notion of a supernatural guidance vouchsafed to him above and beyond all other children of men is the groundwork of the whole superstructure of his ecclesiastical (or rather anti-ecclesiastical) system. He honours and regards the Holy Scriptures, but always in subordination to the inner light whereby they are spiritually discerned. A steepleside priest once ventured to call them "the word of God"; but George Fox told him "they are the words of God, but not the Word, which is Christ" (p. 110), and he meant thereby a great deal more than a poor play on terms of speech. Certainly the Friends' claim to special inspiration enables them to interpret the sacred oracles now with servile bondage to the letter, now with a license of metaphor and allegory which far exceeds that whereby the school of Origen has attained its bad pre-eminence in fame. The Lord and his Apostle bade us "swear not at all," and the Quaker refuses a solemn oath imposed on the gravest occasions by the civil power, though the example of his Master might seem to authorize his submission—as unwavering in his obedience to the

letter. The same Divine Teacher appoints that all the nations should be baptized, and that His people should perform a solemn act in remembrance of Him, "showing forth the Lord's death till He come." To the Friends the Sacraments are but carnal ordinances long since superseded, and never permitted save in tenderness to the people, who had been used to such baptisms as John practised, and "did use to take a cup, and to break bread and divide it among them in their feasts, as may be seen in the Jewish Antiquities; so that the breaking of bread and drinking of wine were Jewish rites, which were not to last always" (p. 131). Expositions like these possess one of the advantages which the author of *Indubitan* imputed to nonsense—namely, that it cannot be refuted, as being in its essence neither true nor false. Deny the spiritual illumination of him who propounds them, and the whole fabric vanishes at once into thin air; admit it, and we must patiently take the consequences, without knowing in the least beforehand what these will be. George Fox was far more successful when dogmatizing in this lofty fashion than when he came to fence with the language of Holy Writ in such poor quibbles as the following:—

But as to the matter, Christ said "Do this in remembrance of me." He did not tell them how oft they should do it, or how long; neither did He enjoin them to do it always as long as they lived, or that all believers in Him should do it to the world's end. The Apostle Paul, who was not converted till after Christ's death, tells the Corinthians that he had received of the Lord that which he delivered unto them concerning this matter; and he relates Christ's words concerning the cup, thus: "This do ye, as oft as ye drink it, in remembrance of me;" and himself adds, "For as oft as ye do eat this bread and drink this cup ye do show the Lord's death till He come." So according to what the Apostle here delivers, neither Christ nor he did enjoin people to do this always, but leaves it to their liberty, ("As oft as ye drink it," &c.).—P. 131.

It may be doubted whether even the prophetic writings of Dr. Cumming contain a finer example than this of the noble art of forcing any form of words to bear any sense that men may like to put upon it.

If the Quakers recognize no Sacraments, we may readily conclude that they reject with scorn the constitution of a settled ministry, and the notion of the Church as a corporate body. Their own Society, whose complex arrangement of meetings for despatch of business and exercise of discipline, whether yearly (first held at Balby, near Doncaster, in 1656, but regularly in London every year since 1672), or quarterly, or monthly, exists pretty much as Fox appointed it, may no doubt vary these meetings at pleasure or convenience without infringing any principle of the sect. To the quarterly meeting it specially appertains to look after the morals of the members—who, to give them their due, are willing to submit to a scrutiny of their private lives more thorough than any that Wesley was able to carry out—to sanction the proposed marriages of Friends, to "read out" unworthy persons, especially those who have unevenly yoked themselves with unbelievers. This last function must have been pretty frequently called into action of late years, though it is usually anticipated by the voluntary withdrawal of such as intend to transgress. In their assemblies for religious purposes (one can hardly say for worship), the most painful novelty which strikes a stranger is the absence of all provision for public prayer. There is often solemn silence for a space, there is much grave exhortation, hopeful encouragement, and earnest warning, in a strain seldom perhaps rising to eloquence, as rarely subsiding into commonplace; but there appears to be rarely any direct or express address to the Almighty. Indeed those who have been admitted into the family circle of the most pious Friends, or who have watched, so far as good manners will allow, their demeanour before meals, can scarcely help doubting whether they pray at all; whether the habit of devout meditation and spiritual self-communion has not superseded with them the Christian rule of making our requests known unto God.

Far below these essential principles of the Quaker creed we place those *bizarre* fashions and gentle absurdities by which from George Fox's time the Friends have been vulgarly known. Such are their silly dislike for the common names of the months and days of the week, their affected use of the second person singular of the personal pronoun (usually with the pleasant variation of *Thou* in the place of *Thou*), and other social or anti-social observances too familiar to need detail. That these things are deemed of minor importance in themselves, still as they were once insisted upon, may be inferred from the fact that the younger people of the present day have largely dispensed with them, if not by direct permission, at least without authoritative rebuke. From this singular community, however, we have already learnt much, and might with advantage learn more. Their care first for their own poor, and then for "the world's poor" (Memoir, p. 225), was early conspicuous. What Friends have done for sufferers in goals and dungeons will never be fully known before the day when all things shall be revealed; their simplicity, or, we should rather say, their pure taste, in regard to female dress, might be imitated by their mundane sisters to the comfort of us all; even their abstinence from outward emblems of mourning is surely in accordance with the Christian notion of what death is; their abhorrence of oaths has removed from the Statute-book many an obligation to take one on slight causes, though it has left somewhat more to be done in the same direction. In a word, your true Quaker may sometimes provoke us by his hardness, or excite a smile by his eccentricities, but he is usually a man of public spirit, upright and sincere, claiming men's respect if they cannot share his convictions.

And for his hardness and obstinacy to English sectarianism can plead no good excuse, for none has been persecuted with the same relentless bigotry as he. When George Fox, at the age of twenty-

three, began his ministry in 1647, the result of the civil wars had left Presbyterianism in the ascendant, and he soon tasted of the tender mercies of old Priest writ large. At Nottingham, in 1648, "where he entered the place of public worship on a First-day morning and spoke to the people," he was thrust into a filthy prison for his pains; at Mansfield Woodhouse, in 1649, on the same provocation, "they fell upon him and cruelly beat him with their hands, Bibles, and sticks," put him in the stocks, and finally stoned him out of the town, injuring him so that he could scarcely walk. This habit of entering the churches and interrupting the public services sorely exercises the spirit of his admirers in the Memoir, who make an excuse for it which we fear is not quite true to the facts:—

Whether the practice of going into the places of worship and addressing the Assembly was at all times warrantable, it would be difficult at this day to decide. That it was not uncommon is evident, and the peculiar circumstances of the times furnish reasons in defence of it which do not now exist. It was by no means peculiar to our Society, and in most cases where Friends did it, there is reason to believe that they waited until the stated preacher had done, before they attempted to speak."—Memoir p. 98, note.

There is yet better reason to believe the direct contrary. At any rate Fox had much to endure, and bore it manfully and patiently. At Derby in 1650, for the crime of preaching only, he had to spend six months in the House of Correction, and another six among felons in the common goal; the committing magistrate, Justice Gervas Bennet, stooping to the enormity of striking the prisoner, first giving him the name of "Quaker," because George Fox had bidden him "tremble at the word of the Lord" (p. 103). Here too, as at so many points, we have a parallel with Methodism, itself originally a nickname, adopted in proud humility by the people on whom it was laid. His worst adventure was at Tickhill, near Doncaster, in 1652, where, going as was his wont to the "public-worship house" there, "the clerk struck him on the face with a Bible, so that the blood gushed out on the floor of the house;" (p. 107), and the congregation beat him, knocked him down, and threw him over a hedge. His Cornish campaign in 1655 was a more troubled one than even John Wesley's first in that barbarous region; and in the case of both partly for the same honourable cause, their lifting up their voices loud against the native sin of "wrecking" (p. 153). At Redruth the zeal of a Friend who persisted in addressing the people in the "steeple-house" (p. 119) got him into difficulty. From St. Ives he was sent to Launceston goal, and, refusing when arraigned to doff his hat to the Judge at the Assizes, he was thrust "into a hole called Doomsdale, which was so filthy, damp, and unwholesome, that few who went into it came out alive" (p. 121). From the mire and water of this dungeon, like another Jeremiah, George came forth to bear fresh testimony to the truth as he held it. His sincerity and plain-speaking had already won the esteem of Oliver Cromwell, who indeed was rather fond of vexing the Presbyterian ministers by talk about Eldad and Medad; yet the Protector's countenance seems to have availed but little. Seven hundred Friends were languishing in different prisons when Charles II. was proclaimed king, and one of his first acts was to set them all free. By this time Fox had spent three years of his life in prison, and his marriage with a reputable widow of mature age in 1669 put him at ease in his worldly affairs. The fire of persecution abated after the Restoration, though it was not wholly extinguished. Friends had even the satisfaction of obtaining in courts of law a formal recognition of the validity of marriages celebrated in their meetings between Friends (p. 181), being the only religious body without the Church which obtained that privilege for many a year. Fox's latter days were clouded chiefly by sorrows which seem but the righteous inheritance of such as he, the schisms and divisions which sprang up among his people. These he put down with a high hand, sometimes with an energy of expression which might do credit to a Hildebrand:—

Whoever is tainted with this spirit of John Perrot, it will perish. Mark theirs and his end, that are turned into those outward things and janglings about them, and that which is not savoury; all which is for perpetual judgment, and is to be swept and cleansed out of the camp of God's elect. This is to that spirit that is gone into jangling about that which is below (the rotten principle of the old Ranters), and gone from the invisible power of God, in which is the everlasting fellowship. And so many are become like the corn on the houstop. . . . (P. 180.)

The reader will easily supply the rest.

Forty years ago Coleridge, in his grand style, compared modern Quakerism to "one of those gigantic trees which are seen in the forests of North America, apparently flourishing and preserving all its greatest stretch and spread of branches; but when you cut through an enormously thick and gnarled bark, you find the whole inside hollow and rotten." The bark is now fast peeling off, and the inevitable fall must come soon, for the tree began to rot from its heart. These who have left the Society since Coleridge spoke are not the vain or frivolous of its *jeunesse dorée* (their revolt may be delayed for a while by the recent indulgences which have been held out to them), but the grave, the thoughtful, the cultivated, the conscientious. These men have ceased to believe in the fundamental doctrine of Quakerism, and have had firmness and honesty enough to endure the wrench of formal separation from their former associations and habits. They are a fatal loss to the communion which they are constrained to leave; they are a valued gain to the Church of England, which, and not the Nonconformists, are a rigid Quaker with much complacency since, as we observe, the departure from his body almost invariably proves

MY DIARY DURING THE LAST GREAT WAR.*

"I WOULD not choose, says a French philosopher"—we are quoting from the *Citizen of the World*—"I would not choose to see an old post pulled up with which I had been long acquainted." Much the same unwillingness should we feel to see our old friend the great Special Correspondent ever laid aside. We have been so long acquainted with him, we have derived so much amusement from him, that we could far better spare a better man. Who can hear a rumour of a coming war, who can read how armies are being placed on a war footing, and ammunition trains formed, without saying to himself with satisfaction, Now is Mr. Russell's servant busy in looking up his master's big boots, and now is Mr. Russell himself still busier in looking up his yet bigger words. To be sure, for anything we know, it may be that Mr. Russell's boots and his words are as great in time of peace as in time of war, and that

Wars like mists that rise against the sun,
Make him but greater seen, not greater grown.

Still we always picture to ourselves that he as well as the combatants has to put himself upon a war footing, and to get into training. Indeed in the work now before us his wind, if we may venture to use the expression, seems at first a little short. It improves with exercise; but it is not till he is through nearly one half of the book and has reached Versailles, that he warms up to the kings, and princes, and grand-dukes with whom he is hand and glove, and with ease becomes a man

Rexes atque tyrannos,
Omnia magna loquens.

We cannot but regret that the plan on which he has written his book does not allow him to repeat the description of that grand dinner at Versailles which may still live in the memory of our readers, when the princes and generals of Germany met their newly-made Emperor and Mr. Russell. This work, however, is no mere republication of those letters to the *Times* which were as long as the last great war was short. We have here what is pleasantly called "a condensation of the matter which has appeared in the columns of the *Army and Navy Gazette* during the last two years." These five hundred and eighty pages may indeed be a condensation, just as we believe the Shorter Scotch Catechism is not, as has been supposed, the longest Catechism in the world. But the specific gravity of Mr. Russell when most condensed would be found to be equal to that of an ordinary writer when most expanded. While the history of the famous dinner is omitted, we are glad to find, given in the most uncondensed form possible, a full account of the memorable controversy between Mr. Russell on the one part and Count Bismarck on the other. The *Times* has already complimented its Special Correspondent on the part he played and the victory he gained, and Mr. Russell may fairly claim to be *le vainqueur du vainqueur de la terre*. When, indeed, we consider the compliments that have been paid him, the learned University that has conferred upon him its degree, the foreigner he has overcome, the literary staff over which he presides, and the hearty relish which he shows throughout all this work for his meals, we are again reminded of the *Citizen of the World*, and of the great man there described:—"The learned Societies invite him to become a member; he disputes with some foreigner with a long name, conquers in the controversy, is complimented by several authors of gravity and importance, is excessively fond of egg-sauce with his pig, becomes president of a literary club, and dies in the meridian of his glory."

Where are we to begin our condensation of such a work as this Diary, which embraces everything from the author's appetite to the battle of Sedan, and from the Crown Prince's white breeches to the fall of Paris? Mr. Russell may be likened to an elephant which with its trunk can raise either a cannon or a pin, or to Nasmyth's steam-hammer which can crack a nut as accurately as it can beat out a huge bar of iron. Perhaps he is greatest when telling of great men doing little things. Of the battle of Sedan and of the siege of Paris we have but a somewhat hazy view in these pages, but of Bismarck, whether "whiffing a cigar" at Bar-le-Duc, or "pulling a cigar" at Rheims, or "lighting his cigar while waiting for his cloak" at Versailles, whether offering Mr. Russell a cigar, or apologising a moment after for not giving him a light at the same time, we have a very striking picture before us. Still more strikingly drawn is the Crown Prince, for whom indeed, as for the elephant and Mr. Russell, nothing is too big, nothing too small. On one occasion indeed, when our Special Correspondent cannot find his lodgings, he does admit that "the Crown Prince cannot attend to small matters. He takes it for granted that those who accompany him are properly attended to or can shift for themselves." We scarcely know, by the way, at which to wonder most—the condensation of Mr. Russell in admitting that the question where he is to lay his head is a small matter, or his obligingness in so carefully explaining to his reader that the Crown Prince does not generally discharge the duties of a quartermaster even when there is a Special Correspondent from the *Times* on his staff. And yet it would not have surprised us if his Royal Highness had really settled whether Mr. Russell should sleep at the butler's or the chandler's, in the front room or the back. For when, on the very day on which the battle of Worth was fought, he joined for the first time the Head-Quarters, he found that he had been expected, and was "to breakfast with the Crown Prince at 12 o'clock."

* *My Diary during the Last Great War*. By W. H. Russell, Author of the "British Expedition to the Crimea," "My Diary in India," &c. London and New York: Routledge & Sons. 1874.

Again, on the day of Sedan, he is roused up by "a knocking at the door," and a rough voice calling out, "The Crown Prince has sent to tell you to come to the battle"; while at the close of the fighting on the next day "a Jäger," we read, "came into my room flushed and bright-eyed, and said, 'The day is ended. The Crown Prince is coming, and you are bidden to dine with him to-night. (God be praised!'" Whether, by the way, the pious "Jäger" praises God because the day is ended, or because the Crown Prince is coming, or because Mr. Russell is going to have a dinner, is not left so clear as might be wished. Perhaps he knew that with the dinner there would be some of the Emperor Napoleon's champagne, or, rather, some champagne which had been intended for the Emperor but had been captured by the Prussian hussars, and so thought that there was need of some extra devoutness. The courtesy of the Crown Prince is repaid to the full by Mr. Russell, who never wears of painting him. The day after the battle of Worth.

His Royal Highness, dressed in flat cap, plain frock, with the Order of Merit and general's badges, white breeches, and heavy riding boots above the knee, came in and gave Lord Ronald and myself a most gracious reception.

The next day, August 8, "at 8.15, the Crown Prince, wearing his flat cap and a black waterproof with military brass buttons, heavy jack-boots and spurs, walked out of the château." A too hasty reasoner might infer that on this occasion the exigencies of warfare had not given the Prince time to put on his breeches, as no mention is made of them. Of the improbability, however, of such a supposition we are warned on August 15, when we read that "his Highness generally wears white breeches and heavy jack-boots." The battle of Sedan, we may add, he gazed at "with his arms folded," and wearing "his flat cap, uniform frock, and jack-boots"; while in the same flat cap and the same boots, unless indeed his Highness has a change or two, he distributed the Iron Cross at Versailles. The King of Prussia, by the way, wears Wellington boots, while the Duke of Coburg and Bismarck wear "white cords or leathers, and heavy jack-boots." What a picture we have for the artist of the Crown Prince in his breeches and boots, when, "as he put up his glass" to look at Paris, "there was, if I mistake not, a gleam of softer feeling than the conqueror's pride in his eye." Madame Tussaud with her clockwork model could alone do justice to him, as on another occasion, "with his arms folded, listening attentively" to the reading of a despatch, "he shook his head slowly." Into the picture of the model should be introduced "the pipe with a porcelain bowl, on which were the Royal Arms of Prussia, painted, it was said, by the fair hand of the Crown Princess." We are glad to say that Mr. Russell finds time to tell us a good deal about himself as well as about the great people and their boots, and the million or so of soldiers and their battles, whom he was especially engaged to write of. He thus gives a graphic account of the sufferings of the wounded and the dying, and of the uncomfortable bed he himself had on the night after the battle of Worth:—

August 7.—The events of last night were too horrible. The wounded men in the room below died almost as fast as they were carried in. Their bodies were taken out from the bloody straw, only to be succeeded by those of men scarcely living. The sounds came up through the thin floor. Soldiers were going round knocking at the door, asking for bread and quarters. Then, in the middle of the night, there came great convoys, and the tramp of troops over the stony street. Sleep was difficult under such circumstances, hardened as I am; and my couch was curved, so that whether I lay in it or on it, I was obliged to look at my feet high in air above my head, my body being bent as if I were a fish tied up head and tail to accommodate the pot in which it was to be boiled.

It is some consolation to learn that on the next day he dined with the Crown Prince, that after dinner "cigars and coffee were brought in," and that in the sight of the porcelain pipe, which he then saw, for the first time, he could forget the horrible spectacles which he had so lately seen. On the morrow, moreover, he "feasted sumptuously on *potage, bouillon*, roast veal, potatoes, and country wine." The diary that he wrote of the battle of Sedan was unfortunately lost. Let us be thankful that it was not the accounts of his bed and his meals, or of the boots and breeches of princes, that fell into the hands of the enemy.

Our readers must not carry away with them the notion that Mr. Russell has forgotten to tell us anything about the war. The first part of his work has undoubtedly a considerable amount of interest. While, half a million of men are fighting at Sedan he makes a nearer approach to forgetting his own existence than we had thought possible. But when he gets shut up in Versailles, then he feeds on himself and becomes very dull indeed. To quote his own words:—

I certainly never bargained for this. It is now three months and three weeks nearly since I arrived in Versailles, and except to make an excursion here and there, to go to St. Germain, St. Cloud, Sevres, St. Cyr, Villecoublay, Villeneuve St. Georges, or the environs, I have been a fixture.

But, though Mr. Russell was a fixture and had little to tell, yet there were a certain number of pages to be filled in telling it. "Each historian, as he," to quote Fielding, "do, in reality, very much resemble a newspaper, which consists of just the same number of words, whether there be any news in it or not. They may likewise be compared to a stage-coach, which performs constantly the same course, empty as well as full." Inspired by the memories of Bonnie the Great and by the presence of so many living princes, at times, like the German bands, he "bursts into a strident strain of triumph," but he too often falls back into what we may call a solo on a penny trumpet. He gives fifty lines

to describe the events of December 2, when, as he tell us, the fight was so severe and the losses so heavy that "General von Rannbach was crying like a child." Of these fifty lines twelve are given to a description of the great coat in which the great Special Correspondent viewed the fight.

Uninteresting as are these petty details, the reader's dissatisfaction is increased by the extraordinary inaccuracy which runs through them. On one occasion, indeed, we detect a gross error in a matter which is by no means potty. On September 14 Mr. Russell writes:—"The German horse have got within 120 miles of Paris, breaking up bands, and displaying the utmost boldness." Mr. Russell, when he wrote this, had with the Crown Prince's army passed through Rheims and Eprenay, and was himself at Montmirail, scarcely sixty miles from Paris. But it is in the scraps of Greek, Latin, French, and German, and the quotations, that he blunders the most terribly and the most needlessly. It was scarcely necessary, in order to bring home to his readers that the King of Prussia—King William the Conqueror, as he calls him—was "well lodged and entertained at the Prefecture of Versailles," to bring in Louis XIV., Xerxes, Alexander, Caesar, or "Napoleon at the Bridge of Lodi or Arcoli," much less to try to quote Greek, and to say "he was an *αυακ ανθρωπος*" (*sic*). We could quite as easily understand how Prussian Versailles had become, without being told that "the *genus* (*sic*) *loci* is certainly Prussian." We should like to know, by the way, why the name of the celebrated street in Berlin is written by Mr. Russell before the war Unter den Linden, and after the war Unter der Linden. Greek, Latin, and German, however, he quotes too sparingly to blunder much. But of French his pages are full, and of a French of which "Stratford atte Bow" or a modern schoolgirl might well be ashamed. "Some Paris papers have arrived," he writes, "which were read with interest. One contained a poem—'Asses d'azur.'" What these azure asses could be we were at a loss to guess. By that time the besieged Parisians had not begun to eat the strange animals of the menageries, and so the poet could scarcely be writing of them. In a few lines Mr. Russell kindly furnishes us with a translation. "Asses d'azur" is the poetical French for "enough of blue." We cannot quote one tenth part of his errors, but the following instances will suffice to show how inaccurate he is:—"Ils n'ont pas osés," "In the evening all the *bourgeois* cowering inside their houses," "bon compagnie," "café-billiard," "franc-tireurs," "Le Ministre l'Intérieur du Seine-et-Oise," "Rue Boissy d'Anglais," "Prince of Wurtemberg," "Wurtembergers," "Wurtembergers" (this seems to be an unlucky word for Mr. Russell), and, lastly, "the ordinary line regiments; le petit perdre de rouge." Worse even than these is the blunder of the following line—"Generals Clément and Thomas were murdered after a fashion possible only in Paris and parts of Spain." What are we to think of the accuracy of a Special Correspondent who was in Paris on the very day when the unfortunate General Clément Thomas was murdered, who "met General Vinoy that forenoon returning from the official residence of M. Thiers, and never saw a man in greater dejection," and who yet can make such a blunder as this? If "the English press" was fairly represented by the author of *My Diary during the Late Great War*, we do not know that there would have been much to regret if it had suffered that "ostracism and paralysis" with which, as Mr. Russell tells us, it was threatened when hostilities first broke out.

TRUE TO LIFE.

THERE is a simplicity about this little story which quite disarms criticism. The author informs us in a dedicatory preface that her sister has been for years urging her to write a story, and that she has finally yielded from a conviction that what bores some people may be interesting to others. The statement, we fear, is not quite true; there are some books which bore everybody. We do not mean to place *True to Life* in this light; for we must admit that it has amused us. If, indeed, we were required to analyse the sources of our amusement, and to say whether the literary merits of the book or the unconscious revelation of the author's character was the cause of our rather gentle amusement, we could not give an entirely satisfactory reply. Indeed, to say the truth at once, the book does not rise to the point at which criticism fairly begins. But for the statement that the author has been asked to write for "many years," we should have attributed it to a very youthful performer indeed. We will not, therefore, be so cruel as to expose it to any of the tests by which we judge works of any pretension; we will not ask whether the characters are good, or the story well told, or the sentiments vigorously expressed; but we will confine ourselves to a brief study of the state of mind indicated by the writings of which this is a specimen. We are quite unable indeed to understand why anybody should publish a book who is compelled, for example, to fill a page by the simple expedient of copying the ordinary form of an invitation to dinner and the reply to it; but there is a kind of interest in endeavouring for once to look at the world as it presents itself to a benevolent young lady. In one of his essays Thackeray describes a scene at a play where the rich uncle turns up at the right moment and puts everything straight by a lavish distribution of funds, and he adds that, if he had once wished the theatre to be like life, he now wished that life might be a little more like the theatre. Some such reflection occurs to us as we read *True to Life*.

We are tempted at moments to wish that the title was appropriate. Perhaps, for example, we have been reading a revolutionary article showing that the world will never be well off till the last king, in the picturesque old phrase, is strangled with the bowels of the last priest; or a reactionary article showing that our only hope is in laying aside our intellects and bowing before an infallible Pope; or a declaration from a follower of Mr. Carlyle that we are shooting Niagara, and going headlong into chaos; or the assurance of a cynic that everything always is and always will be wrong, and that we may as well content ourselves with that conclusion; and we have felt ourselves rather puzzled by the confused hubbub of contradictory cries which arises on all sides of us. Is it not pleasant, after some such experience, to retire into a land where none of these lamentations have hitherto penetrated; where everybody is good and amiable and contented; and where the existence of anything wrong in the world is only indicated by some rudimentary attempts at satire, suggested by the contempt felt by deans for minor canons?

In that charming country all things are seen through a rose-coloured atmosphere, or, to use language more appropriate to the occasion, everything is what young ladies call emphatically "nice." There are a few poor people, but they exist only in order to provide their richer neighbours with opportunities for indulging in a little picturesque charity. They are always affected to tears by any misfortune which happens to the family of the clergyman, and they are able when the daughters of a former incumbent return after a long absence to set before them nice little refectories of buns and currant-wine. The centre of so agreeable a picture is of course the model country parson, and his most intimate friend is, equally of course, the model peer. These two persons respect each other with a warmth which is creditable to human nature, and their only rivalry is a rivalry in doing good. The clergyman is almost too nice for his own happiness. He is so admirable a creature that it becomes necessary for him to go through a death-bed scene. In the region of which we are speaking, indeed, death-bed scenes are not merely edifying, but almost agreeable. The principal performers have a little stock of phrases, some of which may possibly strike us as being somehow familiar, but which they discharge with admirable punctuality at the most appropriate moments. In the regions of the nice, there are no rough gravediggers to make heartless jokes after the fashion of *Hamlet*; no selfish relatives waiting in the background and covering a grim complacency under a mask of studied decorum; everybody is perfectly sincere and admirably considerate. The exemplary widow sheds a few natural tears, but dries them soon under the influence of judicious reflections administered by everybody in the neighbourhood, and of admirably composed epistles extracted, as we infer, from the Complete Letter-writer by the equally exemplary peer. When that nobleman invites her for the time to take up her abode in his elegant mansion in Belgrave Square, she is made quite happy by his delicate attentions and by the numerous letters of condolence which are piled upon her table. Perhaps this last touch is a little too strong. In this commonplace world we have seldom reason to be thankful for letters; and though young ladies regard letters in general as nice, even they, we should fancy, must make some exception in the case of letters of condolence. However this may be, a widow in this world of fiction has other consolations to fall back upon. Of course she has two lovely daughters, and each of the lovely daughters has her pick of several nice young men. There is, for example, the young lord who has lived with them like a brother from their infancy, and whose fraternal affection gradually deepens into a more tender sentiment. When he ventures to express his love to one of the charming girls, she has unfortunately—for it must be admitted that human arrangements will sometimes get themselves into a mess in the nicest of worlds—taken the opportunity of falling in love with another still nicer young gentleman, who is on his way to Australia. But we may be pretty certain that everything will come right in the end. No novelist, even though he belonged to a much sterner variety of his race than the author of *True to Life*, could keep his heroine in England and send his hero permanently to Australia. The trip to the colonies, in fact, is at once perceived to be merely an expedient for showing how independent and vigorous that excellent young gentleman would have been if he had only had the chance. But no lasting troubles can happen to him in a state of things so carefully arranged for his convenience. A gentleman who had left him a large property has indeed perversely managed matters in such a way that the will by which it comes to him is carefully hidden away in a drawer, of which no living person knows the secret. Such an occurrence is in all novels a well-understood preliminary to the will turning up again just when it is wanted. Of course the drawer gets to Wardour Street, and is there bought by the very man who is interested in the will. Such an odd coincidence might seem suspicious in the world of reality. In the world of fiction it raises no doubt in anybody's mind, and the validity of the will thus oddly turning up is instantly recognized by all concerned. But even in the world of ordinary fiction, such an event generally causes a certain amount of ill-feeling. The wicked usurper who has been enjoying the property which did not rightfully belong to him is apt to be of a surly and grasping disposition, and gives rise to a good many troubles before the honest attorney and the incorruptible judge put everything straight a few pages before the final consummation. In this delightful region no such bad passions are admitted. The usurper has taken what did not belong to him

in spite of himself; he has always had a secret conviction that the charming hero ought to have inherited the money, and he has most carefully kept his accounts with a view to a final restitution. And thus, when the will is discovered, far from being annoyed at the change in his prospects, he is delighted at getting rid of a burden to which he was not born, and which, as the poet observes, had been weighing upon him night and morn.

Of course, too, there is an equally nice clergyman for the other sister; and there is a bishop so amiable that he accepts a volume of sermons published by a Unitarian, though he is excusably annoyed when his name is by mistake put down as a subscriber; he has his reward indeed, for the good peer comes to stay with him, and wins the Dean's heart for ever by asking to be shown over the cathedral. When an accident happens in this well-regulated world, it only gives an opportunity for one of these excellent persons to perform an act of heroism; one admirable youth saves a child from being burnt to death, and another saves a shipwrecked crew; but, as a rule, everything happens in the most charming way conceivable; and the volume closes as with the sound of marriage-bells and with a general flavour of wedding-cake.

Is not this a world which it is pleasant to inhabit, even for a spare half-hour? Would it not be as preposterous as cruel to endeavour to compare it too closely with the realities of life, and to condemn it if it differed from them? We might as well say that the *Midsummer Night's Dream* is defective because we have never met Oberon and Titania in any modern forest. Literary criticism would be here entirely out of place; and we can only say that we wish we could be introduced in flesh and blood to a few of these model bishops, these nice young men, and these perfect young ladies. If we were then able to distribute patronage and fortunes at pleasure, and to prevent any one from falling ill till he was prepared for an edifying death-bed scene, things would be pretty nearly as comfortable as we could wish to have them. To whatever remarks of a different kind the author of *True to Life* may be fairly liable, we are content to say that she has obviously a very kind heart, and that, if everything disagreeable could be removed from the world by a simple exertion of the will, we are quite certain that she would put everything straight with surprising rapidity. Perhaps a world conformed to her scheme of things might be a trifle insipid; but it may be that our palates are vitiated.

THE ROD IN INDIA.*

THIS is, in every sense of the word, an Indian book. Its author is a member of the Madras Civil Service. The subject is rod-fishing, principally in the tract of country known as the Western Ghats. The work, though it may be had at four well-known publishers, either at the three Presidencies or in London, was originally published at Mangalore. And the specimen before us was actually bound by a local bookbinder at the same place. We have had abundance of works descriptive of other kinds of sport in India, and English gentlemen of wealth, leisure, and activity need be at no loss for guides to tell them how tigers can be shot on foot, on raised platforms, or from the backs of elephants; whether the art of spearing the wild hog is more difficult of attainment with a lance of eight feet or with one of six and a half; how many quail and black partridges may be reasonably expected in low scrub jungle, with a good line of beaters, on an afternoon in February on the banks of the Sone or the Nerbudda; and what analogies are to be discovered between snipe in a first-class Irish bog and the same birds in the rice-fields of the Gangetic Delta. But we know of no standard authority on Indian fishing; and though many Anglo-Indians are to be found who will defy the heats of April and May in pursuit of tigers, and who will swelter in an afternoon in September for a few couple of snipe, when no cloud obscures the sun and no breeze rustles the plantain leaves, the rod is less frequently handled than the rifle, the cricket-bat, or the spear. The reason of this is not far to seek. Blinding glare and furnace blasts are little heeded when the sportsman is constantly on the move on elephant or horseback. Fishing is obviously a stationary pursuit, and nothing is more trying and exhausting than rowing across a lake from the surface of which the sun's rays are refracted as from a mirror, or fishing in some deep and narrow gorge where the rocks are glowing like an oven, air is shut out, and the sand is literally burning under your feet. The capture of ordinary fish which abound in reservoirs, lakes, and streams gives little excitement, and demands no extraordinary skill. And the increased amount of work demanded of late years from the servants of Government of every grade and denomination leaves but little leisure for such a pursuit as angling. Men who have been boxed up in cantonments for eight months of hot weather and rains, and civilians who have been stifled in a crowded court-house or treasury for seven hours a day, prefer a stirring gallop to wading a stream with the chance of encountering an alligator, and a walk with a smoothbore or a rifle to casting a fly or spinning with an artificial bait. Nevertheless there is always a class of Englishmen interested in any kind of adventure, and Mr. Thomas was interested in holding that his devotion to the subject warranted him in writing a book.

Unfortunately the execution of the work is by no means on a par with the information evidently possessed by the author. The

* *The Rod in India; being Hints how to obtain Sport, with Remarks on the Natural History of Fish, Otters, &c., and Illustrations of Fish and Trout.* By Henry Sullivan Thomas, Madras Civil Service, F.R.S., and F.Z.S. London: Trübner & Co. 1873.

style is disfigured by slang. The anecdotes are marred in the telling by jokes of the feeblest quality; and readers or the fishes themselves are apostrophized after the fashion of the worst of contributors to a third-rate sporting periodical. Yet, of late years, residents in the East have been found to write on sporting subjects with the discernment and accuracy imparted by official training, and with the good taste of scholars and gentlemen. Perhaps one of the best works on Indian sporting was written, thirty years back, by a gentleman who had served in the very Presidency to which Mr. Thomas belongs. If Mr. Thomas could not excel or equal the animation and liveliness which characterize the pages of the *Old Forest Ranger*, his service in South Canara might at least have taught him to avoid slang which would be out of place in the mouth of a girl of the period, and jokes which would hardly excite a smile in the dulllest circle of subalterns devoted to billiards, botching, and "poga." Quotations from modern poets and ancient classics are Mr. Thomas's snare. In two lines taken from Ovid there is an omission and a false quantity which in old days might have brought an Etonian in unpleasant conference with Dr. Keate. In another place Virgil is quoted in the same line with Horace, so as to induce a suspicion that the author believed himself to be citing one continuous passage. And the Virgilian and trite phrase of *facilis descensus* is actually given as *facile est descensus*. In a third passage the author, while describing a certain fishing locality in South Canara, warns his reader that if he fishes late, he must be on the look-out for tigers; and then adds, "reddas incolu-nem, precor." What he really meant to say in his Latin was evidently "redens incolumnis, precor." But then he must have had a regard for grammar and syntax, and he would have lost the point of Horace's prayer in behalf of Virgil. Another disfigurement in the book arises not from the style, but from the woodcuts. Mr. Thomas has been at considerable pains to give effect to his remarks and advice to anglers by what he considers to be graphic illustrations. For this end he seems to have compassed land and sea, to have dived into forgotten numbers of comic annuals, and even to have drawn on Arctic travellers for penguins and whales. In many instances the woodcuts illustrate no one phase of Indian adventure, native custom, or tropical scenery. They are merely dragged in by the head and shoulders to point the moral of the chapters, and are set off by such facetious remarks as "A cool fish, sometimes met," "A land lubber," i.e. a hippopotamus, "Not to be caught with chaff," and so forth. Of real humour Mr. Thomas seems to have little or no sense. He has evidently taken quite seriously an account which appeared in the *Field* of a mahseer which weighed 200 lbs., and which was caught by the angler using his own body as a rod or windlass; and he warns his readers not to be misled by a tale which would have deceived no one but the typical country clergyman who did not understand why the celebrated "Addresses" should have been "Rejected." We will venture to say, too, that no one with the smallest appreciation of *ῥο αἰσχυρὸν ἀνευ λόγου* would ever have put the three following names in juxtaposition. Mr. Thomas informs us that he is quoting from his own Report on Pisciculture, addressed to the Madras Government:—"Long before the commencement of pisciculture as a science, Aristotle, and subsequently Mr. Yarrell, and Sir J. Emerson Tennent, had observed that the impregnated ova of the fish of one rainy season," &c.

We have done with criticism on style and manner, and turn to the gist of the book. In spite of all its annoying defects of slang, and style, and feeble witticism, there is a good deal that is novel and suggestive in the volume. Details are given in regard to at least three kinds of Indian fish, which will repay the attention of fishermen and naturalists. First in size, character, and attractiveness to the angler, comes the mahseer. Mr. Thomas is no doubt correct when he talks of this fish as of the genus carp. But whether rushing away from the angler at railroad speed, or dressed for dinner, the mahseer practically has no resemblance to that fish. It is not found in ponds. It grows to an enormous size; for we see no reason to doubt the fact that a mahseer above 100 lbs. in weight was really hooked and landed in the Deyrah Dhoon only last year, by Mr. Ross of the Bengal Civil Service, a brother of the champion shot of England. The Indian fish that bears the closest resemblance to the English or European carp is the *rohita* or *rohi*, which is often caught of the weight of 20 or 25 lbs. The mahseer, for the purposes of sport or food, is the salmon of India. But a counterpart of the inhabitant of the Spey or the Findhorn is not to be looked for. It is found in all three Presidencies, and includes several varieties. It migrates from the lower to the upper waters of Indian rivers during the rainy season, but never descends to the sea like trout or salmon. Mr. Thomas, from minute and careful examination, concludes that the mahseer lays its ova in batches, and makes at least three distinct deposits, "dropping gently downwards with the continually decreasing waters." Consequently the mahseer rarely becomes lank and emaciated like spent salmon. Its food consists of rice, aquatic weeds, small fish, beetles and earth-worms, flies and grasshoppers, snails and crabs. General and acknowledged rules for the guidance of all fly-fishers must, in India, be subject to modifications. That an angler should study the habits of his fish; that he should keep out of sight; that he should combine wariness, patience, and dexterity of hand; that he should go to the river-side prepared to exchange one fly for another, and any flies for the artificial or the live bait—these and similar cautions, well known to fishermen in Irish and Scotch waters, are equally applicable to the comparatively unexplored rivers in India. But the mahseer must be studied from the

Asiatic point of view, just as the land revenue and the salt taxes, or whatever in social and religious feelings appears strange and abhorrent to European ideas. The best time for fishing is not when the waters are discoloured, but when they are clear. The rains are too violent, the waters too muddy and turbulent, for the fish to feed at such times. The strength of the mahseer, according to Mr. Thomas, lies in his throat, by which he can exert a marvellous amount of compression on hard foreign substances. Hooks and "spoons" are literally crushed by the enormous power which nature has bestowed on the muscles of the back jaw. Then the mahseer has by no means the endurance which enables the salmon to make a long running fight. His first rush is tremendous; but just as the violent impulses of the Asiatic are not to be compared with the dogged perseverance of the Englishman, so does the giant of the Oavery or the Toombuddra try the angler less than a salmon of smaller size in the Tweed or Tay. We are bound to admit that a writer in the *Field*, whom Mr. Thomas quotes in his appendix, inclines to the opinion that the mahseer "for gameness and vigour" is superior to the salmon. But whether the mahseer be wholly or half Oriental in his ways, those who like grand scenery and who are proof against violent alternations of heat and cold, would be amply repaid by a month's fishing in March and April along streams where there are no water-bailiffs, and no exasperating restrictions, and on which no usurious landlord has set a deterrent price.

Mr. Thomas has also some valuable information about other fish, of the very names of which even Anglo-Indians may be ignorant. The murrel, or, according to the pedantic spelling lately enforced by the Government of India, the mairai, is the Indian pike. He has the formidable teeth of this fish, and is given to basking near the top of the water, or to concealing himself in holes under the bank, on the look-out for frogs or other prey. Natives fish for murrel with contrivances clumsy and coarse, but in reality effectual and deadly. A frog is hooked on to the barb and dropped as a bait from an overhanging bough, on the very surface of the water; or the line is made fast to three pieces of bamboo stuck into the mud on the shore. No play is allowed; wire or gimp takes the place of gut; the murrel, when hooked, is hauled out by main force. Then we have a brief notice of a species called "Hyder's fish," because native tradition holds that this sort was introduced by the celebrated ruler of Mysore into ponds at Cundapoor, to serve as a luxury for the table. According to Dr. Day, the present Inspector-General of Indian Fisheries, and no mean authority, the fish originally belonged to the sea, but it has been acclimatized to fresh or brackish water. There is a curious account of its capture written by Dr. Buchanan many years ago and quoted by Mr. Thomas. The shoal is driven by drag-nets across the pond, and forced to leap in the air, and so to fall into a set of other nets spread out above the water by natives standing in rows of small canoes. Much useful advice is given by Mr. Thomas concerning fishing gear, the preservation of hooks, and the preparation of flies. The sore trial of anglers and sportsmen in India is the effect of the climate. Nothing seems proof against a temperature which at one time warps ivory, and at another resembles a hot-house or stifling conservatory thoroughly watered on an English summer's day. The rainfall on the Western coast, from which date all the author's experiences, reaches to 130 inches in the year; and though that of Murree and the Doon and Northern India is generally, in round numbers, not much more than half this amount, yet there is always something in every Indian variety of climate hostile to articles of European make. Hooks rust; swivels eat into the gut to which they are tied; the gut and the silk shrink or slacken; and every kind of implement which requires nicety of hand and artistic skill for its adjustment or preservation is liable to be ruined by mildew or spoilt by native servants. The best plan for an ardent fisherman is to have out his tackle fresh from England at the beginning of the cold weather, or else to be able himself to make use of indigenous materials, and to superintend native workmen, who occasionally display a power of imitation and a delicacy of touch absolutely marvellous.

We could have wished that the author had given us more detailed information as to other kinds of fish, and as to the native modes of catching and dressing them. We might have been spared some speculations as to the power of fish to communicate ideas to each other, and as to the suitability of a forked twig for carrying your catch when you have no basket. Surely every schoolboy who fishes for dace or gudgeon with a coarse line and a willow wand knows how to insert a twig through the gills of his captures. Fish, in the plains of India, are found everywhere during the rainy season. No tank can boast of pure waters without a due proportion of fish; and the first thing which is done by a pious and wealthy native who has excavated a vast reservoir for the population of three villages is to stock it with fry. No stream is without its dozen varieties, and tidal rivers, lakes of two to three feet in depth, and even flooded rice-fields seem alive with small fish, and even fish of half a pound weight, at particular seasons of the year. But nothing is proof against the recklessness and shortsightedness of the Hindu. Cruives and fish weirs of indigenous make are so artfully constructed, and with such intimate knowledge of levels and gradients and outfalls, as to give the shoals little or no chance. It has been found necessary to appoint Inspectors of fisheries, and to take into consideration the necessity for a close season, the various modes of capture, and the size and modes of the native nets. One of the most difficult tasks in Indian administration is to make natives understand that, prodigal as nature is of her bounties, she cannot hold out for ever against

wanton and indiscriminate waste. The forests of India, rich in timber, wax, caoutchouc, and other products, would ere this have disappeared before the fire and steel of squatters and cattle-feeders; many of the smaller kinds of game birds have already vanished from cultivated districts, leaving the crops to be preyed on by grubs, ants, and insects, the natural food of the genus francolin. And the extracts from Mr. Thomas's official writings show conclusively that the restraining hand of a powerful Government has not been put forth one day too soon in order to arrest the annihilation of one of the staple articles of village consumption.

In conclusion, we have only a few words more of advice to offer to Mr. Thomas. In place of illustrations drawn from tales fitted for the nursery and the schoolroom, let him adorn his next work with photographic views of celebrated scenes in Mysore, the plateau of the Nilgherries, or the stations of the Western coast. Artists, professional and even amateur, abound in India, who are quite capable of using either the camera or the pencil, and of enlivening a letterpress with scenes of the jungle and the bazaar. We could gladly exchange the woodcuts of a whale and a panther for a good view of the falls of the Gairsoppa, or for Ranoo and Toolai Dass destroying the fry as they wade in the rice-fields. Let him, we say, draw on his friends or on the professional artists who have photographed the most picturesque scenes in Upper or Central India; let him eschew slang, and avoid false quantities and used-up quotations, and in his next edition he may treat a novel subject in a manner not unworthy of one who has received a medal from the Acclimatization Society of Paris, and of a member of that Service which periodically either delights or terrifies a much-enduring and benevolent Government by a series of exhaustive and luminous Reports.

RATTIGAN'S ROMAN LAW OF PERSONS.*

WHILE the occupants of the Bench and the leaders of the Bar, faithful to the traditions of centuries, trouble themselves as little about the Pandects of Justinian as about the Institutes of Moen, a generation of students is being carefully drilled in the principles and history of the law of Rome. It is impossible to predict the precise result of so great a revolution in legal training; but it is worth while to point out that in the ordinary course of things the high places of the profession will some day be filled by men who have felt its influence. The Judges of the future will have commenced practice equipped not merely with such scraps of knowledge as they may have picked up in the chambers of conveyancers and special pleaders, but also with an acquaintance with that great and carefully reasoned system which is the foundation of all the law of the Continent, as well as of the law of our fellow-subjects north of the Tweed. It is a curiously fortunate coincidence that the fusion of Law and Equity, which will be the work of the next twenty years, will be carried on by men not wholly ignorant of the mode in which equitable pleas were grafted on the old civil law by the pretors, and of the history of the distinction between legal and equitable ownership which was at length put an end to by Justinian.

A reaction against the revival of Roman Law is of course possible; but of this there is no sign whatever, and, in the meantime, the new study is creating a literature of its own. The publication of books upon a subject on which till quite lately scarcely anything had been written in this country is going on at such a rate that it is difficult to keep pace with the new arrivals. They are, indeed, of very unequal degrees of merit. Produced in the first fervour of the study, and often by young men who have made a somewhat rapid transition from the position of learners to that of teachers, they can hardly be expected to reach a standard of excellence which is habitually attained by works of the same class in countries where Roman Law has attracted the exclusive devotion of mature minds for many generations. So inevitably indeed must this be the case, that we incline to think that the study would, for some time to come, be better promoted by translations of the best Continental text-books than by original authorship. It is true that most of these works assume some familiarity with a terminology and method which, though traditional in France and Germany, are strange to the English student; but this is a difficulty which may be removed by judicious annotation and intelligent oral teaching.

Mr. Rattigan has ventured on the bolder course of writing a book of his own; the binding and red-letter decoration of which give it a family likeness to a series of recent works upon various branches of the civil law by Dr. Tomkins and Messrs. Jenken and Lomax, with which it seems however to have only this superficial connexion. It would be an easier task than it is to estimate Mr. Rattigan's achievement if he had told us more precisely what rank his "Law of Persons" is meant to occupy in the hierarchy of books. The materials for the work were, we are told, collected "while the author was preparing for the Honours Examination of Trinity Term 1872." What was the result of that examination we do not know; but if Mr. Rattigan bestowed anything like the same care upon the other subjects in which he must have offered himself as he gave to one branch of Roman Law, his name should have headed the class-list.

The work before us was, therefore, originally a note-book compiled by the author for his own assistance. It is now published, as the title-page informs us, for the use of other students preparing for examination. They will find it a trustworthy guide for the purpose; but the author, if one may judge from his elaborate repudiation of any claim to have made new discoveries in Roman Law, and from an imposing list of authorities cited, seems inclined to rate his work somewhat higher. It is, however, just what he has honestly told us it is—a very carefully revised edition of the notes made in the course of his own reading. As such it deserves the praise of being a convenient and creditably accurate hand-book upon the subject of which it treats; we should therefore have been glad had Mr. Rattigan avoided the apparent ostentation of wide original research which is implied by his long list of writers consulted, and not unfrequently by passages in the body of the work. For instance, with reference to a master's power over his slave, we get the following note, which might seem to condense into three lines the result of an independent examination of the works of at least three jurists:—"This law is ascribed by Hæubold and Hugo to the latter part of the reign of Augustus (764 A.U.C.), but Hotoman and others refer it to the year 814 A.U.C., in the reign of Nero." Any one who has some acquaintance with the literature of the subject, gets to know the ring of this sort of erudition, and, turning instinctively to Ortolan, finds:—"Cette loi est placée par M. Hæubold et Hugo dans les dernières années du règne d'Auguste (an 764 de R.), quoique Hotoman et d'autres auteurs l'aient rapportée à l'an 814, sous Néron." So when a commonplace reference to Blackstone is followed by more recondite citations from Coke, Glauville, and Porteus, one at once concludes that, given the reference to Blackstone, all the other extracts may be found duly set forth in the text of that respectable authority. As the editor of *Lending Cases in Hindu Law*, and author of a treatise on the Hindu Law of Adoption, Mr. Rattigan could doubtless have pointed out many interesting analogies between the Institutions of India and those of Rome. He has, nevertheless, done so but sparingly. We are inclined to quarrel with him on several other minor points, such as his unnecessary translation of common words such as *miles*, "a soldier," *plerumque*, "generally"; and redundantly complimentary phrases such as "Sir Walter Scott's charming romance of *Ivanhoe*"; but must pass on to a larger ground of complaint, which, useful as we believe the book will be found for practical purposes, must prevent it from being welcomed by scholars.

We think that the author has misconceived the limits of his subject. He has failed to grasp the true significance of the "Jus quod ad personas attinet," and is thus led to blame the Roman institutional writers for not treating in one place of matters which they deliberately assigned to different departments of law. The "Jus Personarum," which composes, together with the "Jus quod ad res attinet" and the "Jus actionum," the triple subject of the Institutes of Gaius, and after him of Justinian, was no doubt conceived of somewhat loosely. Mr. Rattigan must, however, be aware that, in the opinion of the best authorities, the term denoted what the Germans call "Familienrecht," and not what Austin, for instance, means by "the Law of Persons." The Roman "Jus Personarum" and the German "Familienrecht" embrace those mutual rights which arise out of domestic relationships, such as the right of a father over his son, or of a guardian over his ward. Austin's "Law of Persons" is, as he explains it, the Law of Status, or of those modifications of rights which are the result of the special character of the parties concerned; such, for instance, as the limitations to the ordinary power of contracting which result from infancy or coverture. Mr. Rattigan has amalgamated the two; and while half of his book treats of Status, the other half deals with the Family. He is quite right in discussing such artificial persons as corporations and the "fiscus" under the head of Status, but he is unreasonable in complaining that the Roman writers did not discuss them under the Law of Family, with which they have no concern. His position is this:—He adopts the threefold division of Law, but thinks that Gaius and his imitators, after inventing a sound system of arrangement, bungled in working it out. "The student continually finds himself under the necessity of referring to one or other of the second, third, or fourth books to complete what has been said in the first book concerning the capacity or disability of Persons." It has therefore occurred to our author to collect together these scattered notices into a separate treatise on the Law of Persons; which he seems inclined to follow up by a treatise on the Law of Things, and by another on Actions. In spite of what, according to the best opinion, is a mistaken idea of what the Romans meant by the Law of Persons, the three treatises would undoubtedly be convenient. Should, however, Mr. Rattigan carry out such a design, he will find it very difficult to avoid repeating himself. In his "Law of Persons" he has already trespassed largely both on the Law of Things and on the Law of Actions—in some instances, indeed, without any justification. He has gone at considerable length into the rules of succession, which is a mode of acquiring property; and has devoted several pages to Partnership, which has really nothing to do with the subject of corporate bodies which led to its discussion.

Although we have been compelled to point out these flaws in the plan of the work, we are bound to say that they do not materially impair its practical usefulness as a student's handbook. A large amount of trustworthy information has been got together, and the author's belief that "few, if any, misinterpretations or misstatements will be found in the actual texts," is not as presumptuous

* *De Jure Personarum*, or, *a Treatise on the Roman Law of Persons*. By W. H. Rattigan, M.A., Ph.D., Barrister-at-Law, Author of "*Lending Cases in Hindu Law*," "*The Hindu Law of Adoption*," &c. London: Widd & Sons. 1873.

tuous as might be supposed. Here and there, however, he will find statements which are capable of correction. The note on "fidejussor," for instance, is very vaguely expressed; and Mr. Rattigan is quite wrong in supposing that the power of an insolvent master to make his slave his "heres necessarius," and so to prevent the stigma of bankruptcy from attaching to his own memory, was conferred by the *Lex Ælia Sentia*. Should the book reach a second edition, it is to be hoped that the mode in which references are made to the different parts of the *Corpus juris* will be altered. The old mode, for nonconformity to which Gibbon thought it necessary to apologize, by citation of the first words of the title, is safe though cumbersome; while the newest mode, by the letters C. or D., for Code or Digest, as the case may be, followed by figures indicating the book, title, and law successively, is short and simple. Both are preferable to Mr. Rattigan's. The mistake of talking of the "Commentaries" of Gaius, as contrasted with the "Institutes" of Justinian, is so general as to be almost venial; but it should really be understood that both works were alike entitled "Institutes," although the earlier work was subdivided into four "Commentaries," and the later one into four "Books." We can recommend the *Roman Law of Persons* to "students preparing for examination."

FORTNUM'S MAJOLICA.*

WHAT Dr. Birch has done for ancient pottery has been attempted by Mr. Fortnum for the several glazed and enamelled potteries of Italy, and for those earlier Oriental ceramic wares from which the fictile arts of Italy most probably "derived their inspiration or acquired their development." Mr. Fortnum explains in a modest preface that he would not have undertaken this task had not Mr. J. C. Robinson, to whom the South Kensington collection of majolica owed in great measure its original formation, been hindered by circumstances from carrying out the intention he had once expressed of illustrating and describing it. Without access to the South Kensington Museum the compilation of this handsome volume would have been impossible. But the collection at Brompton is not only a very large one, but it is especially rich in those signed or marked and dated pieces which are indispensable for an accurate history of the art. There can be no doubt that, with Mr. Fortnum's book in hand, any one could master the whole subject of Italian ceramic art by ocular study in the South Kensington galleries. Not, however, that the volume is in any sense portable. On the contrary, it is prodigiously thick and heavy, printed sumptuously on large thick paper, in noble type, and most profusely illustrated with woodcuts and coloured plates. We express no opinion here as to the propriety of publishing at the public expense a work so costly that it can only be available to the few, and indeed can only be purchased by the richer part of the community. But undoubtedly for those who wish to study Italian pottery Mr. Fortnum's magnificent volume is a very valuable aid indeed, and we proceed to lay some account of it before our readers.

Pottery, or Fayence, is here defined as being formed of potter's clay mixed in various proportions with marl and sand, and divided into soft ware or hard ware, according to the composition of the paste and the degree of heat to which it is exposed. Soft ware is that which can be scratched with a knife or file, and which is fusible at the heat of a porcelain furnace. These soft wares again are either unglazed, lustrous, glazed, or enamelled. The first three of these subdivisions include not only almost all the pottery of antiquity, but by far the greater part of modern earthenware. It is with glazed and enamelled wares in particular that the volume before us proposes to deal. Of glazed ware again, some is vitreous, or glass-glazed, and some is plumbeous, or lead-glazed; while enamelled ware is stanniferous, or glazed with tin. People know so little of ceramic processes that the following lucid account of the methods employed may be not unacceptable:—

In these subdivisions the foundation is in all cases the same, the mixed clay or "paste" or "body," varied in composition according to the nature of the glaze to be superimposed, is formed by the hand, or on the wheel, or impressed into moulds, then slowly dried or baked in a furnace or stove, after which, on cooling, it is in a state to receive the glaze. This is prepared by fusing sand or other siliceous material with potash or soda, to form a translucent glass, the composition, in the main, of the glaze upon the siliceous, vitreous, or glass-glazed wares. The addition of a varying but considerable quantity of the oxide of lead, by which it is rendered more easily fusible, but still translucent, constitutes the glaze of the plumbeous or lead-glazed wares; whereas the further addition of the oxide of tin produces an enamel of an opaque white of great purity, and is the characteristic glazing of the tin-glazed wares. In either case the vitreous substance is reduced to the finest powder by mechanical and other means, being milled with water to the consistency of cream; into this the dry and absorbent baked piece is dipped and withdrawn, leaving a coating of the material of the bath adhering to its surface. A second firing, when quite dry, fuses this coating into a glazed surface on the piece, rendering it lustrous and impermeable to liquids. The two former of these glazes may be variously coloured by the admixture of metallic oxides, as copper for green, iron for yellow, &c.; but they are nevertheless translucent, and show the natural colour of the baked clay beneath.

In all cases where the glaze is translucent, the ornamentation, of whatever kind, is of course executed on the biscuit or surface of the baked piece before the glaze is added. Of the vitreous sort is

all the ancient glazed ware of Egypt and the East, and the modern pottery of Persia and Upper India is of exactly the same manufacture. On the other hand, the ancient European pottery was, generally speaking, lead-glazed. But, not to speak of some exceptions and doubtful anticipations of the process, it may be considered that the stanniferous enamel was introduced, if not discovered, in the fifteenth century. It is to this branch of the art that the true majolica of Italy belongs. The picturesque story that the first specimens of lead-glazed ware were brought to Pisa in the twelfth century by its triumphant galleys after the conquest of the Balearic Isles has been of late discredited. But Mr. Fortnum is now disposed, as it seems, to think that the tradition has some truth in it, and that the Pisan *bacini*, such as are found in so many campaniles of that city, are really of Oriental origin. This part, however, of his introduction is, it must be confessed, ill-arranged and far from clear. It is very difficult to know what his real opinion is. Whatever may have been the original sources of the art, there is, however, no doubt that the stanniferous enamelled lustrous ware of Italy derives its name of majolica from the island of Majorca, where it was practised and perhaps invented by the Moorish potters. The progress of inquiry has robbed Luca della Robbia of the credit of the first invention of a stanniferous enamel; but there is no doubt that this great artist improved the process, and made it in a sense his own.

Pursuing his introductory sketch, which much needs not only more perspicuous arrangement, but less repetition and less self-contradiction, Mr. Fortnum describes the several schools of the Umbrian duchy in particular—the chosen home of artistic pottery—tracing the manufacture down to its revival in our own days at Doccia, near Florence, in the *fabrique* of the Marquis Ginori. Already, it seems, certain pieces of the modern wares of Doccia have crept into several European museums as authentic examples of the genuine ancient majolica of Gubbio.

A very valuable contribution to Mr. Fortnum's book is a selection of extracts from the manuscript of Piccolpassi, written in 1548, forming a complete manual of the potter's art as then practised, from which Passeri and others have borrowed the greater part of their information on the subject. Why are we not told in the proper place that this invaluable manuscript has been acquired for the South Kensington Museum? This fact only creeps out in a foot-note towards the end of the book. The introduction concludes with a description of the chief collections of ceramic art, public and private, in the various countries of Europe.

The bulk of this volume is a classified descriptive catalogue of specimens belonging to every subject of majolica. It begins with Persian, Damascus, and Rhodian wares. Each variety is described; the marks, such as exist, are engraved, and the specimens enumerated are minutely illustrated. Some of the Persian wall-tiles of the seventeenth century are of much interest. They are ornamented with embossed figures of horsemen and the like, and with conventional flowers; the ground blue, the other colours purple and white and green. Next comes the Hispano-Moresque pottery. Mr. Fortnum tells us that connoisseurs are now able to distinguish without difficulty between specimens of this ware and the lustrous majolica of Italy, which was undoubtedly derived from it. Bowls, plates, dishes, &c., of Hispano-Moresque manufacture are here described, and many of them figured. And so we reach Italian pottery. This subject, which is the chief part of the book, is led off with a section on Sgraffiati or incised ware, in which the patterns and ornaments are scratched through a layer of white substance upon the clay beneath, and then the whole covered with a translucent lead glaze. One late Pavian artist in this manner inscribes his work with his full name, thus:—"Presbyter Antonius Maria Cutius Papiensis Prothonotarius Apostolicus fecit, 1694." The best specimen of his work is a bowl bearing the portrait of an ecclesiastic, with pious legends in the border. Mr. Fortnum has been judicious in classifying his Italian examples according to the different local schools of artistic pottery. Here we first encounter the endless variety of pieces, technical names, styles, and subjects which so puzzle the learner in the ceramic art. He must learn to distinguish between the plateau, the tazza, the plaque, the bacile, the vaso, the fruttiera, the chiccera, the drug-pot, the scodella, the ewer, the mezzina, the tagliera, the tondino, the scaldino (or fire-pot), the confettiera, and the rinfrescatojo (or wine-cooler). Then, again, he must learn the special peculiarities of the Tuscan school, including that of Caffaggiolo in particular, and also the different characteristics of the potteries of Urbino, the old Papal States, the Marches, the Venetian States, &c. The pottery of Caffaggiolo is one of considerable importance in the history of the art. It was here, most probably, that Luca della Robbia learnt the secret of the enamel glaze which he applied to his modelled terra-cotta. It seems probable that this *fabrique* of Caffaggiolo was one founded by the Medici family. The finest existing specimen of this school is that splendid plateau, representing the triumph of Pope Leo X., in his *schola gestatoria*, which was purchased for South Kensington from the famous Soulagés collection. But the tagliera, or large plate, representing a majolica-painter in his studio visited by two of his patrons, a gentleman and his wife, which was acquired from the Bernal collection, is scarcely inferior either in design or in interest.

There seems to be scarcely a *bottega* of the art-pottery of Italy which is not described, with woodcuts of the signatures, &c., in these careful and learned pages. Less instructed connoisseurs, who judge chiefly by the eye, will turn with special interest to the account of the school of Gubbio, where the famous Maestro Giorgio invented that iridescent lustre which is the most beautiful and

* A Descriptive Catalogue of the Majolica, Hispano-Moresque, Persian, Damascus, and Rhodian Wares in the South Kensington Museum; with Historical Notices, Marks, and Monograms. By C. Drury E. Fortnum, F.S.A. Published for the Science and Art Department of the Committee of Council on Education. London: Chapman & Hall. 1873.

striking of all ceramic effects, and which is almost peculiar to that particular *fabrique*. Mr. Fortnum tells us that this coveted designation of Maestro, which was prized more highly than a title of nobility, was conferred on Giorgio Andreoli in 1498. All majolica-painters, it is said, were considered noble by profession. The Andreoli family and their Onas still exist, we are told, in Gubbio. But the secret of the opalescent lustre has not remained as a tradition of the family. Indeed the art of the composition and manipulation of the lustre pigments seems to have been lost a little after the middle of the sixteenth century, in the general decadence of Italian ceramic manufacture. We learn, however, that a young chemist and artist, by name Luigi Carocci, has lately reproduced this marvellous lustre, not unsuccessfully, in Gubbio itself. Already modern lustred ware, artificially defaced and "antiquated," has been palmed upon unwary collectors. But the special artistic qualities of the genuine works of Maestro Giorgio have not yet been recovered.

It is impossible to turn over the pages of this beautiful volume without astonishment at the grace and fancy and variety of the Italian ceramic artists. The conceits and legends to be found on so many of the pieces are often rather hard to be deciphered; and they are not always explained or translated by Mr. Fortnum. We think that this is to be regretted. Surely it would have been better to confess ignorance in cases where the inscriptions or devices are really unintelligible. Some of these legends seem to have been repeated without much reason. What, for instance, is the fitness of inscribing different female portraits with the words "Ohi bene guida sua barcha e sempre in porto"? One very beautiful circular dish has the subject of the Incredulity of St. Thomas, with an epigraph thus singularly divided:—TO MA QV IMEVE DISTI E TO RE DEDIS TI. It is to be read thus, we presume:—TOMA QVI ME VEDISTI ET CREDIDISTI. There can be no doubt that many of these beautiful works of art were not meant for use, but rather as keepsakes or presents. This is shown by the legends. Thus on a dish to be given to a friend is found, "Viva, viva in eternum"; or else, perhaps, "Penas a Dios," or "Ama Deo"; or, again, as a motto surrounding an eel, "Così fugi la vita nostra." The heart transfixed with arrows, a not uncommon device in this pottery, is surely an emblem of human love, and not a sacred symbol, as Mr. Fortnum supposes. Marie Alacoque had not yet imagined that strange vision of which we have heard so much lately. The *amatorii*, or lovers' presents, given at betrothals or at other times form a very numerous class. Sometimes on these a pretty damsel bears the coquettish motto "Amaro chi me amara"—"I will love him who will love me." Or a gallant gives his mistress a plate inscribed "Mariana bella sopra l'altre bella." But the more frequent legends are such as Elena bella, Silvia bella, Sura fiore, and the like. Is it not a strange contrast between these charming love-tokens and the coarse and vulgar mugs which our English potteries provide for the same purpose, inscribed with the words "A present from Margate" or some other place as the sole device? The following is an inexplicable legend for a salt-cellar; but it is found on more than one example:—"Excubia agnitus stropitus repellimus hostem." The legend on a scodella of Faenza, about A.D. 1482, with the subject of the Judgment of Solomon, ought surely to be "Non michi nec tibi sed dividatur." But Mr. Fortnum prints it *dundatur*. We notice also some other errors of the same kind. But they are few in proportion to the size of the book; and we have pleasure in bearing witness to the general ability and great value of Mr. Fortnum's work.

TWO VOLUMES OF GREEK AND LATIN VERSE.*

IT is not a little interesting to compare two volumes of translation, issuing in the same year from the same press, but executed by scholars of different dates, each famous in his own school and epoch for a remarkable gift of reproduction. By reference to Crockford's *Clerical Directory* we find that Mr. Gretton, who was long Head-master of Stamford School, took his degree as early as 1826—two years, that is, after the Classical Tripos was established. Mr. Jebb, we need hardly say, represents the younger generation of contributors to the *Serium Carthusianum*, and is foremost in the ranks of those most distinguished for "composition" in the Cambridge of the present time. Mr. Gretton's *Reddenda*—i.e., the English pieces for conversion into Latin—without the *Reddita*, or key now vouchsafed, were published as far back as 1853, when Mr. Jebb had probably scarcely begun to shine as a versifier at school. Yet, setting the works of the one beside those of the other, we might appeal to both as highly creditable evidence of the classical scholarship of the last half-century, and defy the Continental scholars to produce anything in this kind to match it, or to rank as even second to it. Translation has thriven on our soil, and more especially in the University of Cambridge, as it thrives nowhere else among moderns. And though the two volumes that lie before us are very diverse in point of execution and character, both show the same natural aptitude, cultivated by the same study of classic models, and culminating in excellence each in its own kind highly worthy of note.

* *Translations into Greek and Latin Verse*. By E. C. Jebb, M.A., Public Orator in the University of Cambridge. Cambridge: Deighton, Bell, & Co. London: Bell & Daldy. 1873.

Reddenda-Reddita. Passages from English Poetry, with a Latin Verse Translation. By F. E. Gretton, B.D., Rector of Oddington, Gloucestershire, sometime Fellow of St. John's, Cambridge. London: Bell & Daldy. Cambridge: Deighton, Bell, & Co. 1873.

It is not our purpose to dwell upon the Greek verses which form a large part of Mr. Jebb's volume further than to say that his translations into Greek lambics, and his versions of Browning's "Abt Volger" into the metre of the fourth Pythian, and of Wordsworth's "Intimations of Immortality from Recollections of Early Childhood" into Greek hexameters, are *tour de force* of which no lesser scholar would have been capable, and which astonish the reader alike by the translator's nice perception of the original and by his fidelity and fertility in the expression of it. We wish, however, to confine ourselves to the more approachable and simple field on which Mr. Gretton and Mr. Jebb, Old and Young Cambridge, come together, and are comparable with each other—the field of Latin lyric, hexameter, and elegiac. Here, though the two translators are near to each other in excellence, they have each a distinct tone and character which renders their styles worthy of study; and to those who either still cultivate the Latin Muse, or cling to the recollections and the delights of such exercises, the books before us will furnish hours of thorough enjoyment.

That which can scarcely fail to strike a careful reader of both is that the characteristic of Mr. Gretton's translations is simplicity, while that of Mr. Jebb's is subtlety. The former renders Herrick's ditties and the octosyllabics of Moore, Byron, Scott and others, with an ease and pellucid transparency of meaning which make no bad imitation of Ovid. Mr. Jebb, though he always does justice to the sense of the poet he translates, is not so immediately perspicuous, and apparently desires not so much the honour due to clearness at first sight as that which rewards the process of disentangling an elaborate web. There will be many to admire both styles, for each has its own merit; and all that we would say to the reader by way of advice is that Mr. Gretton's versions are fitter for the lazy half-hour, while Mr. Jebb's invite reflection and thinking out. Take a stanza from Darwin, with Mr. Gretton's rendering into elegiacs:—

Light Graces docked in flowery wreaths
And tip-toe joys their hands combine;
And Love his sweet contagion breathes,
And, laughing, dances round thy shrine.
Serta ferunt Charites; junctas quoque gaudia circum
Suspensis pedibus conseruere manus.
Inter quas spirat contagia læta Cupido,
Arridesque tuæ necit in æde choros.

These lines represent the "ludentis speciem" without the torture or rack of the brain. Their ease sits natural, and is to the manner born. On the other hand, if we take the version of Tennyson's *Tithonus* by Mr. Jebb, even in its first opening, the sense is not so explicit. You have to think twice or thrice before you catch the translator's response to the English:—

The woods decay, the woods decay and fall,
The vapours weep their burden to the ground,
Man comes and tills the field and lies beneath,
And after many a summer dies the swan.
Marcescunt nemorum, nemorum labuntur honores,
Horiferæ deficiunt nubes, oriuntur et arvis
Incumbunt subterque hominum defuncta recumbunt
Secula, nec astatas non decidunt olores.

This feature, we think, makes Mr. Jebb's translations, by comparison, a severer study, though it must be acknowledged that that study is often well repaid by the fine and even grand renderings to which it introduces us. In the same poem the team of the goddess is imagined welcoming and speeding the dawn:—

The wild team
Which love thee, yearning for thy yoke, arise,
And shake the darkness from their loosened manes,
And beat the twilight into flakes of fire.

Mr. Jebb does admirable justice to the English in his Latin, as follows:—

Neodum exultantia seruent
Corda repositum sibi quæ moderetur equorum;
Effunduntque jubar ut opaca volumina currus
Discedat tenebrarum, insulsetque ignifer umbris.

Another sample of the subtlety which is a feature of this translator's work will be found in Prior's ode to Chloë, pp. 78-81. In the first issue of the *Arundines Cumi*, Lord John Manners turned this into elegiacs which were much admired at the time for their grace and ingenuity. Mr. Jebb's version is wonderfully spirited and felicitous in reproducing the flavour of the original, although, if it were to be compared word for word, little of the body that was will be found to remain in the version. Here is the last stanza, though it does not represent our view a whit more closely than the other three:—

Fair Chloë blushed; Euphelia frowned;
I sung and gazed; I played and trembled;
And Venus to the Loves around
Remarked how ill we all dissembled.

Nec color huic unus nec frons innubila læsæ;
Ipso queror, stupeo, blandior, uror, amo.
At Venus irrident dum multa jocantur Amores,
Istud ut infabre dissimulat i ait.

The asyndeton in the second verse is a very happy resource.

Although, however, in the exchange of Mr. Jebb's Latin for the original, we do not get the exact counterpart which we should receive from Mr. Gretton—for instance, when the former has to turn "Before this mortal shall assume 'tis immortality" in Campbell's "Last Man," he renders it—

Sic demum caduci
Siderum jubar induemus—

still it frequently happens that his mental analysis of a passage enables him to render its spirit with a great deal of happy succinctness. Thus he gets three lines of that poem where the solitary watcher sees day after day

The blaze upon the waters to the east,
The blaze upon the island overhead,
The blaze upon the waters to the west—

into a line and a half of hexameters which satisfy the whole demand of the English—

Furit ignibus aquor colis,
Terra furit mediis, furit excoelestibus aquor—

and which have withal a very Virgilian ring and rhythm. We have not, luckily or unluckily, an opportunity of pitting the two translators together upon a single passage, as they do not trench on each other's ground; else we should like to have seen how Mr. Jebb would turn Bryant's "Rivulet" into elegiacs, though it might have been hard to decide between his result and the version by Mr. Grettou, of which we give two stanzas with the English. By the way there is a curious correspondence between a pretty piece of the Cornish poet, Mr. Hawker, about the course of Tamar from its source to its mouth, and this admired strain of the venerable American poet:—

Ah! what wild haste! and all to be
A river and expire in ocean;
Each fountain's tribute hurries there
To that vast grave with quicker motion.
For better 'twere to linger still
In this green vale, these flowers to cherish,
And die in peace an aged rill,
Than thus, a youthful Danube, perish.
Cur frustra properas, quo te dementia cogit,
Rivus ut equoribus emoriaris aquis?
Dum t. mnes addit sceleratas fons quisque, profundum
Te rapit in cacum præpetiore fuga.
Ah! quanto melius viridi sic valle morari,
Floribus ornatus, floribus ipse decor.
Fonticulus melius requiescat pace senili,
Cur rapidis percas sic novus Ister aquis.

There is nothing in Mr. Jebb which occurs to us as so unlaboured and natural as this; but we may quote one of his newest pieces of elegiac translation given in this volume for the first time as being very nearly so. It is a version of James Aldrich's "Her sufferings ended with the day":—

Her sufferings ended with the day;
Yet lived she at its close,
And breathed the long, long night away
In statue-like repose.
But when the sun in all his state
Illumed the eastern skies,
She passed through glory's morning gate
And walked in Paradise.

Janque die non illa quidem vergente laborat,
Sed licet emeritam terra parumper habet:
Noctis enim tristes ultra remorata per horas
Lingere marmoreum noluit aura sinum.
At dubis splendens quom sol discusserat umbras,
Aurea quom toto lux oriente rubet,
Dignum triumphantum que sic intraret Olympum
Asseritur superis manè Serena chorus.

The second couplet of the four hits the force of the corresponding English to a wonderful degree, and bears witness to a poetical sympathy between the author of the original and his translator. And so it is in many other pieces that we could name. With a true poet's instinct the translator grasps the author's drift, and what the Latin idiom does not let him express in so many words, he renders with close approximation of sense and spirit by a correlative idea. We should point to Matthew Arnold's *Progress of Poetry*, turned by Mr. Jebb into twelve capital elegiacs, as one of the most successful illustrations of this compensatory treatment.

Both the translators before us shine in their own way in hexameter translations, as would be admitted could we quote a sample from Wordsworth, turned by Mr. Grettou in p. 29 of *Reddita*, or from Tennyson ("Tears, Idle Tears," &c.), by Mr. Jebb, pp. 54-7. But what space we have left must be devoted to a glance at their several Alcaic experiments, the Alcaic being with good reason pressed into the service of both much more frequently than any other Horatian measure. Here Mr. Jebb excels at one time in just and pregnant condensation, at another in skilful realization of the language and manner of Horace. Taking the passage from Gray's ode, "Awake, Æolian Lyre," we cite the concluding lines of the extract, and ask the reader to note how every idea of the five English verses is caught and represented in an Alcaic stanza:—

Perching on the sceptred hand
Of Jove, thy magic lulls the feathered King;
With rustled plumes and flagging wing:
Quenched in dark clouds of slumber lie
The terror of his beak and lightnings of his eye.
Regi volueram te Jovis in manu,
Dum torpet ala languidus horrida,
Mandiva, trux rostrum soporis
Nube premens oculique fulmen.

A couple of stanzas could have added nothing to the full expression of the sense, and the result of compression is to add force and verisimilitude. Again, to turn to one of the same translator's new pieces (all of which are indicated by their numbers in a very brief preface), how happily does he render every turn of the passage from "In Memoriam" beginning with "Witch-elms that counter-

change the floor," though this rendering indeed is not Alcaic, while quite Horatian in flavour. Very fine, however, throughout, is his Alcaic presentation of Milton's *Hyman on the Nativity*, out of which we may quote the two stanzas which represent "No war or battles' sound," &c.:—

Non orbe toto martis erat sonus,
Non conferantur signa cohortium:
Hastile defunctumque pariam
Militia paries habebat:
Non fulx cruorem traxerat hosticum,
Non excitabant armigeros tubæ:
Regum latebantur venire
Ora metu pavescita regum.

Mr. Grettou, on the other hand, deserves well of all young scholars for the happy examples he gives in his *Reddenda-Reddita* of the style in which the Greek choruses may fitly reappear in Latin lyric measure. Not that he strictly translates from the Greek, for he prefers to take the English versions of Anstice and recouvert them into Alcaic stanzas. But the result is much the same. We catch the breath of the Greek, though the phraseology and the metro are imitative of Horace, when we examine the rendering of choruses from the *Alcestis* or *Hippolytus*, which seem to have lost very little by a double process of conversion. If there be a fault in this translator's Alcaics, it is their tendency to expand rather than condense the scope of the original, which is against the genius of Latin lyric. Thus eight lines of Shirley's ode, "The glories of our birth and state," are wrought into three Alcaic stanzas; whereas, as we have seen, Mr. Jebb succeeds in representing five longer lines of English in a single quatrain. But we must not quarrel with one who in the very same extract renders the concluding stanza of the English into the Alcaics with which we conclude, and which are not above the average of his imitations in this particular measure. The reader is referred to the English in p. 126, "The garlands wither," &c.:—

En sarta marcent fronte tuâ! monent
Ne sis superbus quid bene gesseris;
En victor expirans ad aras,
Victima nil miserantis Orci.
Cujusque tandem devenit caput
Umbras sepulchri; suaveolentia
Tum facta restabant plorum,
Pulvere et exorientur atro.

We are tempted to wonder whether, in these days of triposes in law and science, divinity and philosophy, this pleasant and humanizing gift of translating into the ancient languages will maintain its excellence in a third generation. If so, Mr. Jebb and Mr. Grettou will not have wrought in vain, or set a profitless example.

THE MASTER OF GREYLANDS.*

THE years come round with their appointed regularity and we know pretty well what we have to expect. Flowers in spring, weeds in autumn; a transcript of real life told in choice English by George Eliot, a novel of impossibilities hammered out in dubious syntax by Mrs. Henry Wood; larks in the sky, frogs in the pond—we know them all, and accept all with thankfulness or resignation according to their respective deserts. As for Mrs. Henry Wood's novels, the wisest thing that we can do now is to receive them with resignation. We have done our best to induce her to reconsider her ways and give the world good work instead of bad; but it is in vain. Mrs. Wood is an institution which changeth not; and mean ideas, vulgar diction, wooden characters, and absurd sensationalism come in regularly as part of the produce of the year. They are defects which spoil an aptness of storytelling and a power of construction that are of no common order. But, while showing no sign of improvement in any of her characteristic faults, the *Master of Greylands* is not, we are sorry to say, up to the mark in her characteristic good qualities. The story is dull, disjointed, and put together with singular infelicity; and though dealing with the good old themes of apparitions, murder, secret passages, disguises, smuggling, and the like, it is a story of the lantern and turnip-head kind, nothing being quite so bad as it seems to be. Though the book is stuffed full of crimes and criminals, including a fraudulent banker as a relief from those of the more violent kind, no one is really so very much to blame after all; and the curious moral obtuseness shown before now by Mrs. Wood is repeated in this story.

The *Master of Greylands* has a double plot. One turns on the question, what has become of Anthony Castlemaine? is he murdered, or is he not? and if he is, by whom? The other turns on a question of proprietorship; is the present master, James Castlemaine, the rightful owner of Greylands? or is he holding the estate unlawfully, against the just claims of his elder brother Basil, should that expatriated worthy turn up again, either in his own person or represented by a legitimate son? Side by side with these mysteries runs the mystery of the Grey Friar who appears in solid bulk enough every now and then in the Friar's Keep. Who is he? what is he doing there? with his lantern and his cowl? Ghost he cannot be; what is he then? marauder or murderer? and what is his business in the ruins of the Keep? And here it is that Mrs. Wood fails in the proper growth and development of her story. James Castlemaine, the proud owner of Greylands, is a smuggler; his son Harry is also a smuggler; and Commodore Teague and half the fishermen of the

* *The Master of Greylands. A Novel.* By Mrs. Henry Wood, Author of "East Lynne." 3 vols. London: Richard Bentley & Son. 1873.

place help them. But, save Mr. Castlemaine's occasionally descending the broken steps of the Keep at night, and Commodore Teague's fancy for driving his spring-cart abroad also at night, we find no intimation of the peculiar practices carried on by these gentlemen; so that the discovery comes on us with a sense of rawness and suddenness which is not art. Any one who has read *Mauprat* must remember with what consummate skill George Sand revealed part, while concealing part, of the villany she was handling; but Mrs. Wood has so effectually concealed hers—the Master's illicit transactions in lace—that we are only surprised when he turns out to be a smuggler running cargoes from Holland, with a little playful interlude of homicide to enliven the monotony of landing kegs in a secret passage. We must also take exception to the Grey Sisterhood. Had Mrs. Wood cared more for her art than for her Protestantism, she would have made them what they would necessarily have been, if existing at all, a quiet sisterhood of Roman Catholic nuns. Though rare, they were to be found some years ago, as in the pretty Vale of Lanheerne, near Mawgan; and Greylands, with its old-world nunnery, might well have received a real sisterhood instead of the sham anachronism of a Protestant body. Miss Sellon had not set the stone rolling in the days chosen by Mrs. Wood for her story, and the circumstance is out of keeping from first to last. As for the text with which she ends her story, and the action of Mary Ursula which it consecrates, we hold that too to be as untrue as all the rest. To be a Grey Sister was not the same thing as being a nun, and there was no reason in heaven or earth why Miss Castlemaine should not have taken off her grey lincey gown and her grey straw bonnet, and returned to the world and ordinary life as the wife of Sir William Blake-Gordon. Mrs. Wood does many offensive things in her novels, but none more so than her perpetual reference to religion and the Bible. At the best, novels are but shams, the function of which is to deal solely with the probable motives of certain imaginary characters, and the probable events springing from certain imaginary causes. To buttress up these shams by texts taken from the Scriptures, or by a page or two of pious maundering, is to offend one's deepest sense of reverence and truth. And the effect is simply to make the whole thing more transparently unreal than it was before. It is an easy substitute for a strong situation or a noble action, and is as inartistic in method as it is futile and disagreeable in result.

Of course the *Master of Greylands* abounds in those oddly phrased realistic touches which do duty with the author for careful work and lifelike delineation. Thus we are told all about the division of Sunday duty between the two parishes of Greylands and St. Mark's at Stillborough. The Reverend John Marston, who holds both livings, is a pluralist without a curate, "fond of fox-hunting in winter and of good dinners at all seasons." He lives at St. Mark's, and "of course," says Mrs. Wood, "with two churches and only one parson to serve both, the services could but clash, for nobody can be doing duty in two places at once." After which profound remark she goes on to tell us that "once a month, on the third Sunday, Mr. Marston scuffled over to Greylands to hold morning service, beginning at twelve, he having scuffled through the prayers (no sermon that day) at St. Mark's first. On the three other Sundays he held the Greylands service at three in the afternoon," &c. &c. Nothing of all this has the least reference to the story; if we except the fact that, owing to Mr. Marston's propensity for fox-hunting, liking for old port, and neglect of all parish work generally, the Grey Sisters soothed "many a sick and dying bed" that ought to have been his care, and "more than one frail infant, passing away almost as it had been born, had Sister Mildred, the pious Superiress, after a few moments spent on her knees in silent deprecatory prayer, taken upon herself to baptize, that it might be numbered as of the Fold of Christ." One other circumstance connected with Mr. Marston binds him into the phantasmal brotherhood of the Greylands world; he has married Harry Castlemaine to Jane Hallet, and kept the secret. But this was scarcely sufficient cause why so much minute description should be given to the reverend gentleman in the beginning. Also, and of course, the *Master of Greylands* contains that favourite figure of Mrs. Henry Wood's gallery, the froward child. The kitchen and the nursery are her choicest playgrounds, and she is never so much at her ease as when she can elaborate the description of a servant's dress or the pertness of a badly-trained child. All her novels have their specialized whipping-boy; and Flora Castlemaine, "an indulged, selfish, ill-bred girl of twelve, forward enough in some things for one double her age," is the whipping-boy in this. She plays barbarous chords on the piano with one hand and abuses Ethel Reese alternately; calls her a toad, says she will kick her, brandishes a poker to within an inch of her mother's nose, is insolent to her governesses, though finally somewhat subdued by Madame Guise, gets shaken by her half-brother Harry, and flies off to the kitchen when things go wrong in the parlour "to demand bread and jam and worry the servants." "She had been brought up to exercise her own will and disobey that of others," says Mrs. Henry Wood. "We can scarcely wonder at her commentary; 'Bad training! bad training for a child!'" But seriously is this art? Very few writers can deal satisfactorily with children. The perverted insolent child, like Flora Castlemaine, against whom the author has as much evident animosity as Mrs. Wood displays, is sure to be vulgar and tiresome. Moreover the reader feels less inclined to condemn than to pity, and instinctively takes the part of the imp, impleth though it may be. The saintly, large-eyed, thoughtful child suggests water on the brain and perhaps an early death—besides being unnatural and

tiresome, too, in its own way; so that between imps and angels the real healthy, loveable, and lifelike young creature of undeveloped conscience and fairly virtuous instincts gets but badly rendered, and we object equally to Mrs. Henry Wood's Flora and Mrs. Stowe's Eva.

Mrs. Wood is fond of disguises; and the *Master of Greylands* has its pale reflection of the central point of *East Lynne*. When Anthony Castlemaine, the expatriated Basil's eldest son, comes over to England from Gap, in Dauphiné, to assure himself that his uncle Mr. James Castlemaine is holding the family estate by right and not by fraud—when, not being able to assure himself of this, he is seen to follow his uncle into the Friar's Keep, whence are heard immediately after the report of a pistol and the scream of a human being in his death agony, but whence Mr. Anthony Castlemaine never returns—the search for some proof of his death or life is undertaken by his wife. She finds her way to Greylands, where she puts up at the Dolphin Inn, like her husband before her, and is fortunate enough to obtain the situation of governess to Miss Flora Castlemaine. Installed in the house of her husband's murderer, as she believes him to be, under her maiden name, though with a difference (Madame Guise), she begins to watch and search. But beyond opening Mr. Castlemaine's private bureau, finding her husband's ring therein, and blowing out the candle when she hears Harry's voice—"and the candle was making a dreadful smell," writes Mrs. Wood—she does no good. Her brother-in-law, Mr. George North Castlemaine, who also comes to Greylands, where he drops his surname and appears as Mr. North only, gets more to the root of the matter. For when the preventive men come upon the smuggling party in the Keep, and Mr. Harry Castlemaine gets shot in the fray, Mr. James, his father, is too broken-hearted to resist any longer the finger of fate and the force of events, but makes a clean breast to his nephew George, and hands him over the estate like a man. Then it turns out that Anthony had been shot by a Dutchman, one Van Stan, "a huge angular fellow," who took him for a spy; as perhaps was natural, seeing that in following his uncle he suddenly appeared in the midst of the smugglers, and cried out, "I have caught you, you illicit villains! I see what nefarious work you are engaged in; cheating His Majesty's revenue. What ho! constabulary!" Fortunately for the huge angular Van Stan, he died not long after in Holland of "nothing but a neglected cold," so that George is saved the unpleasant necessity of hanging him; which else, we imagine, he would have been obliged to do.

As for any interference with Mr. James Castlemaine on the plea of his being an accessory to a murder, no one is so impolite as to suggest such a thing. Many persons in the neighbourhood had believed all along that he had murdered his nephew with his own hand, but no one had had the manliness to say so. Even Mr. Bent, who is sturdy enough in his own way, had not the courage to bring the law upon the Master, who thus has rejoiced in the threefold luxuries of smuggling, murder, and unlawful possession, with a fine presence, a loving heart, a proud spirit, and an indomitable will. We ought to add, however, that George North Castlemaine marries Ethel Reese, who holds a rather anomalous position in Greylands, being the child of Mrs. Castlemaine's former husband. Yet she calls the Castlemaines papa and mamma, and is loved by the gentleman smuggler apparently with more affection than he bestows on his own daughter. Mrs. Castlemaine, on the contrary, "was unkind and tyrannical" and "Ethel Reese had much 'to put up with in her everyday life; for Mrs. Castlemaine's conduct was trying in the extreme; Flora's worse than trying." In consequence of which she often "puts her bonnet on," and goes out a good deal on the cliffs by herself, where she takes off her hat, holds it by "its ribbons, her hair floating in the wind; the sky and the waves seeming to speak to her soul of immortality; to bring nearer to her the far-off gates of heaven."

Thus and thus the author mauls and stumbles through her allotted space, and we end at last our dreary task of reading what she has written. We lay down her book with a deeper conviction of the emptiness of life than we had before we began it; and the vanity of all things human seems to find its culmination in the *Master of Greylands*. Without spirit, fire, or art, without delicacy of character-painting or vividness of scene-painting, written in queer English, penetrated through and through with vulgarity of thought and expression, such a book as this gives one but a melancholy idea of the taste and intelligence of the public to which Mrs. Wood addresses herself, and from which she hopes to win applause and support.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

THE UNITED STATES.

The Annual Subscription to the SATURDAY REVIEW, including postage to any part of the United States, is £1 10s. 6d., or \$7 50 gold, and may be forwarded direct to the Publisher, at the Office, 38 Southampton Street, Strand, or to Mr. B. F. SEEVERS, American Agency, 17 Henrietta Street, Covent Garden, London. International Money Orders can be sent from any office in the United States, and Subscriptions, payable in advance, may commence at any time.

Nearly all the back Numbers of the SATURDAY REVIEW may be obtained through any Bookseller, or of the Publisher, at the Office, 38 Southampton Street, Strand, W.C., to whom all Communications relating to Advertisements should likewise be addressed.

Saturday (November 22).—Eighteenth Saturday Concert.
Monday.—Chrysanthemum and Winter Flower Exhibition Opens.
Tuesday.—Opera, "Don Giovanni."
Wednesday.—Instrumental Concert.
Thursday.—Opera, "Lucia di Lammermoor." Pauer's Lecture on Haydn and Mozart, at 8.
Saturday.—Ninth Saturday Concert; London Rifle Brigade Prize Distribution.
Admission, Monday to Friday, One Shilling; Saturdays, Half-a-Crown; or by Guinea Season Ticket.

LONDON BALLAD CONCERTS, St. James's Hall, under the
Direction of Mr. John Boocoy. Eighth Year.—THREE CONCERTS will be given before Christmas, on Wednesday Evenings, November 20, December 3 and 10. At the first Concert, on Wednesday next, the following Artists will appear:—Madame Otto Alvaldehn, Miss Foynte, and Madame Pater; Mr. Sims Beever, Mr. Henry Guy, and Mr. Pyatt. Violin, M. Saurget; Piano-forte, Madame Caruso. The London Vocal Union, under the direction of Mr. Frederick Walker, Conductors, Mr. J. L. Hatton and Mr. Meyer Lutz. Prices of Admission—Stalls, 6s.; Family Ticket, 21s.; Gallery, 2s.; Area, 3s.; Gallery and Orchestra, 1s. Tickets to be had of Austin, St. James's Hall, the usual Music-sellers, and Buxey & Co., 11, St. James's Street.

ARUNDEL SOCIETY'S COLLECTION OF COPIES from the ANCIENT MASTERS, including the celebrated Altar-piece by Memling, at Lubbock, ON VIEW daily at 24 Old Bond Street, W.

FAC-SIMILES IN COLOUR of the ARUNDEL SOCIETY'S DRAWINGS are sold to the Public as well as to Members. Prices from 10s. to 45s. Lists sent on application to 24 Old Bond Street, W.

THE PAYMENT of £1 is, as an Entrance Donation to the ARUNDEL SOCIETY constitutes Membership for Life. Members can purchase the Publications at a lower Price than the Public. Circulars are sent on application to 24 Old Bond Street, W.

THE SOCIETY of PAINTERS in WATER-COLOURS.—THE TWELFTH WINTER EXHIBITION of SKETCHES and STUDIES will OPEN on Monday, December 1. 5 Pall Mall East. Ten till Five. Admission, 1s.
ALFRED D. FRIPP, Secretary.

DORÉ'S GREAT PICTURE of "CHRIST LEAVING the PRÆTORIUM," with "Night of the Crucifixion," "Christian Martyrs," "Francisco de Rimini," "Neophyte," "Andromeda," &c., at the DORÉ GALLERY, 26 New Bond Street. Ten to Six.—Admission, 1s.

AUTOTYPE GRAND FINE ART GALLERY.—ON VIEW AUTOTYPE FACSIMILES of the Oxford Drawings, Louvre Pictures, and Ancient and Modern Masters' Christmas subjects.—38 Rathbone Place (next to Winsor & Newton's).

THE SCOTTISH CORPORATION.

President.
H.R.H. the PRINCE of WALES, Duke of ROTHESAY, K.G., &c.

Vice-Presidents.

His Grace the Duke of ROXBURGH, K.T.
His Grace the Duke of ARGYLL, K.T.
His Grace the Duke of MONTROSE, K.T.
His Grace the Duke of RICHMOND and LENNOX, K.G.
The Most Hon. the Marquis of LORNE, K.T., M.P.

Treasurer.

Sir J. HERON MAXWELL, Bart., of Springhill, 77 Eccleston Square, S.W.

The TWENTY HUNDRED and NINTH ANNIVERSARY will take place at the Freemasons' Tavern on December 1, for St. Andrew's Day, when the Right Hon. the LORD MAYOR of LONDON (Mr. Alderman LING, M.P.) will preside.
Those Noblemen and Gentlemen who have not yet replied to the Special Letters and Circulars forwarded to them are respectfully requested to do so at their earliest convenience.
N.B.—As many Noblemen and Gentlemen as may find it convenient are requested to appear at the Festival in Highland Dress or Uniform. Immediate application ought to be made for tickets.

The Scottish Corporation, Hall, Crane Court, Fleet Street, E.C.
November 21, 1873. MACRAE MOIR.

CAMBRIDGE EXAMINATION for WOMEN, June 1874.—LOCAL SECRETARY for the LONDON CENTRE, Mrs. ALBERT DENT, at 25 Ashley Place, Victoria Street, S.W.

SCHOLARSHIPS and EXHIBITIONS.—An EXAMINATION will be held at MALVERN COLLEGE on December 12 and 13, for the Award of FIVE HOUSE SCHOLARSHIPS of £50, and FIVE EXHIBITIONS of £20. The Awards will be for one or two years, according to merit, and to other Classical or Mathematical Candidates.
For Particulars apply to the HEAD-MASTER.

BRIGHTON COLLEGE.

President.—The Earl of CHICHESTER.
Principal.—The Rev. C. BRIGGS, M.A., late Senior Student of Orléans, Oxford.
There are special Modern Forms affording every necessary preparation for the India or Army Examinations. The School is well endowed with Exhibitions. FOUR SCHOLARSHIPS, of about £50 a year, will be awarded by open competition in January.—Apply to the Rev. the SECRETARY.

MALVERN COLLEGE.—FIVE SCHOLARSHIPS of £80 per Annum, and FIVE of £50, will be awarded at Christmas. Young Candidates have great advantages in this Competition. Apply to the Rev. FRANCIS R. DREW, M.A., Senior Master on the Modern Side, who receives FORTY BRADSHAW, and makes special arrangements in his house for the welfare of YOUNG PUPILS between Eight and Twelve years of age. References to nearly a hundred Parents of previous Pupils.

EXHIBITIONS.—CHATHAM HOUSE, Ramsgate.—An EXAMINATION will be held January 20, to award FOUR ENTRANCE EXHIBITIONS, value £25, tenable for Two or more years.—Apply to the HEAD-MASTER.

EDUCATION.—SEASIDE (Worthing).—Preparation for Public Schools and Universities, Military and Civil Service Examinations, by the late Principal of a Public School in connexion with the London University, assisted by a Cambridge Wrangler. Modern Languages taught and spoken.—Letters may be addressed to C. R., care of Messrs. Rivington, Waterloo Place, London.

WOOLWICH and ARMY DIRECT.—Rev. Dr. HUGHES (Wrang. Cam.), who, with Twenty Years' experience, has passed 320 (and last September, 516) Pupils on the Modern Side, who receives a few PUPILS especially for the above.—Chatbam Court, Ramsgate, W.

SCHOLASTIC PARTNERSHIP.—WANTED, after the Christmas Vacation, by an Oxford Graduate, 27 years of age, Second-class Moderations, and formerly in the sixth form of a large public school, a PARTNERSHIP in a really good School for the Sons of Gentlemen. He can produce the highest testimonials as to his fitness and capability for such a post, and he has had considerable experience in tuition. He would be prepared to pay a Premium not exceeding £1,000 for an adequate position. No one need answer this advertisement unless his school can bear, in every sense, the clearest investigation.—Apply, in the first instance by letter, to A. Z., United University Club, 7 Pall Mall East, London, S.W.

TO PARENTS and GUARDIANS.—An ARCHITECT and SURVEYOR in First-class General Practice has a Vacancy for a PUPIL. An excellent opportunity for a Youth desirous of learning the profession. Premium of minor importance.—Apply, by letter addressed W. B., 64 Goulford Street, London, W.C.

PRIVATE SETTLEMENTS with CREDITORS ARRANGED
for Persons in embarrassed circumstances, in Town or Country, by Mr. HOWSE, 40 Leicester Square, whose pamphlet, "How to Get Out of Trouble," will be forwarded free to any address on application by letter. Established 1848. Mr. HOWSE has special Claims for Confidential Matters, and Agents in America, Australia, France, Germany, Norway, Denmark, and the Island of Malta. Translations in every European language.

HYDROPATHY.—SADBROOK PARK, Richmond Hill. Physician, Dr. EDWARD LANE, M.A., M.D., Edin. Turkish Baths. Consultations daily (Saturdays excepted) at 7 Pines Street, Hanover Square, from Ten till Twelve.

BEN RHYDDING, Yorkshire.—Physicians, W. MACLEOD, M.D., R.F.C.P., Edin. THOMAS SCOTT, M.D., Edin. The Therapeutic uses of the Ben Rhydding Water are found very singular in diseases of the nervous system, of the stomach and liver, and from the potash they contain, makes them also specially beneficial in gout, rheumatism, and diseases of the kidneys. The Compressed Air Bath is considered the most powerful curative agent known for the cure of chronic bronchitis and asthma; also for palmaria and the flexibility of the heart.—For detailed prospectus address T. H. MANAGAN, Ben Rhydding, by Leeds.

BRINDISI MAIL ROUTE to Egypt, India, China, Australia, Rome via Palermo, Naples via Foggia, Shortest and Cheapest Route. For Through Tickets and information, apply to the South Italian Railway.—Agents, LEBEAU & CO., 6 Billiter Street, London, E.C.

MADEIRA.

THE PACIFIC STEAM NAVIGATION COMPANY'S ROYAL MAIL STEAMERS.

Sailing from Liverpool every Wednesday, Bordeaux every Saturday, and Lisbon every Tuesday.

Call at Madeira to land and embark First and Second Class Passengers only.
For Rates of Fares and other particulars apply to N. GRIFFITHS, TATE & CO., Fenchurch House, Fenchurch Street, London; MALCOLM, MACGOWAN, & CO., Exchange Square, Glasgow; or at the Office of the Company, 31 James Street, Liverpool.

W. J. CONLAN, Secretary.

BRIGHTON.—BEDFORD HOTEL.—Every endeavour is made to render this Hotel equal to its long-existing repute. Spacious Coffee Room for Ladies and Gentlemen. Sea-Water Service in the Hotel.—Communications to the MANAGER, Bedford Hotel Company, Limited.

THE PALL-MALL.—This RESTAURANT is REMOVED to more spacious and commodious Premises. 11 REGENT STREET, WATERLOO PLACE.
(Embracing the late Gallery of Illustration, which is now available for Regimental Dinners and similar Parties).
Entrance to Private Rooms in Carlton Street, adjacent.
Open for Supper, as before, under an Exemption License.

**NICE.—HOTEL des ANGLAIS.—A First-class Hotel, facing the Sea, and under English management. 40 Coleman Street, London, E.C.
H. BAKER HAYS, Secretary.**

ADDITIONAL PREMISES.—J. GERSON, Fine Art Gallery and Depot of the Berlin Photographic Company, 5 Rathbone Place, W., and 71 London Wall, E.C., beg to announce the opening of a New City Depot at 60 CORNHILL, corner of Gracechurch Street. Now on View, the Unique Collection of PERMANENT PHOTOGRAPHS Direct from Paintings of the Old Masters in the Galleries of London, Paris, Florence, Berlin, Dresden, and of the Chief Works by Modern Artists of all Nations.—Catalogues free. Shippers and the Trade Supplied.

WHAT WILL THIS COST TO PRINT? A Copy of INFORMATION for AUTHORS on PRINTING and PUBLISHING may be obtained on application to R. BARRETT & SONS, 13 Mark Lane, London.

E. DEFT & CO., 81 Strand, and 34 Royal Exchange, Manufacturers of CHRONOMETERS, WATCHES, ASTRONOMICAL INSTRUMENTS, and RET. CLOCKS, to Her Majesty, and H.R.H. the Prince of Wales; Makers of the Great Clock of the Houses of Parliament, and of the New Standard Clock of the Royal Observatory, Greenwich. Catalogues on application.—81 Strand, 34 and 35 Royal Exchange (adjacent Lloyd's), London. Factory, Savoy Street.

OLD ARTIFICIAL TEETH wanted to PURCHASE.—Persons having the above to SELL can apply "with the Teeth," or if forwarded by post their value will be sent per return.—Messrs. BROWNING, 9 Chancery Street, W. and 11 Booth Street, Piccadilly, Manchester.

ELECTRO-SILVER PLATE and TABLE CUTLERY.

DEANE & CO.'S Priced Catalogue, with Engravings, post-free.
Table Knives, Ivory, 10s. 5s., 3s.

THE CUBAN QUESTION.

A PREFERENCE for the excitement of foreign complications over domestic politics is not peculiar to the people of the United States. The reaction against the Republican party in several of the States, the conviction of Twiss for fraud, and even the financial crisis, have almost ceased to attract public attention after the execution of the prisoners taken on board the *Virginus*. As several of the victims were English subjects, the American Government has no exclusive right of remonstrance; but it will probably be found that the vessel was legally entitled to the protection of the United States. In such cases public interest is stimulated by neighbourhood; and an active section of American politicians has for some years past urged upon the Government interference in the affairs of Cuba. The facts of the capture are not yet accurately known; but it seems probable that the conduct of the Spanish authorities will be found wholly inexcusable. The pursuit of the *Virginus* by the *Tornado* appears to have commenced on the high seas, and the capture was effected beyond the limit of English jurisdiction in Jamaica. If the *Virginus* was in the service of the insurgents of Cuba, it may perhaps be contended that foreign Powers have no right to interfere with the consequences of an act of hostility which was an incident in an irregular civil war; but the Americans cannot be expected to allow an excuse which the English Government is precluded from entertaining by the conduct of its own servants. The *Virginus* sailed from the port of Kingston with a regular clearance from the Custom House officers, who had ascertained by inspection the character of the vessel and the nature of the cargo. International law still recognizes the lawfulness of a trade in warlike munitions, especially during the technical continuance of peace. It was perfectly known at Kingston that the ship conveyed supplies and reinforcements to the rebels in Cuba; but the flag and papers could not have been those of an insurrection which has no recognized existence. If there had been a blockade of the coast of Cuba, the *Virginus* would only have been liable to forfeiture, and her crew to temporary detention. As no blockade had been proclaimed, not even a right of capture had arisen, except indeed on the fictitious pretext that the vessel was a pirate. As there was no concealment of the object of the voyage, the Custom House officers of Kingston must, on the Spanish assumption, have been accessories to the crime of piracy. It would be intolerable that a mere abuse of language should be allowed to serve as an excuse for a judicial murder. It is useless to taunt the Government of the United States with the shameless extravagances of doctrine which were propounded by authority during the Civil War. It seems that in one case the counsel for the Government insisted that the trade of a nation with a belligerent was an act of hostility to the other party in the war; but the Courts never sanctioned any proposition of the kind, nor did the American Government either murder the crews of blockade-runners, or even treat them as prisoners of war.

If those of the rebel leaders who were Spanish subjects had been taken prisoners on the soil or in the waters of Cuba, foreign Powers could scarcely interfere with the bloodthirsty practices which are in Spain characteristically combined with the most squeamish aversion to the doctrine of capital punishment. Foreign sympathizers with the rebellion are morally more guilty than indigenous insurgents; and within the jurisdiction of the Government which they attack, they are liable to the legal consequences of treason; but when they are outside Spanish territory they are entitled to the protection of their Governments.

If the *Virginus* proves to be an American vessel, the Spanish Government will be responsible to the United States for the blood even of the Cubans who were executed. When Mr. SLIDELL and Mr. MASON were by a lawless abuse of superior force taken from an English packet, the only adequate satisfaction was afforded by the restoration of the captives to the protection of the English flag. If the Federal Government had been capable of the atrocity of putting its prisoners to death as traitors, such an outrage would certainly have been followed by a declaration of war. CESPEDES and his companions were, like SLIDELL and MASON, insurgents against a regular Government; but for the time they were under the protection of any flag to which the *Virginus* had a legal right. The majority of American journalists take a sound view of the question of international law, although some of them are excusably eager in urging their Government to premature action. The discussion between the American and the Spanish Governments will probably disclose little difference of opinion; and the demands of the United States, if they are correctly reported by the Correspondent of the *Daily News*, are eminently just and moderate. The surrender of the vessel and the surviving prisoners, an indemnity to the families of the American victims, and a salute to the American flag at Santiago, are claims which the Spanish Government might honourably concede. Señor CASTELAR will, however, be unable to afford the reparation which is specifically demanded. The military and naval commanders at Santiago thought it expedient to interrupt telegraphic communication with Havannah, in the reasonable apprehension that the CAPTAIN-GENERAL might prohibit the execution of the prisoners. The Spaniards in Cuba, or those who profess to represent their opinions, loudly applauded the vigour of the authorities at Santiago; and it is highly improbable that the authors of the outrage should be compelled to submit to the demands of the American Government. The appeals which have been made to the PRESIDENT's sympathy with the Republican Government at Madrid are likely to obtain all the success which they deserve. Political orthodoxy or sectarian sympathy furnishes no excuse for the breach of international obligations.

The rashness of the dominant party in Cuba is more unaccountable than its ferocity. The Governor of Santiago and the Captain of the *Tornado* could not but know that an active party in the United States had long been seeking for an opportunity of interfering in the affairs of Cuba; and the leaning of the PRESIDENT to a policy of territorial aggrandisement has never been disguised. It must have been foreseen that the execution of the prisoners would cause extreme irritation in the United States; and the most inflated believer in the power of Spain can scarcely think it possible to resist with effect an American claim for satisfaction or for an equivalent penalty. One consequence of the defiance which has been offered will probably be a demand for the immediate emancipation of the slaves; nor will the American Government trouble itself to stipulate for compensation to the owners. The Republican Congress in Spain may pass laws at its pleasure for the abolition of slavery, but it has no means of enforcing its decrees. If the Government of the United States once takes up the question in earnest, the slaveholders will be compelled to submit. The Volunteers might perhaps not strongly object to a declaration of the independence of Cuba, if only they were allowed to compete for the control of the new Republican Government; but with the emancipation of the slaves, their wealth, and even their interest in the affairs of Cuba, will disappear. The extinction of a selfish and tyrannical

power would not be a cause for regret if the community contained any element of good government. The Creoles who maintain the insurrection have probably suffered oppression; but in peace or in war they have never displayed the qualities which might enable them to form a civilized and flourishing State. The negroes are still lower in the scale of civilization than the emancipated slaves in the Southern States, because large numbers of them have been imported from Africa within the lifetime of the present generation. The result of American interference may perhaps be the establishment of some kind of protectorate which it would be impossible to define beforehand. At present either the independence or the annexation of Cuba seems likely to be attended with grave difficulties.

The English demand for redress may perhaps produce another form of embarrassment in deciding on the course which is to be followed if reasonable satisfaction is withheld. Hostile proceedings against Spain would be repugnant to the national feeling and policy; and there are strong objections to any mode of dealing directly with Cuba. It is true that England might with a better grace than the United States demand the emancipation of the slaves, of whom the majority have been brought into the island in violation of English treaties with Spain. Five-and-twenty years ago when Mr. CALHOUN urged the French and Spanish Governments to vindicate the cause of slavery against England, and fifteen years ago when Mr. BUCHANAN proposed the annexation of Cuba for the purpose of extending and strengthening Spanish institutions, England was engaged at a heavy cost of life and treasure in contending against the importation of slaves into Cuba. The dislike of the English nation to slavery has not since abated; but the inconvenience of interfering in the domestic affairs of foreigners is more justly appreciated than in former times; and, as England has no ambitious designs on Cuba, the revolution which might perhaps ensue on emancipation would be controlled by the action of the United States. Although it is seldom the fortune of England to escape calumny, it may be as well not to furnish censorious foreigners with a new proof of the profound and malignant sagacity of English statesmen. For many years after the emancipation of the West Indian negroes it was a commonplace that the sole English motive for abolition was to ruin commercial rivals by forcing them to adopt a similar policy. The probable destruction of the flourishing sugar trade of Cuba by the emancipation of the slaves may perhaps increase the demand for the produce of Mauritius and of Trinidad, and the consequence would be immediately converted by candid critics into the cause and object of English interference. The calumniators of England, belonging chiefly to the democratic faction, habitually spare the United States, even when they are not themselves Americans.

THE FRENCH MINISTRY AND THE CONSERVATIVES.

AFTER a week of rumours and counter-rumours, the Duke of BROGLIE has reconstructed his Cabinet with a larger infusion of new material than was originally looked for. The Duke himself becomes still more than formerly the leading influence in the Government. He exchanges the Ministry of Foreign Affairs for the Ministry of the Interior, and for a long time to come the latter post will be by far the more important of the two. There is no reason to suppose that M. BEULÉ's policy will be in any way departed from. But though the writer of the Press circular had thoroughly mastered the principles of Conservative administration as they are understood by the Duke of BROGLIE, he had not been altogether happy in applying them; and where delicate handling is required, a Prime Minister may naturally prefer to be himself the author of the policy for which he must be responsible. So far as the other changes mean anything, they indicate an approximation on the part of the Cabinet to moderate ideas. Two members of the Right have been replaced by two members of the Right Centre, and the new Minister of Public Instruction belongs in name, though of late not in act, to the still more Liberal Left Centre. It is probable, however, that the fact that these gentlemen have accepted the offered places is more really significant than the fact that the places were offered. The Duke of BROGLIE's policy is sufficiently well known to bring popular suspicion on the constitutionalism of any politician who consents to enter his Cabinet. He may find reason hereafter for aban-

doning the reactionary policy which has lately been attributed to him; but if he does so, it will be in deference to considerations of more weight than the remonstrances of his new colleagues. The changes in the Cabinet may be valuable as marking the drift of the Duke's own mind, but they will not of themselves do much to modify his resolutions. The most encouraging feature in the political prospect is the array of Parliamentary obstacles that the Ministry are likely to encounter if they bring forward any questionable measures of importance. The division on M. LÉON SAY's interpellation showed that on a question of confidence in the Ministry, as distinct from confidence in the PRESIDENT, the Assembly contains a minority of 314 against a majority of 364. Twenty-four Bonapartists and nineteen members of the Left Centre abstained from voting, and men who would not support the Ministry on a question the interest of which had been so greatly lessened by the vote of the week before can hardly be counted on in the more exciting discussions which are to come. A majority of fifty, which may at any moment be reduced to one of seven without the defection of a single supporter, is not calculated to give a Minister any very great sense of strength.

The Constitutional laws promise to offer another difficulty. It is understood that the retirement of M. ERNOUL and M. DE LA BOUILLERIE implies a determination on the part of Marshal MACMAHON and his Ministers not to continue at any Monarchical intrigues. The Conservatives of the Right Centre have apparently made up their minds that they must help themselves, instead of waiting for HENRY V. to help them, and their ideas will probably take the hitherto unknown shape of a reactionary Republic. A Constitution which should contain an Assembly purged of those grosser materials which have defiled it under the reign of universal suffrage, a Second Chamber organized so as to check any inadvertent relapse of the First Chamber into its old independence, and an Executive strong enough to set both Chambers at defiance, supposing that Conservative interests are held to require it, would satisfy their requirements notwithstanding that it retained the name of a Republic. But such a settlement as this would not at all suit the purposes of the Right. They still cling to a Restoration as the only expedient that can give permanent peace to France, and it is consequently far from being their object to make even a dictatorship strong enough to rival the Monarchy as a security for order and tranquillity. The Right and the Right Centre are agreed in repudiating a Republic in fact; but while the Right are equally resolved to repudiate even a Republic in name, the Right Centre think that the name may be tolerated provided that the thing can be moulded to their views. Whenever the Constitutional laws come on for discussion this difference of opinion can hardly be any longer concealed. If the probable defection of the Right from the Ministry is not made up by any fresh accessions from the Left Centre, the Duke of BROGLIE will be hard put to it to find his majority. It is to be feared, however, that the Ministry, foreseeing that constitution-making is likely to prove a dangerous employment, may try to unite their supporters on a preliminary question of such moment that even the Constitutional laws will be of minor consequence by its side. Will any considerable number of the Left Centre join the Government in an attack upon universal suffrage? The cohesion of the party is so slight that it is quite possible that the leaders may not have power to prevent a large section of their followers from joining the Duke of BROGLIE on such a point as this. As yet the apparent progress of Republican opinion in the most Conservative districts of France seems to have exerted no influence upon the Conservative party in the Assembly. They cannot be brought to believe in the genuineness of the preference for a Republic shown by one constituency after another, but explain it by theories of Conservative inaction or of Radical zeal. They will not admit that the peasantry, the true strength of French Conservatism, can be so untrue to their past history as to wish to see the Republic permanently set up in France. Certainly the action of the peasantry under the Empire may be instanced as an argument against the sentiment evidenced by their recent votes. NAPOLEON III. found that his chief strength lay in appealing to their dread of that very form of government which they now seem anxious to see adopted, and the Conservatives in the Assembly find it hard to understand how they can have changed so completely in so short a time.

Yet the considerations by which the peasantry have probably been influenced are not of a very recondite order. In

the first place, their experience of the Government of National Defence showed them that a Republican Government could be both strong and national. Whatever faults may be attributed to M. GAMBETTA, want of energy is not one of them; and the manner in which he came to the front when so many others were ready to despair appealed strongly to French patriotism, and relieved the Republic of that reputation for excessive cosmopolitanism with which its association with Republicans in other countries had rather tended to invest it. Again, M. GAMBETTA's rule convinced the peasantry that the Republic could defend as well as attack them; that it could have other purposes in view than confiscation of property or destruction of churches; that, instead of proscribing its opponents, it could summon them to take part in the common work of resisting invasion. All this might have been forgotten if M. THIERS had not succeeded to power. But after the experience of 1871, it is of little avail to preach to the peasantry that only the dictatorship of Marshal MACMAHON can protect them against the Radicals. The very persons who tell them this have also told them that the worst and most dangerous outburst of Radicalism which France has ever known was the Commune, and the Commune was put down by M. THIERS. What the Republic has done once, and done more thoroughly than any preceding Government, the Republic may be trusted, if necessary, to do again. Further, M. THIERS's name is connected with an immense financial success. The indemnity has been paid off as if by magic, and though the taxation which will be needed in consequence must tell heavily on the peasantry hereafter, it does not seem to have been much felt by them as yet. In this way the Republic has been proved to possess a particular kind of strength to which the peasantry attach very great value, and in which they had always supposed it to be wanting. In the third place, the peasantry have come to understand that the choice which France has to make is the choice between the Republic and Legitimate Monarchy, and for Legitimate Monarchy they have a special and intelligible dislike. Rightly or wrongly, they set extraordinary value on the law of succession to land. They feel that the actual subdivision of property would have but a small chance of continuing if this law were altered. They know further that the wealthy nobility dislike this law intensely, that they are always doing their best to set it aside by family arrangements, and that in this way they have already succeeded in getting together very considerable estates in various parts of France. It is these very nobles whom a Restoration would carry to the head of affairs, and what, the peasantry probably ask themselves, can be more natural than that, when they are once in power, they should procure the abolition of a law which hampers them in making eldest sons? The Legitimist aristocracy have ceased to be personally unpopular in the districts in which they live, because they have become completely dissociated from government. They are richer than the peasantry around them, but they have no larger share of political power. But the hatred which the peasantry bore to their grandfathers might possibly revive if they became members of an hereditary Chamber or the immediate advisers of a King. If the Right Centre could take in this change in the views of the peasantry, they would probably be wise enough to see how rich in Conservative elements a Republic resting on the peasantry would certainly be.

MR. DISRAELI AND THE GOVERNMENT.

AT the close of his visit to Glasgow Mr. DISRAELI gave himself and his hearers a day of pure entertainment and the fulfilment of the more arduous and sober task of moralising on the lives of Scotch lads, and dilating on disturbances of prices. He had prepared a perfect battery of epigrams against Mr. GLADSTONE's Ministry, and he let them off with the keenest relish and to the great amusement of those who listened to him. He was nominally addressing a Conservative Association, but he said that he could have wished to have quitted Glasgow without saying anything to offend any one in the town; and he succeeded in his object, for Liberals must be very thin-skinned indeed if they felt hurt at what he said. He set himself to justify the language of his famous Bath letter; and to show that the career of the Ministry had been one long course of blundering and plundering. The

Ministry have made blunders so numerous and gross that outside official circles there is nothing for Liberals to do except to own that clever men are often very silly. No epigrams on the Corn Law appointment or the Zanzibar Contract can go beyond the mark, and a political opponent is entitled to make his epigrams on them as strong as he can. Mr. DISRAELI had also a fair triumph in digging up the memory of an unfortunate speech made by Mr. LOWE in opposition to the Abyssinian war, and nothing could have been more ingenious than the speaker's reference to the pink fly which Mr. LOWE prophesied would extirpate the English army. It is a conspicuous instance of the difference which office makes that the Abyssinian alarmist should now be sitting in a Cabinet conducting a war of almost a precisely similar character; and when the reference to the fly was followed by a remark that Mr. LOWE seemed inclined to vituperate the insects of Abyssinia as if they were British workmen, the highest pitch was reached in that style of abuse which consists in making the errors of an adversary flash on the minds of an audience. The list of instances in which, according to Mr. DISRAELI, the Ministry has harassed trades and professions was somewhat overcharged; but it cannot be denied that the Ministry has not only been occasionally rash in making changes, but has been still more rash in suggesting changes from whim or caprice, and without any attempt to consult public opinion, and then withdrawing them in such a manner as to leave unabated the irritation and alarm of those whose interests were threatened. Mr. LOWE has been a great offender in this way, and he has repeatedly spoken as if every class of taxpayers were his conquered enemies on whom he felt at liberty to levy any form of tribute he could devise. But then, after all this is admitted, Liberals who have agreed with Mr. DISRAELI and enjoyed his smart sayings are obliged to ask themselves what is to be done. There must be some Ministry in power, and if the existing Ministry cannot be replaced with advantage to the country, there remains nothing but the hope or expectation that the free criticisms of friends and opponents will do the existing Ministry good. It is only fair to the Ministry, and especially to Mr. GLADSTONE, to acknowledge that there are many signs of criticism having produced this salutary effect. Mr. GLADSTONE himself passed through last Session without giving any cause to complain of that air of dictatorship which used to characterize him. He has lately made appointments solely on the ground of public usefulness, and at some cost to his own prejudices or feelings. He has shelved Mr. AYTON, he has removed Mr. LOWE from an office which betrayed him into perpetual errors, he has sent Mr. BUTCH to the quiet seclusion of the Peers. He has in effect acknowledged the blunders of himself and his colleagues, and undertaken to do his best to avoid a repetition of them. This must have been painful to him in many ways; but in doing it he has done the best for himself and the country, and he deserves to have credit given him for having shown more sense and patriotism than those who judged him by his conduct during the first four years of his Premiership had much reason to expect.

Mr. DISRAELI, however, not only attacked the Ministry on points where Liberals think the Ministry wrong, but on points where Liberals without exception think the Ministry right. Yet nothing that Mr. DISRAELI can say on these subjects can offend Liberals seriously, or damage the Ministry in the slightest degree. The Irish Bills of Mr. GLADSTONE's Cabinet were not the Bills of the Ministry, but of the whole party; and, so far as a nation speaks by an overwhelming Parliamentary majority, of the nation. It is idle to fight over again the battle of Disestablishment and Tenant-right. But it may be conceded that Mr. GLADSTONE specially and personally did some harm by choosing to rest his defence of these measures on the general policy that Ireland should be ruled according to Irish ideas. There is a sense in which this doctrine is quite consistent with the maintenance of a sound Imperial policy. Mr. GLADSTONE's unguarded language may probably have done somewhat to encourage Irishmen in the notion that they were entitled to be governed according to their ideas, whether those ideas were right or wrong, wise or foolish. Perhaps Mr. GLADSTONE, had he been more cautious, would not have carried his Bills amidst so much enthusiasm and with such ease; but his want of caution has probably had something to do with the Home Rule movement. But then, if we look not so much at Mr. GLADSTONE's language as at the Acts themselves, the argument may be turned the other way, and we may ask

whether Home Rule would not have been a much more serious thing to deal with if the Irish Church were still established, and the petty tenantry of Ireland were still discontented. As it is, the Home Rule movement has, at least for the time, collapsed. The Irish will not commit themselves to it. They see that they gain by their connexion with England, and England feels entitled to insist that, if the connexion is to be maintained at all, Imperial policy shall prevail in Ireland as in the other parts of the United Kingdom. But there would have been no common consent of Englishmen to uphold this cardinal maxim unless the stumbling-block of the Establishment had been removed. If it is Mr. GLADSTONE'S language that has made the Home Rule movement begin, it is his measures that have made it wither away. Mr. DISRAELI, as usual, indulged in exaggerated language, and shook the rod of vague terror over an audience he wished to startle. He described Ireland as in a state of rebellion, covered under a very thin veil. Where are the signs to be seen of anything of the sort? Mr. DISRAELI speaks of Ireland as the present French Ministers speak of France. They love to describe themselves and every one else as living perpetually on the brink of anarchy and ruin; but as soon as any serious effort is made to govern firmly and fairly, it is found that those who practically determine the destinies of the country are very ready to submit quietly. As to the future, Mr. DISRAELI is in the highest degree mysterious and terrifying. He delights in painting impending horrors, and he seems to wish his Glasgow hearers to believe that they would shortly have to choose at the sword's point between a Red Republic and an Ultramontane despotism. They need not make themselves particularly uneasy. The way to combat anarchical forces is to show that we are not afraid of them. The Imperial policy of England is to repress vigilantly and quietly, but with the utmost determination, both Red Republicans and Ultramontanes; and as ninety-nine Englishmen out of a hundred are resolved to uphold this policy, they may rely on effecting their object. The very thing that Ultramontanes, and perhaps Red Republicans—although we hear so little of the latter here that we know nothing about them—most desire, is to inspire the belief that they are possessed of a mysterious, awful, and secret power, and that a sort of battle of Armageddon may be expected to begin at any moment. This is an advantage which Mr. DISRAELI is far too ready to concede to them. It is only necessary to look the Ultramontanes in the face, and they will be found to be not such very terrible beings after all.

On one subject, however, we must allow that Mr. DISRAELI spoke with great good sense and sagacity, and has rendered the Ministry and the Liberal party a real service by the mode in which he handled it. He touched on the project for extending the household franchise to the counties, and he pointed out two consequences of a Liberal Ministry taking up the subject at the present time which deserve serious notice. In the first place, he appealed to the history of the fifteen years which preceded the Reform Bill of 1867, to show that when once Parliament touches the question of Reform it cannot work heartily at anything else. The gift of a vote to the agricultural labourer must be an immense national gain if, in order to secure it, it is worth while to make the next Parliament useless for any other purpose. In the next place, Mr. DISRAELI pointed out what enthusiastic young Liberals appear to forget, or to pass over as not worthy of attention, that the representation of boroughs of moderate size must pass away altogether if the constituencies receive any wholesale enlargement. Mr. DISRAELI objects to this, and he may honestly claim to say that, in objecting to it, he is not influenced by party motives. The smaller boroughs are on the whole Liberal, whereas, if these boroughs were swamped in a new county division, the influence of Conservative landowners would be sure to make itself more felt than it is now. Liberals at least need not be so Quixotic as to wish to reduce the strength of their own party; but even if they chose to be generous or weak enough to be indifferent to the party consequences of the change, they ought to show that they have duly considered the great detriment which the abolition of the special representation of boroughs of moderate size would be to the character of the House of Commons, and to the interest of the nation generally in political matters. It is not too much to ask that there should be some places left for which a candidate of moderate means may stand, and in which a voter has the amusement of thinking that it will

make a difference which way he votes. Of course Mr. DISRAELI did not venture, nor would any leader of any party venture, to insist on the fundamental objection to the extension of the county franchise, that until education has spread a little further the agricultural labourer is totally unfit to vote. As every statesman expects that the agricultural labourer will soon get a vote, every statesman wishes that the new voter should think the party to which the statesman belongs is composed of the labourer's real friends and admirers. Mr. DISRAELI confined himself to subsidiary objections; but although these objections are subsidiary, they are of a kind which command themselves to the notice of Liberals quite as much as to that of Conservatives, and the Liberals of Glasgow, far from being offended at the Conservative leader for making them, ought to be very much obliged to him.

THE ARBITRATION CROTCHET TESTED.

THE Italian Parliament has, on the motion of Signor MANCINI, approved by a unanimous vote the principle of arbitration. Mr. RICHARD, who was present among the audience, may perhaps have induced the mover to propose a resolution which the English House of Commons had not been ashamed to adopt. If philanthropists take pleasure in committing representative assemblies to barren and ridiculous propositions, the Peace party may be congratulated on another verbal triumph. It would be interesting to learn whether the majority either at Westminster or at Rome had inquired whether arbitration would be applicable to any of the disputes which now disturb or endanger peace in any quarter of the world. Even Mr. RICHARD would scarcely maintain that the troubles on the Gold Coast could be settled by a reference and an award; but it might perhaps be contended that civilized nations should avoid the risk of quarrelling with savages by withdrawing from an intercourse which is likely to be interrupted by misunderstandings. Some similar excuse might perhaps explain away the obvious inutility of any attempt which might have been made to refer the differences between Russia and Khiva to arbitration; but the advocates of the newfangled contrivance will find that it is equally worthless as a remedy for the differences which arise between civilized Powers. The English Government will perhaps acquiesce without serious protest in the political rebuff which it has received by the recent publication of the treaty which reduces Khiva to the condition of a Russian province; but if it were thought expedient to resent a direct breach of faith, no remonstrance would produce the slightest effect unless it were backed by a display of force. The Emperor of Russia would assuredly not allow any arbitrator to decide whether he should restore the independence of which the Khan of Khiva has been deprived; nor could an award, however solemn, be more binding than the voluntary engagement of last winter which has now been cynically disregarded. When States are not disposed to maintain their alleged rights or supposed interests by force of arms, arbitration is not necessary for the maintenance of peace; and the comparison of forces is not within the competence of an arbitrator. In minor disputes, as in the determination of the San Juan boundary, or in cases such as that of the Washington Treaty, where one of two disputants desires to cover his submission to the demands of an adversary, arbitration is practicable, and it is not a novelty.

The Khiva misadventure may convey a lesson to diplomatists, as well as a constructive reproof to philanthropic projectors. The announcement that the English Ambassador at St. Petersburg had been instructed to oppose the conquest of Khiva caused natural surprise, though the measure appeared afterwards to be in some sort justified by the mission of Count SCHUVALOFF to England. The professed anxiety of the Emperor ALEXANDER to reassure the English Government involved an acknowledgment of the right to remonstrate; and the explanations and promises which were voluntarily tendered purported to remove a feeling of alarm which was tacitly assumed to have been reasonable. Lord GRANVILLE properly accepted the personal assurances of the Emperor as not less valid than formal diplomatic pledges; and he may be well convinced that the most formal treaty would not have been more binding on Russia than Count SCHUVALOFF'S unofficial declarations. The Imperial Government had, only two years before, deliberately repudiated the obligations of a treaty to which all the great Powers of

Europe were parties; and England and Turkey were forced to submit, or to adopt the alternative of treating the breach of treaty as a case of war. The Emperor ALEXANDER assured the English Minister that he had no intention of annexing Khiva, and that the Russian troops would return as soon as they had obtained satisfaction. The EMPEROR'S Lieutenant in Central Asia has now annexed that part of Khiva which lies on the right bank of the Oxus; and he has asserted the right of occupying any part of the left bank which may be required for Russian purposes. The KHAN is forced to declare himself the servant of the EMPEROR, to renounce the right of war and peace, and to exclude from his remaining dominions all commerce except that of Russia, and all foreigners who may not be provided with Russian passports. In every respect Khiva is now a province of the Russian Empire; and if the prospective annexation was objectionable to England, the right of threatening war or arbitration must now have revived. The publication of the treaty is evidently intended as a defiance of England, and it perhaps implies a sneer at the simple credulity which accepted Count SCHUVALOFF'S assurances. The professed understanding as to the border-line which was to separate Afghanistan from the Russian dependencies will of course be in the same manner disregarded when it may suit the convenience of Russia to meddle with Afghan affairs. The injudicious timidity of Mr. GLADSTONE'S attempt to explain away the obligation incurred by England may perhaps hereafter furnish an excuse for a breach of the understanding by Russia; but it is not known that Mr. GLADSTONE'S imprudent language provoked any protest. The Russian newspapers which took the opportunity of declaring that the engagement was no longer binding had previously announced that the EMPEROR had not made a promise, although he had announced his intentions for the moment.

It would probably have been judicious to offer no ostensible opposition to the acquisition of Khiva by Russia, not because the extension of the Empire was acceptable to England, but because there was no sufficient motive for interference, and still more because there was no facility for resistance. The consolidation of Russian supremacy in Central Asia is not in itself unjustifiable, although it involves ultimate danger to India. Khiva is out of reach; and the English nation is not prepared to engage in a war with Russia on a remote and scarcely intelligible issue. The conquest and annexation of the territory would not have been an affront to England if it had not been effected in violation of an express and recent promise. The country lies far within the outer range of the Russian dominion, and it is distant from the frontier of India. As a general rule, diplomatists ought to demand nothing which cannot in the last resort be enforced. Even a Geneva arbitrator could return only one verdict if he were asked whether the annexation of Khiva was consistent with Count SCHUVALOFF'S promises; but the most conscientious tribunal might hesitate to decide that the suppression of the independence of a petty and barbarous State was in itself undesirable. In dealing with Russia, English statesmen may henceforth prudently decline both regular treaties and informal understandings. Unlimited license of disregarding national engagements offers much discouragement to friendly negotiation.

Signor MANCINI and Mr. RICHARD may easily find other cases by which they may test the utility and efficiency of arbitration. It might have been supposed that even sentimental theorists could have scarcely thought it possible that the American Government should refer to arbitration its right of demanding satisfaction for the Santiago executions, and even now Spain would not allow any tribunal to dictate the surrender of Cuba. It seems that Señor CASTELLAR did propose arbitration, but it was summarily and properly rejected by the American Government. The Italian Parliament may find near home a still more crucial instance. The Archbishop of PARIS lately expressed the opinion of the clerical and Legitimist factions of France in his demand that the French Government should restore by force the temporal power of the POPE; and it is well known that the same policy would have been pursued by M. THIERS if he had not been restrained by reasons of convenience and expediency which are below the notice of Legitimacy and of orthodoxy. If the French were at liberty to invade Italy, their claims on behalf of the POPE would probably not be confined to the restoration of his sovereignty in Rome itself and the adjacent district. The Legations also are

part of the inheritance of St. PETER; and the Italian Government might be summoned to disgorge all its sacrilegious acquisitions. It is scarcely probable that the leaders of the crusade would propose to refer the question of the dismemberment of the Italian kingdom to arbitration; but it might be still more confidently asserted that an Italian Minister who accepted such a proposal would be justly and unanimously denounced as a traitor. The indiscriminate approval of the system of arbitration is founded on the assumption that national honour and independence and the integrity of the territory are questions to be determined, as often as a dispute arises, by the judgment of an impartial tribunal. It is difficult to say whether it is more idle to appeal to an unjust aggressor or to a defender of assailed national rights to submit their respective pretensions to the decision of a stranger. The cases in which wars are waged on doubtful issues on which a real difference of opinion can arise are comparatively few; and when both parties are, as in the American Civil War, to a certain extent in the right, the passions aroused by the struggle are commonly too earnest to allow of any solution except by a conflict of force. When Russia, the United States, and Italy are respectively prepared to refer to arbitration the occupation of Khiva, the Santiago outrage, and the possession of Rome, the vote of the Italian Assembly will deserve a certain amount of practical respect. In the meantime the constituents of the English House of Commons are unfortunately not in a position to censure even the least wise proceeding of a foreign Legislative body.

THE TRIAL OF MARSHAL BAZAINE.

IT is an English rather than a French custom to wash the dirty linen of the nation in public. We rather pride ourselves on the process, and regard it as a proof of the courage that likes to know the worst and is determined to get at the bottom of things. For once in a way the French are imitating our example, not without many protestations on the part of sensitive Frenchmen against what they regard as a national humiliation which serves no good purpose; and so strongly do the opinions of the French influence those who live among them, that most of the English Correspondents at Paris seem to agree that the revelations made at the trial are very shocking, and that no good is gained by having them made. But this is scarcely the impression which the history of what is going on during the trial is calculated to produce in English readers on this side of the water. What is repulsive is not the record of what was said or done during the war, so much as the many expressions of bitter feeling and the puerile insults to political opponents which proceed from the lips of witnesses, or are to be found in journals which comment on the evidence. The evidence is often trivial, and still more often irrelevant; but this is almost always the case in French trials, and would not be worth noticing were it not that witnesses take the opportunity of gratifying their present political passions. We may be glad to think that under the English system the evidence of an officer would have been rigidly excluded who, as a contribution to the decision of BAZAINE'S guilt or innocence, deposed that when a prisoner in Germany he often heard German beer-drinkers exclaim "St. GAMBETTA pray for us," in derision of the famous person who was supposed to be leading France into the depths of ruin. The general character of the evidence does not place the conduct of Frenchmen during the war in any new unfavourable light. On the contrary, it has shown that there was a spirit of patriotism and a love of adventure which prompted many poor men to run the most serious risks in order to make themselves useful by carrying information through the enemy's lines. It shows that the Army of the Rhine behaved with bravery in action, and endured considerable privations with constancy. It may also, we think, be said to show that the chiefs in command inside Metz were in a position of very great difficulty, and honestly did their best after their own fashion. Lastly, it places in a clear light what may be termed the main circle of French misfortunes, out of which there was no moving, and which was this:—No one of any party, neither the EMPRESS, nor BAZAINE, nor JULES FAYRE, nor M. THIERS, was either able or willing to make peace in the September or October of 1870 on the only basis which the Germans would accept, the cession of territory. The military men, however, were all of opinion that the war could not be prolonged

with any rational hopes of success. A civilian who believed in possibilities which to military men seemed impossibilities was the only man that could prolong the war, and this man was found in GAMBETTA. As GAMBETTA insisted that the war could and should be prolonged, the military men, or at least some of the best of them, obeyed him. But GAMBETTA was totally incompetent to devise or arrange military operations, and he sent his military men, and especially BOURBAKI, to certain disaster. Thus France could only prolong the war by a machinery which made the prolongation of the war ruinous. But it was France, not GAMBETTA, that prolonged the war, and it is despicably unjust to reproach GAMBETTA for having gratified the wishes of the country. On the other hand, the military men were perfectly right in their appreciation of facts, and it is very unjust to them, when their conduct is criticized, to forget that they were right.

The evidence given against Marshal BAZAINE is of the most multifarious kind, and much of it is hardly connected with the Marshal at all. It is, however, difficult to understand the value of evidence merely by reading it; and when evidence given on one side is denied pointblank on the other, it is generally hazardous to guess which side is right without having had the advantage of seeing and hearing the witnesses. There are, therefore, minor points on which the Court may justifiably have conceived an opinion adverse to BAZAINE. They may think, for example, that he received despatches which he states he never received, or that he may not have taken advantage of favourable circumstances which he alleges did not exist. But on the main heads of accusation so far as the evidence has as yet gone, what has been established appears to coincide much more closely with the statements published by BAZAINE in the book he wrote in his defence than with the charges of the Government prosecutor. The first of these main heads of accusation is that, after the news of Sedan were received, BAZAINE used his army not to fight, but to negotiate; whereas his army was quite capable of fighting with a good chance of a great success. BAZAINE quite admits that he used his army to negotiate, but then he says that this was the best use he could possibly make of it. He asserts that the army could not have fought better than it did. He allowed it to fight to a certain extent, with the object of keeping up its spirit, as well as of making the enemy respect it and therefore of allowing better terms in negotiation, and of detaining as large a number of Germans as he could in the East of France. Throughout he made one mistake which almost every French general made also. He trusted far too much to subordinates, accepted statements without testing them, and took for granted that orders were executed because he had given them. If the object of the trial was to show that he was a second-rate man in every respect, the issue would be as clear as daylight. But when it is said that he made a wholly unsatisfactory defence with a guilty purpose, we want evidence to show that the defence was unsatisfactory. All the military men who were with him of high rank—and they were at least men, like CHANGARNIER and CANROBERT, of incontestable eminence after the French standard—bear witness that the army could not get through the enemy's lines, and that it was totally impossible to introduce supplies on any adequate scale. In one way their evidence is not worth much, for the conduct of the defence had their approval at the time, and so they too are to some extent on their trial. The Germans, it is well known, thought highly of BAZAINE as a commander, the best English correspondents were of opinion that the Metz army could not break through, and no military critic of any reputation has suggested since the war that BAZAINE ought to have been able to force his way out of Metz. This is all very vague in the way of evidence. But then what is the evidence given on the other side? It is impossible without reading it to appreciate its peltrey and trivial character. It is the evidence of men totally incompetent to look at any but the tiny incidents that came under their own notice. It is the evidence of citizens of Metz who declare that they wondered then, and shall wonder to their dying day, how it happened that a certain number of sheep they had seen near a fort were not brought into the town, or how several pounds of bacon were unaccountably forgotten. It is the evidence of a Metz manufacturer who swears that he protested in vain that he and not some preferred rival was the right man to have a contract given him. It is the evidence of an enthusiast who reveals that

he offered to the Commandant of Thionville to swim into Metz to carry despatches to BAZAINE, and that he was barely prevented from swimming seven or eight kilometres under the noses of the Prussians. It is the evidence of two or three worthy creatures who declare that they happened on different occasions to be lurking on the extreme edge of the ground held by the French, and saw BAZAINE go out in a mysterious way and talk with the enemy. All that can be said of this evidence is that it was mostly given by Frenchmen whom a hard fate has now made Germans, and that France need not perhaps grudge them the intense pleasure they seem to have experienced in giving testimony which they believed to be perfectly crushing against the traitor who has made them pass into the hands of the enemy.

BAZAINE and all his generals admit that, if he had thrown all his force against the enemy, some soldiers would have got through. On one occasion a calculation was made, though not by BAZAINE himself, that if the whole French army had been used in a sortie, one-third would have been killed, one-third driven back into Metz, and one-third would have got, in a disbanded and broken state, into the neighbouring woods, whence some of them at least might have made their way into Belgium, or joined other French forces. BAZAINE says, and every impartial person must allow that there is much to be urged on behalf of his opinion, that it was much better for him to detain two hundred thousand Germans round Metz, and to use the army as a means of negotiation. But he states, and no evidence has been offered that in the least shakes his assertion, that he strictly confined himself to what came within his scope as a commander, negotiating for the surrender of his army with the honours of war. Prince BISMARCK entirely declined to negotiate on these terms. Either the surrender of the army of Metz must be a repetition of the surrender of the army of Sedan, or it must be a part of a general arrangement for peace. To negotiate peace was, in the opinion of BAZAINE, entirely out of his province, and belonged only to the Government; and for him the Government meant only the Government of the EMPRESS, or rather of the EMPRESS as Regent, and Prince BISMARCK also told him that Germany would only negotiate with the EMPRESS. Accordingly he allowed REGNIER to conduct BOURBAKI to Hastings, and later on sent General BOYER to Versailles. From Versailles General BOYER went to Hastings, and there learnt that the EMPRESS would have nothing to do with a peace involving a cession of territory, and was occupied in trying to induce the Germans to accord exactly what BAZAINE was aiming at, the concession of the honours of war to the Army of the Rhine. There were, in fact, three different persons or sets of persons with whom the Germans were to some extent negotiating. There was the EMPRESS, there was the Government of National Defence, and there was M. THIERS with his combination for help from foreign Powers; and Prince BISMARCK played off one against another. M. JULES FAYRE stated in his evidence that when he met Prince BISMARCK in September the Prince asked him whether he thought he could count on the obedience of BAZAINE, and the Prince was, in fact, at this moment in negotiation with REGNIER. When BOYER went from Versailles to Hastings, Prince BISMARCK told him that if the EMPRESS would agree to make peace, BAZAINE must engage to pledge the army to support her, to which the General replied that this looked too much like a pronunciamiento to be in accordance with the usages of the French army. But then it is said that, even if it were admitted that BAZAINE might honestly think that the existing Government for him was that of the EMPRESS, he ought to have sunk for the time every cause of difference and co-operated with the Government of National Defence, just as the EMPRESS herself advised BOURBAKI to go to Tours when he left her. BAZAINE's answer is, that this might have been his duty if he could have communicated with the Government of National Defence, or if that Government could have communicated with him. However much he had communicated with them, he could not have done more for them than he did by detaining two hundred thousand Germans round Metz till the last possible minute, but no doubt each party would have derived some advantage from communicating with the other. But neither party could communicate with the other. GAMBETTA, who gave evidence the same day as JULES FAYRE, could only say that it was very curious that none of his messengers arrived at Metz, and it was shown on fairly good testimony that shortly before the capitulation despatches from BAZAINE

were received at Tours, which were however useless, because they were in cipher and the key of this cipher was in Paris. BAZAINE, no doubt, was full of hostile contempt for the new revolutionary Government, and he considered war conducted by enthusiastic civilians an absurdity. But it is very difficult to say precisely what he ought to have done on behalf of the Tours Government which he did not do, and to prove that he could have done it. What really annoyed the Tours Government, and made GAMBETTA issue his violent proclamation accusing BAZAINE of treason, was not so much that he capitulated, but that he capitulated ten days too soon for the success of the Army of the Loire. BAZAINE quite admits that he would be deserving of the severest censure if he had capitulated ten days, or one day, before he was absolutely compelled to do so; and thus we are brought to the third great issue between the parties, that as to the terms and the time of the capitulation, the evidence as to which has not as yet begun.

MR. FORSTER AT LIVERPOOL.

MR. FORSTER'S speech at Liverpool on Tuesday is a complete justification of the prediction that Mr. BRIGGS's return to the Cabinet would make no change in the educational policy of the Government. Nothing can be more unmistakable than Mr. FORSTER'S reassertion of the principles upon which the Act of 1870 was founded. There is not an uncertain note in the whole speech. Every sentence displays a settled determination to continue the work of making elementary education universal on the lines already laid down. Those who read Mr. BRIGGS'S speech to his constituents with the cure it deserved will not be surprised at Mr. FORSTER'S unshaken attitude. A Minister who had taken office on the understanding that the policy of the Government on an important question was to be reversed would hardly have been as frank as Mr. BRIGGS was in his condemnation of what his colleagues had done. He would rather have tried to make their indispensable capitulation pleasant to them. Mr. BRIGGS'S criticism of the Education Act was the utterance of a man who speaks his mind freely because he can speak it without pledging himself. He proclaimed that he differed from his colleagues upon one part of their past policy; but it was precisely because he regarded it as past that he was able to say all he thought about it. He views the Act of 1870 as an experiment which is still in progress. Down to the moment at which it was begun it was open to Parliament to decree that this experiment should be tried under this or that set of conditions. Mr. BRIGGS holds that the right course would have been to try it under Secularist conditions. Mr. FORSTER and the majority of the Cabinet thought that it could only be tried under Denominationalist conditions. Mr. BRIGGS believes that this preference will make the experiment a failure, but he confesses at the same time that, whether he or the rest of the Cabinet are right can only be ascertained by results. There was nothing in his speech to show that, even if he could persuade his colleagues to begin the experiment afresh, he would do so. It is quite possible to regret that an experiment should have taken a particular form without being for that reason anxious that the progress already made in it should go for nothing. At all events it was abundantly clear that Mr. BRIGGS had made no stipulation that it should go for nothing. Yet, in the face of this self-evident certainty, Conservative partisans and Liberal malcontents insisted on attributing all kinds of occult meaning to Mr. BRIGGS'S return to office. They must now be in the position of a conjurer who has professed to tell the contents of a closed box and is disconcerted at finding it empty. As regards the Liberal malcontents, it will soon be seen whether their recent suspension of operations was due to conscious exhaustion or to a genuine incapacity to read the political sky. After Mr. FORSTER'S speech they cannot plead any longer that they are waiting to know the mind of the Government.

We are not at one with Mr. FORSTER as to the theoretical demerits of Secularism. If the country had been disposed to separate secular and religious instruction, and to say that the subjects upon which all men are agreed shall be taught at the common expense, while the subject upon which men must be content to differ shall be taught at the expense of the separate religious denominations, we see no reason why the plan should not have answered. But to plead the abstract advantages of Secularism as an argument against the Elementary Education Act is like pleading

the abstract advantages of Republican Government as an argument against the Reform Act. At this moment it would be as easy to declare Mr. GLADSTONE President as to proclaim the universal and compulsory severance of religious and secular instruction. It is the manner in which this fact is received that marks off the man with whom education is a primary object from the man with whom it is a secondary object. The Council of the League would probably admit that, if the Education Act had been framed so as to satisfy their present demands, it would have been impossible to pass it, and still more impossible to carry it out. In that case, they say, the right course would have been to have waited until public opinion had declared itself with sufficient emphasis to make a Secularist Education Act possible. They have a perfect right to hold this view, provided that they acknowledge that in their estimation it is better that children should remain uneducated than be educated in Denominational schools. That is what we understand by making education a secondary object. In this respect the extreme Secularist is on a level with the extreme Denominationalist. Both alike repudiate secular instruction unless it can be had under the particular circumstances of which they severally approve. Between these two sects of fanatics comes that vast multitude of Englishmen who are willing to subordinate their preferences for this or that kind of education to their desire that children should be educated somehow. It is upon these last that the success of the Education Act really depends, because it is they alone who are able to invite co-operation upon whatever terms will secure the largest number of auxiliaries.

On the principle that the party that makes most noise gets credit for being the most numerous, it is these extreme opinions that have seemed to be most important in the recent School Board elections. Bible Rights and Liberal Rights, Church candidates and Unsectarian candidates, have appeared to have the field almost to themselves. The extravagance of the Secularist opponents of the Act has developed an almost equally extravagant opposition to it in the very midst of its professed supporters. It is a leading principle of the Act that accommodation shall be at once provided for the whole number of children who ought to be at school. The complaints that have of late been brought against School Boards seem to ignore this principle altogether, and to assume that before building new schools a Board should be satisfied, not only that there ought to be no vacancies in the existing voluntary schools, but that there are none. In many cases the Denominationalist candidates, though they may secure their election for this time, have done so at the cost of furnishing their opponents with a weapon which will be used against them with tremendous force hereafter. If they could only have played their cards with more self-control they held an extremely good hand. They might have impressed the ratepayers generally with the conviction that they were genuinely anxious to obtain the utmost educational results of which the Act was capable, while at the same time they were equally anxious to impose as light a burden as possible on the ratepayers. In their haste to snatch at this latter advantage they have gone far to sacrifice the former. They have appeared to be preaching economy at any price, instead of preaching education at the lowest price. If they have won an election here and there by thus appealing to the poorest and most ignorant class of ratepayers, they have laid themselves open to the charge of not caring for education except when it is under their own control; and when the present cold fit passes away, they will find that educational enthusiasm would have been a safer sentiment with which to have their names associated than a mere desire to spare the ratepayers' pockets.

From an educational point of view the most important part of Mr. FORSTER'S speech is the reiteration of his willingness to bring forward, and of his ability to frame, a general measure of compulsion. In order that such a measure should be passed and worked, he stipulates for two things—first, that no parent shall be compelled to send his child past a school which he likes in order to go into one which somebody else likes; secondly, that the ratepayers shall not be compelled to build schools merely because somebody wishes that the children should be sent to School Board schools instead of to the voluntary schools. These stipulations seem to involve the maintenance of the 25th Clause in one shape or another. It cannot but happen from time to time that a Denominational school will be

nearer the house of some indigent parent than a School Board school, and if the indigent parent is not to have the school fee paid for such of his children as are attending the former school, he will in effect be compelled to send his child past a school that he likes. Again, there will constantly be cases in which there is no effective demand for additional school accommodation, and in which, if the 25th Clause did not exist, the ratepayer would be compelled to build schools simply to gratify the dislike which a few violent partisans entertain towards Denominational schools. The second of Mr. FORSTER'S conditions may perhaps indicate that he contemplates some measure of compulsion which shall not be indissolubly associated with School Boards. If the ratepayers are not to be forced to build schools where they are not wanted, it seems hardly expedient that they should be forced to form themselves into Boards which are chiefly necessary when new schools have to be built. For ourselves, we are perfectly willing to see School Boards made universal, but there cannot be much doubt that the opposition to a general measure of compulsion would be greatly lessened if the two provisions were found not to be inseparable.

THE HOME RULE CONFERENCE.

IT is possible and probable that the Irish agitation for Home Rule or separation may be troublesome; but, in its recent form of a Conference, it has not a formidable appearance. The title of the meeting was unusually applicable, because there were many conflicting opinions to reconcile or to compare. Political and sectarian Conferences and Congresses in modern times for the most part resemble the mob-gatherings which are called demonstrations, except that they are held under a roof. A number of agitators or delegates meet together for the purpose of exhibiting their numbers and unanimity, and of assuring one another that they are resolved to have their own way. The Home Rule speakers had not previously come to any agreement as to the meaning of Home Rule; and the few members of Parliament who were present, having satisfied a section of their constituents by their attendance, were apparently not anxious to enrol themselves among the followers of Mr. BUTT. It is surprising that even an audience was wanting, as if the disaffected rabble of Dublin appreciated the hollowness of the entire proceeding. It was indeed a dreary occupation to debate the comparative merits of federation and of simple repeal of the Union. According to the scheme which seemed to find favour with the majority, the Scotch Union Act also is for the sake of symmetry to be repealed, and three subordinate Parliaments are to legislate for as many portions of that which is now the United Kingdom. The preliminary inquiry whether the Scotch have any desire for a restoration of their ancient Parliament, or the English for the institution of a second-class Parliament, was naturally thought superfluous. A wholly imaginary edifice requires no material foundation. An impediment of the same kind to the ideal completeness of the plan had occurred even to Mr. BUTT'S sanguine mind. As he had repeatedly said, the new Irish Parliament is to consist of Queen, Lords, and Commons; and yet not a single Irish peer is ready to concur in the project. Nor would it be easy to supply the defect by the most liberal creation of separatist peers, because no presentable candidates for the honour could be found among the supporters of Home Rule. Mr. BUTT is to be congratulated on the simple-minded sincerity of his agitation for an object which, as he virtually admits, would be unattainable even if all external opposition were withdrawn. A Home Rule House of Lords without a peer who is a Home Ruler is but one of the flagrant anomalies of Fenianism in its transparent disguise. Mr. BUTT must be taken at his word; but the mass of his followers, like SYDNEY SMITH'S Ballot mob at an election, habitually shout for principles which they abhor. And Mr. BUTT himself, since the close of the Conference, has illustrated his loyalty and moderation by addressing a seditious mob assembled for the purpose of doing honour to the Manchester murderers.

After the boastful announcement that at the next general election eighty supporters of Home Rule are to be returned, it is remarkable that not half that number of members and of probable candidates could be induced to attend the Conference. Of those who were present, some appear either to have been unwilling to acknowledge Mr. BUTT as their leader, or to have rebelled against his pretensions to control

their political action in detail. A demagogue who relies wholly on his own readiness of speech occupies a precarious position. Unless he has some independent source of power, as in personal popularity with the multitude, he is incessantly exposed to the jealousy of his lieutenants and allies. O'CONNELL'S Irish Brigade obeyed his orders because it consisted of nominees whom he could have dismissed into obscurity on the faintest show of resistance to his dictation. The confidence of the priests and the devotion of the people were given to the leader alone. Mr. BUTT is for the present only the mouthpiece of an undefined and shifting body of discontented politicians. On more than one occasion during the sitting of the Conference he found it expedient to explain away or disavow suggestions which were thought to savour of undue assumption. O'CONNELL might with impunity have laid down for his followers any course of action which he might have professed to regard as conducive to his general object. When Mr. BUTT demanded that no Home Rule member should on any pretext have an interview with an English Minister, the protests of indignant colleagues speedily compelled him to repudiate the plain meaning of his words. Another class of susceptibilities was aroused by the words of a Resolution in which the Irish nation was to pledge itself to respect persons and property when it should become regenerate and independent. Landowners and capitalists would not attach much value to a cobweb security; but the patriots of the Conference objected to the pledge on the pretext that it was an insult to the Irish character. Mr. BUTT was accordingly driven to shelter himself by the lame excuse that he had only copied a flourish from the American Constitution. Nothing, he said, short of so august a precedent would have induced him to use language which, as he allowed, was liable to misinterpretation. The conscientious convictions which have compelled Mr. BUTT to abandon the Conservative principles of his youth must be his only consolation for the innumerable mortifications of his present career.

The Conference would probably never have been held if the managers had foreseen that it would consist exclusively of professional agitators and of a few members of Parliament anxious to preserve their seats. When the meeting was first proposed its promoters hoped that it would serve to celebrate and cement an alliance between the Roman Catholic clergy and the Home Rule faction. The Bishop of CLOVNE had recently professed his adhesion to the cause; and the aged Archbishop of TUAM had renewed his consistent professions of the doctrine of Repeal as it was advocated by his friend and contemporary O'CONNELL. It was believed, both in Ireland and in England, that the Bishop of CLOVNE would not have joined the agitation without the cognizance and assent of the great body of the hierarchy. There may perhaps have been negotiations for the amalgamation of the Home Rule movement with the struggle of the Bishops for the exclusive control of education; but the alliance, if it has been attempted, has failed for the present; for only the two prelates who were already pledged to Home Rule, together with an insignificant number of priests, signed the requisition for the Conference, and no ecclesiastical dignitary attended the meeting. It is possible that Mr. BUTT may have hesitated to make concessions which, among other results, would have placed the Home Rule movement under the control of the clergy. He must be fully aware that, in spite of his earnest professions of admiration and respect for the Roman Catholic hierarchy, no heretic will ever be trusted to represent their policy in the country or in Parliament. At the Conference Mr. BUTT declared that he would never tolerate exclusive religious ascendancy, and his pledges were repeated by a notorious priest. Cardinal CULLEN may perhaps not approve of excessive professions of toleration and indifference. The Fenian element which alone makes the agitation for Home Rule formidable is for good reasons distasteful in the highest degree to the Roman Catholic clergy. Whatever may be the explanation of their refusal to share in the Conference, their abstention deprived it of nearly all its expected importance. Mr. BUTT will perhaps now fall back on his ingenious scheme of proving that England and Ireland have no natural political connexion, by inducing Irish voters in English boroughs to use their franchise with a view to the separation of the two countries.

The nature and extent of the political influence of the Irish priests will be severely tested at the first general election after the establishment of vote by ballot. The obedience of their flocks has been compounded, in undetermined proportions, of love and fear; and one of the factors

will in a system of secret voting almost wholly cease to operate. Notwithstanding his habits of religious obedience, the ordinary Irishman is perfectly capable of deceiving his priest, if he wishes to oppose his recommendations without incurring reproof or denunciation from the altar. On the other hand, the obedience which has been rendered was probably in many cases willing; nor will popular candidates venture to dispense with the services of priests as election agents. The Roman Catholic Church has the great advantage of unity of organization; and in every separate diocese, if not throughout Ireland, the clergy will obey the instructions of their bishops. The choice of the object which the influence of the hierarchy will be directed to obtain will perhaps depend on their estimate of their own forces. If Cardinal CULLEN and his subordinates were confident of their power to return a majority of Irish members, they would probably in all cases refuse to ally themselves with the Home Rule demagogues. When the agitation first commenced three or four years ago, the priests utterly defeated a Home Rule candidate for an important constituency; but when the balance of success was reversed in a neighbouring county, they thought it prudent to support the winning side. The outrageous proceedings of some of the prelates and clergy of Connaught, recorded in the celebrated judgment of Justice KEON, were adopted for the benefit of a Home Rule candidate, as it is said, on local grounds. On the whole, it may be concluded that the Roman Catholic bishops dislike Mr. BUTT and his agitation, but that they would rather make terms with the separatists than acknowledge their own inability to defeat them. If an alliance should at any time suit their purpose, it would be the more feasible because the clergy and laity of the Protestant Church of Ireland have with characteristic loyalty refused to avenge themselves on the Imperial Parliament and on the English nation for the heavy blow of disestablishment. Whether Home Rule were to result in the establishment of Roman Catholic ascendancy, or in the creation of a democratic Republic, it would be equally obnoxious to the upper and middle classes of Ireland, and especially to the Protestant community. Mr. BUTT indeed suggests with more than ordinary candour that the power of England would in the last resort be available for the protection of Protestants against the oppression which they might possibly suffer under a federal system. On the whole, it is more convenient that equal rights should be maintained by a common Government than that they should be reasserted, after they had been violated, by an abnormal exercise of force.

THE GOVERNMENT AND THE RAILWAYS.

THE PRESIDENT of the BOARD OF TRADE has deemed it his duty to call the attention of the Railway Companies in a formal manner to the notorious fact that a large proportion of the accidents on their lines are due to causes which are perfectly within their control; and he has intimated that, if the Companies will not of their own accord make an "effort to meet the reasonable demands of the public and of Parliament," the Government may find it necessary to resort to legislation on the subject. It is extremely improbable that this circular will produce the slightest effect on the minds of railway directors. It is nine years since the QUEEN addressed a touching appeal to them in her own name, reminding them of "the heavy responsibility which they have assumed, since they have succeeded in securing the monopoly of the means of travelling of almost the entire population of the country," and expressing a hope that the "same security may be insured for all as is so carefully provided for herself;" but the management of railways is now, if possible, more perversely reckless and wantonly dangerous than ever. All that Mr. FORSCUE has to say has been said over and over again in all sorts of ways, and there is nothing very terrible in his signature at the bottom of the document. It is true that he threatens the Companies, if they continue to refuse to make their lines safe, with legislation which they may not altogether relish; but the way in which the threat is conveyed will, we fear, be accepted by the Companies as a comforting assurance that, for the present at any rate, the Board of Trade has made up its mind to leave them alone. It is to be hoped that Parliament will not tolerate so mischievous a waste of time, for there are several points upon which it is indispensable that there should be prompt and stringent legislation.

In the meantime it is something perhaps to have a public declaration by the Government of the principles on which railways should be managed. When Mr. BRIGHT was at the Board of Trade, he rebuked the Inspectors for their bad manners in venturing to suggest that the Companies occasionally killed people unnecessarily; but his successor has discarded the doctrine that accidents, like adulteration, are a legitimate form of commercial competition. It is an obvious truism that, as Mr. FORSCUE observes, "safety for life and limb ought to be a paramount object," although in the policy of the Railway Companies it sinks into a subordinate and comparatively insignificant detail. It is equally undeniable that "it is within the power of the Companies to take care that the permanent way, the rolling stock, and the station and siding accommodation, are kept up to the requirements of the traffic; that the officers and servants are sufficient in number and quality for the work to be done, and that proper regulations for their guidance are not only made, but enforced." It is also within the power of the Companies to take care that trains shall not be habitually irregular and unpunctual. A statement of the things which the Railway Companies can do and ought to do is at the same time a statement of the things which, for their own reasons, they resolutely and systematically neglect or ignore. The inquiries into the uninterrupted slaughter of the last few months have shown clearly enough that permanent way, rolling-stock, and station and siding accommodation, are certainly not kept up to the requirements of the traffic. Wigan Junction is probably by no means the worst station on the London and North-Western; but it may be taken as a fair sample of the dangerous condition of one of the chief railways in the kingdom. It is an important junction, at which three or four lines meet. Yet the main line has practically been converted into a goods-yard, in which shunting is continually going on; while at the same time there is a constant flow of traffic backwards and forwards, and expresses are frequently dashing through at full speed. As if this were not enough, it was found that the permanent way at this critical spot was insufficiently maintained. During another recent inquiry it was stated that Crews is sometimes so overcrowded that goods trains have to wait outside for six hours before having a chance of getting in. It is equally notorious that the staff of the railways is very far from being sufficient either in numbers or quality, and that the rules under which railway servants are supposed to work are only paper rules which are provided in order to be produced at inquests, and for strict adherence to which a railway servant would at once be dismissed. It is known that on some lines engine-drivers have to work from fourteen to twenty hours at a stretch without getting sleep; and cases have been mentioned of drivers being on duty for ninety-six, and even a hundred, hours a week. In one instance a signalman who went on for a stretch of thirty-six hours was asked when he slept. He said that he put on the points and signals, and then dozed off, trusting to the telegraph-bell to awaken him; if it failed to do so, the driver would blow his whistle; and if that did not rouse him, perhaps the driver would send the fireman to the signal-box to see what was the matter. If the driver did not take this precaution, there would probably be an accident. This is a very suggestive illustration of the way in which railways are worked. The overworked signalman goes to sleep trusting to the engine-driver, and the driver, to make up for lost time, dashes on, taking for granted that everything is all right. A few days ago an engine-driver was found fast asleep on his engine just as he was beginning to descend a steep incline, at the summit of which he should have gone into a siding. The most mysterious kind of accident on a railway is certainly the safe arrival of the passengers. The ordinary so-called accidents are simply the natural result of a deliberately prepared train of circumstances.

It is important to observe what the statements in this circular amount to. It is asserted on the authority of the Government that a large proportion of the disasters which occur on railways are due to causes which are within the control of the Companies. Last year there were 246 train accidents, and in one way or another 1,145 persons were killed and 3,038 injured; and the Government accuses the Railway Companies of having by wilful misconduct killed and maimed a large proportion of these unfortunate persons. This is a very serious charge, and unfortunately it is a charge which everybody knows to be true. Railway directors will learn

nothing from this circular which they did not know perfectly well before; and if they are not shocked and shamed when they take up the newspapers day after day, and read the same miserable story of smashing and killing perpetually repeated, it is not very likely that anything in Mr. FORTESCUE's letter will have much effect on them. It is not only well known that a great many people are killed and mutilated every year who, if proper precautions had been taken, would have been carried safely, but it is also known why this happens. It is simply because the Companies will not spend the money necessary for making their lines safe. The way in which directors argue with themselves is probably this. It will put us to great expense to enlarge our sidings and stations, to lay down additional lines where they are required, to augment the numbers and improve the quality of our staff, and when all is done, accidents of one kind and another will still continue to occur. On the other hand, if we leave things just as they are, there is always a chance that disasters will not happen so often as they might do, or, if they happen, that nobody will be killed; and so we shall only have to pay compensation to a few of the sufferers, and shall save the money we should otherwise have had to spend on the lines. This may seem rather a cold-blooded calculation, but it is impossible to resist the conclusion that it has been deliberately made and acted upon. Railway directors would rather not kill their passengers if they could help it, but they hold that they can afford to lay out only a certain limited sum in giving travellers a chance of safety.

Every kind of moral persuasion has been exhausted without producing the slightest impression upon Boards of Directors, and there is no reason to suppose that Mr. FORTESCUE will be more successful than his own Inspectors, the newspapers, and the QUEEN herself. The time for this sort of pleading has gone by, and the time for action has arrived. Nor can there be any doubt as to the line which this action should take. The Railway Companies must be attacked in their pockets. To kill a passenger must be made much more costly than to take the precautions which would prevent his being killed. And the way to do this is to provide the public with new facilities for obtaining compensation for injuries. It is also a question whether, in cases where compensation cannot be claimed by individuals, a penalty should not be exacted by the State. It is further necessary that there should be some kind of summary process for obtaining compensation, not only for loss of life or injuries, but for annoyance or loss incurred through the unpunctuality of trains. Mr. FORSTER has obtained a decision in his favour on this point, but the question should be placed beyond doubt. The Companies are at liberty to make up their time-tables as they please; when they have once issued the tables, they should be compelled to adhere to them, or to make amends to their defrauded customers. Every railway-ticket should be in two parts, like a cheque; and the passenger should retain one of these parts, on production of which before a magistrate or County Court judge, with evidence that a train was very much behind time in accomplishing its journey, he should be entitled to receive back the whole or part of the fare, with, if necessary, additional compensation. The railways are armed with all sorts of summary powers against the public; and the public will be very foolish if it allows another year to pass without obtaining corresponding powers against the Companies. It is possible that Mr. FORTESCUE, in reserving to the Government the liberty of proposing legislation on this subject, may have had in view some measures of a more extreme nature—such, for example, as powers to compel the Companies to double their lines where it appears to be necessary, or to bring their rolling-stock, station accommodation, and personal establishment up to the requirements of traffic. Such measures, however, may be reasonably postponed until the effect of a simpler mode of treatment has been tried. In the meantime the circular of the PRESIDENT of the BOARD of TRADE, if it does not touch the consciences of railway directors, may possibly disturb the equanimity of shareholders, and may thus produce indirectly some effect. It can hardly be doubted that in the long run the present system of management is a very expensive one, and that it would not be followed if railways were worked, like other commercial enterprises, solely with a view to the natural and regular profits of the business. Unfortunately, as the *Times* mildly puts it, influential persons may occasionally have temporary purposes to serve, and may be bent upon effecting immediate savings which will produce

for the moment an increase of dividends and a brief inflation of the price of shares. The truth is that railways are worked more with a view to serve the schemes and speculations of directors than to promote the permanent interests of the great body of proprietors. Sir E. WATKIN stated the other day that the average receipts of each holder of ordinary railway stock were rather less than the weekly wages of a railway artisan, but it may be presumed that the gains of directors are on a different scale. If shareholders were wise, they would make common cause with the public.

SELF-KNOWLEDGE.

THE leading thesis of Mr. Disraeli's Inaugural Address at Glasgow, the importance of knowing the spirit of the age, has probably received as much attention as it deserves; and we need not ask again what light Mr. Disraeli's speech throws upon the problem or upon Mr. Disraeli's own character. The speech, however, included another proposition which was less noticed, because less original. Indeed Mr. Disraeli himself observes that the topic has "for ages furnished philosophers with treatises." Young men, he said, ought to know themselves, and he tried to point out how the knowledge is to be obtained. We do not profess to add anything material to the long series of philosophers amongst whom Mr. Disraeli modestly declined to assume a place; but we may venture to dwell briefly upon one or two of the reflections suggested by his speech.

The remark about the importance of self-knowledge is one which occurs to everybody with unpleasant force at a certain period of life, as though it were a fresh personal discovery. When a man has finally fixed himself in the groove along which he is to work for the remainder of his life, and begins to perceive definitely the limits of his possible career, the thought occurs to him in various forms. Some few happy men may possibly reflect upon the good fortune which has provided the appropriate sphere for their talents; others will regret that they are doomed to be always cutting blocks with razors, or, if they are unusually modest, that they are for ever to be hampered with duties too high for them. But almost everybody has a tacit conviction that he would have done much better if he had known his talents at twenty years of age as well as he knows them at forty. Few and fortunate, indeed, are the men who have not to look back upon a lamentable waste of power; who have not spent the most valuable years of their lives in learning something which proves to be utterly useless, and making false starts along paths which led to nothing. Waste, it is said, is the law of the world; and nothing is more conspicuous than the waste of talent. Men who have made a great mark upon their contemporaries differ from their neighbours not merely in intrinsic power, but in some fortunate coincidence of circumstances which has enabled them to concentrate their energies from early life upon some given point. Yet we find that many even of the greatest men have, so to speak, been fighting with one hand tied; and, owing to a partial misdirection of their talents, have given us but a fragment of what might have been extracted from them if they had been turned to the best possible account. Newton made some valuable discoveries; but how much more might he not have done if he had not been distracted from the studies in which lay his appropriate sphere of labour? De Foe succeeded in writing an excellent novel; but he had first spent an ordinary lifetime in producing work which nobody now cares to remember. If only we could distribute the proper part to each actor in the great drama from the time when his talents are first developed, and make him study it with undivided attention, we should effect a saving of genius more important than the saving of many mechanical powers. We forget what proportion of all the coal raised is said to be wasted by our extravagant modes of burning; but, whatever it may be, it cannot approach to the quantity of good intellect thrown away upon inappropriate tasks.

We might attempt to console ourselves by a theory which was at one time in favour. Genius, it was said, was nothing but great general power turned in one special direction. The same man who under one set of circumstances makes a great general, would under another be a first-rate mathematician or an accomplished lawyer. If so, one part of the apparent waste would be illusory. It would not matter to what work a man turned himself so long as he worked at something. Any man would fit any hole, and we need not bother ourselves about fitting the round hole with a square peg. The objection to the theory, to mention no other, is that it is palpably false. A man with delicate nerves may be a first-rate poet, and is pretty certain to be a bad lawyer. The calculating boy would be of no use as a preacher. Mathematical ability of a higher order is generally a special idiosyncrasy, and is consistent with utter incapacity for poetical or even philosophical activity. Of course, as a rough practical rule, there is some force in the argument. Geniuses are rare, and the bulk of mankind has no special idiosyncrasy. A man of the average capacity will do respectably, and will not do more than respectably, in almost any walk in life. Ninety-nine out of a hundred clergymen and lawyers might have changed places without any particular loss to the world at large. There is probably, too, more flexibility in most professions than people generally notice. A man is not fixed

down so rigorously to one particular branch of work as he is in some mechanical trades. We have read of a man at Cincinnati who surpassed all other human beings in the art of killing pigs as decidedly as Napoleon surpassed the generals of his day in the art of destroying men. If this hero had been diverted from killing to flaying pigs his special idiosyncrasy would have been wasted. But this is an exceptional case. As a general rule, a man may find employment enough for all the talents which he possesses in any of the ordinary walks of life. A barrister, it is often said, will at some time or other find the use of any bit of knowledge which he possesses; and in any of the liberal professions the same may be said for the ordinary rank and file of humanity. If they work at what comes in their way, they will find some employment for any little capacity in which they may happen to excel their neighbours. Making this allowance, however, it must be admitted that, even in ordinary cases, there is considerable waste of power whenever a man is driven into an uncongenial employment; and that the waste becomes really lamentable when we have to do with the exceptional cases of men of strongly marked genius.

We admit, therefore, the importance of the problem suggested by Mr. Disraeli. How are we to discover as early as possible for what a man is fittest, and so avoid putting potential generals to add up figures in a ledger, and potential philosophers to talk nonsense in the House of Commons? Is the judgment to depend upon a man himself or upon his neighbours? Mr. Disraeli thinks that even Jesuit schoolmasters are likely to be mistaken in detecting the special tendencies of their pupils. That Jesuits are fallible is quite true; and we may grant that the family circle and the contemporaries of a lad are equally liable to deception. We doubt, however, whether the liability to error is not rather exaggerated. It is curious, when we have the chance, to compare the judgment formed of a set of youths at college or school with their subsequent reputations. That many mistakes should be made is inevitable. Nobody could foresee that the scholar who promised to be a second Bentley would marry young, have twelve children by the time he was five-and-thirty, and be forced to squeeze a precarious living out of his crinoid and hastyest thoughts. Nor could it be known that a promising mathematician would prefer many briefs to extending the borders of science; or that the youthful statesman would choose to bury himself in a country living. The judgment can only be formed from the talents which display themselves in a narrow sphere, and without reference to the disturbing influences which may exert themselves in later life. It is only what we might expect, therefore, when we hear from anybody whose memory goes far enough back of men who have disappointed early expectations and been outstripped by less promising competitors. The judgment may have been a sound one, though it could not include all the elements of success. As a general rule, we should guess that the opinion of contemporaries is generally the most trustworthy. Though, as Mr. Disraeli tells us, youth may be generous and disposed to admire qualities not intrinsically valuable, yet it has quick perceptions and good materials for judgment. Stupid lads may lavish excessive admiration on mere popular qualities, or even on purely physical qualities; but young men of promise are ever excessively alive to intellectual excellence, and are often more generous in recognizing it than their elders. The hero of the passmen may be the leading athlete of the day; but even passmen do not suppose as yet that athleticism is a qualification for literary or official success. The hero of the authorities will be generally the young man who passes the most brilliant examinations. The criterion may be good as far as it goes; but it tends to give an undue advantage to docility as compared with originality. Success may be obtained in the Schools without that force of character which is the most useful quality in after life. The hero of the able youths is generally that one of their own companions who distinguishes himself in some extraneous department; who is the best speaker at the Union, or writes verses which he mistakes for poetry. The speeches and the poems may be equally detestable in the eyes of a severe critic, but the disposition which they indicate is one of the highest value. It may be described as a strong self-confidence, or as a readiness to make a fool of oneself, or, more simply and fairly, as a superabundance of energy; and though, for sufficient reasons, it is not a quality to be encouraged by undue praise, it is generally symptomatic of power, and therefore of success. In these matters a school or a college is a more or less effective rehearsal of the scenes of later life; and therefore the judgment of a youth's companions is often an anticipation of the verdict which will be pronounced on a larger stage. It would be easy to confirm these opinions by illustrations, if it were not for the fear of personality; but the recently published list of distinguished men who had been presidents of the Oxford Union is some proof that young men succeed in recognizing the merits of their equals.

We may perhaps admit that most men of much mark have made their powers felt by their contemporaries before their education is finished. But it must be admitted that the judgment thus obtained is too vague to be of much value. We should not recommend any young man to take to statesmanship because his speeches were cheered at the Union, or to devote his life to metaphysics because he was regarded as a philosopher by a clique of college friends. Success in such directions is obtained with too little knowledge to be much of a test. It shows vigour; but it hardly indicates the special line along which the vigour will develop itself. And, indeed, a man must be very weak who would really permit himself to regard the opinion either of friends or superiors as more than a useful indica-

tion. He will choose for himself, unless he is so feeble that it matters little what he chooses. Moreover a youth so unpleasantly pedantic as to determine his choice by a deliberate survey of his faculties would be not much better than one of the philosophers of the Laputan school who would steer his course across the park by the help of a sextant and a compass. If he has no very strong propensities, the consideration which will outweigh all others will be the ease of obtaining his bread and butter. It is so much more necessary that an ordinary human being should be able to pay his weekly bills than that his tastes and talents should be exactly suited, that we must put up with a certain roughness in our adjustments till we have arranged the world on a new plan. If, however, we take the more exceptional case of a youth with a strong propensity for some special employment, we may be pretty sure that, in spite of all that Mr. Disraeli and we can say, his opinion of his own faculties will be determined by his likings. We at least have never yet known such a monster as a youth who combined a strong taste, say, for science, with a recognition of his incapacity to do good scientific work. Everybody naturally takes his taste as a guarantee for his talents. The inference is unluckily not a certain one. There are people who have gone on painting pictures or writing poetry without possessing even the rudiments of an artistic or a poetical taste. To what causes this kind of monomania is due is a question which we need not investigate. That it sometimes exists is unfortunately a familiar fact of which everybody can produce ludicrous or pathetic instances. The chief use of self-knowledge, in the sense of an accurate estimate of our own talents, would be to enable us to discriminate between these cases. It would be very useful to know whether our passion for a particular employment of our faculties is, as Mr. Disraeli puts it, "idiosyncratic," or "mimetic"; whether, that is, we want to work because we have strong muscles, or think that we have strong muscles because we want to work. Unfortunately no very consistent answer can be suggested, except that we should try the experiment as often as we please. We may ultimately work our way to success, and have the pleasure of turning the tables upon the critics who ridiculed our first efforts. More frequently, we shall go on breaking our shins in attempting impossible feats to the end of the chapter. In that case, whilst we regret the waste of human energy, we must admit that there is some consolation. We cannot precisely approve, but yet we have a sort of sneaking sympathy for the gentleman who goes on writing epic poems in the conviction that a remote posterity will enjoy what his contemporaries reject. The spirit of good, robust, thick-skinned self-confidence is so valuable that it meets some sort of approval even where it is misplaced. Whilst our power of predicting success is so limited, we must be content to trust to the struggle for existence; and the great stimulus to the struggle is not reason and self-observation, but blind confidence in ourselves. If well placed, so much the better; if not, there is something sublime even in thorough stupidity.

BOATING TOURS ABROAD.

THE reappearance of an old friend in a new dress strongly suggests to us the paramount influence of caprice or accident in the direction of the very pursuits that are most congenial to Englishmen. Messrs. Chatto and Windus produce a pretty little blue volume, and on the cover a light-built four-oar, with the Union Jack floating proudly at the bow, is being propelled up the flow of a golden stream by a square-shouldered crew in golden flannels. The four-oar enjoyed a European reputation in its time, and its crew were distinguished public characters. They were mobbed in the chief of the river cities of the Continent, and made standing themes for the wildest romance in the columns of the leading Continental journals. Their actual achievements were sufficiently creditable to their pluck and enterprise. For those hardy mariners were the first to navigate European waters in a rowboat from the Western to the Eastern sea; or, at least, to spunk more correctly, from the fens of the German Ocean, far down the water-shed that slopes towards the Black Sea. They braved the perils of the Lurlei, that Rhenish Scylla; they traced out the sinuous windings of the Main among rushes and shallows, and semicataracts; they faced the still swifter currents of the Moselle and Neckar; they forced or turned the series of lock-gates in the canal that links the Main to the Danube; they shot the rocky passage under the cliffs of Passau; nor were they daunted by the traditional horrors of the terrible stream of the Strudel, or the seething whirlpool of the "Wirbel." They passed the Lurlei as much at their ease as if they had taken tickets in a Rhine steamer, and, if the dangers of the Wirbel were not altogether mythical, they were very much milder than the adventures had been led to believe. Yet, sooth to say, their voyages were not without their dangers. On more than one occasion the travellers narrowly escaped shipwreck, and that in circumstances where the strongest swimmer might have regretted he had not begirt himself with a life-belt. But, after all, the dangers they ran were scarcely greater than those that are involved in a first-class Alpine ascent, while the counterbalancing delights were more sustained, if not more intense. They came back in safety, carrying their "log" with them. It had been carefully kept by Mr. Mansfield, the originator of the idea of the cruise, who figures in the log's pages under the pseudonym of Smith. Mr. Mansfield gave it to the world, and its reception was a great success. It ran rapidly through several editions; we believe it had the honour of transla-

tion into a foreign tongue, and we know that it sold very freely among travellers as one of the volumes of the Tauchnitz series. Its success was justified both by its matter and its style; and what was more, it proved to demonstration the special charms of that mode of locomotion. For not only did it touch a variety of points of interest altogether avoided by railways and roads, and very rarely puzzled out by pedestrians, but it was evidently written, from first to last, in a fine flow of high animal spirits, which augured the perfection of health and hearty enjoyment.

Having said so much, we are brought back to the point we started from, and we are impelled to ask how it has come to pass that Mr. Mansfield and his shipmates have not been followed by a host of imitators? We keep up a couple of Universities and a number of public schools for the study of boating as one of the fine arts; we have famous boating clubs on the Thames and Tyne and others of our rivers; shoals of our boating men go across to the Continent in each succeeding season; and how is it that they leave their fleets and flannels behind them, while they swelter through the summer days in shooting-coats and the stuffiest of first-class carriages? It is true, Mr. Mansfield tells us in his preface, that his example has found imitators, and that scarcely a year goes by without some boat going over to the Continental streams. It may be so; but this we are sure of, that he and his companions never formed a school, and that his imitators must be few and far between. In the course of a pretty extensive Continental experience during the twenty years that have elapsed since the cruises of his *Water Lilies*, we have neither seen nor heard anything of English crews afloat. The fact can only be explained, as we observed at the outset, by one of those caprices of taste for which there is no accounting. For Continental canoeing, which is of comparatively recent date, became at once extraordinarily popular. To say nothing of the *Rob Roy*, the splash of English paddles has been heard in most places, and they have roused the echoes even in the Norwegian fiords and the lonely lakes of inner Scandinavia. Now we have nothing whatever to say against canoeing. Men like Mr. Macgregor clearly enjoy it thoroughly. We can conceive that there must be a certain pleasurable sense of independence in launching out on the waste of waters and your own resources; while there is a decided convenience in being able to carry your vehicle when you are weary of being carried by it, and in tucking it under your arm like an umbrella when the fancy takes you to stretch your legs. Yet it must be owned that canoeing is but a misanthropic manner of enjoying a holiday. Your pleasure, such as it is, must be all self-contained; a solitary man cannot relieve his feelings in strong language with any satisfaction; and even if you are cruising in company, it must be disagreeable to have to hail your friend in order that he may listen to your stentorian oburgations or respond to the signals of your transports over the scenery. In travelling in a party in a four-oar, on the other hand, you ought to have pretty nearly the perfection of sociability. We assume that the crew have been picked to pull together in more senses than one. As nature has been working from primeval times to map out a route which you can hardly help following, there can be no difference of opinion on that score. You have only to lay your heads along the course of the streams, and all that remains to settle is the times of the start and the lengths of the stages. On these points, as you shake down into your habits, there need be little difficulty in coming to a pleasant understanding. Druced and invigorated by hard exercise and sound slumber, you will naturally be inclined to early and regular hours. Good health means good spirits, and good spirits imply a disposition to be mutually agreeable. But you are only tied to accommodate the general inclination of the party, and not to trains and time-tables. There is no being hurried down to the hotel omnibus five-and-fifty minutes before the departure of the train. There is no scrambling for tickets, and fighting over the counting and weighing of the luggage, before being locked up in the waiting-room. Above all, there is no being scattered through hot carriages, among warm women and crying children, and foreigners with bulky packages and heavy coats in the head, who fumigate you with the coarsest of homegrown tobacco. There is no being stowed away in a seat on the wrong side, out of sight of the cool river and against the hot limestone wall that is glaring in the sunbeams; no being shot into the bowels of the earth just as you reach the castle-crowned gorge that has been lauded up to the skies in the guide-books. No; your carriage is waiting for you, and you may order it at what hour you please. There is no bother about horses and postboys, and none of the expense and squabbling attendant on posting. You are comparatively independent of the quality of your inn. If you arrange your halt at an hotel, you are sure to be made much of, arriving as eccentric and distinguished strangers who advertise the house. Your suit of flannels is the easiest and most comfortable of wear, and if you should take less pleasure in being mobbed than the master of the *Rob Roy*, at least your party keep each other in countenance in wearing them. But if it suits you better to put up at some homely inn, Epicurean as you may be, it must be bad indeed if you are not content with it. You may count with confidence on your appetite; the cooking that repels you must be poor indeed; and the wines of the country go down pleasantly over a palate which has just been sufficiently jaded to appreciate them. You are sure to sleep the sleep of the just, in spite of the briefest of beds with narrow Teutonic coverlets. As a rule, the great drawback to travel, and especially in out-of-the-way districts, is the too frequent dullness of the evenings. You have dined early; the rain is coming down in streams, and there is nothing for it but to mope or sulk, unless you

are gifted either with unusual mental resources or extraordinary powers of suction. In the crew of a four-oar, you have just the party for a rubber, and the coxswain is there to out in as odd man. With a couple of packs of cards you may laugh at the spite of the elements, as you wait patiently while time flies by; and the stroke in one of Mr. Mansfield's voyages showed a just appreciation of the necessities of this particular mode of travel when he shipped himself with cards, a corkscrew, and a Greek Testament as the chief part of his modest luggage.

It may be thought that we have dwelt unduly on the subsidiary charms of a boating tour, forgetting that the chief ends of travel are understood to be self-improvement and the cultivation of a faculty for universal admiration. But we must take the world as we have found it, and it is our experience that, if tourists are to be improved at all, it is by relieving them to the very uttermost of all sense of duty and responsibility. Possibly a man who knows nothing of ecclesiastical architecture, and cares less for associations with mediæval history, may be impressed by the solemn interior of a cathedral if he chance to stroll into it while his cutlets are cooking for breakfast. Send him there later under custody of a guide, with a dozen other churches to be checked off before dinner-time, and his faculties are numbed by the feeling of what an unspeakable weariness it is. Let him prepare himself to admire Rheinfels, Heidelberg, or Mülk by the officious help of his Murray or his Beedeker, and of course he is disappointed even by the striking reality when he sees it. Setting out in flannels and a four-oar, you are absolved in advance from all responsibilities of the kind, and you start on your tour without any calls on your conscience. Yet you start without prejudice to the indulgence of any special tastes which you may possess; if you pass near to that Rubens, or that other Albert Diirer, there is no reason why you should not make a stop to go and look at them. Your friends will be happy to wait for you, as you are sure not to have trespassed on their good-nature. It is very possible that they may even propose to accompany you, and so give you the opportunity of developing their neglected tastes for the æsthetic. As for admiring nature, we suspect that the vigorous gentlemen stretching to their oars in the fresh air and the sunshine are likely to have a keener appreciation of its beauties than the passengers on the *Kaiser Wilhelm*, who are handling their knives and forks under the awning with their backs persistently turned to the Drachenfels. We do not fancy that Mr. Mansfield's crews volunteered especially because they were enthusiasts, yet every chapter shows how the sights that greeted them at each turn of the stream sweetened the heavy labour of the oars. As a matter of course, they saw a great deal more than other people. For not only did they go where not one traveller in a hundred thinks of following the course of the water, but they were by no means tied to time or to their boat. The kits they stowed under their seats were small, but they were accompanied by heavier *impedimenta* in the shape of portmanteaus, which were sent forward to particular points. When the fancy took them, they cast their boating slough, and gave themselves up to the pleasures of society as English gentlemen in the dress of the period. We may add that generally their fame had gone before them, and their mode of travel assured them a welcome even where they were not provided with personal introductions; although we cannot hold out hopes that the most unexceptionable English boat would continue to act as a passport into the best Continental society, were their example to be more promiscuously followed. Be that as it may, however—and it is probable that most boating men would think their voyage all the pleasanter the smaller the sensation it created—we are sure that no way of touring could be more enjoyable than boating abroad in a favourable summer.

OLD FRENCH LITERATURE.

THE publication of M. Littré's great Dictionary will have for its necessary consequence an increased impulse towards the study of old French texts. The interest in the French literature of the middle ages has greatly extended itself during the last ten years; and editions of old poets which formerly would have had no chance whatever of a remunerative sale are now undertaken with confidence by well-known publishers such as Jouaust, Tross, Maillot, and others; whilst the prevalent fashion in printing and paper-making for works of this especial class is the most exquisitely tasteful that has ever prevailed, and will no doubt be thoroughly appreciated by book-collectors long after the present generation shall have passed away. Perrin of Lyons, Claye and Jouaust of Paris, have produced editions which for the art of the printer are simply faultless; so that poems which existed only in precious illuminated manuscripts now exist in typography not less beautiful than the handiwork of the mediæval scribe. Paper-makers like Hallines do their utmost to rival the fine old Dutch papers that are so well known to Continental collectors; and as the books, when they come out, have as yet escaped the great peril of a vulgar binding, they are, materially speaking, a pure delight to the connoisseur. If illustrations are admitted, they are either careful reproductions of original illuminations, without the colour, or else etchings by some distinguished etcher of the contemporary French school, such as M. Flameng. Whether the literary contents are so generally appreciated by collectors as the paper and print we have no positive means of ascertaining; but we know that in cultivated French society there has existed for many years an increasing

and always more and more intelligent interest in everything connected with old France, perhaps because the nation feels itself so widely severed from the past, and therefore experiences a greater curiosity as to what the past was like. It may be suspected from the nature of some old books which have been reproduced in the manner just described, that the public is not appealed to altogether on the side of purity and virtue, for the publishers occasionally bring out such works as the tales of the Queen of Navarre (not quite modestly illustrated by M. Flameng), and the *Decameron* of Boccaccio; yet, on the other hand, they give us decent enough romances of the Round Table, and at least one volume full of the most genuine beauty of sentiment, and remarkable for admirable elevation of moral purpose, the noble *Livre des Cent Ballades*. All these books are published in small editions, and the usual sale of them seems to be from two hundred and fifty to five hundred copies.

It is hardly possible to possess and study the magnificent Dictionary which M. Littré has recently completed without feeling a strong desire to know more about that mediæval literature from which he quotes so constantly in his illustrations of the history of the language. We are not altogether ignorant of it even in England; we know that there were *chansons de geste*, and *romans de la table ronde*, and *romans d'aventures*, and *rond-nez d'amour*, and *fabliaux*; but most of us are deterred from any serious study of this old literature by what appears at first to be the almost insuperable difficulty of the language in which it was written. The notion, utterly erroneous but very widely prevalent, that old French is a more barbarous chaos, destitute of grammar, has much impeded the study of it on rational and methodical principles. The fact is, as M. Littré points out, that, in comparison with modern French, it had rather more grammar than less; for it preserved a remnant of the Latin cases, and in many other respects, of which we intend to say more a little later, it was more logical, as well as more grammatical, than the French of our own times. There is, in fact, a visible decadence in the French of to-day. It has lost many accuracies and admitted not a few solecisms which would have given just cause of offence to a Frenchman of the time of the *trouvères*. And yet the old language has been regarded, first with indifference in the seventeenth century, and then with hostility in the eighteenth. Voltaire fancied that the French of the middle ages was formless and barbarian, and he despised it as a jargon:—

Mais il n'y a aucun compte à tenir [says M. Littré] de son jugement et de tout jugement pareil, car ce jugement était porté en pleine ignorance des faits; nul ne soupçonnait alors que le vieux français était une langue à deux cas, et que cette *ruille* apparente, ce jargon prétendu, dépendissent de règles syntaxiques qu'on admirait grandement dans le latin. Une étude positive témoigne que le français ancien est plus voisin du latin que le français moderne, et qu'à ce titre il faut en écarter toutes les imputations de barbarie grammaticale et de jargon grossier; le latin suffit à le protéger.

M. Littré observes that, although there are differences between modern French and the French of Corneille, these are merely differences of usage; that Corneille might write *autant comme* instead of *autant que*, and that a hundred forms used by him and his immediate predecessors may be no longer employed in these days, yet still that his French and the French of to-day are strictly the same language because they have the same syntax. But old French had an entirely different syntax. It had cases—not six cases like Latin, but two, the nominative and the accusative. Everybody knows the two old French words *sire* and *seigneur*. Both are used to-day; a king or emperor is called *sire*, and Christ is called *seigneur*. In old French, however, they were the two cases of one word, *sire* being the nominative and *seigneur* the accusative, and they answered to the Latin *senior*, *seniorum*, the prolongation of the word being in consequence of the position of the tonic accent in the Latin accusative. In like manner *terre* was a nominative of which *larroen* was the accusative from *latro*, *latronum*. These examples may serve to show how one class of substantives formed themselves; but there was also another class in which the Latin original did not change the position of its tonic accent, and then the old French accusative simply added a syllable; thus, *homo* became *hom*, and *hominem*, *home*, the final *e* being an additional syllable in French. The familiar French title *comte* is an old accusative, as *seigneur* is. The nominative of *comte* is *cuens* or *cons*, answering to *comes*; the accusative is *comte*, answering to *comitem*. In the second of these categories the old French nominative singular had an *s* which came from the nominative of the second Latin declension, and this *s* was naturally lost in the accusative, as we perceive at once that it must have been when we know the rule. Thus for *caballus* we have *li chevals*, or *chevaus*, or *chevaux*; whilst the equivalent of *caballum* is *le cheval*; in like manner *li chevols* or *chevaus* answers to *capitulus*, and *le cheval* to *capitulum*. Modern French has preserved in *ils* the *s* of *filii*, and so in this instance kept the nominative whilst dropping the accusative *fil*, though in very many instances the modern tongue has preserved the accusative by preference. The custom of adding an *s* to nominatives extended itself to words where according to the Latin derivation it was not so strictly required.

Plurals of words derived from the second Latin declension having a nominative in *s* and an accusative in *os* followed the original language with the same fidelity as the singular, and this produced the remarkable effect of counter-changing, most puzzling to any one who does not know the grammatical reasons for it, and of itself quite sufficient to convey the impression that the *langue d'oïl* was a mere barbarous confusion. The nominative singular has the same form as the accusative plural, being distinguished from it only by the article, whilst the nominative of the plural reproduces

the singular accusative, as the reader will see at a glance from the following table:—

	Sing.	Plur.
Nom.	li chevols	li chevols
Acc.	le cheval	les chevols

The preservation of the final Latin *s* in the case of adjectives produced sometimes the same termination in both masculine and feminine. So, we have *uns hom loials*, for *unus homo legalis*, and also *une femme loials* for the nominative, with *un home loial* and *une femme loial* for the accusative.

The old possessives were exceedingly simple. The custom was to put the thing possessed followed by the possessor in the accusative; *la fille le roi*, the king's daughter, *li chevols l'empeor*, the emperor's horse. Modern French retains this in one or two instances—*fête-dieu*, *hôtel-dieu*. *Empereor* is the accusative of *emperere*, *imperator*. Here is the declension:—

	Sing.	Plur.
Nom.	li emperere	li empereor
Acc.	le empereor	les empereor

It is worth remarking that the comparative in old French was formed with *de* and not with *que*, and this was a rendering of the Latin ablative; thus *major fratre* in old French would be translated quite closely and accurately by *plus grant de son frere*. The termination of French adverbs in *ment* had its origin in that habit of thinking in Latin which was common in the middle ages; for, although the Romance languages dropped the Latin adverbial terminations, they added one which contains a whole Latin word, the word *mens*. Thus *vraiment*, *prudemment*, mean truly-minded, prudently-minded, and the old French preserved the gender of *mens* by putting the adjective before it in the feminine, as, for instance, *bonnement*.

In conjugation, old French came nearer to the Latin than the French of our own day. It is interesting to hear what Littré has to say of a peculiarity which the ignorant have looked upon as a fault, and which is only permitted in this century in the character of a poet's license:—

Quand à la conjugaison, la principale observation est que la première personne du singulier ne prend point d'*s* à moins que cette lettre ne soit du radical; *je voi*, *je vi*, etc. Ces formes sans *s* sont restées dans notre versification à titre de licences; mais, bien loin d'être une licence, c'est une régularité, car l'*s* conformément à la conjugaison latine, type de la nôtre, n'appartient pas à la première personne (*video*, *vidi*), et c'est à tout que de la seconde personne, dont elle est caractéristique, on l'a étendu à la première. L'imparfait est en *ois*, *oies*, *oît*, *je aimoi*, *tu aimoies*, *il aimoit*; ce qui représente les désinences latines *abam*, *abas*, *abat*; le conditionnel suit la même formation; *je aimeroie*, *tu aimeroies*, *il aimeroit*. Certains verbes de la première conjugaison subissaient au présent de l'indicatif une modification qui change le son de la voyelle du thème; *je doin*, *tu doins*, *il doit*, *de donner*, *je aim*, *tu ains*, *il aint*, *de aimer*.

The old French pronunciation and orthography are interesting subjects to all who care to read the literature of the middle ages. There are certain data even for the pronunciation. How are we to pronounce the *langue d'oïl*? The natural temptation of the beginner is to pronounce it as it is written, because the orthography seems strange to him, and he fancies that the stranger he makes the pronunciation the likelier it is to be near the customs of old times. This, however, is based upon the mistake of supposing that the Frenchmen of the middle ages came nearer in pronunciation to their spelling than their successors of the present day do to theirs, and we have no evidence to warrant such a supposition. The true principle appears to be, that in all the fundamental sounds the pronunciation of to-day has preserved the habits of former ages; and M. Littré believes that, after some deductions which are evident of themselves, the way to approach nearest to the pronunciation of a *trouvère* is simply to sound the words as if they were modern French. There is a consideration in support of this view which M. Littré does not mention, yet which may be worth suggesting. The French peasantry have in all probability preserved a good deal of the old pronunciation, since they and their fathers have been illiterate, as the higher classes also were in the middle ages, and have learned the language entirely by ear. Now, although the French peasantry do not pronounce exactly as cultivated people do in the present day, their pronunciation is much nearer to cultivated pronunciation than it is to any orthography, ancient or modern; so that in all likelihood the two have always been to a great extent independent of each other. M. Littré has no doubt that *il puet* (the old form) should be pronounced *il peut*, and *euer*, *œur*; whilst he believes that *ier* was pronounced *yeux*, that *dier* was pronounced *dieux*, the *r* being only an orthographic sign, as it is to-day. There is a probability, amounting almost to a certainty, that the spelling has been modified by the pronunciation, and that the pronunciation of to-day existed before the Latin forms were definitively abandoned. Thus it is probable that when people wrote *tete* and *tempeste*, from *testa* and *tempestas*, they pronounced the word *tête* and *tempête* just as we do to-day. To put it in M. Littré's phrase, the etymological orthography had to yield to that of pronunciation, the latter having established itself in the earliest history of the language, when it became no longer Latin. Spelling and pronunciation are two forces that react continually upon one another. When there is little grammatical teaching, and men learn their language much more by their ears than by their eyes, then it is the pronunciation which modifies the orthography and assimilates it to itself. On the other hand, when books are much used, the spelling gains empire over pronunciation, and the tendency is to pronounce all the letters that one sees written; at

this time tradition succumbs on many points to the influence of the eyes.

When French began to be formed, the educated classes used Latin exclusively for authorship and correspondence, employing the language of their own country only as a necessary means of communication with the vulgar. It was formed, in fact, simply by popular instincts, and the writing of it was only a record of changes which these instincts had produced. M. Littré makes a distinction between *dialect* and *patois* which has not hitherto been familiar to us; indeed we have not, in English, two words corresponding to the two things, and are obliged to borrow one of them from the French. When the unity of language and literature did not as yet exist in France, each of the different forms of speech which prevailed in the provinces had as much right to its independence as another. At that time there existed various independent dialects, such as those of Picardy, Normandy, Burgundy, the Isle of France, and Lorraine. But at the end of the fourteenth century the provincial lordships lost much of their feudal character; the monarchy became preponderant, Paris became a capital, and then a language was formed which belonged alike to all cultivated persons. From that time the dialects gave place to what we now call *patois*. There are dialects so long as the great fiefs exist, but when monarchical unity has absorbed these local centres the *patois* take their place. M. Littré defines a *patois* as a dialect which, having no longer any literary uses, is only employed for the necessities of ordinary life. He strongly protests against the prevalent notion that the *patois* are a corruption of correct French. The dialects, he argues, from which the *patois* descend, were not the result of a dismemberment of a French language that existed before them, but preceded the French language; or rather the French language is one of the dialects, which, owing to political circumstances, has gained the first place. M. Littré makes a comparison between the formation of the Romance languages and that of dialects, which is ingenious and, we believe, new. He says that the great districts called Italy, Spain, Provence, and France, imprinted their character on the Latin language as the smaller districts which we call provinces also imprinted theirs; and that the diversity had rules of its own. He observes that the mutations take place just as if there had been a previous understanding about their nature. The field open to divergence was unlimited, the point of contact unique, yet these languages always agree together on the principle of their mutations. They agree to reduce the Latin declension, to suppress the Latin neuter, to create the article, to introduce compound tenses for the past in conjugation, to form a new mood—the conditional—and to express the passive no longer by terminations, but by a combination with the verb *to be*; to organize auxiliaries for conjugation. They agree to invent a new sort of adverb with the suffix *ment*; and, lastly, when these languages go outside of the domain of Latin to express new ideas, or to replace terms which have fallen into disuse, they almost always adopt the same words. These languages were formed simultaneously, and the history of one cannot be understood without reference to the history of others.

The Latin that is most changed in French belongs to the early language which was modified by popular use, but words that were adopted by the learned at a later date are preserved in a more accurate form. Thus *frêle* and *fragile* both come from *fragilis*, but the first was a popular form, and therefore much altered, whilst the second was a learned introduction. In the old words we have a key to the accent used in the Latin of the decadence, and the Romance languages are dialects of Latin. The old French preserved declensions for the space of three centuries. There were two cases during the eleventh, twelfth, and thirteenth centuries, and if it is a perfection in the ancient languages to have them, then old French deserves some share of the credit. The time when French lost its cases was the latter half of the fourteenth century. In the first half the old rules were still followed, at least in literature; all correct writers were careful to observe their nominatives and accusatives; but towards the end of the fourteenth century the barriers of tradition were broken down, and the new grammar which recognized no cases began to be openly employed, so that there was a confusion of two grammars. The same writer would at one time employ his nominative and accusative, and at another time neglect to employ them, using one form only. Thus the nominative *empereur* is dropped, and *empeur*, the accusative, is retained. In some instances both cases are preserved; but when this happens, each has a special use, as we have already pointed out in the familiar example of *sire* and *seigneur*, which were formerly a nominative and accusative.

The origin of the *s* for plurals is highly curious, and entirely dependent on the declensions in old French. We have seen how these were formed. The nominative singular often took a final *s*, on account of the Latin termination, but so did the accusative plural. When the nominatives were dropped, the accusatives remained, and so it happened that the plurals in many instances were provided with an *s* by inheritance from the Latin. You cannot get a final *s* out of *enbalme*, but you can get it out of *enballos*. This suggests the very curious reflection that, if the French language had chanced to retain nominatives instead of accusatives, the singular of modern French (and English) nouns would most likely have ended with an *s*, and the plural have been deprived of it.

In some respects old French was more grammatical than that which is spoken in our own day. For example, in the thirteenth century no one would have thought it allowable to put a masculine termination to a possessive pronoun when the thing possessed was

of the feminine gender. Nobody would have said anything so outrageous to grammar as *mon épée, mon amie*; a Frenchman of the time would have said *m'espée, m'amie*, just as, instead of saying *ton âme, son enfance*, as we do, he would have said *t'âme, s'enfance*. Modern French has preserved a similar elision after the article, and the question is why it has not preserved it after the pronoun. M. Littré is justly angry with the people of the fourteenth and fifteenth centuries who introduced a solecism at once so flagrant and so unnecessary. It was a gratuitous spoiling of the language, and it is wonderful how quickly it took root, and how authoritative it became, so that it was soon a fault to use a feminine possessive with a feminine noun if the latter began with a vowel or an *h* not aspirated.

Modern French is a very modern language indeed, if we date from the introduction of its present syntax, which only came into use in the fifteenth century. The revolution in syntax had been begun by the fourteenth century; but it was not completed till late in the fifteenth, when French became what grammarians called an analytic language. Spanish and Italian were formed before, and on the same analytic principle which the modern French adopted. It is on account of the profound difference in syntax that old French is to be considered a separate language, and now a dead language. It is, however, not difficult to learn by any French scholar of to-day, when once its principles are understood; and it is certainly worth learning by any one who cares for truly romantic literature. Unfortunately there exists as yet no thoroughly good and complete dictionary of the *langue d'oïl*, but this is a deficiency which modern erudition is sure to remedy in time.

ΔΕΙΞΑΜΕΝΟΙ ΣΤΟΠΗΝ ΦΙΛΟΜΗΤΟΡΑ.

IN the garden of the King's School at Shrewsbury many fair flowers have been reared. We cannot help looking upon the projected removal of that ancient and famous school to a new site as obliterating features to which the memory of her sons most fondly clings. There is something almost pathetic in the explanation which Dr. Kennedy gave to the Public Schools Commissioners why, with conditions apparently favourable, Shrewsbury School had been in his time so ill supported:—

Schools are upheld and extended by influence and combination far more than by their intrinsic merit, whatever it be. Some have family connexion and influence; some joint-stock influence and exertion; some the influence of religious parties. Shrewsbury School has nothing of the kind. It has relied on its own unassisted merits, and those merits appealing to a portion of society which becomes smaller and smaller every year; those, I mean, who still ascribe some value to a University education and classical training.

The Commissioners to whom these words were addressed reported that the great reputation which the school had acquired under Dr. Butler and Dr. Kennedy as a place of education had sustained it in spite of many disadvantages, but that these disadvantages were now the more severely felt on account of the competition of the new proprietary and other schools which had of late sprung up in various parts of the country. "The very bad condition of the buildings, and the want of funds to place them in a proper state, operate more and more to deter parents from sending their sons as boarders, and the want of boys tells upon the teaching of the school." This Report is nearly ten years old. It was followed by the Public Schools Act of 1868, under which the new Governing Body of the Shrewsbury School has been established, and that body, with the energy of youth, proposed not only reconstruction, but removal. It is possible, however, that a strong manifestation of the wishes of old pupils of the school may induce the Governing Body to build upon the old foundations.

This question, however, cannot be regarded as one of mere sentiment; and, in order to form a practical judgment on it, we may usefully look into the Report, already quoted, of the Public Schools Commissioners, to see what opinions, if any, were expressed *ante litere motam*, if we may so say, on this alternative of reconstruction or removal. Dr. Kennedy referred to an opinion expressed by one of the Trustees, that the smallness of numbers in the School was chiefly due to the defectiveness of means of accommodation, and he said:—

I admit that these are old, unattractive, and in some respects inconvenient and inadequate. Still the houses are solid, well ventilated, and shown by long experience to be more healthy than many places of new and elaborate construction.

At the same time Dr. Kennedy wished that exertions had been made many years ago to rebuild the houses in accordance with the demands of the age. It seemed a little hard that, while new schools without any endowments could venture to build large and extensive premises, and even to incur debt for that purpose, a school of considerable endowment and established position and name should fall into comparative decay, for want of that amount of energy which would have enabled former Trustees to borrow money for the complete restoration of the premises, providing for interest and repayment partly by the temporary stoppage of exhibitions, partly by capitations, which Dr. Kennedy would gladly have concurred in. The new Governing Body are not likely to incur the same censure as the old Trustees for want of energy, and indeed it seems the fate of schools and other institutions to suffer alternately from torpor and spasmodic activity. The Public Schools Commissioners of course visited Shrewsbury, and went over the school buildings, and as their Chairman, Lord Clarendon, put it, "I

daresay, the Trustees will not be surprised to learn that we did not admire them very much." The Trustees explained that they had made a representation, putting it in very strong language asking the Charity Commissioners to enable the Trustees to purchase property adjacent to the school, and they had consulted an architect as to how the property to be thus acquired could, with the sites of the present Head and Second Masters' houses, be made most convenient as future residences for the Head and Second Masters, with proper accommodation for a limited number of boarders. The Trustees added that they would be glad to receive the sanction of the Commissioners to the proposed improvements.

Thus the matter stood when the Public Schools Commissioners made their Report, which bears date 16th February, 1864, and the essential features of the question have not been changed since. The property of the school is no larger than it was ten years ago, and yet it appears to be now assumed that a sum of money may in some way be provided for building purposes much larger than was thought practicable at the date of that Report. We hear a good deal of the spirit of the age influencing the institutions of the country, and if it can induce people to lend money without security to rebuild a school, we shall be inclined to believe in it. Dr. Kennedy was unwilling to appeal to the friends of the school for subscriptions towards restoration, but we cannot see why Shrewsbury should not use means by which Harrow and Rugby have largely profited. But if friends are to contribute towards restoration, their wishes must be to some extent consulted as to site and plan. The onus seems to rest on those who propose a change of site to justify it. The idea probably is to collect upon one site all the buildings of every kind that may under any possible circumstances be needed for the school. The symmetry of such a scheme is perhaps captivating to some minds, but other minds may not dislike complexity and variety. Charter House, having been moved from town to country, necessarily occupies a single site. But at Harrow and Rugby we find a central block of buildings with boarding-houses dotted about the town. The boys and masters have to pass to and fro along the streets between these houses and the chapel and schoolrooms, whereas if all the school-buildings were collected on one site, they might transact a whole day's duties without even exposing themselves once to the outer air. But if the spirit of the age treats this arrangement as necessary, we should incline to regard it as equivalent to effeminacy. The "Old Sclapians" who are proposing a memorial to the Governing Body say that the alleged grievance that the playground is not immediately contiguous to the school-buildings appears to them to be "unduly exaggerated," and to be an objection made for, not by, the boys. "It was not felt as a hardship in our time, and it must be borne in mind that the same conditions exist at Harrow and Westminster." The present cricket-ground is at Colton Hill, half a mile from the school, and the Memorialists believe that it is sufficiently near, and the accommodation can be rendered sufficiently ample. They suggest however that, if necessary, an excellent and convenient playground might be obtained by throwing a light foot-bridge over the Savern, and acquiring one or two fields within a short distance of, and visible from, the school. As regards buildings, they state that the present site of the school contains about nine thousand square yards, of which the existing buildings cover about two thousand, and adjacent ground to the extent of about five thousand square yards is obtainable at moderate cost. They assume that all the existing buildings would be removed, except the original stone building fronting to school gardens, which, in addition to the class-rooms, comprises the chapel and library, and the residence of some of the assistant-masters. By utilizing the whole of this building for schoolrooms only, they believe that an ample area for that purpose will be provided, and that the remainder of the site will afford adequate space for all the other erections that are required, including boarding-houses, without interfering with the supply of light and air. But, in the event of the adoption of the modern system of detached boarding-houses owned or rented by and under the control of the several assistant-masters (as carried out at Harrow, Rugby, and elsewhere), the only boarding-houses to be erected out of the school funds would be those under the immediate superintendence of the Head-Master. The Memorialists say that "the present site is especially favourable to such a scheme, as many oblique houses in the immediate vicinity have undergone changes in occupation during the last few years, and might, with ordinary care, be secured as the necessity for increased accommodation occurs."

It appears to us that the Memorialists are substantially right in argument, while sentiment is altogether on their side. It must not be forgotten that this is, or might be, a day-school as well as a boarding-school, and a central situation is desirable for a day-school. The Memorialists quote Dr. Arnold as an authority for the opinion that a school should not exceed three hundred boys. But their plan, if detached boarding-houses form part of it, would admit of increasing the school beyond this limit. The Head-Master, who has drawn up a statement of reasons in favour of removal, doubts whether the present site is adequate for the future needs of the school if provision is to be made for even three hundred boys. The Memorialists think that the present site would be adequate for that number, but they suggest that a part of the number might be accommodated in detached boarding-houses, so that no doubt might rest on the adequacy of the accommodation. In the printed papers before us the Memorialists answer the Head-Master, and we have no opportunity of knowing what reply he could or would make to them. But substantially his view

appears to be that the present site is probably inadequate for three hundred boys, and certainly for a larger number, and therefore a new site must be adopted. The Memorialists answer that, even admitting the Head-Master's premises, the conclusion does not follow, because detached boarding-houses would meet the difficulty. It is unsatisfactory to pronounce an opinion without hearing what the Head-Master would say to this; but we think that the desire for the concentration of the whole school upon one site is at most matter of taste and sentiment which is counterbalanced by the strong attachment of old Sclapians to the "time-honoured site." They ask the Governing Body not to root up their most cherished associations, and they may perhaps be right—and it is impossible to prove that they are wrong—in thinking that the fair and delicate flower of classical scholarship would not flourish equally upon a strange soil and under new conditions. The prosperity or failure of schools depends on many concurring and conflicting circumstances which almost defy analysis. But one way towards success is to enlist sympathy and to cherish sentiment. The Memorialists *δαίμονες σπουδῆς ἐκλαμπρόντα* desire that successors of the *Tres vix floribus legendis* may gather in future years garlands for Sabrina from the very garden which was in former days so fertile. It is impossible for any one, however trained, who loves that scholarship which has so long been the ornament of this school, not to feel interested in its prosperity, and to dread any step that may tend to destroy its associations and traditions, and to sever the continuity of its life. To quote the words of the triumvirate to whom scholars owe a charming volume:—"Quom haurimus litterarum studia, qua revermur ne in dies obsolescant, nondum penitus excidisse videmus, condendum censuimus monumentum, quod posteris hominibus traderet, veteres illas Musas ac Camenas non ad Tameis solum sed in Sabrina etiam ripis aliquando vestigia posuisse." The monument which we should desire to see would be the school rebuilt on the old site.

SHERRY POISON.

OLD-FASHIONED people in the country sometimes talk of sherry wine as if there was another kind of sherry which was not wine; and, though they are perhaps not aware of it, they are undoubtedly right in suggesting this distinction. There is a sherry—and it is the sherry which is usually sold and drunk in this country—which is not wine at all, but simply alcoholic poison. The true character of "curious old port" is now beginning to be pretty well understood, and the consumption of this remarkable liquor is rapidly declining; but the virtues of sherry are still a popular superstition. Many people who would be shocked at the idea of drinking spirits, and especially raw spirits, think nothing of a glass of sherry; yet, in the majority of cases, the sherry is only cheap bad brandy disguised as wine. At Blackburn, the other day, a man drank four gills of sherry, and died from the effects of the dose. This event has given rise to an interesting correspondence in the *Times* as to the adulteration of sherry, and also as to whether there is really such a thing as pure natural sherry in existence as an article of commerce. One writer, with the benevolent intention of making "the question clearer to that large portion of the public who enjoy a glass of sherry," and allaying "the nervous fears of moderate wine-drinkers," stated, as the result of many hundred tests which he had performed on the *maelo*, or young wine, in Spain, that 26 per cent. of proof-spirit is the average strength naturally generated in sherry. Upon this Mr. Denman, the wine-merchant, at once pointed out that the average strength of Spanish wines as first manufactured is only about 22 per cent.; but that the sherry of commerce is rarely, if ever, imported containing less than 38 to 40 per cent. of proof-spirit, and that, by the rule for fortifying wines, wine containing 22 per cent. requires 30 gallons per cent. of proof-spirit, and at 26 per cent. 23 gallons, to bring it up to 40 per cent. This was confirmed by Mr. W. Barton, who was formerly connected with the Custom House, and who stated, as the result of many thousand tests made in the London Custom House, that the average strength of sherry as it is imported to this country and passed into consumption, is not less than 37 per cent. of proof-spirit, and some parcels contain as much as 46 and even 50 per cent. Therefore, taking the strength of sherry in its first stage at 26 degrees of proof-spirit, more than 18 per cent. of proof-spirit must have been added to bring the strength up to the lowest average of the imported wine. It can hardly be wondered at that, after such disclosures as these, the large portion of the public who enjoy a glass of sherry should become rather nervous; and indeed it is very desirable that they should become nervous, and should take flight in good time. A wine-merchant appears to think that he has settled the question by saying that we must distinguish between pure sherry as known to England and pure sherry as known in Spain, and that the latter would be unsaleable in England. Wine-merchants are certainly not bound to keep on sale what is unsaleable; but it does not follow that they are entitled to sell any sort of noxious drug which people are foolish enough to buy.

There is of course nothing new in these revelations as to the real character of the sherry of commerce; but the mischief which is done by the consumption of this disguised alcohol is so serious that no opportunity should be lost of drawing attention to it. If a man chooses to drink whisky or brandy with his eyes open, and knowing what he is about, there are no means of preventing him; and, as he is aware of the nature and qualities of the potion, he will

probably be on his guard against its effects. But the people who drink the sort of sherry we have been speaking of flatter themselves that they are very moderate and temperate in their indulgence, and poison themselves under the delusion that they are taking only a mild tonic. What they are actually drinking is a dram of alcohol, sweetened with sugar and roiked with a flavouring of some common Spanish, or perhaps French, wine. The usual price in an hotel or at a drinking-bar for this concoction is 6d. a glass. Its value is something less than a penny. In England the cost of alcohol is from 1s. 11d. to 2s. a gallon, with the addition of 10s. to the revenue. The consumption of sherry is probably decreasing in private houses, but it is increasing at the refreshment-bars which are springing up all over London, and which are doing a great deal more than the public-houses to ruin the constitutions of the rising generation. A steady bout of drinking, ending in stupor, on the whole does less harm than the pernicious practice of taking nips at intervals during the day, thus keeping the stomach in a state of perpetual irritation, exciting a false thirst which grows by indulgence, shaking the nerves, and finally perhaps producing paralysis. Even the better sort of sherry is apt to have a bad effect on the temper of people who drink it, but bad sherry is of course an inflammatory agent of the most malignant kind. A statistical estimate of the number of glasses of sherry which are tossed off in the City between eleven and four in the day would probably be somewhat startling; and any doctor who has practice among this class of patients could tell a melancholy story of the results. The most abominable stuff which is sold as sherry is of course the forged wine of Hamburg, which is variously known as Elbe sherry, vatted sherry, and Hamburg sherry, and to which pushing dealers give names of their own invention. This atrocious compound has been described as a preparation of neutralised acid wine, Elbe water, potato spirit, capillaire, and chemical flavouring matter. It is believed, however, that the importation of this stuff has been declining for some years. But what we wish to point out is that even in the more honest kinds of sherry the proportion of alcohol is excessive. This is proved by the Custom House tests to which Mr. Burton has referred. There is a story of a Scotch blacksmith who was a deep drinker, but who had never been seen really drunk. Some of his friends one night played a trick on him which brought him under the table. They set before him a bottle of whisky and a jug of hot whisky, which he took for hot water, and he was surprised to find that the more water he put in his toddy the stronger it became. The fortifying processes which are applied to sherry are of a similar character. The manufacturer in Spain adds so much alcohol, and the wine-merchant in England adds so much more. According to competent authorities, sherry (and we are now speaking of the better qualities of this wine), after it has undergone a certain amount of fermentation, receives an addition of spirit—said to be six gallons per butt—and another four gallons on being shipped. Next there is an addition of so much "mother wine"—old brood wine kept for the purpose—to give flavour; while richness and colour are produced by an infusion of the "Doctor," composed of wine made from juice concentrated by boiling. When it comes to England more brandy is added, and there is a great deal of mixing of different wines. Dr. Thudichum states, as the result of his observation and experiments, that "carumel," used for producing colour, contains from 35 to 50 per cent. of proof spirit; and that the "dulce" which is added to give sweetness to the brew, contains about 33.78 per cent. of proof spirit. Ultimately brandy is added to the mixture to the extent of fortifying it up to 35 as the minimum, most frequently up to 40 or 42, and sometimes up to 50 per cent. of proof spirit. Dr. Thudichum remarks that this is not, in the ordinary sense, a process of adulteration, but the regular process of manufacture, and suggests that it may be a question whether it leaves much room for adulteration, and whether, in fact, all sherry is not adulterated from the first. He also points out that the must is further adulterated by the addition of a large quantity of plaster of Paris, and that, while bakers are prosecuted and fined for adding a trifling quantity of alum to their bread, plastered wine is regarded as a natural and legitimate preparation.

The usual argument in favour of alcoholizing sherry is that it is a wine which will not keep unless it is fortified in this way. Anybody who wishes to know the value of this argument cannot do better than consult Dr. Druitt's amusing and instructive *Report on Cheap Wines*, of which a new edition, re-written and enlarged, has just been issued. He shows, first, that fermentation, being checked in the first instance by the use of alcohol, begins again, and has to be again checked by further doses of spirit; and that the effect of alcohol is to kill the virtues of the grape juice, and to produce headache and dyspepsia. He next shows that when wine is properly made it does not require fortifying; and he quotes the evidence of Dr. Gorman, Physician to the late British Factory at Oadiz, and long a resident in Spain, who was examined before a Committee of the House of Commons in 1852. Dr. Gorman stated that no natural sherry comes to this country; it is all mixed and brandied, and the less mature and less perfectly fermented the wine is, the more brandy is added to preserve it. "It is not," he added, "necessary to infuse brandy into any well-made sherry wine; if the fermentation is perfect, it produces alcohol sufficient to preserve the wine for a century in any country." Speaking generally, Dr. Druitt observes that good old sherry is a most valuable cordial and stomachic, and has marvellous uses in stimulating a feeble heart and making a refractory stomach do its work; but

good sherry is expensive, and cheap sherry is suspicious. Bad sherry he divides into two kinds—the sickly and the sad. Under the first head he includes "those detestable liquids, hot, fiery, and yet sickly-sweet, that are advertised incessantly as the 'Marylebone,' the 'People's Sherry,' and the 'Lord Mayor's Own,' &c., &c." By sad sherry he means a dry liquid, oftener hotter than spirit of wine could make it, thin, with little body, but with a smell like that of nitric ether, and utterly destitute of the taste of wine. There are also, he says, some natural or unbranded sherries of low price, which keep very badly, are very thin and flat, have no body, and are not wholesome, and seem to have had their acidity neutralized by artificial means. On the whole, Dr. Druitt does not give an encouraging account of sherry, and his advice is to avoid it, unless it is known to be really good, and to resort as a substitute to the light wines of other countries. We are quite disposed to agree with him in thinking that the ordinary sherry of commerce is about the most unwholesome thing under the sun, and that everything should be done to discredit it, not only on account of the rogueries connected with its manufacture, but on account of its bad effects on the physical and moral condition of those who drink it; but we doubt whether the wines which he recommends can be altogether regarded as a substitute. The great recommendation of sherry for ordinary middle-class people is, we imagine, that it is a wine which can be kept in a decanter, and which is consequently always at hand, and can be served in small quantities at a time. The light wines which find favour with Dr. Druitt, and which are no doubt excellent in their way, are bottled wines; so that if you want only a glass, a bottle must be opened, and in the case of most of these wines what is left is more or less spoilt. The problem would seem to be to produce a popular unbranded wine which will keep fresh and good for some time after the bottle has first been opened. Some of the Hungarian and Greek wines perhaps answer this description; but French and German wines certainly lose their flavour and freshness when opened and corked up again. It is a pity that there is no association of rational temperance people to take up the question.

ANCONA.

THE wayfarer through the streets of Rome has his eye struck in many of the open places of the city, by some monument of the old days of Paganism crowned with some Christian emblem, and inscribed with the legend which tells how such or such a Pope—stout Sixtus the Fifth perhaps oftener than any other—cleansed the heathen structure from all impiety and dedicated it to the service of the true faith. Such a christening of Trajan's column more than twelve hundred years after the conversion of Constantine awakens amusement rather than sympathy; but the case is very different when we come to works which underwent the like change when the new faith was still in the full glow of its first triumphs, when Paganism was still a real and living enemy—an enemy decaying perhaps and trodden down, but an enemy which still was not dead, and which, as one great example showed, might spring up again with renewed strength at least for a season. In these days we can fully go along with the feeling which changed the basilica into the church, and the throne of the judge into the chair of the bishop—which turned the temple of all the gods into the church of all the martyrs—nay, even with the spirit which bore away the marble columns as trophies from the vanquished heathen, and reared them again in new forms and for new uses in the long-drawn arcades of the earliest churches of Rome and of Ravenna. But there are cases in which nature seems to have done the work without the help of man, or rather cases in which man has done the work by a happy choice of sites which of themselves seem to proclaim the triumph of the new creed over the old. Let us stand on the quay of Ancona, and turn away our eyes from the noble bay, with the long line of its coast dotted with towns and castles, and with the mountains rising behind them. Let us turn our eyes inland, and from several happily chosen spots the view immediately before us seems a worthier symbol of the great change that has come over the world than the half-spiteful device of surmounting the monuments of Trajan and Antoninus with objects of Christian reverence. Close before us rises the arch of Trajan, where the prince to whom his own and later ages decreed the title of the Best is celebrated, not for any of his warlike exploits, not for adding provinces beyond the Danube and the Tigris, but for the more useful task of finishing the work on which we are standing, the great mole of the harbour of Ancona. Through the narrow arch, from a well-chosen spot—soaring above the arch and all that it supports, from a spot still better chosen—we see the peninsular hill which rises above the port and city, itself crowned by the stately Duomo of Ancona, the church of the martyr Cyriacus. The Christian temple seated on its lordly height seems to look down with an eye of silent rebuke upon the monument of the prince who condemned Ignatius to the lions. The moral of the group is perhaps disturbed rather than heightened when we carry our inquiries further, when we learn that the church of St. Cyriacus is itself an example of the less noble form of Christian triumph—that it has taken the place and grown out of the materials of the chief temple of the city in heathen times. We could perhaps rather have wished that the triumph of the new faith on such a site had been embodied in some building wholly the design of

Christian skill and the work of Christian hands, a building which owes nothing to the despoiling of the holy places of the fallen creed. But from the points of which we speak thoughts of this kind cannot suggest themselves. The Duomo of Ancona, as seen from the mole, as seen anywhere from the outside, is a building whose forms are purely and eloquently Christian. Unlike the earlier basilicas of Ravenna and Rome, it is not satisfied to be all glorious within; it has its external outline, the outline of the now triumphant cross, the four arms joining to support the cupola as the crown of the whole, as distinctly marked as in any minster of England or Normandy. The cupola instead of the massive tower, the detached campanile, unworthy as it is of the building to which it belongs, tell us that we are not in Normandy or in England, but in Italy. But another feature of the building tells us that we are in one of those spots of Italy on which influences from the other side of the Adriatic have left a lasting impress. The city which had once been the Dorian Aukon, the city which was to be the last fortress in Italy to be held by the troops of a Byzantine Emperor, not unwittingly shows the sign of kindred with the East in the form of the chief monument of its intermediate days. The Duomo of Ancona follows neither the oblong type of the basilicas nor the Latin cross of Pisa. The church which contains the columns of the temple of the Dorian Aphrodite is still so far Greek as to follow in its general plan the same Greek cross as St. Mark's, though without that further accumulation of many cupolas which makes the ducal church of Venice one of the many reminders that in the city of the lagoons we are in the Eastern and not in the Western world.

The city itself stands nobly, climbing the sides of the steep hill, of which the Duomo occupies, not indeed the highest, but the most striking point, the peninsular projection, the very *elbow* from which the place takes its name. Modern fortifications are spread over the heights through a vast range, but the precinct, first of the heathen and then of the Christian temple, remains free of access as when in ages past the seamen far away on the Adriatic greeted the first glimpse of the house of the patron goddess. From the porch of the church the eye ranges over the long line of coast, thickly strewed with towns and villages, and sheltered as it were by the mountain wall further inland, the barrier between the comparatively obscure shores of the great gulf and the more historic lands beyond the Apennines. We can well understand how attractive this noble bay with its sheltering hills must have seemed to colonists of early times; and we can picture to ourselves the struggles, the ups and downs, the abiding growth and the momentary checks, which must have been gone through by more civilized settlers planting themselves and their arts among the ruder native inhabitants. And from those days our thoughts float on to those far later days when the connexion of the Dorian city with the lands beyond the Adriatic was again renewed in so strange a form, when the cities of Italy allied themselves alike with the Pontiff of the Old Rome and with the Caesar of the New, the better to shake off their allegiance to the King and Emperor whom they shared with the lands beyond the Alps. Fresh from the painted forms of Justinian and Theodora at Ravenna and of the trial of Heraclian Emperors at Classe, we feel it less amazing on the same coast to hear how the hosts of Manuel Komnenos appeared among the many foes of his Swabian rival—how it seemed for a moment possible that the Old Rome and her Pontiff should again return to the allegiance of the sovereigns from whom they had parted off at the election of the great Charles. We think of the great siege at the hands of Archbishop Christian, of the long endurance and hard privations so graphically set forth by a writer of the next age; and we feel that, after all, the place of Ancona in the world's history is one not to be despised. And we may think too how the long connexion of the city with the Eastern lands went on in yet another form, how the prosperity of Ancona in days nearer our own was largely due to trade with the lands whence her first settlers had come forth, and to the presence of fresh settlers from the same coast who found in her a harbour of refuge from their Finnish oppressors.

The church which has supplanted the ancient temple on the peninsular height is not wholly unworthy either of the lordly position on which it stands, or of the long train of associations which is called up by the prospect on which it looks down so proudly. The Greek cross perhaps makes us ask for the four subordinate cupolas gathering round the great centre, as in the three examples which form as it were the family tree of domical architecture, St. Sophia, St. Mark and St. Front at Périgueux. Our first feeling perhaps is one of puzzlement at the seemingly amazing length of the transepts and shortness of the nave. The south transept indeed, furnished as both of them are with aisles and finished with apses, might for a moment pass for the eastern limb. In fact, the western limb is internally the shortest of the four. Each consists of three bays, the eastern, northern, and southern being originally furnished with an apse. But the eastern apse has unluckily given way to a square-ended edition of a somewhat later time, which greatly mars the general proportion of the building. It is easy to see that, in more than one point, changes have taken place in the details of the ornamental pilasters and arcades; but, except the awkward addition at the east end, there is nothing to interfere with the general character of the building as a pure, but not very rich, specimen of the Italian Romanesque at its best point, when it had shaken itself quite free from classical trammels and was not yet corrupted by hopeless imitations of Northern forms. The chief ornamental feature outside, the only feature where there is any

great degree of enrichment, is the magnificent western porch, with its many receding orders and its columns resting in true Italian fashion on the backs of lions, lions among the most lifelike of their kind. We fancy that in some of the orders the beginnings of pointed arches may be detected, but they do not thrust themselves into such prominence as seriously to interfere with the Romanesque purity of the building. The rest of the front is plain; there is no trace of the arcades of Pisa and Lucca, and Saint Zeno's wheel of fortune is, both here and in the transept, represented only by a simple circle. But when we have once taken in the peculiar arrangements of the church, the whole fits in well together, and the octagonal cupola on its square base rises well over its four supporting arms, far better than it could have done if the nave had attempted anything of basilican length. Within, an ingenious arrangement of pendentives supports it well over the four arches which bear it up, though we might have wished that they and the piers on which they rest had been made more prominent objects in the interior. The arches of the four limbs rest on monolith columns, the spoils of the ancient temple, and they are crowned by capitals of various forms, classical and quasi-classical, some almost barbaric in their foliage, but still all confluencing themselves to foliage, and not seeking for richness in the shape of human or animal forms. Those in the south transept are worthy of special study as showing some of the curious ways in which the volute and the other classical details might be used in the various attempts to avoid exposing the delicate work of the capital to the full weight of the arch which it had to bear. But the study of the columns and capitals in the Duomo of Ancona is a case of the pursuit of knowledge under difficulties. Anconitan taste seemingly looks on a marble shaft and a Corinthian capital as something which is less of a thing of beauty than certain fragments of red rags with which the greater part of column and capital are carefully covered. The first impression is that the thing is a trick upon travellers, akin to the swindle of covering up pictures in order to get a franc by drawing back their curtains. But we suspect that pilgrims to St. Cyriacus do not come in such throngs that a trade of this kind would be likely to be profitable. The rags are meant as a permanent ornament; and they are found not only in the Duomo, but in a more thoroughgoing shape in the lower church of St. Mary, where the columns are so completely swathed that their material and the form of their capitals cannot be made out at all. In truth this wonderful notion of ornament is not peculiar to Ancona; to the shame of the Eternal City, it may be seen on certain high days in the patriarchal church of the world. And, after all, this display of Anconitan taste is not more wonderful than that which condemned the north transept and the crypt below it to be mercilessly Jesuited. The crypt under the southern transept has escaped; it keeps its natural columns, and it is rich in tombs and inscriptions of various dates and kinds, one of them in the Greek language, recording the burial-place of the martyr Dacios.

The narrow and winding streets of this hill city, many of which consist of actual stairs impassable for carriages, present many picturesque points, with peeps here and there of the hills and of the harbour; but besides the arch and the Duomo the only building worthy of special notice is the church which we have already mentioned as having its pillars so utterly shrouded from sight. Disfigured without mercy within, heaped in among mean buildings without, furnished with an unworthy campanile, it still retains its west front of the very richest form of the more barbaric variety of the Italian Romanesque, that which departs most widely from classical and approaches most nearly to Northern forms. It is covered with arcades, with a magnificent doorway in the centre, and almost every arch of the design is living with figures, human, animal, and vegetable. The doorway is utterly unlike its equally splendid neighbour in the Duomo. It has, in fact, not only a Northern, but, one might almost say, an Irish or North Welsh character, in its utter rejection of the column in favour of a system of members, square and round, continued round both jamb and arch, the round members being repeatedly banded in a way which, to the few who have made their way to so wild a spot, will at once suggest the grand doorway of Strata Florida in Cardiganshire. Having thus come down to the lower town, we lit once more to the mole and the arch of Trajan. Tall, narrow, and simple, it stands with a dignity worthy of the prince whose name it bears, a contrast alike to the rudeness of some arches of the kind and to the overdone splendour of others. No greater contrast of proportion can be found than between the arch of Augustus at Rimini and the arch of Trajan at Ancona. Difference of position may perhaps account for it. One stands by itself as a monument, the other spans a street, and is practically a gateway. The arch at Ancona has the great advantage of omitting the sham pediment, the worst of all the features of the Greek masks with which the Roman architects faced their own constructions. The actual beauty of columns goes far to excuse them, even when constructively they are meaningless; but the sham pediment is a mere sham, and an ugly sham; it is a sign of advance in Trajan's architect at Ancona to have got rid of it.

STEAM IN THE STREETS.

THERE is nothing more wonderful or amusing in its way than the idea which appears to possess various small knots and cliques of people that the whole world has been created solely for the purpose of providing them with a field for the exercise of their

private schemes and crotchets. There is an old story of a ship captain who admitted that land was very useful as something to anchor at and to get provisions from; and Brindley, the civil engineer, informed a Committee of the House of Commons that the object of rivers was to feed canals. At the present day there are many worthy persons who seem to imagine that rivers are natural sewers, and that their only purpose in the great scheme of Providence is to give manufacturers the trouble and expense of consuming or otherwise disposing of their refuse. But the most amazing delusion of this kind is that with which the tramway fanatics or speculators have been seized. They have apparently satisfied themselves that roads are constructed by the public merely in order that they may be handed over to Tramway Companies. The broom-maker who stole twigs for the purposes of his business was puzzled to understand how his rival could afford to undersell him, until he heard that the other stole the brooms ready-made. The Railway Companies have to purchase land, and to construct their own lines; but the Tramway Companies enjoy the advantage of having their roads made for them by the public. There can be no doubt that tramway cars are very convenient for the people who ride in them, and they are supposed to repay the ingenious audacity of their projectors; but, on the other hand, the public at large is deprived of the free use of its own highways. There are several important thoroughfares in London in which a succession of tramway cars are continually meeting abreast, so that there is barely room for a vehicle to pass on either side, even supposing the side to be clear; and as there are frequently carts or carriages waiting by the kerb, it follows that the effect of the tramways is practically to block up the whole space. In other instances the tramway cars can be passed only on one side, and that with difficulty. A District Superintendent of Police reports that "one part of the Chapham Road has for nearly two years been in such a state that it has been almost impossible to pass with a light carriage from one side of the road to the other, the tramway rails standing about an inch and a half or two inches above the level of what was once a good road." The roads in Camberwell, Peckham, and Greenwich are also, he says, in a very bad state. Of course if everybody rode in tramways this might be endured. But then it is, even on the most liberal calculation, only a comparatively small fraction of the community which patronizes this mode of conveyance. There are carriages, carts, omnibuses, and all sorts of vehicles which require the use of the roads just as much as the tramway cars, and which are put to the greatest inconvenience, annoyance, and danger by the practical monopoly of public property which has been granted to private speculators.

All this is bad enough, but it turns out that it is only the thin end of the wedge. There are tramways and tramways; there are horse-tramways, and there are steam-tramways; and it is now gravely proposed that in London horses shall be replaced by locomotive steam-engines. The *Daily News*, which supports this pretty scheme, makes use of an argument which is no doubt regarded as unanswerable by the promoters of the project:—"It is said that the cost of working compared with horses is expected to be one-half." Here we have the profits of the Tramway Companies doubled at once. Surely this is enough. As the roads have been surrendered to the Tramway Companies, it would be inconsistent to object to their making as much out of them as possible. It is true it might be suggested that the danger of this class of conveyances to the public would be immensely increased if they were to be propelled by steam; but the promoters of the scheme have no doubt their answer ready—that, if the public is afraid of steam-engines in the streets, it has only to keep out of their way. The tramway people have perhaps some right to assume that, if the public had a notion of retaining any claim to the use of the roads, it would never have given them up to the tramways. We are also assured by the same journal that "no annoyance from the engine is experienced by passengers." Thus it appears that the new arrangement will suit both the people who ride in the tramway cars and the people who get an income out of them; and of course there are no other people in the world whose interest or convenience need be thought of for a moment. Nevertheless the writer is good enough to try to persuade the public that steam-tramways will not add very much to what it has already to endure. For instance, timid people may be afraid of explosions; but let them reflect "that steam-engines are at work in nearly every street in our towns, not only for manufactures and trade purposes, but for cooking, and for warming and ventilating houses and halls." There is thus peril on every side already, and a few more boilers ready to blow up is not worth speaking about. This is a line of argument which the writer might have found it worth while to work out a little more fully. Thus he might have said, Nothing can be much worse than the horse-tramways from which you now suffer in the interest of an impudent speculation; steam-tramways will be only one drop more. They may perhaps drive all other traffic more effectually off the roads on which they are used; but it has very nearly come to this already. Steam-tramways will probably be more destructive to the roads, and will frighten the horses and make them turn round and bolt the other way; but the roads are so bad already, and driving is so dangerous, that it is desirable on public grounds that people who are foolish or reckless enough to think of using roads which are occupied by the tramways should have their horses frightened off in a safer direction. The writer in the *Daily News* comes to the conclusion that the "only ground for fear is that which the engines may provoke in horses which they will pass in their routes"; and of course a trifle of this kind is hardly worth mentioning, except

to show that it may perhaps be rather for the good of the community than otherwise.

We have already had some experience of locomotive steam-engines on the public highways. Occasionally in the country a solemn procession is met with. First comes a man with a red flag, which sends your horse shying into the hedge. When you have passed this startling object, you are immediately confronted by a monster on large wheels, grunting, spluttering, shrieking, emitting volumes of black smoke, and scattering behind it a trail of red-hot cinders. After this in all probability you will know nothing more; but, if you are not killed on the spot, some friend may perhaps tell you, as you lie in dismal parody of plaster and splints, which way it was that your horse fled, and where you were picked up insensible. A Select Committee of the House of Commons took some one-sided evidence on this subject last year, and came to the conclusion that it was the red flag which frightened horses, and that they rather like steam-engines than otherwise. It is of course obvious that a horse which is frightened by a flag must be such a remarkable and self-possessed animal that it would not be in the least put out by the most awful puffing and blowing and screeching on the part of a steam-engine. A manufacturer of road-engines who was examined before the Committee could not account for the perversity of horses who did not like engines, but he supposed that "some horses are bad the same as some human beings are, and there are also fools among horses the same as there are fools among human beings." He urged that all horses which shied at an engine should be shot. Another manufacturer thought it was the fault, not of the horses, but of the drivers, but he did not go so far as to propose to have them shot. A third took the matter philosophically. "No doubt," he said, "there may be a certain number of accidents; accidents will happen from a variety of causes." If, however, by any chance you should get your horse past an apparition of this kind, you would be pretty sure to find the road ploughed up in front of you. The manufacturers of engines, who were the principal witnesses examined, were all convinced that, if engines caused accidents, it must be the horses or the drivers who were to blame; and that, if they broke down bridges, and cut up roads into pits and holes, it was because the public did not make sufficiently good roads for their purposes. It is therefore suggested that an Act should be passed to compel the public to reconstruct the roads to suit the convenience of traction-engines.

It might be pleaded that in the country life is so wretchedly dull that about any sort of excitement ought to be welcomed; but we have surely enough excitement in town. When anything particularly absurd and outrageous is proposed to be done nowadays the excuse is always that it will educate somebody. Give ignorant labourers votes, we are told, and they will at once become statesmen and political economists. Give women votes, and they will immediately beat men in every branch of reasoning and science. In the same way, it is suggested that if you only allow horses to be run down often enough by steam-engines, it will expand their minds, and enable them to enter more fully into the spirit of the race. It is proposed that the roads of the country should be let loose upon the crowded thoroughfares of London. Already we have tramways, butcher-boys, railway carmen (as if their masters did not do enough in killing off people on their own lines), and Thug-like cabbies; and amongst them they get through a very fair amount of slaughter in a year. And now to these varied and active agencies of destruction are to be added steam-tramways. It requires very little consideration to see how admirably adapted London, with its narrow streets, overflowing traffic, and incessant movement to and fro, is for an experiment of this kind. The writer to whom we have already referred feels confident that steam-engines will soon supersede horse-power on all our tramways; but another less enthusiastic journalist suggests that "the defect about this steam-car appears to be the difficulty of stopping it within given distances—in fact, to have its movements under control." After all, however, this is only a detail, affecting nothing more than the safety of the public; the great thing is that it will enable the Tramway Companies, who at present, although they get the roads for nothing, have to pay for their horses, to reduce their working expenses by one-half. And what is mere safety of life and limb to this?

WASHED-OUT HEROISM.

IT is perhaps our fault that we do not see that the Early Heroes of Temperance, who are canonized in a little volume that has just reached us, were particularly heroic. We would, if we could, "do justice to the courage" which led one of these heroes forty-seven years ago to utter his mind freely on the subject of intemperance, only we cannot discover anything particularly courageous in his conduct. We are under the impression that England and the United States have been free countries for much more than forty-seven years, and that throughout this century it has been distressingly difficult for enthusiasts on either side of the Atlantic to accomplish anything that can reasonably be called martyrdom. Dr. Lyman Beecher composed and published six sermons on intemperance, and "we remember reading them when a boy." If there can be any heroism in connexion with sermons, it might be expected that the hearer, and not the preacher, would exhibit it. The author may have shown boldness of imagery in these discourses; but that is a very safe kind of heroism. Mr. Dunlop, a Scotchman,

shows better claim to the title of hero; for, after visiting France, he had the boldness to confess that his own was not the most moral country in the world. To him is ascribed the merit of proposing an association and pledge in Scotland. He brought forward this proposal at a meeting of twenty influential gentlemen, who did not seem to see much in it until one of the party, "prompted unquestionably by the Great Mover of all, rose, and with considerable emotion stated that the painful subject of intemperance had occupied his mind for several years, and that the hopeless consideration of the mournful case had not unfrequently kept him from sleep during the night." Here, at any rate, was something like a hero, and his resolution awakened others who spoke strongly in favour of something being done. Ministers at first looked coldly on Mr. Dunlop, but all this is changed now, as appears by the recent example of "the President of the Wesleyan Conference, himself an abstainer, when he alluded in dignified yet reproving terms to ministers who fancied they could not preach two sermons on a Sunday without resorting to stimulants." We fear there are a good many ministers who entertain this fancy. One of Mr. Dunlop's converts had at any rate the heroism to confess that he was not a hero. He became an "unpledged abstainer," and he says that he continued thus for about three months amid sneers and ridicule. He then dined out, and after dinner a tumbler was placed before each gentleman of the party that he might make toddy for himself and a lady. He begged to be excused, but his host told him that he could not refuse to make toddy for a young lady; and as he was young and the lady was agreeable, his host was right. "You will not greatly marvel that I made it and shared it with my lady friend." But he then and there resolved to become "a pledged abstainer." We obtain from this story a clear conception of the value of a pledge. The lady by whose side this young and unpledged abstainer was seated does not seem to have been of the sort for whom "Drink to me only with thine eyes" was written. She was prepared to take her honest share of toddy, and would have been surprised if her companion had declared his intention to be content with kisses. But it seems that the existence of this pledge would remove temptation and silence importunity. Our own experience of society has perhaps been gained in circles ill adapted for the development of heroism. We are insensible of any difficulty in abstinence, pledged or unpledged, and we are tempted to beg these heroes to abstain, and make no fuss about it. The heroism of Mr. Dunlop was, however, combined with common sense. He said in 1862 that a Maine Law, in all its wholesome vigour, laid on Great Britain at that moment, would have to be repealed in a few months. He said further that he who demands a Maine Law demands what would virtually force the community to give up drinking intoxicating liquor altogether. He adds that a state of national adaptation, which he implies has not yet been attained, is clearly a pre-requisite for any effective prohibitory law. All this is rational, although not particularly heroic. He desired "fundamental operations," instead of superficial agitation and petition to an unpledged Legislature; but he had at the same time the shrewdness to perceive that a definite object like the Maine Law would be far more attractive to earnest-minded men than "measures favourable to general temperance." We admire the sagacity of Mr. Dunlop, but we rather demur to the twice-repeated character given of him by his biographer. The statement that he was "a Christian patriot and philanthropist" sounds like a declaration of opinion that there may be patriots and philanthropists who are not Christians.

The next on the list is a real hero, and no mistake. Professor Edgar, an Irishman, "inaugurated his splendid temperance career by opening his parlour-window and pouring out into the court before his house the remaining part of a gallon of old malt whisky, purchased some time before for family consumption." One of the early difficulties of the movement seems to have been that those who abjured wine and spirits did not know what to take in place of them. A young man who, if not a hero, was a genius, "with his eyes sparkling with hilarity and glee," proposed that the Committee should have a tea-meeting. The President is thought to have shown boldness in taking up this idea, which was successful. The first of innumerable tea-meetings was held on a cold and stormy evening in December 1829, and "it passed off very favourably." "From this idea," says the author, "a vast amount of pure and innocent enjoyment has resulted," and yet those who proposed it seem to have been uneasy at the ridicule of their friends, who called the entertainment a "tea-fuddle." A ticket for the first tea-meeting ever held in Scotland is said to be in existence, and it ought certainly to find a place in the South Kensington Museum, although we should judge from a facsimile which is given of it that as a work of art it is not remarkable. We come now to England, where the temperance cause has been much indebted to the "venerated" William Morgan, and the "intelligent and generous-hearted" Thomas Beaumont, "both of whom," says the writer, "I doubt not are now in Heaven." It occurs to us that the author can have no special ground for the confidence which he here assumes, and probably he means no more than to assert that patriots and philanthropists who are also Christians do go to Heaven. Without questioning this assertion, we may remark that they get there on easy terms. Indeed the heroes of this book seem, according to the author of it, to have made a tolerably good thing out of both this world and the next. William Collins, also "now in Heaven," inflicted on himself a kind of martyrdom by thumping the desk in preaching, until his hand became sore, and he was obliged to have a pillow placed to receive the thumping. Mr. Livesey narrated to the author the incident which

led to his becoming an abstainer. He called at the house of a Scotch friend in Preston, where he lived, and the friend, according to custom, brought the whisky bottle on the table, and invited Mr. Livesey to take a glass, which he did, filled up with water. He took only a single glass, yet he felt much the worse for it, and in the evening was very unwell. "As the father of a family, and as one connected with several useful movements, and having a strong feeling on the then prevailing intemperance amongst all classes, he considered that he should be doing best to abstain altogether, and next morning he made a vow to that effect, which he has solemnly and religiously kept to the present day."

It seems wonderful that these petty personal details should be preserved for forty years and published. But doubtless the author thinks that a special Providence caused Mr. Livesey to be "very unwell," in order that his powerful aid might be secured to the cause of abstinence. That cause has owed much to fluent speech, and something very important—namely, the name "teetotaler"—to stammering. Mr. Livesey came to London, and he and a friend engaged a room for lecturing. Then they went into the streets and rang a bell, and invited people to their meeting. They had not gone far when a policeman tapped one of them on the shoulder, and stated that if they did not stop that he should be obliged to take them into custody. Mr. Livesey was once very ill, and a doctor urged him to take some alcoholic stimulant; but, as he said afterwards, "he was prepared to die, but he was not prepared to dishonour the glorious cause" of teetotalism. Mr. Mason, who had been trained for a prize-fighter, was employed to keep the door at an hotel where a hall was given. But ere this, says he, he had heard the sound of the Gospel trumpet, and had experienced in truth the Spirit's enlightening influence. "And the more I gazed on that frightful picture before me at that ball, I felt it to be a sort of hell upon earth." So deep was the lesson on his mind, and the impression on his heart, that he was afraid that in righteous vengeance the wicked multitude would be swallowed up by an earthquake. Under this alarming conviction he ran away "as fast as the devil was intent to stop me." Indeed, hearing "a trampling uproar" behind him he gave a kick at "the enemy of souls," like one horse kicking at another, and away he ran, and he trusts that the bond was broken for ever. In early days in Scotland and Ireland abstinence from spirits alone was inculcated by the missionaries, but as beer was almost unknown as an article of consumption, the practical result was that of total abstinence. It appears, however, that Mr. Mason allowed himself to take beer for some years after he had become a lecturer on temperance. He adopted the stricter pledge under the influence of the zeal of other missionaries of the same cause. The biographer says with much simplicity that he received "an English education," but he learned nothing of Greek or Latin, and "for the accuracy which he afterwards acquired as an English speaker he was chiefly indebted to the circumstance of having mingled a good deal in respectable society where the language was correctly spoken." This statement is in several respects remarkable. Mason was by trade a carpenter and builder, and the "English education" which he received was, we presume, such as was deemed suitable to his training. The biographer assumes that it did not suffice to enable him to speak English accurately, but he thinks that, with the best instruction in Greek or Latin, it would have sufficed. This is our own opinion as to the value of classical teaching, but we did not expect to find confirmation of it in the life of a teetotal hero. On such authority, however, we feel justified in assuming that Greek and Latin are equivalent to respectability.

DRAMATISTS AND CRITICS.

EVERYBODY will agree that a very reasonable verdict has been returned by the jury in the action for libel which was brought by Mr. W. S. Gilbert, the dramatic writer, against the *Pall Mall Gazette*. Mr. Gilbert complained of a letter which had appeared in that journal, in which "much coarseness, both of general idea and of detail," was imputed to his fairy comedy, *The Wicked World*. The writer remarked that "the whole scene between the rowdies Ethais and Phyllon and the ladies, when Ethais tells Selene that on earth it is a mark of the greatest respect towards any one to place the arm round his or her waist and imprint a tender kiss on his or her lips, and where the free indulgence of such marks of respect calls from the ladies the exclamation that they are very pleasant, seems to me in its general suggestion both vulgar and coarse—vulgar, through the air of barnyardish sentiment running through it, and coarse, in the exhibition of endearments lavished on creatures in whose manner and bearing are doubtfully attractive." He also said that "the scene where the sisters taunt Selene for her vigil seems to me simply indecent." It should be observed that the *Pall Mall Gazette* had previously, in its own person, spoken not unfavourably of this play, and had apparently not discovered any impropriety in it. The letter which was alleged to be libelous was intended by the writer as a protest against the exaggerated praise which, in his opinion, had been bestowed by the critics generally, including, we may suppose, the critic of the *Pall Mall*, on what he regarded as a coarse and rather indelicate piece. In publishing the letter the editor of the *Pall Mall* may reasonably have imagined that he was only giving fair play to different opinions. He had given his own estimate of the piece, or at least the estimate of his dramatic critic, but he was quite willing that other people who took a different

view of the matter should be allowed to express their opinion too. It constantly happens that newspapers insert letters from correspondents in which statements are made which are not only not in accordance with, but in direct opposition to, their own opinions; and this will be acknowledged to be a very wholesome feature of English journalism. It promotes free discussion, and gives every side a hearing. At the same time it is of course indispensable that the proprietor of a newspaper should be held responsible for everything that appears in it, whether in an article or in a letter; for if it were not so, he would be enabled to publish libels with impunity under the cover of anonymous correspondence. If the jury had come to the conclusion that the letter about Mr. Gilbert's play contained a malicious slander, it would have been very proper that the *Pall Mall* should suffer for it; but in determining this question it was also necessary to remember that the *Pall Mall* was discharging an important function of journalism—that of giving expression, not only to its own opinions but to the opinions of the public. The case for the plaintiff was, that the imputations of the writer of the letter on the *Wicked World* were unfair in themselves, and that the *Pall Mall* generally, in noticing his other pieces, had not done justice to their merits. The Judge ruled that the Court could not go into the question of the fairness of the criticisms on Mr. Gilbert's other plays, but that they might be referred to as evidence of malice.

It is unnecessary for us to discuss the question of the morality of Mr. Gilbert's play. It did not occur to us that there was anything indecent in it when it was produced, and the jury have expressed an opinion that it is of an innocent character. This is probably the conclusion to which most people would come who had any acquaintance with dramatic literature, and were not too eager to look below the surface and to discover double meanings. But it does not follow that everybody is to be compelled, under penalties, to concur in this view. This is supposed to be a free country, but it would be a very odd sort of freedom if, because certain newspaper critics had not detected any impropriety in a play, nobody else were allowed to express a different opinion. Questions of decency are often, to a certain extent, questions of taste; and about questions of taste there is proverbially no end to controversy. The *Wicked World* is a picture of the disturbing influence of mortal love in a fairyland where it had previously never been known; and it must be admitted that this takes us upon rather delicate ground. To some it may seem to be the most pure and innocent story in the world; to others it may appear to be full of prurient suggestion. The author's counsel stated that the moral of the piece was that those who are not subject to temptation should not be too severe on those who are. This is an excellent moral, but a good moral does not necessarily make a moral play. If the temptation were very vividly depicted, it might help to enforce the moral, and yet give offence to a delicate mind. There is a naughty dance, which in France is not allowed to be performed publicly, but which, in a slightly modified form, may be witnessed almost any night in most of the London theatres; but its indecency is probably not discovered by a large part of the audience. It does not seem to us desirable to cultivate a very keen and active scent for improprieties of allusion or suggestion; but it would be monstrous that persons who were offended by a performance of this kind should not be permitted to say so. In the present instance a number of actors and dramatic critics were called as experts to say that they saw nothing wrong in the *Wicked World*. Mr. Buckstone was asked to give the Court an idea of how he looked at a particular part of the play, but his bashfulness overcame him. The jury were provided with copies of the book of the play, but it is a question whether they ought not to have attended an actual performance of it. It is obvious that a peculiar meaning may be given to a phrase by the gesture which accompanies it. This indeed was one of the points raised in a recent case in which a well-known dramatic author claimed damages for a charge of having produced an indecent work on the stage. A passage was cited which appeared innocent in itself, but it was alleged that the way in which the actor spoke the words, and the action he used, invested the passage with a gross meaning. This is one of the difficulties with which the dramatic censorship has to contend. The censor may be satisfied with the dialogue of a piece, but on the stage the dialogue may acquire a meaning which he never dreamt of. Not long ago a French comedy was licensed and performed in London, but the licence was withdrawn on account of a scene in which a married lady is chased by a lover round the room. A compromise was arrived at by which the chase was to be only twice round the table, and a visitor was to interrupt the interview at a somewhat earlier moment, and the licence was then renewed. On the whole, a healthy sentiment will not be too prone to detect indelicate insinuations; but there can be no better guarantee of the decency of the stage than perfect freedom of criticism.

This case is important not so much in itself, as in its general bearing on the privileges and responsibilities of criticism. Mr. Justice Brett laid down the law on this point very clearly and concisely. He told the jury that the question they had to decide was, not whether the strictures in the letter were just, but whether it was written with a malicious intention. No matter how hostile or wrong the criticism might be, if it were confined to the work under consideration and to the mode of its execution, and did not travel out of the work for the purposes of slander, it was privileged. But, if words were used which were delamatory of the author personally, this would be evidence from which they might draw a con-

clusion as to whether the criticism was fair. It was clear, he said, that the mere fact that a man had written a play or published a book would not justify imputations on his life and character; nor, on the other hand, could critics be strictly limited to mathematically accurate reviews. It seems to us that this is not only sound law, but plain common sense. If, in this case, the inference had been drawn from passages in the *Wicked World* that Mr. Gilbert was a person of immoral character, he would very properly have been entitled to a verdict and heavy damages; but, in regard to the character of the play itself, there ought to be a large—we do not say unlimited—freedom of opinion. The most atrociously indecent publication known in the present day was issued under the auspices of a very pious nobleman and a number of clergymen. These gentlemen would certainly be entitled to protection against any attack on their private characters on account of this work, but it would be intolerable that the work itself should not be permitted to be denounced in the strongest language. In considering the extent to which freedom of criticism may be allowed, it is reasonable to observe the side to which criticism usually leans. Do people when they go to the theatre usually find that the pieces have been underrated or overpraised by the critics? Anybody who has read the conventional "Opinions of the Press" in a playbill can have no difficulty in answering this question. The truth is that great injustice is often done to mediocre actors and commonplace dramatists by the ridiculous and fulsome eulogy which is bestowed on their efforts by too kindly critics. It would give a zest to a dramatic performance if it were found to be, after all, better than the audience had been led to expect; but the tendency of criticism is usually the other way. It has been justly observed that a more robust style of criticism, if occasionally less agreeable to authors, would be more invigorating, and would be for the benefit of the public. However that may be, there should be no assumption of infallibility of judgment in matters of taste. The author and his friends may be right in thinking that his work is a triumph of pure literary art and lofty moral purpose; but other people have also a right to hold a different opinion. The jury, approaching the question in this case as Mr. Justice Brett advised them to do, not with feelings of sickly sentimentality, but as men of the world, returned the very sensible verdict that Mr. Gilbert's comedy and the *Pall Mall's* letter were both innocent. The dramatic author has thus vindicated the purity of his work, while the freedom of honest criticism has been fully sustained.

REVIEWS.

THE MEDIEVAL TALE OF TROY.*

WHAT the heroes connected with the siege of Troy were not only familiar to scholars of the middle ages through the medium of Virgil, but that they and their adventures were subjected to strange modifications when they were transplanted to Western Europe and afforded subjects to romantic poets, is a fact generally known. But we doubt whether the fortunes they underwent from the eleventh till the end of the thirteenth century were ever more accurately traced or more succinctly described than by Dr. Dünker of Dresden. So completely is his book in the nature of a pedigree that he is able to supplement it with a pedigree drawn up in due form, by which the degrees of relationship between the several poems under consideration may be perceived at a glance.

Homer, as represented by "Pindarus Thebanus," of whom more presently, holds a place in this pedigree, but it would almost be complete without him. The intellectual ancestors of the mediæval poets who sing of Troy are Dares and Dictys Cretensis, both of whom were supposed in good old times to be writers of remote antiquity. Dares, whoever he was, meant himself to be the Dares mentioned by Homer (Il. v. 9).

Ἦν δὲ τις ἐν Τρώϊσσιν Δάρης, ἀέριος, ἀνὴρ ἄνδρ.

The book of the so-called Dares which has come down to us is in Latin, and bears the title *Historia de excidio Troje*. Prefixed to it is a letter to the historian Sallust from Cornelius Nepos, stating that he found the original MS. in Athens, and has translated it into Latin in order that people may be more correctly informed about the siege of Troy than they have been hitherto. Dares, who actually witnessed the war, must needs be a much better authority than Homer, who did not live till many years afterwards. That Dares was really the Dares he pretended to be is, of course, not believed by any modern scholar; but a question has arisen whether his book ever existed in Greek at all. Dr. Dünker, after a careful examination of authorities, arrives at the conclusion that the ostensible translation which has come down to us is the original work, of which, we need not say, Cornelius Nepos is entirely innocent, and that this was written at a comparatively late period, but not later than the sixth century. The *Argonautica* to which pseudo-Dares refers, he considers, after the comparison of the two works, to be the still extant, though rarely read, poem of Valerius Flaccus, who lived in the reign of Vespasian.

The work ascribed to Dictys Cretensis, which is in six books and bears the title *Ephemeris Belli Trojani*, likewise lays claim to great antiquity, its ostensible author being the Cretan Dictys,

* Die Sage vom trojanischen Kriege in den Bearbeitungen des Mittelalters und ihren antiken Quellen. Von Dr. Hermann Dünker. Leipzig: Vogel. 1869.

a comrade of Idomeneus and Meriones, who, after his return home, wrote it in the Phœnician tongue, and ordered it to be buried with him after his death. According to the prologue, it was discovered, after the tomb had been destroyed by an earthquake, by some shepherds, who sent it to Nero. The Emperor caused it to be translated into Greek. Of the Greek version not a trace is to be found, and all that is left us is a Latin translation by one I. Septimius. Dr. Dunder doubts the existence of the Greek translation altogether, and considers pseudo-Dictys just as much and just as little an authority as pseudo-Dares.

Dares in the middle ages was used much more largely than Dictys; but before we come to a more minute inspection of him and his intellectual progeny, we must give a passing notice of two early writers to whom he was unknown. One of them was Bernhardus Floriacensis, who lived in the eleventh century, and wrote in Leonine verse a poem "De Excidio Trojæ," of which the following odd lines, showing how much labour was expended to produce a hideous symmetry, are a specimen:—

Pergama fere vo-	lo	fato Danaïs data so-	lo
Solo rapta do-		capta reducta so-	
Exitiale so-	na	que prima tenes Helico-	na
Et metra me do-		promere posse bo-	

The other writer was Simon Capra Aurea (Chèvre d'or), who wrote in elegiacs an Iliad in two books.

We now come to Dares and his descendants. It cannot precisely be said of the patriarch, "gemino bellum Trojanum orditur ab ovo," but his principle is the same as that of the poets of whom Horace disapproves; that is to say, determined to record the two sieges of Troy, he begins with the expedition of the Argonauts. Jason, at the instigation of his uncle Pelias, King in the Peloponnese, undertakes to proceed to Colchis, accompanied by his friends, whom Dares does not think it worth while to enumerate. "Qui vult nos cognoscere," he says, "Argonautas legat." On their way they stop at the mouth of the Simois, but are no sooner landed than they are ordered by Laomedon, King of Troy, to quit the spot. They accordingly go their way, and the rest of the expedition is described with a brevity truly marvellous:—"Colchis profecti sunt, pellem abstulerunt, domum reveri supt." Hercules, however, has not forgotten the affront at Troy, whither he betakes himself, accompanied by a band of heroes. The city is destroyed, Laomedon is killed, and his daughter Hesione falls to the lot of Telamon. Priam, the King's son, happened at the time to be absent on a warlike expedition; but he no sooner hears of the disaster at home than he returns with all his family, rebuilds the city in splendid style, and, after he has made himself sufficiently strong, despatches Antenor to Greece to demand the restoration of his sister. This being refused, Priam calls a meeting of his children and friends, and urges them to avenge the insult. His son Alexander begs to be sent to Greece, Venus having, as a reward for his judgment in her favour, promised him the most beautiful woman in that country; and, in spite of the warnings of Helenus, Panthus, and Cassandra, Priam's warlike scheme is approved by the people. Alexander sets sail for Greece and lands at the island Cythra, whither also Helen repairs, allured by the report of his beauty. The enamoured Trojan carries her off at night and returns with her to Troy. General indignation is excited through Greece; a meeting of kings is held in Sparta; war is declared against Troy, and Agamemnon is elected chief of the expedition. Here comes a catalogue of ships, similar to that of Homer. The Greek forces assemble at Athens (not Aulis), and before their departure Achilles is sent to Delphi to consult the Oracle as to the issue of the war. He returns with the answer that the city will be taken in ten years, and is accompanied by the Trojan priest Calchas, who has been sent to the Oracle by the opposite party, but has been warned by the God to join the Greeks. He is well received, and the fleet sets sail; but the wind is unfavourable, and by the priests' advice it is moored at Aulis, where, by some process not explained, Agamemnon averts the wrath of Diana. Having left Aulis, the Greeks land safely at Tenedos, and while they are there an abortive negotiation for peace takes place. In the fight that immediately ensues Proteus is killed, and on the following day in a terrific battle Patroclus is killed by Hector, who is on the point of burning the ships, but, recognizing Ajax, the son of Telamon and Hesione, as his cousin, foregoes his purpose. After a two years' truce, solicited by the Greeks, the duel between Alexander and Menelaus takes place, which is interrupted by nightfall, and now there is a truce of three years, followed by a series of battles, until at last Hector is slain by Achilles. Shortly afterwards the crafty Greek Palamedes succeeds in deposing Agamemnon from his lofty state, and becomes chief in his stead. Battles and truces now alternate with each other, till, on one occasion, when the anniversary of Hector's death is solemnized before the gates of Troy, Achilles perceives Priam's daughter Polyxena, and, suddenly enamoured of her, privately sends a Phrygian slave to demand her hand. Priam will not consent to the union on any other terms than the departure of all the Greeks, and Achilles, not being able to prevail on them to make the desired retreat, retires sulkily from the contest. Palamedes is killed by Alexander, the ships are then set on fire, and are only saved by the valour of Ajax Telamon; but Achilles remains unmoved. In nine fierce battles the Greeks are hardly pressed, especially by Priam's youngest son Troilus; and Agamemnon, who has been restored to his pristine authority, prevails on Achilles to send his Myrmidons to the rescue. These are no match for the valiant young Trojan, and at last Achilles returns to the field and kills Troilus and Memnon of Ethiopia. Hecuba, burning to revenge the death of her best son, invites

Achilles to the temple of the Thymbræan Apollo, on the pretext of discussing the proposed marriage with Polyxena. Achilles, suspecting no ill, proceeds with his friend Antilochus to the temple, where he is murdered by Alexander. The Greeks are so distracted by the loss of their best warrior that they are on the point of returning home, but are warned by the Gods to persevere, assisted by his son. During the absence of Menelaus, who has gone to Seyros to fetch Neoptolemus, the Trojans find a new ally in Penthesilea, Queen of the Amazons. Fortune seems to be once more on their side, but Neoptolemus makes his appearance in the Greek camp, and Penthesilea is killed. As, in spite of this reverse, Priam determines to continue the war, several Trojans of distinction, Antenor and Æneas at their head, resolve to surrender Troy to the Greeks, with whom they communicate through the medium of Polydamas; and it is not long before the Greeks enter the defenceless city by the Scaean Gate, on the outside of which the head of a horse is painted. Most of the inhabitants, with the exception of the conspirators, are put to death, the city is destroyed, and the Greeks are about to return home, when they are detained by adverse winds, against which, according to Calchas, there is no remedy but the sacrifice of Polyxena on the tomb of Achilles. After a long search Polyxena is found in the house of Æneas, who has concealed her with a view to her safety. As a punishment Æneas is compelled to leave his country, and the daughter of Priam is sacrificed according to prescription.

What could not be found in Dares was for the most part supplied by Dictys Cretensis, the six books of whose *Ephemeris Belli Trojani* contain the history of the war from the rape of Helen to the return of the Greeks. He was, however, less in repute than Dares; for though his work is more agreeable reading, it had this disadvantage in the eyes of mediæval poets—that it was written with Greek proclivities, whereas Dares is staunch on the side of Troy. The whole age was under the influence of Virgil, and, as a matter of course, when the tale of Troy was told, the sympathies were always with the vanquished.

Other ancient works from which the mediæval writers derived their knowledge of the Trojan War were the *Metamorphoses* and *Heroides* of Ovid, and the *Achilleis* of Statius. The very slight mention that is made of Homer is not to be accounted for on the hypothesis that his works were inaccessible, since a Latin hexameter poem written by some unknown person ambitiously styling himself "Pindarus Thebanus," and entitled "Epitome Iliados Homerice," and embodying the substance of the Homeric story, was long current among mediæval scholars. Homer was comparatively alighted because he was thought an untrustworthy authority who had grossly perverted the truth, plainly stated by his conscientious predecessor Dares, who never outraged common sense by introducing gods and goddesses into the midst of human battles. There is no doubt that the so-called Dares takes what may be called a truly "rationalistic" view of the tale of Troy. As we have seen, he makes very moderate use of supernatural agency, and even reduces the wooden horse to a painting on a gate. That the admired Dares had nothing to do with the priest mentioned by Homer, but was a prosaic narrator of a comparatively recent date, of course never entered the heads of the admirers. Josephus Iscanus, an English monk who about the end of the twelfth century wrote a poem "De Bello Trojano," thus gravely rests the value of the "Vates Phrygius," as he calls him, on the unquestionable fact that he was an eyewitness of the battles he described:—

Mira quidem dictu, sed vera, advertite, pandam;
Nam vati Phrygi Martem certissimus Index
Explicuit præsens oculus, quam fabula necit.

So says Iscanus, one of the most important of the mediæval poets who treated the subject in Latin. Equally important is Albertus Stadensis, a German abbot, who lived through the greater part of the thirteenth century, and wrote a "Troilus" which, according to Dr. Dunder, was never printed, and a MS. of which is only to be found in the Wolfenbüttel Library. Albertus seems to have been rather a facetious person, somewhat given to punning. Thus, he says:—

Æneas Æneas, ejus caput anpa cassis
Protegit—

with other pleasantries of a like kind. Like Iscanus, he used Dares as his principal source, and, speaking of himself, thus bears testimony to the value of his authority:—

Nulla postarum posuit signamenta, Daretis
Historiam, soliti scribere vera, tenena.
Et Phrygius fuit iste Dares et tempore belli
Ipse quidem milles prelia rite refert.

No Homeric nonsense or anything of that kind! Stick to your Dares, who only wrote about what he saw. Albertus, however, aspires to a licence similar to that claimed by Thukydides:—

Hunc (Daretam) sequor adiciens interdum verba vitiorum
Quasi loquebantur vel potius loqui.

However, with all his professed rigour, Albertus has allowed himself to make use of Dictys, Ovid, Virgil, the Christian Paulus Orosius, and even Pindarus Thebanus. In like manner Iscanus has used Dictys, Ovid, and Statius. The work of Albertus was not altogether a labour of love, and he felt so sadly bored at following Dares through dry descriptions of battles that he sought solace in laughing at himself:—

Ridetur chorda qui semper oberrat eadem
Quamvis sit doctus et utbarista bonus.
Vocibus instare nos semper oportet cladem
Sternuntur, sternunt, milia multa cadent.

There is a humour in the above which tempts one to overlook false quantities.

These Latin tellers of the tale, students of the cloister, intended to be classical in their style, and to follow as best they might in the steps of the antique. But with the courtly lay poets of France and Germany who wrote in their respective vernaculars it was otherwise. To their eyes the whole story became an affair of chivalry, like the *Cycles* of Arthur or Charlemagne. The hero becomes a knight who fights in honour of his lady-love, the Gods dwindle down into magicians. When Herbert of Fritular sings of Hercules, he gives him the old Hesse-Thuringian coat of arms. Konrad of Würzburg introduces among the chiefs of ships *Curacion* of Hungary, *Levent* of Scotland, *Awachel* of England, and other imaginary heroes, who are more remote from myths than myth is from history. As a theatrical manager would say, the whole thing comes out with "new scenery, dresses, and decorations."

The oldest of what we may call the romantic poets who have treated the subject, older indeed than Icanus and Albertus, was Benoit de Saint-More, a French *trouvère*, probably of Touraine, who flourished about the middle of the twelfth century; and who, besides a version of the *Æneid* and a history in rhyme of the Duke of Normandy, wrote a long "roman de Troyes" in 30,000 lines of this kind:—

Ceste estoire nest pas usee,
Nen gaires leus non est trouvee,
Ja retraite non fut encore
Mes Benoiz de Sainte More
La retraite faite edite, &c.

The poet, who writes in the third person, boasts, as will be seen, that he has rescued the story from oblivion; but there is no doubt that his chief authority is Dares, whom he indeed mentions as "Daires," and that he also uses Dictys, Virgil, and Ovid. It seems that he also avails himself of a new source of information—the "Cosmography" of Julius Honorius Orator, once ascribed to Julius Caesar. Nor does he scruple to enliven his narrative with episodes of his own invention, and to him we are apparently indebted for the first mention of the loves of Troilus and Briseida—a lady who is not to be confounded with the Briseis of Homer. Passing through the hands of Boccaccio and Chaucer, she ultimately became the Cressida of Shakespeare, who, like Benoit, makes her the daughter of Calchas, a Trojan prince, as he is described by Dares. The "*Liet von Troye*," a German poem by Herbert von Fritslar, who at the command of Landgrave Hermann of Thüringen wrote it towards the beginning of the thirteenth century, is little more than a translation of Benoit's "roman."

Of great literary importance is the poem which its author, Konrad of Würzburg, left unfinished at his death in 1287. To him as to Herbert the poem of Benoit served as a basis, and, though he refers to Dares, he seems only to know him at second-hand. He is, however, no slavish follower of the Frenchman, and makes an independent use of his Ovid and his Statius. What is very singular, he tells a pretty story of the infancy of Paris, which, it seems, is not to be found anywhere but in the *Iliad* of Simon Capra Aurea. By the command of Priam the shepherds are about to kill the dangerous child with a sword, but Paris, seeing his own face reflected in the blade, smiles at it so sweetly that they desist from their purpose. The words of Simon are these:—

Sed puer aspiciens enssem radiare coruscum
Arridet gladio nescius ense necis.

Konrad's unfinished poem was completed by an anonymous successor who was content to use Dares and Dictys.

The knowledge of the tale was widely diffused by Guido de Colonna, a learned judge in Messina, who, in spite of many interruptions, completed in 1237 an "*Historia destructionis Trojæ*," which, written in barbarous Latin, was translated into the language of every European nation that took an interest in literature, and had several successors. Otherwise the work is not very important. His chief source is Benoit, whom he does not name, and he uses other authors.

We could, if it were worth while, give a tolerably full description of another German poem, wrongly attributed to the celebrated Wolfram of Eschenbach. But in this the author shows himself so utterly independent of all precedent, and so recklessly jumbles together all that he may have derived from ancient sources, that he can scarcely be regarded as a link in the chain which connects mediæval with ancient Troy.

KINGSLEY'S PROSE IDYLS.*

MR. KINGSLEY, as we all know, is a very versatile writer. He has ventured, with more or less success, into the fields of poetry, fiction, history, theology, politics, and science. Whatever the merit of his contributions to these various departments of thought, there is one branch of literature in which he will receive, if not the highest, at least the most unmixt praise. Friends and enemies must alike admit that he has an admirable turn for graphic descriptions of natural scenery. We have not read some of the sketches in this volume since they first appeared in the pages of *Fraser's Magazine*; and one, we are sorry to remark, appeared so long ago as July 1845. Yet we remember them with a distinctness which, as we willingly admit, is due to the power of the

writer, and not to any special retentiveness of our own memory. Now a magazine article which one remembers distinctly at the distance of four-and-twenty months, to say nothing of as many years, must certainly have given unusual pleasure at the time. In fact, Mr. Kingsley has powers which place his descriptions quite above the usual line. He has a true eye for nature. He sees the smallest objects, and yet knows how to select the really characteristic points. He is therefore unusually vivid, and yet does not overcrowd his pages with detail. His love of natural history enables him to give that local colouring which is often unattainable by the poor cockney who enjoys scenery on his annual outing, but is quite unable to describe the very things which most impressed him. We have often had to regret, for example, on reading the voluminous records of Alpine adventure, that the tourist's ignorance of the names of the commonest rocks and plants limited him to mere generalities, or to descriptions of his own emotions, instead of their causes. Mr. Kingsley is always ready to describe the flies which haunt the meadows, or the larvae which swarm in the chalk-streams, as well as the broader effects of cloud and mountain wall. He has but one fault worth noticing, which sometimes mars the general impression. It is quite becoming for a lover of scenery to be moved by some religious emotion when admiring the beauties of nature, and it is well that he should occasionally express his emotion delicately and reverently. But we will venture to add that an ebullition of polemical theology is not quite so much in keeping with descriptions of scenery. When we are worshipping in the temple of nature our feelings should partake for a time of the soothing impartiality characteristic of the goddess. The sun shines not only on the just and the unjust, but on the heterodox and the orthodox; and we are a little annoyed when his rays are made the pretext for aiming a sly blow at some pet adversary of the writer's school of thought. We do not complain of Mr. Kingsley for seeing his own theology reflected in the face of nature; but he should see its positive, not its controversial, side; and to our thinking he is rather too apt to find excuses for flourishing his own dogmas in the face of all comers, and to enlist the sea or the sky as opponents of Positivists, Papias, or artistic and scientific heretics. This failing introduces a certain restlessness of style which at times jars upon us. In the essay upon North Devon, for example, Mr. Kingsley is accompanied by an imaginary artist called Claude, whom we have encountered in his other writings, and who serves to justify certain superfluous outbursts of a didactic tendency which we could willingly have spared. By the time we get to Lundy Island we congratulate ourselves on having left all controversialists and preachers safely on the mainland, and are annoyed to find that we have got one in the boat with us.

With this exception, however, we have read all Mr. Kingsley's essays with sincere pleasure. Our pleasure is rather increased than otherwise by the fact that we have a slight difference of opinion with him upon certain points; and we will venture to argue one question with Mr. Kingsley, though it is a question of taste, and though his theory was expressed fifteen years ago. Possibly he may have changed his mind, and be now upon our side against his former self. Mr. Kingsley, in fact, makes a humorous attack upon mountain scenery. The essay in which it occurs was published in 1858; the year, if we remember rightly, in which the Alpine Club first astonished mankind. The conjunction proves that Mr. Kingsley did not convert the world to his own views; though it by no means proves that he was wrong. Let us, however, take the main counts of this indictment against a creed to which we confess ourselves to be adherents, and see how far we can answer them. Perhaps we shall be able to call Mr. Kingsley himself as a witness, all the more valuable because unwilling.

A mountain, says Mr. Kingsley, in the character of "a certain peevish friend," is a great stupid giant, with a perpetual cold in his head, whose highest ambition is to give you one also. A muscular Christian would reply that he also gives you an appetite. Should I respect him for his size? asks Mr. Kingsley's friend; as well respect Daniel Lambert. Or for his cunning construction? there is not a youth who scrambles up him that is not a hundred times more beautiful when he is stripped. Be it so, we reply, if you will; but Mont Blanc's inferiority to a University athlete does not prove his inferiority to Primrose Hill. The question is not between men and mountains, but between mountains and molehills. You may be always more beautiful than any inorganic mass, big or little; but with a mountain for a pedestal, you will be a bigger man for practical purposes than when your feet are planted at the sea-level. But, replies the peevish friend, mountains don't improve people's characters. They send tourists back as stupid as they went out. The Scotch lowlander and not the highlander, has made Scotland what it is. The Jews of the west of Jordan were superior to the "barbarous mountaineers of the eastern ranges." Shakespeare never saw a hill higher than Malvern; and the noblest of races, such as the Tyrolese and the Circassians, could do nothing whilst cooped among their mountains. These scenery, we answer, which will infallibly make tourists wiser has not yet been discovered; for there is no scenery which they cannot vulgarize; but at least in mountains there is something to be vulgarized. As for the influence of mountains upon their permanent inhabitants, the question is something of the largest. If some of the highest types of men are to be found amongst them, it is also true that we may find some of the most degraded. Thus much we may say; Switzerland and Holland resemble each other in this, that they demand strenuous labour from their populations to render them habitable at all, and that so far, the mountains, like the sea, may either

* *Prose Idyls; New and Old.* By the Rev. Charles Kingsley. London: Macmillan & Co. 1872.

develop noble qualities or suppress them, according as the constitution is or is not strong enough to stand a bracing atmosphere. The mountaineer is sometimes next door to a crótin; more frequently he is superior in independence and intelligence to the clodhoppers of a lowland district. But we are talking morality instead of æsthetics. A rose is more beautiful than a potato, though it is not so good to eat; and mountains may inspire poets, though it may not be good for man to live entirely in a poetical country.

And here, leaving Mr. Kingsley's peevish friend, we encounter Mr. Kingsley himself. Mr. Kingsley is a utilitarian in a fashion of his own. He insists on believing that the world grows steadily better as civilization spreads, and he thinks it right to admire all the products of civilization; and therefore to welcome in imagination the time when purple moorland will be changed into ploughed fields, and herds of cattle graze where the wild deer still ranges. There is something, he persists, unsocial in the love of mountain scenery; and he would never care to look upon a lovelier scene than the rich Thames valley from Taplow or Clevedon. We will not quarrel with his principle. Let us even try to share Macaulay's aspiration for the day when cultivation will have climbed the edges of Helvellyn, and Ben Novis be turned into market-gardens. And yet, to say the truth, our imagination becomes here a little recalcitrant. Let us take Mr. Kingsley's own evidence, as we have already proposed. Where is it that he really finds the beautiful in these vivid sketches? The country which we should judge him to love best is North Devon; and what he loves in North Devon is the grand range of cliffs that fronts the broad Atlantic, where the falcon hangs in mid-air above the breakers, and through which the streams force their way from moorland still haunted by red deer. Then he admires the fens, which are at first sight an antithesis to the mountains. But when we ask what is the element of beauty in the fen country we come to the same principle. Fen scenery, in the first place, has often a certain grandeur, because, like the mountains, it gives a sense of vast space. The boundless plain, like the ocean, or like the view from a mountain-top, is impressive, because it carries the imagination beyond any limited horizon. Mr. Tennyson gives the secret when he speaks of the

Waste enormous marsh,
Where from the frequent bridge,
Like emblems of infinity,
The trenched waters run from sky to sky.

And, in the next place, Mr. Kingsley's imagination is really excited by the thoughts of the undrained fen of former days: when it was still frequented by innumerable flocks of wildfowl; when Whittlesea Mere was still the largest sheet of water in England; or when the Isle of Fly was a fortress of great strength, girded by its impassable breadths of swamp. In both these cases it is the wildness and the infinity which appeal to a poetical mind. But Mr. Kingsley, it is true, can describe scenery of a different kind, and which seems, at first sight, more suited to his thesis. He dwells with great vigour upon the charms of the chalk-streams, and of what he calls his "winter garden"; that is to say, the moorland country in the neighbourhood of his own living. We will not insist too much upon the fact that here, too, it is the remnant of wildness amongst cultivated scenery which is really charming, and that when he wishes to be picturesque he describes the wild animals and plants which die out as cultivation advances, not the sheep and the corn which it encourages; but we must remark that when he describes an English country house with an attempt at enthusiasm, and says that he would not exchange it for the sight of all the Alps, his real argument is the painfully utilitarian one of "Fleas, fleas, fleas." To our thinking—though we do not mean to lay down a general principle—an English country house is too often the visible incarnation of the spirit of dulness; but, admitting that fleas are disagreeable, we must add that they are irrelevant. We should be glad to introduce Mr. Kingsley to many Alpine villages where, in spite of his remarks, roads, inns, cooking, and beds are all superior to those ordinarily found in England, and where even fleas are "conspicuous by their absence." In such a case we may say, without fear of affectation, that we prefer the range of the Oberland or Mont Blanc to a quickset hedge or even a park-paling, considered as a background to scenery.

But here we come to the principle which may perhaps reconcile us to Mr. Kingsley. We admit the force of his argument up to a certain point. So far as mountains are symbols of pure savagery, they do not deserve to be worshipped. Mere inhospitality is not by itself a merit; and to admire a region because it is unfitted for human habitation is mere Byronic misanthropy. But then we deny that this is the true secret of the modern love of mountains. The charm of the Alps, if we may speak mathematically, is a function of three quantities. One part of their beauty depends, no doubt, on the wildness which is grateful to an overcrowded population. Another depends on the kind of cosmopolitan sentiment which they suggest. We are impressed by the Alps because we feel that we are on the backbone of Europe; and because, therefore, they convey a dim suggestion of all the vast districts which are watered by their streams, and of their decisive influence upon the history and character of the civilized world. But, thirdly, they are impressive precisely because they are the scene of an ancient civilisation. The chains of the Alps would be spoilt but for the chalets, and the winding paths, and the high pastures, all of which recall to us the struggles of

a race of our fellow-creatures, gradually moulded by the conditions of their existence. Make the Alps really savage; denude them of their population; place them out of all relation to mankind in the central wastes of Asia or America, and their beauty would perhaps not vanish altogether, but it would certainly suffer serious injury. The wildness is an element in the total effect; but it is not the only element; and to abuse them because they are wild is to deny the goodness of wine because pure alcohol is an unhealthy and disagreeable drink. And hence we may add that the progress of civilization does not imply the complete extinction of this element, but merely its judicious mixture with others. Mr. Kingsley can only make his streams and meadows interesting by descriptions of sport. That is, he must retain some remnant of the old barbarous life to render cultivated country tolerable to a poetical imagination. Now in the Alps nature is powerful enough to dispense with these artificial aids. A lowland stream pleases Mr. Kingsley because fish cannot be tamed like sheep, and because he may therefore enjoy the task of inveigling an animal stupid enough to mistake a gaudy mass of wool and feathers for its natural food. He delights in his fields and woods because he can there join a crowd of men, horses, and dogs occupied in running down the poor little representative of the old fauna of savage times. In the Alps the scenery can dispense with such artificial aids. A man may, if he pleases, enjoy a nobler sport than fox-hunting or fly-fishing, in following the chamois; but he will find nature impressive enough if he only lies on his back and looks at a distant glacier. We are glad to find from the article called "From Ocean to Sea" that Mr. Kingsley can speak worthily of the glimpses of snow-mountains when he really sees them; and perhaps therefore he will join in the hope that that pleasure may never disappear. When man has fairly conquered nature, let us hope that he will not turn all the world into potato-patches, but find a place in his heart for the untameable sea and mountains, and reserve even some part of this little island as a garden, if not as a wilderness. Certainly whenever the whole country has been sophisticated, and men's tastes accommodated to their dwelling-places, people will lose their pleasure in Mr. Kingsley's writings. He may be tolerably content, however, soaring his ambition, if they preserve it until that period.

SPENCER'S STUDY OF SOCIOLOGY.*

WE hardly know whether to be glad or sorry that Mr. Herbert Spencer has issued this book. If there were any serious apprehension, which we trust there is not, of the *Principles of Sociology*, which are to form the next part of his great work, not being completed in due course, we should be thankful for this collection of introductory matter as a precautionary instalment. On the other hand, if the production of the *Principles of Sociology* may be considered as at all within sight, and if any considerable amount of energy has now been diverted from the preparations for the greater undertaking, we are disposed to regret it. It seems hardly worth while for a philosopher to spend time in popularizing his own ideas. There are many persons more or less competent to work out the various applications of Mr. Herbert Spencer's thoughts, or to bring the general character of his results to the notice of such as cannot or will not appreciate them at first hand; but there is no other person who can produce or organize the thoughts themselves. And, besides the loss of power which might have been used elsewhere with better permanent results, there is some positive danger of the philosopher not doing himself justice when he attempts to be his own interpreter. The conditions of his particular instances may be comparatively unfamiliar to him: and as a man who knows very well how things ought to be done in his own special business will often be ludicrously wrong when he assigns general reasons why they should be so done, even so a thinker who is unrivalled in the power of deriving general principles from a comprehensive view of facts may err strangely when he comes to apply those very principles to a special group of facts under his immediate observation. After all there was wisdom in Hegel's lofty answer to the question about the hundred thalers; it is the business of the disciples, not of the master, to "apply the notion to the finite relations of thalers and groschen." And Mr. Spencer himself very well says, "One prone to far-reaching speculations rarely pursues to much purpose those investigations by which particular truths are reached, while the scientific specialist ordinarily has but little tendency to occupy himself with wide views." We have so few scientific specialists in politics—at least in active politics—assuming that there are some few whose devotion to political economy justifies us in so calling them, that we can scarcely tell how far they occupy themselves with wide views. But Mr. Spencer, whose far-reaching speculations, though at certain points we may not be able to concur in them, are among the most remarkable and the most valuable of our time, bears unconscious witness to the truth of the other branch of his statement. When he quits the point of vantage whence he views the evolution of society on a large scale, and embarks on the investigations by which particular political truths concerning the present state of society in England ought to be reached, he arrives every now and then at paradoxical or even contradictory results.

Thus he incidentally expresses his opinions on two of the points

* *The Study of Sociology.* By Herbert Spencer. London: Henry S. King & Co. 1873.

contained in the latest advanced political programme we have heard of—namely, “free schools” and “free law.” He is very clearly (and it seems to us very justly) against free schools, on the ground that parents ought to provide for their own children, and that any diminution of the individual parent’s responsibility would be directly mischievous, in precisely the same way that Poor-laws have hitherto been. And he obviously thinks that the existing system of Government grants has gone too far in this direction already. One might expect him in like manner to hold that every man ought to pay for his own litigation, and perhaps to doubt whether the expenses of keeping up the permanent apparatus of civil justice ought not to be borne by the suitors in a greater proportion than they are now. But, so far from this, we find indications which, when we remember certain passages in *Social Statics*, look as if Mr. Spencer would like to throw the whole cost of litigation on the State. That is, my neighbour ought not to contribute to my children’s schooling, but he ought to contribute to my lawsuit. What is the cause of this apparent inconsistency? It is not that there is anything at fault in Mr. Spencer’s logic; but, as we conceive, that his attention has never been properly directed to that class of facts which is at the bottom of legal proceedings. Ignoring or underrating the difference between civil and criminal law, he seems to assume that there is an absolute moral right and wrong in every lawsuit, one party being wholly in the right, and the other wholly in the wrong, and that the innocent party ought to be able to assert his rights at the expense of the public. This, however, is not clear, for we also find traces of a notion that it is all the fault of the State for not making the law more certain, and therefore the State ought to bear the costs; and we are not quite sure which view predominates. Anyhow it is certain that Mr. Spencer is not at home in this particular field of observation; and this becomes still more curiously manifest when, in one instance, he quotes an exceedingly commonplace flourish about the liberty of the subject from Professor Sheldon Amos’s pretentious and unsatisfactory work on the Science of Jurisprudence, as if he were producing an important authority, and while he dwells on real or supposed abuses of the law of England, he misses an excellent illustration of the natural growth of institutions with which its good side might have furnished him. For the best parts of our common law are precisely those with which direct legislation has meddled least, and which have been allowed to adapt themselves by spontaneous and gradual development to the growing complexities of men’s dealings with one another. In this, as well as in divers other matters, Mr. Spencer’s judgment is warped by his making it a general article of faith that all things done by the State are ill done. Moreover there is a strange and almost unreasonable want of sympathy in his appreciation, or rather depreciation, of most contemporary events and tendencies. In the regeneration of Germany—perhaps the most wonderful and splendid event of modern history—he seems to see nothing beyond the establishment of a dangerous military despotism. He has no encouragement to give to the cause of national education at home beyond observing that we do not know yet what education is, and that, if we think to make people virtuous by reading and writing, we are much mistaken. We perfectly agree in Mr. Spencer’s general belief—namely, that while society is on the whole ever improving in the adjustments of its institutions to its needs, yet it is idle to expect any one measure to make men wise and happy all at once; but his practical conclusion seems to be that no single thing that any one proposes is likely to do any appreciable good, and that consequently anybody who is much in earnest about any such single thing is rather making a fool of himself than otherwise. Of course we know that he would not assert this in general terms, but such is the impression left on our mind as the sum and substance of all his particular depreciations. In short, Mr. Spencer has tried the experiment of writing for popular effect; his new manner is effective in even a greater degree than we should have expected; but he has also fallen into exaggerations and distortions such as come amiss from a philosopher, though in authors who write merely for effect they seem natural enough.

So much for our disagreements with Mr. Herbert Spencer. We find much to dissent from in what may be called the extra-judicial part of his teaching, but the next best thing to agreeing with a thinker whom one respects is to find him an open and straightforward adversary, and no one can complain of Mr. Spencer for being otherwise. Bound by no ties to any party, he attacks the cherished opinions of all with perfect impartiality; Tory and Radical, capitalist and workman, have all the same measure meted to them, and may all find not a few home truths to reflect on. We may now proceed to give a rough notion of the book in its outline, and to call attention to some of the passages where Mr. Herbert Spencer excels in his proper element.

That which we fear we must resign ourselves to calling sociology (a name against which we protested not very long ago) is physiology writ large; as physiology generalizes and explains the phenomena presented by the individual life of man, so this science of society is to treat the phenomena presented by the collective life of societies of men. The art corresponding to it and guided by it is the art of politics and legislation, which has to do for the body politic that which medicine, the art corresponding to physiology, has to do for the body persona. It must be observed that in this comparison the body politic—or, as Mr. Spencer more commonly says, the social organism—is by no means a mere metaphor; but on this point we can here only refer the reader to the essays, one of them quite recent, in which it is more fully worked out than

in this book. Mr. Spencer gives some space to meeting the preliminary objection which may be urged, that the difference of human nature from the rest of nature makes it impossible for any such science to exist. He answers that every ruler and legislator, nay every man who acts in his own affairs on his judgment as to what other men are likely to do in given circumstances, is stultified if it does not exist. We venture to add that at least one branch of the science has in fact so far established itself that its importance is generally recognized, and its teaching has already had much weight in the government, not only of men’s thoughts, but of the commonwealth; we mean political economy.

Again, the scientific method of dealing with history, which has now well nigh driven out the bald piecing together of battles and gossip so justly condemned by Mr. Spencer, is another important contribution to the same end. One of the quaintly didactic tales of *Evenings at Home* is founded on the motto—“Whatever man has done, man may do.” The value of history as an instrument of the social science may be expressed by the variation of one word in this; whatever man has done, man will do. The first thing is to get as accurate a knowledge as may be of the things man has done, and the circumstances under which they have been done; and then we may hope for some reasonable foresight of what man may do and will do under such circumstances as we can look forward to. We need hardly add that social science in this sense does not mean desultory canvassing of the pet grievances of the day, nor the indiscriminate propounding of schemes for bringing about the millennium. But we must let Mr. Spencer speak for himself in two of his most striking paragraphs:—

You see that this wrought-iron plate is not quite flat; it sticks up a little here towards the left—“cockles,” as we say. How shall we flatten it? Obviously, you reply, by hitting down on the part that is prominent. Well, here is a hammer, and I give the plate a blow as you advise. Harder, you say. Still no effect. Another stroke? Well, there is one, and another, and another. The prominence remains, you see; the evil is as great as ever—greater, indeed. But this is not all. Look at the warp which the plate has got near the opposite edge. Where it was flat before it is now curved. A pretty bungle we have made of it. Instead of curing the original defect, we have produced a second. Had we asked an artisan practised in “planishing,” as it is called, he would have told us that no good was to be done, but only mischief, by hitting down on the projecting part. He would have taught us how to give variously-directed and specially-adjusted blows with a hammer elsewhere; so attacking the evil not by direct but by indirect actions. The required process is less simple than you thought. Even a sheet of metal is not to be successfully dealt with after those common-sense methods in which you have so much confidence. What, then, shall we say about a society? “Do you think I am easier to be played on than a pipe?” asks Hamlet. Is humanity more readily straightened than an iron plate?

And, again, in a later chapter:—

Did not experience prepare one to find everywhere a degree of irrationality remarkable in beings who distinguish themselves as rational, one might have assumed that, before devising modes of dealing with citizens in their corporate relations, special attention would be given to the natures of these citizens individually considered, and by implication to the natures of living things at large. Put a carpenter into a blacksmith’s shop, and set him to forge, to weld, to harden, to anneal, etc., and he will not need the blacksmith’s jeers to show him how foolish is the attempt to make and mend tools before he has learnt the properties of iron. Let the carpenter challenge the blacksmith, who knows little about wood in general and nothing about particular kinds of wood, to do his work, and unless the blacksmith declines to make himself a laughing-stock, he is pretty certain to saw askew, to choke up his plane, and presently to break his tools or cut his fingers. But while every one sees the folly of supposing that wood or iron can be shaped and fitted, without an apprenticeship during which their ways of behaviour are made familiar; no one sees any folly in undertaking to devise institutions, and to shape human nature in this way or that way, without a preliminary study of Man, and of life in general as explaining Man’s life. For simple functions we insist on elaborate special preparations extending through years; while for the most complex function, to be adequately discharged not even by the wisest, we require no preparation!

The difficulty of the preparation here spoken of is, however, as fully recognized as its necessity. A good part of the book is taken up with the consideration of the various motives and influences which are apt to hinder men from taking an impartial view of the evidence on which the desired scientific judgments are to be founded. Mr. Spencer is careful to point out that almost every bias of opinion prevailing among a majority has its counterpart in an opposite bias equally potent with the minority. Thus there is a patriotic bias which naturally leads an Englishman to assume that England is in every way better than other lands; but there are those who, not striving to escape this error, fall into an anti-patriotic bias, and needlessly cry down the works of their own countrymen. On this point Mr. Spencer takes occasion to answer the current saying that we are falling off in scientific eminence; and he gives an admirable and triumphant summary of the progress of scientific discovery in England within this century. We select two more of Mr. Spencer’s special points for notice. The interest of the first is that it exhibits the affinity of his method of handling social phenomena to that which is already admitted in political economy. In this place he points out, as a truth of biology, that whatever remedies are applied to counteract special causes of mortality cannot of themselves diminish the total amount of mortality in the community, since the average maintains itself by a self-compensating process, and what is driven out at one door comes in at another. Malthus, who is commonly reckoned as a pure economist, arrived long ago at the same conclusion by an almost identical line of reasoning. We are not concerned to enlarge on the proposition, but only to point out the coincidence, which, even if not free from some unconscious reminiscence, is equally good for our purpose.

The remaining point is remarkable for the intrinsic merits of its treatment. Near the end of the book Mr. Spencer considers the difference between the characters of men and women in a passage which is quite in his best manner. He accounts for the differences in question partly on physiological grounds, partly by a very ingenious historical, or rather prehistorical, hypothesis; and he regards them altogether as deeply rooted in the nature of men and women as they now are, and by no means to be lightly passed over. He does not express any decided opinion on the expediency of giving increased political power to women, though he does say with truth that they have a great deal more already than we suppose; but it is at all events clear that he is no longer of the same mind as when he upheld the equal rights of women in *Social Statics*.

We lay down the volume with many temptations to desultory comment still unsatisfied: it contains, as any writing of Mr. Spencer's needs must, a great amount of interesting and suggestive matter, and our only fear is that it may have stolen too much of his time and thought from the working out of his principal task.

LELAND'S ENGLISH GIPSIES.*

WE should hardly have looked for a fitter man to write an account of the English gipsies than the author of *Hans Breitmann's Ballads*. The keen perception of character, the fine ear for tones or shades of speech, the sympathy with native humour, and the power of picturesque description which gave so much life to Mr. Leland's honest Dutchman, must needs be the very thing to give us, in a lifelike, natural, and racy set of sketches, the gipsy and his outlandish ways, his roving life, and his foreign tongue. Our author has flung himself with considerable zeal into his subject. He has with infinite tact and patience broken the ice which guards the secrets of Romany life at home, and makes the Rye so chary of talk with the suspected *gorgio*. And he has gone as far East as Egypt to follow up the nomad race to one of its reputed sources, and to note what differences mark it off from the gipsies of our own lanes, commons, and race-courses. Of the truthfulness of all he tells us we have not the slightest doubt or misgiving. The book bears its own witness to the writer's assurance that all which is stated in it relative to the customs or peculiarities of gipsies has been gathered directly from gipsies themselves, and that every word of their language here given, whether in conversation, stories, or sayings, was taken from gipsy mouths. This would have given him the fullest title to our gratitude had he introduced us to a race wholly new and strange, who held no place in literature, and had never drawn to itself the critical inquiry of science.

But what are we to say to a writer who sets out with studiously ignoring or setting aside the whole of what has been sought out and made known before now? The earliest authors and the most recent fare much about the same at Mr. Leland's hands. Not only the nicer disquisitions of ethnologists and philologists, but the writer whose dramatic pictures have made the gipsies a household word among the English public, have been shut to him as he wrote. Whilst entertaining the highest respect for the labours of Mr. George Borrow in this field, he has carefully, we are told, "avoided repeating him in the least detail;" and he has been equally above taking anything from Simson, Heyland, or any other writer on the Romany race in England. The two German gipsy letters which he has gone so far as to admit may, he hopes, be excused as serving to illustrate an English one. "Whatever may be the demerits of his work, it can at least claim to be an original collection of material fresh from nature, and not a reproduction from books." Not that he is willing to profess himself wholly ignorant that others have taken up the subject before him; for he speaks in his preface of there being in existence about three hundred works on the gipsies. He has at all events, we may suppose, seen the backs of them upon library shelves, or a list of them in catalogues of books. Nay, more, he has dipped into them so far as to express a doubt whether many even of our scholars are aware of the remarkable social and philological facts which are connected with this strange and numerous class of our outdoor population. It is the more provoking that he has contented himself with this mere taste, instead of drinking or enabling us to drink more deeply of this recondite spring. Having by a self-denying ordinance of his own precluded himself from making use of what men of learning and research have done before him, he trusts, forsooth, that "the critical reader will make due allowances for the very great difficulties under which he has laboured." What allowances would be made nowadays for the difficulties of a man who sat down to draw up an English dictionary with a rigorous determination to leave out of account the labours of Johnson? It is especially of English authors that Mr. Leland seems to take pride in keeping himself ignorant. He refers indeed to the works of Pott, Liebhich, and Paspatis, though even then he is careful to state that it was only after his own vocabulary was finished that he looked into the pages of Pott, and was pleased to find that most of his own words were already there. He appears at the same time to be wholly unaware how greatly Pott was indebted for his stock of Romany words to the labours of Bryant, who wrote nearly a century ago, and of

Colonel Harriot, whose vocabulary appeared in the Royal Asiatic Society's *Transactions* for 1830. It is perhaps less surprising that he should never have heard of the most copious and valuable list of English gipsy words extant, with comparative references to allied roots, and thoughtful remarks upon gipsy grammar and accidence, gathered at first hand from gipsy sources by Dr. Bath Smart, first printed in the *Transactions* of the Royal Philological Society for 1862-3, and since then issued as a separate pamphlet by Asher of Berlin. Now that we are promised a Romany English vocabulary to follow Mr. Leland's present work, which is to be many times more extensive than any ever before published, reaching, he hints, to possibly five or six thousand words, we would fain hope that the author will hold himself no longer bound by his singular vow of literary abstinence, if only for the sake of sparing himself unnecessary trouble. As it is, he has been at the pains of "reading a copious Hindostani dictionary entirely through word by word to a patient gipsy, noting down all which he recognized and his renderings of them," and he is kind enough to say that, had Pott and Paspatis done the same, those learned men would have found overwhelming proofs of the Indian origin of Romany. As he has met with a writer in an American magazine who declares that "gipsy had very little affinity with Hindustani," besides another author who coolly asserts that the fact of there being a "few Hindu words" found in gipsy by no means proves its origin to be Indian, he may perhaps take the more credit for what he would appear to think an original and independent conclusion come to by himself from studying Anglo-Romany and different works on India. Even now his study has but led him to the queer definition of the language as "in the main Sanskrit with many Persian words intermingled," whilst his historical discovery amounts to little more than the general and vague belief that the gipsies are the "descendants of a vast number of Hindus, of the primitive tribes of Hindostan, who were expelled or emigrated from that country early in the fourteenth century."

Of the fact of Upper India having been, either aboriginally or in the second degree, the home of this nomad people, no scholar, if for linguistic reasons alone, will now venture to doubt. To connect their migration, however, as is so often done, with the invasion and the barbarities of Timour, is to take undue account of what appears from the conqueror's Life by Arabachah, that gipsies were met with by Timour at Samarcand prior to his invasion of Hindostan. Would it moreover have been the low or pariah caste, to which the gipsy seems most nearly to correspond, that the usurper would be most likely to drive out? And would they within twenty years' time have made their way so far West as Germany, where there are intimations of them between 1416 and 1420? whilst at Paris, as Pasquier tells us from the city chronicles, they showed themselves in a troop of a hundred or so in August 1427, giving themselves out as Christian pilgrims expelled from Egypt by the Mahometans. Their own traditions, were they ten times more definite or unanimously held than they are now, would go for little in the estimation of any practised ethnologist. But the fact is that nothing like a common or settled account is given of themselves by the gipsies of any two lands or communities. Vaguely pointing towards the East, their tradition tends on the whole towards the Egyptian origin which the popular notions of European nations had in general till of late years assigned to them. Yet that the Rom or Romani are to be identified with the Don or Domni caste of Hindus, allied to the Nats, the real gipsies of India at the present day—the letters D and R being hardly distinguishable in gipsy mouths—is not only attested by the name they give themselves, but borne out by proofs without limit from the study of their speech and of their characteristic customs or habits, of which the volume before us furnishes so many interesting samples.

Within his own limits, and telling his own experiences, Mr. Leland does much to justify the anticipations we had been led to form of his powers as a painter of gipsy life. Though falling short of the dramatic skill and weird humour of *Lavengro* or the *Romany Rye*, his pictures of the strolling Bohemians of our highways and byways are picturesquely drawn, and coloured to the life. He has evidently about him that intuitive tact, or that magic of *bonhomie*, which is needed to penetrate the freemasonry of this peculiar race, and to draw out their esoteric lore. So rare indeed is any familiarity with the Romany speech among the *gorgios*, or outside class of mankind, that the gipsy is half prepared by the first utterance of his peculiar tongue to hail in the speaker a brother in blood. "You don't look like a gipsy yourself, sir," said a travelling tinker, in a tone of gentle reproach, on being addressed in Romany by our author on the Brighton Parade; "but you know you are one—you talk like one." The large number of Anglo-Indians resident amongst us must indeed give at times opportunities to these itinerants of the roads of holding colloquy with masters of their speech beyond the pale, and may remind them that their traditional secrets are not to be kept with the mystery which for the first centuries of their European sojourn hung over their origin and their ways. Still, as our author's experience enabled him to verify, the secret of the Romany has on the whole been well kept in England. Though mingling freely enough with vagabonds and tramps of every shade, though crossing their blood without much restriction, and intermingling with their Eastern speech any amount of slang and patter, there remains in the gipsy an undergrowth of nature which keeps him apart from the Cheap Jack, the tramping pifferer, or the mere loafer and beggar of Irish or English birth. There is especially, as our author insists, in no other class in these islands

* *The English Gipsies, and their Language*. By Charles G. Leland, Author of "Hans Breitmann's Ballads," &c. "The Music Lesson of Confucius," &c. London: Trübner & Co. 1873.

so much that is quaint or well adapted to the purposes of the novelist. You may not detect a trace of the subtle individuality or nationality on the road; but once become acquainted with a fair average specimen of a gipsy, pass days in conversation with him, and, above all, acquire his confidence and respect, and you will wonder that such a being, so widely different from yourself, could exist in Europe in the nineteenth century. Whether or not he corresponds in point of intellectual status or of latent philosophical belief to the ideal positivist whom our author inclines to see in him, it may be conceded that the gipsy shows under exceptional circumstances a freedom of thought, a refinement of manner, and an occasional dignity of soul which surprise us by their contrast with the squalor and the degradation of his ordinary surroundings. In this respect, as in the sense of charity traditionally observed among the gipsy women, are to be seen traces of Oriental extraction. Under the more favourable circumstances of life in the New World Mr. Leland has found many gipsies raise themselves to places of affluence and dignity. In this country the gradual encroachment of commons and waste lands, with other discouragements to vagabond life, can hardly fail ere long to extinguish the race. The higher value must in consequence be attached to sketches of these nomadic peripatets so lifelike and often touching as those before us. We may regret that Mr. Leland did not follow the example of Simpson and Christopher North when the well-killed, full-blooded gipsy whom he calls the Professor made him the inviting proposal to wander together over England coast-free with a donkey and a *richini jana* to tell fortunes. More adventurous than himself, two Oxford undergraduates, he tells us, could not resist the golden chance of going off on a six weeks' lark with a couple of gipsy girls, but, so far from glorying in the exploit, were in mortal dread of it, getting into the county newspaper. What secrets of the inner Roman life might in some such ways be gained to the gentile world we can but imagine. From what our author draws out of the Phœnix, or tramp, the Kalmucko, or scissor-man, or the *Actingro*, already made familiar to us by Borrow, and from the quaint examples of the Gull, or gipsy stories, which he has brought together in the appendix, we can judge how inaccurate a book he might with more sustained and systematic efforts have set before us. We can scarcely expect his zeal for homely talk or legend, stimulated as it is by copious extracts with accompanying translations, to kindle amongst his readers any wide or burning thirst after gipsy literature. Nor, judging from his chapter on gipsy etymologies, which we regret we have no space to go into in detail, should we expect to find him a very sound or certain guide among the intricacies of Oriental derivatives or roots. Still, for the simple truths it gives of gipsy life, and the many curious facts with which it bestows upon this little-known people and their language, his book deserves to be read with attention and thanks.

RUSSIAN METRICAL ROMANCES.*

(Second Notice.)

A *SKAZKA*, or popular tale, is a *skladka*, or something made up, says a Russian proverb, but a *pesnya*, or song, relates to events of fact. That many of the *pesny*, or "metrical romances," about the heroes of Kiev, dignified though they may be with the title of "historical poems," have very little to do with the sober realm of fact, will be sufficiently evident to every reader of our former notice (November 8, 1873) of Mr. Hillerding's collection of "Ognei Buiilims." But side by side with these mythological fancies or adaptations of foreign romances, there occur in his capacious volume a number of poems of a really historical character—records of actual events, memories of real persons, all moulded after the pattern of the metrical fancies in which are embodied the traditions of a prehistoric or imaginary period. Mr. Hillerding has not arranged the fruits of his researches according to their subjects, as has been done in the case of the Rubnikol and Kirevsky collections, but has kept together all the poems revised by each rhapsodist, of whatever nature their themes may be. And therefore the reader is liable to pass with startling abruptness from tales about winged steeds and seven-headed snakes to metrical chronicles of Swedish or German campaigns, from fantastic dealings with airy nothings to somewhat prosaic recollections of Ivan the Terrible superintending the siege of Kazan, or Alexis Mikhailovich convoking the General Assembly. From an artistic point of view these really historical songs are decidedly inferior to their mythical predecessors; but they are always interesting and often valuable as relics of bygone public opinion, traces of the impressions made by various historic characters on the minds of the Russian peasantry.

Remarkable as is the fondness with which the village minstrels of North-East Russia dwell on the long-vanished glories of the South-Western principality of Kiev, still more strange at first sight appears the comparative reticence of Russian popular poetry with respect to the Tartar yoke under which so many generations of Russians groaned. But records which tell of past splendours are naturally more attractive than those which recall a time of humiliation, and so the ideal picture of a victorious Vladimir, feasting among his irresistible champions in the gleaming halls of Kiev, was not likely to be displaced in the national gallery of the people by even the most trustworthy portraits of

foreign tyrants or the most faithful delineations of ignominious defeat. The Tartars, it is true, are frequently mentioned in those poems, but their names are generally taken in vain, just as were those of the "Saracens" in our metrical romances. Russian heroes visit the Golden Horde, Baly and Kalin lead their armies to the siege of Kiev, but the aim of the visit, the results of the attack, differ widely in their poetic aspect from their prose reality. The facts of the Tartar domination have for the most part died out of the memory of the people; but certain words connected with it have survived, and the names of Turkish or Mongol conquerors are now employed, by one of the revenges familiar to the whittling of time, to point a Christian moral and adorn a Russian tale. Almost the only genuine songs about the "accursed Tartars" seem to be those which tell of Christian women and children carried away into Pagan captivity, the memories of domestic suffering having proved more permanent than those of national disaster. In the present collection we find several references to facts of this nature. A Christian hero meets "a heathen Tartar" a-field, and "by God's assistance" overcomes him, "kneels up on his white breast," and demands his name and birthplace:—

"Tell me, thou heathen Tartar,
From what land art thou, of what Horde?
By what name art thou called?"

To which the infidel at first replies that, if he were the conqueror, he would not trouble his foe with questions:—

"Were I kneeling on thy white breast,
Thy white breast would I spit up,
And pick out thy life heart."

But he eventually complies with his conqueror's request, and divulges his name. No heathen Tartar is he, but a Russian prince, carried away when three years old by Tartar captives. As soon as the victor hears his captive's name and address,

He seizes him in his white arm,
Lifts him to his swift feet,
Kisses him on his sweet lips,

and greets him as his long-lost brother. The Slavonian Valentine and Olen then ride home, and Fedor, the victor, introduces Luke, the vanquished, to his mother as a captive Tartar, asking that he may be hospitably treated. Whereupon he replies:—

"Ah, thou dear child of mine!
Dost thou yet see my old step-mother,
I would go forth into the wide court,
Seize the Tartar by his ruddy curls,
Bring the Tartar into the doorway,
Put the Tartar on yellow sand,
Give the Tartar water from the swamp to drink."

But, of course, when she hears that the stranger is no heathen, but her own son,

She hastens into the wide court,
Runs to where her son is standing,
Seizes him by the white hands,
Kisses him on his sweet lips,
Calls him her son, her own dear son;

and then, on hospitable thoughts intent, carries off the brothers to her own bower, where

She seats them at the oaken board,
Regales them with dainties rare,
Offers them honeyed liquor to quaff.

In the poems describing Tartar sieges of Kiev by Baly and Kalin, there is but little that is characteristic of the Tartar period. The invaders are always repelled, being in that respect singularly unlike the terrible foes who from time to time swept across Russia like a flood, leaving nothing but desolation behind them, or who, from their distant camps, ruled their Christian vassals with the firm sway of contemptuous strength. Many of these poems are preceded by a kind of prelude, in which the beleaguered city is represented, under the form of a fair maiden, as mourning over its approaching woes:—

All along the wall of the city,
There goes a maiden fair to see,
Holding in her hands the holy Gospel.
But less does she read than weep.
That is no mere maiden fair,
It is the city wall which weeps,
Divining that over Kiev is impending woe.

Equally unhistorical, although real persons and places are mentioned in them, are the poems about Lithuanian invasions and sieges of Moscow, in which the enemy are baffled, not by arms, but by magic. It is not until we reach the songs about Ivan the Terrible that we begin to tread upon really historic ground. In them the Tartars are justly placed in an inferior position, and certain events, such as the capture of Kazan, are described with tolerable accuracy. In one of them, for instance, we see the terrible Tsar watching the beleaguered city, and flying into a passion because the mines he has had constructed beneath its walls do not explode. One of the gunners is about to explain the cause of the delay, when suddenly the fire reaches the powder, and the walls of the citadel are hoisted into the air:—

Then all the Tartars became terrified,
They submitted themselves to the White Tsar.
Thus spake the Tartars:
"For ever be our Kazan beneath holy Russia,
Beneath holy Russia the invincible,
The invincible, the by God beloved!"

In the present collection the poem about Ivan the Terrible which most frequently recurs is that which relates how he ordered his

* *Ogneishnaya Buiilims*, &c. [*Ognei Buiilims*, written down by A. F. Hillerding in the summer of 1871.] St. Petersburg: 1873.

son Fedor to be put to death. A Tartar chieftain from the Golden Horde sends to inform the Tsar that he is about to ravage Russia and occupy "stone-built Moscow." The angry Tsar orders his three sons to annihilate the insolent foe, "not leaving so much as a fowl alive." This is done; but after the victory Prince Vasily calumniate his brother Fedor, accusing him of treachery. The passionate Tsar orders his son's head to be struck off and set on a lance, adding:—

Bring hither his daring head,
Set it up in front of my white-stoned halls,
In front of my latticed casement,
In front of my crystal mirrors.

Fedor is led away to the scaffold by Malynka Skuratof (really one of the worst of the Tsar's vile instruments). But the prince's mother rushes in haste to the house of her brother, who gazes in astonishment at her disordered dress until he learns the cause of her hurried entry. Then he gallops after the executioners, smites off Skuratof's head, and rescues the young prince. Next day the Tsar is mourning bitterly "in God's church" over his son's death. "Thieves and robbers," he says, "find protectors and preservers, but for my own son is no protector, no preserver to be found." Then his brother-in-law tells him that the young prince is still alive, and the Tsar's heart becomes once more joyful.

Of the time of confusion which followed the reign of the Terrible Tsar we have but few and fragmentary records in the present collection. Still they suffice to bring before our eyes some scenes in the eventful life of the ill-starred "Grishka Otrepiet," the original "False Demetrius." According to one of these popular versions of his story,

No sooner had the dog and thief got him off neck Tsar,
Than the dog and thief determined to get married;

not choosing a bride from among the daughters of "the Princes and Boyars in stony Moscow," but wedding the Lithuanian Princess Marishka (Marina), and that on one of the days kept holy by the Church, so that

The Prince and Boyars were going to divine service
As Grishka and Maria went to the bath,

Moreover he ordered "the biggest bell of all" to be sounded, and proclamation to be made that his beloved father-in-law was coming from foreign parts to pay him a visit. The consequence of all which was, that one day Grishka looked out of window and saw that his palace was beset by troops, "all by troops with lances." Whereupon

Grishka thinks in his princely mind,
"I will make myself diabolical wings,
And will fly away as a devil."

Instead of doing so, however, he only fumbles out of the window and is killed. But his wife Marishka turns herself into a magpie and flies far away.

As a specimen of the not very numerous poems referring to the reign of Alexis Mikhailovich, we may take that which describes how he calls his Boyars together, and asks them whether he shall consent to give up Smolensk to the King of Sweden in exchange for another city. Forth to the Princes of Bokhara and Astrakhan, draw nigh to the Tsar, bow down low before him, and say that, as Smolensk is not "a Muscovite city," but is "a Lithuanian city," and contains very few soldiers and not a fother's-worth of treasure, it will be as well to part with it. But Prince Danilo Miloslavsky contradicts them flatly on every point, whereupon the Tsar at once makes him Voevode of Smolensk;

But as for the Prince of Astrakhan—he took and hanged him,
And as for the Prince of Bokhara—he chopped his head off.

At a later period we find a similar story told of the Empress Catherine II., who is summoned by the Swedish King to allow him free quarters in the Kremlin. All "the principal field-marshal" are in a terrible fright, and are ready to submit to any degradation; but a Don Cossack and another soldier who stand beside the Empress utter such brave words as restore her failing courage. By way of conclusion we will quote the following metrical record of the occupation of Berlin in 1760, after the battle of Kunersdorf, by the Russian troops under the command of Tottleben:—

Oh! weep and wails our Prussian King,
As, seated afar on the hill so high,
He longingly looks on his stronghold dear,
His stronghold dear, his city Berlin.
"O, stronghold of mine; O, stronghold dear!
O, city Berlin, mine own Berlin!
By whom art thou held, my stronghold dear?
By the Tsar, the White Tsar, art thou held,
And eke by the Russian General!"

Through the streets as a trader the General goes,
For powder and ball does the General trade,
Trades, moreover, for cannon (so score).
Captive he leads the Prussian Wife,
Captive the fair one leads and asks:—
"Whither away has the Prussian fled?"

"Ha! ye Generals dolt and dull!
At his table sat the Prussian King
As a snow-white swan!
At his window sat the Prussian King
As a pigeon blue!
As a raven black the Prussian King
To his ships has down."

NANCY.*

THAT prevailing tolerance for inferior literary work which deluges libraries and covers drawing-room tables with the trashy productions of writers who are ignorant of the first principles of the art they profess, has also an evil reaction upon those who have all the talent necessary to make a good artist and want only the industry without which talent is a wasted gift. The same ignorance or indifference on the part of the public which leads them to accept, as first-rate, performances on the stage which their ancestors would scarcely have endured, has established it as a rule in literature that when once an author has made a success his name is to become a possession for ever, a talisman that will ensure excellence to his works. The readiness of an artist, whether painter, player, or writer, to take advantage of this benevolent disposition is no bad test of his love for his art. That Miss Broughton has all the talent which a writer needs to rise to eminence cannot be doubted. In her first book the real flame of creative power shone out, and gave promise of a valuable addition to the fiction of the country, a promise which has not yet been accomplished. The flame, indeed, has glimmered more or less brightly in all her succeeding works, but it has not been fostered or tended; it has been left to its own devices, and now its light and warmth are mournfully faint. *Nancy* opens well enough, with a lively description of all the children, big and little, of the Grey family, of which Nancy herself is a member, engaged in making toffee. That the heroine should be built on exactly the same lines as all Miss Broughton's other heroines was only to be expected; it has long been the fashion of novelists to reproduce their principal characters, either in their old names or cloaked with the thin disguise of a new one, in all their works, and for this mistake the author has the excuse that she makes it in good company. And at the outset Nancy, as well as the rest of the Grey family of brothers and sisters, hickering yet affectionate over their manufacture of toffee, commands our sympathy and interest; and when the excitement of toffee gives place to that caused by the arrival of Sir Roger Tempest, a rich elderly bachelor, a visitor to the house, feeling certain as we do that this visit will end in his marrying Nancy, we hope also that he may turn out to be agreeable as well as wealthy. All the talk consequent on the announcement of this arrival is well touched and natural, in the author's best style of humorous description, as is also this account of family prayers in the Grey household:—

Algernon has thrust his head far out between the rungs of his chair back, and affects to be unable to withdraw it again, making movements of convulsed suffocation. The Beat is stealthily walking on his knees across the space that intervenes between them to Barbara, with intent, as I too well know, of unseen pinches. If father unbent his eyes, or more his head one barley-corn, we are all dead men. I hold my breath in a nervous agony. Thank heaven! the harsh recitation still flows on with equable loud solemnity. In happy ignorance of his offspring's antics, father is still asking, or rather ordering, the Almighty (for there is more of command than entreaty in his tone) to prosper the High Court of Parliament. Also the Beat is now returning to his place, travelling with surprising noiseless rapidity over the Turkey carpet, dragging his shins and his feet after him. I draw a long breath of relief, and drop my hot face into my spread hands.

But the reader, unless callous in the matter of the most ordinary humanity and social observance, is doomed to swift disappointment as to the heroine's character. Two days after the arrival of Sir Roger Tempest, an old friend of her father's, a perfect stranger until then to her, she confides to him that his old friend is an object of hatred to his children. Mr. Grey was no doubt a disagreeable person, ill-tempered and selfish, courteous only in the presence of company; but the possession of these qualities would scarcely warrant his daughter's hating him, still less her talking of him in such a manner to a man whom she knew to entertain an entirely opposite view of his character. The baronet, however, in all other points a most worthy and finished gentleman, either has lax ideas on the subject of filial duty, or is entirely blinded by the infatuation of love; for in reply to the ill-matured tirade delivered by Nancy against her father, he attempts a lame apology for his old friend, and, having taken a fortnight to think the matter over, proposes to Nancy and is accepted. The scene in which she announces this important fact to the brothers and sisters in conclave assembled recalls, as do all the family scenes, the keenness of observation and lightness of touch which first brought the writer into notice; and so does that between the heroine and her accepted lover, although this is marred by a piece of bad taste which the author takes occasion to repeat elsewhere afterwards. "Roger," says Nancy, "is a name I have been very partial to, until—" (laughing a little) "the Chairman threw discredit on all Rogers!"

The wedding-day gives the author an opportunity for a piece of description so pretty and clever that we quote part of it to show that Miss Broughton can write really well when she chooses to take the trouble:—

All round the old flowering thorn there is a small carpet, milk-white and rose-red, of strewn petals. Every flower that has a cup, is holding it brim-full of cold dew. Vick is sitting on the top of the stone steps, her ears pricked, and her little black nose working mysteriously as she sniffs the morning air.

On the bright gravel walk stands the jackdaw, looking rather a funereal object in his black suit, on this gaudy-coloured day: his gray head very much on one side, and his round sly eyes turned upwards in dictioned meditation. A worse bird than Jacky does not hop. His life is one long course of larva, and I know that if he had the gift of speech, he would also be a consummate liar.

* *Nancy*. A Novel. By Rhoda Broughton, Author of "Red as a Rose is She," &c. 3 vols. London: Richard Bentley & Sons. 1873.

From this point the book steadily declines in manner, tone, and interest; not that there is much to be said for the manner up to that point. A young woman of nineteen who says, as Nancy does, speaking of the number of her brothers and sisters, that "a Frenchman might well hold up his hands in astonished horror at the insane prolificness (*sic*), the foolhardy fertility of British householders," would be very likely to make her hearers hold up their hands in astonished horror. This sort of thing is accompanied in the commencement of the book by a dash and spirit which, if they do not quite carry it off, at least make the reader look upon it more leniently than when, as later on, it occurs in the midst of a dullness which, unlike Miranda's, is far from being good. The plot of *Nancy*, such plot as there is, begins with the heroine's marriage to Sir Roger Tempest, and reminds one of nothing so much as of those rivers mentioned by Herodotus, which commence with an ordinary stream, and, instead of flowing naturally to the sea or a lake, diminish gradually in their course, growing ever thinner and poorer, until they vanish mysteriously and are lost to sight. The happy pair arrive during their foreign tour at Dresden, a place which has of late become a very fashionable resort for people in novels. Miss Broughton takes occasion to display an extraordinary piece of carelessness by speaking of the young Bavarian officers in light blue uniforms who are to be seen in Dresden. It requires no great geographical accuracy to ascertain that this town is in Saxony, and the light blue Saxon uniform is well known in Germany by its very peculiarity. At Dresden, however, while the impulsive Nancy is performing the somewhat unusual feat of looking stealthily over a strange officer's shoulder into his plate to see what he is eating, she encounters the gaze of a young Englishman, who turns out to be an old acquaintance and neighbour of her husband's. This young man, Mr. Musgrave by name, who has a way of looking "murderous," and like "a handsome thunder-cloud," whatever that may be, promptly makes love to Lady Tempest. He makes the first declaration of his passion in a sentimental riddle, which strikes her as so funny that, to use the author's own words, she "covers her face with her handkerchief and roars." The Tempests return to England, and soon after their arrival Sir Roger is taken out to the West Indies by business, and leaves Nancy established alone at Tempest with Mr. Musgrave for a close neighbour. Her behaviour at this juncture would in any one else be surprising; in her one can be surprised at nothing. So far from avoiding or repressing him, she begs him to come and see her as often as he can. It is true that when he does come she treats him with remarkable rudeness, but this treatment she bestows on all her friends with commendable impartiality.

Mr. Musgrave, although his behaviour is not strictly moral or praiseworthy, certainly has reason and truth on his side when, having openly declared his love to her, and having been repulsed with scorn and surprise, he tells her that a woman must have been blinder than any mole not to see whether he was tending, and that if she meant to be surprised at such a declaration, she ought not to have made herself common talk for the neighbourhood with him. No woman, unless either idiotic or more innocent than the most innocent *ingénue* who ever tripped on a French stage, could have behaved as Nancy did. And in her conversation there is ample evidence that she was neither of these things. Mr. Musgrave, however, although disappointed in his hope of gaining Nancy's love, has succeeded in instilling into her mind a drop of jealousy of her husband. It is sufficiently absurd and weak that a young woman married to an elderly gentleman for whom she has never shown any absorbing love should be uncomfortably surprised at hearing a report that long ago he was engaged to another woman; but this is nothing to the absurdities that follow. This other woman is a Mrs. Huntley, who lives in the neighbourhood, and of her, on Sir Roger's return, Nancy becomes frantically jealous, because he is obliged to visit her once or twice on matters of business. He, meanwhile, has heard strange reports concerning Musgrave and Nancy, the spreading of which certainly served her quite right. These she might easily explain away, but she does not choose to do so, and so we have husband and wife at daggers drawn in mutual jealousy and mistrust. This, though a forced and artificial situation, might have been turned to good account, but the story rambles about in the most aimless uneven fashion, and whatever germ of interest lies in it is entirely thrown away. Who and what Mrs. Huntley may be is never fully explained, but she does duty as a siren to entangle one of Nancy's brothers, who, rushing up from Aldershot to visit her, straightway is struck down by a fever which is caught by Barbara, Nancy's model sister, who dies. What end or object is gained by all this it is impossible to imagine; it seems as if Miss Broughton were afraid of sending out a book to the public without a death-scene in it, and, weary of killing her heroines, has hit upon the ingenious method of substituting their sisters as victims. One fact which takes place amid all this is the most difficult to explain, and therefore perhaps the least explained of all, being nothing less than the engagement of Musgrave to Barbara. After all there is this good in her death, that she escapes a marriage with him. The story wanders weakly on after Barbara's death, and concludes with a vehement declaration of love from Nancy to her husband. Certainly her behaviour makes some assurance of the kind very necessary.

It is matter of regret that *Nancy* should do its author so little credit, the more because, as we have already observed, she is capable of producing creditable work. From internal evidence we conclude that the book has been written, or at least finished, in a great hurry, but whether this be so or not, it is certainly written with

great negligence. It exaggerates all the writer's old faults and introduces some new ones, among others a detestable habit of riddling the pages with unmeaning italics. Sir Roger remarks that their difference of age is "a monstrous, an unnatural disparity." Nancy replies, "It is not nearly so bad as if it were the other way." And there is one fault more objectionable than any venial fault of style. Nancy, speaking of the German Blutwurst, remarks, "How the Germans do call a spade a spade!" It would have been well had Miss Broughton paid more heed to those words in her heroine's mouth. There is an offensive prudery which obtains to a certain extent in the present day, and it is good to avoid this; but it is not good to fall into the opposite error. It is best to call a spade by its own name, but there are things more ignoble than spades of which it is best not to talk under any name.

ART COLLECTIONS OF ENGLAND.*

THIS folio volume of etchings from "Works of Art in the Collections of England" is intended as a companion to the analogous work published in Paris under the title of *Les Collections célèbres d'œuvres d'art en France*. The English publisher has in fact throughout employed foreign agencies; the artists are French, the printers of the plates and of the letterpress are French; even the paper has been made in France. We confess it to be rather humbling to find that the result, though not all that might be desired, is more satisfactory than it would have been if the work had fallen into the hands of English artists and artisans. We have not at present in London a band of trained engravers on copper equal to the eleven artists who have turned out these fifty folio plates. The school of young etchers at Kensington we have heretofore found occasion to commend; but the two hundred etchings from objects in the South Kensington Museum sent to the Vienna Exhibition appeared juvenile and tentative when compared with such mature and masterly products as M. Valentin's "Eau Forte," also exhibited in Vienna, taken from Mr. Magniac's famous Ewer in Henri Deux ware. It is right to mention, however, that in the Paris mode of work there is a source of inaccuracy from which the Kensington school is preserved. At Kensington the etchers have the advantage of copying with the needle on the copper direct from the objects; whereas the plates before us have been executed from drawings, which, though made expressly for the purpose, are of the nature of that secondary evidence which involves error. A like cause is known to militate against the trustworthiness of many of the most brilliant and elaborate of Italian engravings from the old painters. Herr Unger, whose etchings from the Galleries of Brunswick and Cassel we have before favourably noticed, worked on the copper-plates, seated before the original pictures. It is a misfortune that the actual conditions in the present instance precluded a practice so salutary; the objects to be reproduced remained in England, while the artists were in France. The treasures here delineated are in truth too rare to be made itinerant; they had, in fact, never met together till they here found themselves massed in the same volume.

This volume, which has the advantage, as well as the disadvantage, incident to a miscellaneous collection, comprising comices, wood-work, metal-work, &c., once more declares the unsurpassed riches of the private as distinguished from the public collections of England. It is true that some few specimens have been taken from the British Museum and the South Kensington Museum; but the greater part of the examples come from private sources. Among the principal contributors are Sir Dudley Coutts Marjoribanks, Mr. John Henderson, Mr. Holford, Mr. John Malcolm, Mr. Alfred Morrison, Mr. Charles Magniac, Mr. Franks, Mr. Addington, Sir Richard Wallace, Baron Lionel, Baron Anthony and Baron Ferdinand de Rothschild, and the late Mr. Alexander Barker. Yet a multitude of well-known collectors do not appear in the list of contributors; indeed we need not say that the all but inexhaustible resources of the country would furnish materials for a second or third volume. But a work of this character is so costly in production, and so circumscribed in circulation, that the experiment is, we fear, not likely to be soon repeated. Moreover, the difficulty is to obtain objects which, even by reason of their merits, have not become almost too well known. Owners have been so liberal in their loans to London and provincial exhibitions, or to *soirées* of fine art clubs, that a large proportion of the treasures of the country come before connoisseurs as old acquaintances. For example, several of the specimens here engraved have already appeared in the volume on the Manchester Art Treasures, or in the series of photographs from the Loan Exhibition of 1862. Nevertheless, it is not easy to see too much of a good thing, and any means by which a fine work of art can be reproduced, multiplied, and widely diffused is a gain to that general public whose appetite for the arts seems to grow every year more insatiable. With few exceptions the objects selected are the best of their kind, not only rare and costly, but of real worth as models of excellence. Of special interest are the specimens of Oriental porcelain, bronzes, and enamels; of rare beauty is the Chinese porcelain vase of the seventeenth century from the collection of Mr. Franks. M. Bracquemond's etching from this vase brings out with truly artistic effect the clustering flowers of

* *Works of Art in the Collections of England*. Drawn by Edouard Lièvre. Engraved by Bracquemond, Courty, Flameng, Greux, L'Hermite, Le Rat, J. Lièvre, Musella, Rajon, Randall, and Valentin. London: Holloway & Son.

the white wild prunus, a favourite decorative study in these Oriental ceramics. Force and delicacy, detail and generalization, are here shown to be within the reach of the etcher's art.

It is cause for regret that in this otherwise highly-wrought volume the letterpress descriptions are scanty in the extreme; one reason assigned for this defect is that no written notes were taken before the objects when the drawings were made. Yet surely it would have been easy to give a full and critical account of Albert Dürer's highest achievement in plastic art, the small but delicate carrying on soapstone in the British Museum representing the Birth of St. John the Baptist. This precious gem has been cited as a matchless work of the master by Dr. Kugler and M. Labarte; the latter engraves the composition in his volume on "The Arts of the Middle Ages." A whole treatise might be written on the composition. We have here another proof of the universality of genius. Dürer, like his contemporaries Raffaele and Michael Angelo, passed with ease from the pictorial to the plastic arts—a transition not difficult when the primary aim of any school of painting is form and not colour; a distinction which may account for the fact that the great colourists, such as Titian, have never used stone as a vehicle of expression. It is interesting to observe how all great masters, even when they approach to universality, make the manner of the art in which they are strongest dominate over the sister arts. Thus Michael Angelo, essentially plastic, paints like a sculptor, while, on the contrary, Dürer and Raffaele, primarily pictorial, use a chisel as a brush. The picturesque relief hero rendered with singular fidelity has, in fact, the character of an easel painting. The mother of St. John the Baptist is supported by cushions in a tester bedstead; in the background are hangings, a doorway, a cupboard, with jars, books, and boxes lying about as in a crowded and disordered German dwelling. A discussion evidently has arisen as to the naming of the infant; "the man near the bed is the Doctor. The father Zacharias is writing on a tablet the name of the new-born son John, the writings in Hebrew are legible. A man entering at the door is supposed to be Dürer himself, whose monogram and the date 1510 are cut on a tablet at the foot of the bed." The celebrated French engraver, Leopold Flameng, who has recently been seen in Vienna as the translator into black and white of pictures by Rembrandt, Delacroix, Ingres, Bouington, and Meissonier here very properly throws himself into the manner of Albert Dürer. This etching in its severity, dryness, and abstemious use of light and shade might almost be mistaken for a plate executed in the school of Dürer. In like manner this French engraver, who in the best sense has learnt to make himself all things to all men, here abstains from the suggestion of colour, whereas in a highly esteemed plate from Rembrandt by the same hand, colour as well as texture are indicated in every touch. In no quality do engravers differ more widely than in the translation of colour; Toschi, Raffaele Morghen, and Italian engravers generally show themselves colourists, and in looking through this volume we find that French etchers also can be colourists when they choose. For example, the renderings of a Commode and a Coffin in richest boulevards, belonging to Sir Richard Wallace, are almost as abounding in sense of colour as if a paint-brush had been used in place of a graver. On the other hand, "the embossed steel cuirass," from the collection of Mr. Charles Magniac, is fittingly allowed to remain as cold as the material in which it is wrought.

A melancholy and sensitive head by Leonardo da Vinci, bending in the neck and looking downward to the ground as a lily drooping on its stem, has been very lovingly rendered by the French artist M. Rajon. The fascination of the female heads, of which this is a representative form, is almost too subtle to be defined. Leonardo was possessed with an ideal type of womanhood; indeed in Italy in the middle ages each great creative mind had its own symbol answering to the longing of the heart for a perfect image of the true and the beautiful. Dante, Da Vinci, Michael Angelo, and Raffaele, seem in turn to have been sustained by a vision of the divine in the human. In the head now before us, from the collection of Mr. Holford, ascribed apparently on better grounds than often to the great master of Milan, there is a shadow of sadness, a sorrow that has supernatural sustenance. In this face, often repeated in the school, the eyelids droop heavily; they are full of tears, as the half closed petals of a flower filled with the cold dews of night. The mouth, too, though in repose, is eloquent; it speaks of maternal love and of a peace made perfect through suffering. We often wonder how far Leonardo meant all this when he put pencil to paper; yet with him the mental process is ascertained to have been not merely that of intuition, but rather of prolonged induction from nature. The well-known form which became in the school as immovably fixed as a stereotype grew, we believe, out of that hidden correspondence between the artist's mind and the outward world which lies as the secret behind all types. But the image which at first issued forth as if by revelation soon became petrified and traditional. Such is the history of all art. And the transmitted power in the hands of disciples of reproducing the most vital conceptions of a master was peculiarly present in the school of Da Vinci. We see no reason to doubt the authenticity of this lovely head; yet we may mention that in the Picture Gallery of Parma there is a sketch by Leonardo all but identical with this study here engraved. The work in Parma cannot be surpassed in subtlety of superhuman sentiment. Dr. Waagen, apparently without sufficient authority, says that the example in Mr. Holford's collection is the study for the Madonna in "La Vierge aux Rochers" of the Louvre. Anything that can elucidate Leonardo is to be received most gladly.

Works on the art wealth of England have of late years multiplied greatly; some consist of treatises, others of illustrations, and many combine printed descriptions with lithographs, engravings, or photographs. It may be said that we live in an age of catalogue-making. The drawings of Mr. Malcolm, the engravings of Mr. Alfred Morrison, have all been catalogued; also the ivories, the textile fabrics, and the ceramics in the Kensington Museum, have severally been made the subjects of exhaustive and richly illustrated disquisitions. Moreover, special exhibitions, such as the Art Treasures of Manchester and the Loan Exhibition of 1862, have added to the art literature of the country. All these volumes are now before us for comparison with the latest addition to the number, the *Works of Art in the Collections of England*. Each of them is distinguished by individual merits and defects; the book recently published has, as we have seen, no claim to critical acumen, and the want of adequate description must be supplied by reference to the standard text-books. On the other hand, it is scarcely possible for the art of etching to do more, though none of the plates quite reach the unapproachable excellence of M. Jacquemart as seen in the *Histoire de la Porcelaine*. And yet it is marvellous to mark the perfection of realism to which these plates attain; the distinction between metal-work, ceramic ware, tapestries, and crystals, is clearly defined by quality of touch, by reflected lights, and by surface texture. Even colour, as we have said, is suggested, as in M. Gren's etching from the Limoges enamel dish in the collection of Sir Dudley Coutts Marjoribanks. And yet, on the whole, we must regard these etchings as free translations rather than as facsimile reproductions. They almost of necessity lack the solidity of lithographs, and the illusive reality of photographs. In fact, each method has its specific value. Thus we have found photography inimitable in the reproduction of crystal vases and of ivory plaques. In like manner chromo-lithography has rendered with a perfection possible by no other process "a Boule Cabinet," lent by Her Majesty to the Art Treasures at Manchester. On the other hand it must be admitted that nothing can be more precise in drawing, or more consummate in handling, than the etchings from an engraved Persian bottle and an engraved Persian pail in the collection of Mr. John Henderson. Equally good are a "Brass Aiguille," Venetian, but of Oriental character, belonging to Mr. Alexander Cassella, and a Chinese Bronze from the collection of Mr. Alfred Morrison. Such master-works bear out the assertion of Mr. Hamerton that "the strong points of etching in comparison with other arts are its great freedom, precision, and power." Etchings, too, when of fine quality, as some of these are, have the value, not only of transcripts, but of creations; they are more than copies, they partake of the character of originals. Lastly, these plates are records; unlike photographs they are enduring; if any of the treasures should perish, these prints will remain. The old engravers, Marc Antonio and others, thus perpetuated works which otherwise would have been lost.

BRAZIL.*

JUDGING from internal evidence, we should say that the work of fine-sounding learned title, "Chorography of Brazil," is a puff, done to order of the Brazilian Government, for the purpose of displaying to ignorant Europe the infinite excellence and sublime perfection of Brazil. It has been translated into infamous English by a gentleman whose name suggests that he is a Frenchman. It has been probably expected that the thing would tell better for being presented in the unsuspicious form of a geographical treatise; but it was surely an unwise economy to spoil it for English readers by employing a wholly incompetent translator. The mixture of bad English with the grandeur of all Brazilian things described has the drollest effect. This English translation of *Notions on the Chorography of Brazil* contains some four hundred and eighty octavo pages. The writer vouches for his modesty of statement in a passage full of unintelligible magniloquence:—

In what has been just shown, the riches of Brazil in the three kingdoms of Nature, that is, in the magnificent and extraordinary opulence of its soil, a wonder of spontaneous treasures, which no country possesses united in that great degree, is stated in a modest description, and that trebly deficient in order that above all, the extraordinary grandiloquence of truth shall not compromise and prejudice the verisimilitude, in the opinion of those who do not yet know the marvels of Brazilian nature, and therefore have a right to be slow in belief of the exposition of the marvellous.

A large labouring-class immigration is the special aim and end of this expensive system of elaborate Brazilian puffery in Europe. But the bait is skilfully dressed for higher social classes. Among the aristocracies and gentries of Europe, voyages to Brazil now becoming every day easier and easier, parents should keep a very sharp look-out on susceptible sons. See the temptation held out by Brazilian ladies:—

The sensual passions and instincts in all nations and countries tell of and conceal lamentable acts of giddiness and falls; the burning climate of Brazil should facilitate the increase, or show a greater number of examples of breach of chastity, but the education and character of the Brazilian woman challenge inquiry as to their virtue and correct behaviour, and can bear comparison with any women of the most moral nations.

Intelligent but obedient, sympathetic but chaste, high spirited but yet

* *Notions on the Chorography of Brazil.* By Joaquim Manoel de Macedo. Translated by H. Le Sage. Leipzig: Printed by F. A. Brockhaus. 1873.

Brazilian Colonization, from an European Point of View. By Jacard Assu. London: E. Stanford. 1873.

restrained; beautiful and vain, yet true to the principles of morality and duty, the Brazilian daughter never entirely detaches herself from her parents, as a wife she ever watches over her love, and even when neglected and unloved, she honours for her honour's sake the name of her husband, and as a mother, words are insufficient to render justice to her sublime qualities,—beyond spouse, the infinite in the imagination of tenderness, of weakness, and indulgence, in a word of the unfathomable depths of maternal love.

The valour and prowess of the great Brazilian army and navy equal in wonder the merits of Brazilian women. The naval officers especially shine:—

They have already given proofs of what they can do and are worth in struggling against tempests, and in the agonies of shipwreck; they have already shone as fearless and most distinguished, in the horrid blaze of fire, which they have known how to fight against; and the best and the brightest of their blazoned, beardless heroes in the last war have already given to Brazil admirable examples of inexorable bravery, of conquerors and of sublime martyrdom. One of them, the young, almost child—Greenhaigh was killed whilst embracing and defending the national flag; if others of the same school did not imitate him in the grandeur of his fall, they knew how to equal him in stupendous acts of bravery, and there was not a single one who failed in the heroic, and, at times, the temerity of his colleagues, companions and brothers. . . . There is no patriotic exaggeration in this opinion; let who will study and question, the spirit and frank expansion of feelings in the young naval officer, as well as in the simple sailor, and in those of the soldiers of the army of Brazil, and he will acknowledge that both sailors and soldiers tolerate the hypothesis of equality; but they do not admit the superiority of valor, of constancy, and of martial daring.

It can be set down only to the simplicity of a young nation or to much experience of the gullibility of senile Europe that Brazilian Administrations can continue in the belief that such transparent balderdash as the above can have any convincing effect.

It is a relief to turn from such egregious nonsense to the truth-telling little work of Jacaré Assu, a fantastic pseudonym assumed by a very clever, accomplished, and well-informed English writer. This gentleman rips open with a scalping-knife Brazilian puffs and pretensions. He is an ironical writer:—

Brazil has been contemplated so often from the rosy point of view; people paid and unpaid have at various times been so fulsomely mendacious on her account; placards, newspapers, guide-books, and itineraries have contained such startling paragraphs—often under the hand of those who ought to have known better—about the marvellous fertility of the empire and the exceptional advantages it offers, that a little sober truth becomes more than ever necessary. If the advantages of Brazil, its balmy climate, its deep soil, its mineral wealth, its warm reception of emigrants, its rigid adherence to contracts, its sound institutions, and the affinities of its people for things and minds Teutonic, were left to spread their light by the radiating force of truth alone; if the importation of whites was restricted to facilitating the transit and establishment of those who followed that natural attraction which the means of wealth and happiness necessarily exercise upon the poor and miserable—without official meddling, subsidizing, or puffing—if these were the conditions of the movement, then there would, indeed, be nothing to say against it. But would it then ever take place at all? As far as regards the English agricultural labourer, I think we may answer, "Never."

Jacaré Assu gives an exhaustive account of the sad experiences of Brazilian colonization from every nation of Europe:— from the very beginning with Swiss, fifty-six years ago, to the last deplorable English adventures of 1872. It is a collection of terrible tales of false representations, broken promises, violated contracts, governmental mismanagement and cruelty, pestilential climate, and barren or scanty soil, where health and fertility have been positively promised, and of the sickness and death of a long succession of heartlessly deluded dupes. The writer is anonymous, but internal evidence shows his mastery of the subject: and confirmation is fully given by official Reports lately published, received from the British Minister and British Consuls in Brazil. The success of some German colonies in the southernmost province of Brazil, Rio Grande do Sul, where the climate is temperate, is explained by its climatic advantages, and by the perseverance of the German immigrants, in spite of ill-treatment and every sort of discouragement, until they have made themselves a power in the province which cannot be despised and must be respected. The Germans are now nearly fifty thousand strong in the province of Rio Grande do Sul. The future of these German settlements in that one province, says our author, "is the most hopeful in all that dark calendar of error, recklessness, and speculation." There are resemblance and affinity between Germans and German-Swiss. Both the German and Swiss Governments have been compelled to send out missions of inquiry into the grievances of their colonizing subjects, and have received deplorable accounts of hard treatment and misery. Herr von Tschudi, the Swiss Envoy, reported in 1860 that Swiss colonists in the province of Espírito Santo had met with "endless knaveries, violence, injustice, and lies." Herr Haupt, German Consul in Rio, described in 1867 the German colonists of San Paulo as "irremediably enslaved, notwithstanding the many sacrifices made by the European communities to which they belonged, to effect their liberation from their contracts." In 1862 the German Government, exercising a paternal authority, prohibited German emigration. We quote again from Jacaré Assu:—

In 1863 we find the German envoy in Brazil journeying to San Leopoldo to endeavour to obtain a settlement of the long-standing complaints of the colonists with respect to the measurement of their land—late justice, which he seems by the co-operation of the Central Government to have succeeded in procuring; and, finally, in recent days, we hear of the Federal Government of Germany warning its people through the columns of the *Staats-Anzeiger* against contract colonization schemes lately set on foot by the provincial governments of San Paulo and Rio Grande do Sul. . . . What the Brazilians paid for in money and loss of reputation, Germany subscribed

in flesh and blood, making a heavy bill against the hordes of paid puff-brokers, agents, recruiters, speculators, and rascally directors. We have seen to what scenes and recominations the issues of this bill gave rise as they occurred. The bitter tone of the German Consul's writings on the subject, though, may be, excessive, speaks for the impression produced on an intelligent man and an advocate of European colonization in a position giving him unusual facilities for judging of the question.

Why should Englishmen, who have before them the choice of large fields of emigration in Canada and Australia, under the protection of their own Government, and with the advantages of their own language, traditions, and religion, fly to a pestilential climate, with strange language, uncongenial customs and institutions, and unsympathetic religion? The laws and customs of Brazil are an interesting study, and of vital interest to persons thinking of becoming Brazilian colonists. Civil marriages are not permitted. All marriages must be accompanied by a religious act, and performed by a clergyman recognised by the Government, who, in the case of a mixed marriage, must be a Roman Catholic priest. A Protestant clergyman in Brazil is a very rare phenomenon. No Roman Catholic clergyman will celebrate a marriage, unless a dispensation has been obtained, except on condition that the children be brought up as Roman Catholics. In the two colonies of Cananea and Assunguy, to which our poor countrymen were lately drafted, there is no clergyman at all, though a clergyman was officially promised. The practical choice then for almost all British colonists in Brazil is between concubinage and marriage by a Roman Catholic priest, on condition of bringing up the children as Roman Catholics. Existing marriages are not safe. In 1861 a Protestant Swiss colonist's wife got tired of her husband, whom she had married in Europe, fell in love with a Brazilian, declared herself a Roman Catholic, and was married to her paramour by a Roman Catholic priest, and the Bishop of Rio pronounced the first marriage null and void, and sanctioned the second. Shortly afterwards the Bishop of San Paulo refused to dissolve a Protestant marriage under similar circumstances, where the husband had become a Roman Catholic in order to get rid of his wife and marry a Brazilian woman; but part of his judgment was that it behoved the convert to spare no pains to convert his Protestant wife and bring up his children in the Roman Catholic faith. The sanctity of Protestant marriages is as yet an open question. There being a marriage either previously in Europe or after arrival in Brazil, the laws of the country as to distribution of property give half to the children on the wife's death, without power of dispute by the husband, or, in default of children, give half to the wife's relations. On the father's death the Brazilian Court of Orphans takes charge of the property for the children. On this point Jacaré Assu is worth hearing:—

Not only the fate of orphans, but all matters of succession to the property of a dead colonist, are, of course, by right in the hands of the local authorities, subject alike to Brazilian law and Brazilian favouring. In Petropolis the tact of the late German Consul had created a happy exception; by an affable, intelligent understanding with the native officials, based on a knowledge of character, he kept the practical management of most cases of succession among his countrymen in his own hands. . . . It has been often and justly remarked that a very imperfect code promptly administered with impartiality and uniformity is better than any superior legislation applied by vacillating and dilatory hands. It is not alone in cases of inheritance that the foreigner will meet with opportunities of verifying the truth of this statement in Brazil. . . . A lawyer of the capital once told me that he had been more than a year endeavouring to recover the small sum of 3*l.* for a client. A case came under my notice of an immigrant kept nearly three months in prison on a charge of threatening, and then dismissed for want of evidence; of an Englishman charged with assault, and only brought to trial after ten months; of another committed on suspicion of robbery, and not brought to trial after nine months.

Let us return for a moment before we conclude to the puffing "Chorography" with which we began. The colonies of Cananea and Assunguy, of which so many of our countrymen have been lately victims, and which have been in existence from ten to fourteen years, and are yet without roads to the ports respectively fifteen and eighty-four miles distant, are thus complacently described by the patriotic Brazilian:—

Faults of administration, which the Government is endeavouring to correct, have hindered the development of the colonial nucleus [Cananea], which will certainly prosper once rid of that drawback, more especially when endowed with the road which to the extent of 23 kilometres will tend to connect it with its respective port.

Colonization continues, and will continue, but what the province of San Paulo, and those which follow to the south ought to hope for, is the spontaneous immigration of the Europeans of the North and of the South, who without dispute will evidently encounter here a much better Europe than their own, by reason of its temperate climate so beneficent and the fruitfulness of its soil.

Yet with still a little more favour, a little more patient solicitude, a few more sacrifices, which will be as it were seed most advantageously sown, and the development in project, and already set on foot for the construction of good and extensive roads, will give to the magnificent but hitherto poorly appreciated province [Assunguy] a very numerous European immigration, which cannot fail to resort to a territory so rich, so fertile, with a climate so favourable and mild, so extensive as to enable tens of thousands of laborious families easily to become proprietors of lands, the very fertile soil of which offers health, long life, freedom, and opulence.

Whatever the advantages for Brazil, or whatever magnificence may be in store for her "poorly appreciated" provinces, we can only hope that no more of the seed sown will be trees of British subjects.

CHRISTMAS BOOKS.

"TO do the English justice," says the Citizen of the World, "their publications in general aim at mending either the heart or improving the common weal. The dullest writer talks of virtue, and liberty, and benevolence with esteem; tells his true story, filled with good and wholesome advice; warns against slavery, bribery, or the bite of a mad dog, and dresses up his little useful magazine of knowledge and entertainment at least with a good intention." True as this was a hundred years ago, it is scarcely less true now, in spite of the dullest writers of all—the sensational novelists. But more especially is it true of the writers of those Christmas books who, with the turn of a year, have again in all their hosts come forward to claim our notice, and, like the bride at the altar, to ask to be given away. The author who talks of virtue talks of it with quite as much esteem, and possibly with quite as much self-esteem; wraps up the same good and wholesome advice in a history, so mixing the two together that, like a powder in a jam, the one cannot be enjoyed without the other being at the same time swallowed. Though we have still in our tales and magazines recipes given against the bite of a mad-dog, and indeed against any chance that can befall any one, from an unexpected offer of marriage to the arrival of a casual guest when there is nothing but cold mutton in the house, yet against bribery (in these blessed days of Balloting) and slavery warnings are not given, as warnings surely are not required. Happily other matters have arisen to take their place, so that the warners are not left without a theme, or the mad-dog without a fellow. One party has in well-selected texts a famous recipe against the errors of Ritualism, leading as they do to Rome; and another party has a no less famous recipe in the authority of the Church against the errors of Evangelicalism, leading as they do to dreary Dissent. Each party dresses up its little magazine at least with a good intention, and shows that in its ranks alone is to be found a prosperous piety. Then, too, we have another host of writers who are more moral than theological, and who would teach us that in punctuality, in early rising, or ginger-beer drinking, true happiness lies. Besides these three great parties, who only care to amuse so that they may at the same time instruct, we have others who only instruct so far as it is necessary to justify serious people in being amused; while we have a few—but a very few indeed—who have never thought for a moment that it is their duty to be their brother's keeper, and who, careless of making him wiser and better, care only about making him merrier. There is, again, another set of books—the largest set, perhaps, of all—that are written neither chiefly to edify, nor to improve, nor to instruct, nor to amuse, but to be given away. The time of the year has again come round when every one who is not utterly brutalized begins to get ready to make a present to every one else. At first sight it would seem that a good deal of trouble would be saved if each person made the present to himself, as the result in the long run would be just the same. But then we must not forget that so blessed is the act of giving that it hallows even the republication of engravings, somewhat worn though the blocks may be, that have long ago appeared in some Keepsake or in the *Art Journal*. Our criticism of such works as these shall be as gentle as honesty will allow, for we are coming to that season of the year when "no planets strike," and no critics too, "so hallowed and so gracious is the time." It is, we suspect, quite as much on the kindly feeling and the geniality which then abound, as on the passion for making presents, that authors most rely when they choose the wintry season for starting their new ventures. "Books," as Mr. Fudge the publisher says, "have their time as well as cucumbers. I would no more bring out a new work in summer than I would sell pork in the dog-days. Nothing in my way goes off in summer, except very light goods indeed. A review, a magazine, or a sessions paper may amuse a summer reader; but all our stock of value we reserve for a spring and winter trade." He goes on to add, as we think one or two of our modern publishers would say with him, "It is not my way to cry up my own goods; but without exaggeration I will venture to show with any of the trade; my books, at least, have the peculiar advantage of being always new; and it is my way to clear off my old to the trunk-makers every season." By the way, the trunk-makers nowadays are not quite so well treated. Certain books take a good many seasons to clear off. However, as the publisher is very careful not to put the date on the title-page, they have, though old, the peculiar advantage of passing as always new. Such books as these, however, whenever we detect them, we shall leave to take care of themselves. For the rest we shall be ready, if they have any merits, to praise them in much the same way as was praised the Roman general of old:—*Multa enim et in homine Romani dicere*. No small literary merit considering that it is a Christmas book.

A Gallery of Illustrations Literary Characters (Chatto and Windus). Though all that is worth anything in this volume is merely a republication, yet it is, in some ways, the most interesting of the Christmas books that have as yet come before our notice. "It consists," to quote the editor's preface, "of a reproduction of the Portraits and Groups originally published in *Fraser's Magazine*, 1830-38, under the title of '*A Gallery of Illustrations Literary Characters*,' and of the biographical-critical sketches by which these were accompanied." The portraits are all believed to have been the production of Maclean, while the accompanying notices were, with a very few exceptions, written by Dr. Magian. Maclean's sketches, though they are "tinged with caricature," are full

of vigour and individuality and life. They bring home to us the famous writers of forty years ago far better than all the portraits that adorn the fly-leaves of all their works. While Maclean's writing is often very clever and full of humour, yet it is quite as often disgraced by a scurrility at which, happily the present generation, on this side of the Atlantic at least, will stand aghast. The political bitterness of those Reform Bill days is brought out in a most striking manner in this book. The New York papers, though they have none of Maclean's wit and learning to give a kind of sweetness to their scurrility, are certainly not more scurrilous or more unscrupulous than was this writer in the respectable and Tory *Fraser*. The attack on Miss Martineau is as indecent and as brutal a piece of writing as we remember ever to have read. If it was disgraceful of Maclean to write it, and of *Fraser* to publish it, it is by no means creditable to the editor of this volume (Mr. William Bates, B.A., Professor of Classics in Queen's College, Birmingham) to have republished it. A woman who has done Miss Martineau's good work might have expected that she would not have the dirt that was cast upon her in her youth reaked up once more to be cast upon her in her old age, when she was weighed down with years and broken in health. Mr. Bates says, indeed, that she has twice refused a pension "when failing health rendered literary exertion impossible and pecuniary anxieties were impending," and refused it "on the ground that acceptance was inconsistent with her expressed opinions on the subject of taxation." This, he goes on to add, "must gain our respect, even in face of her erroneous notions as to the metaphysical nature of a Deity." He would have done better if he had either not republished a scurrilous libel or else had spared his praises. How his part in this work has been done we can show in a very brief space. Maclean had drawn Campbell smoking a long pipe and Lockhart a cigar, and Maclean writes, "It will be seen by a reference to our plate of Campbell, that the *New Monthly* and the *Quarterly* take different sides on the question, the former patronizing a pipe, the latter a cigar." Mr. Bates puts this harmless sentence through what we may be allowed to call a Braumagem rolling-mill and brings it out as follows:—"As we have just had Campbell inhaling solace through the somewhat plebeian conduit of a 'Bensley,' so do we now find Lockhart making use of that later and elegant device by which mediate fumigation is rendered needless, and the convoluted weed made to serve as its own pipe."

The Masterpieces of Sir Robert Strange (Bentley and Son). In this handsome volume we have "a selection of twenty of Sir Robert Strange's most important engravings reproduced in permanent photography." The photographs are admirably executed, and do all that photography can do to bring within the reach of large numbers some of the greatest works of this great English engraver. The accompanying memoir by Mr. Francis Woodward is fairly interesting, though written perhaps in rather too big words.

Walter Crane's New Toy Book (Routledge). Though the title of this work is not correct, for some of the pictures we have seen before, yet what is old is so good that it is quite worthy of republication; and what is new is in sufficient quantities to go far to justify the name. The drawings are for the most part very spirited and very amusing, as unlike as can be to the gaudy pictures which are far too commonly thought quite good enough for those whose taste has yet to be cultivated. We hardly like, however, the drawing of the robber in Ali Baba who is peeping out of the jar, lifting up the lid with his head. The remembrance of his face would, with a sensitive child, greatly increase the terrors of darkness.

Faithers and Fairies, by the Hon. Augusta Bethell (Griffith and Farran). These are very pretty little stories, and well suited to children who are old enough to read easily, and young enough to read with the greatest pleasure when they are hidden away in some quiet corner, or coiled up on some sunny window-seat.

Great African Travellers, by William H. G. Kingston (Routledge). Mr. Kingston has done well in giving a full account of the travels of some seven or eight of the chief explorers of Africa, instead of giving, as so many compilers would have done, short sketches of every one who has written about Egypt, from Moses and Herodotus to Mr. Stanley. The book will be found interesting and full of information, and while it is written no doubt chiefly for boys, might be read with pleasure by their elders. The introductory chapter, however, is by no means so clear or so accurate as it ought to have been. Mr. Kingston, if we do not mistake him, seems to think that we took Cape Colony from the Dutch before Bruce explored Abyssinia. If compilers of history would give the date of each event which they mention, they would keep themselves and their readers from many errors. It was not, moreover, Sir John, but Sir Joseph Banks, who was one of the founders of the African Association.

Our British Portrait Painters. Sixteen illustrations, with descriptive and historical notices, by Edmund Ollier (Virtue and Co.). While most of the engravings in this handsome volume would be found interesting by all, and while each one of them would be found interesting by many, yet we are a good deal surprised at the curious medley that is made when they are brought together. It is not likely, for instance, that any one who greatly admired Mr. Sant's picture of the "Royal Sisters" would care much for Hogarth's "Portrait of Garriek and his Wife." However, perhaps it is thought advisable that these "Portrait Galleries," like a pedlar's basket, should have in them something suited to every taste. The engravings, though not new, are well executed. Mr. Ollier has done his part of the work with discretion.

Aunt Judy's Christmas Volume, edited by Mrs. Alfred Gatty (Bell and Sons). This volume of *Aunt Judy's Magazine*, the last literary work that its amiable editor was to live to do, in no wise falls short of the earlier numbers. It is written in simple language, and deals with simple things. Unlike some other of these Christmas Annuals, it does not seek for a large sale by gratifying any unhealthy taste. The young people who have with pleasure read its pages, and who have taken part in the good work in the Children's Hospital which it has so steadily and so warmly advocated, will feel that this Christmas they have one kind friend less in the world.

Those who have not as yet had enough of Jules Verne's extravagances of travel will find two new stories provided for them in his *From the Earth to the Moon* (translated from the French by Louis Mercier, M.A., and Eleanor King) and the *Far Country* (translated by N. d'Anvers), both published by Sampson Low and Co. Happily for authors, each year sees a new crop of readers spring up. The child who last year had only eyes for pictures can this year spell out an easy tale in small words but big letters, and the year after will have become a rapid story reader. So that M. Jules Verne and writers like him need not be afraid that their readers, like the critics, will have had enough of their humorous exaggerations.

The *Stately Homes of England*, by Llewellynn Jewitt, F.S.A., and S. C. Hall, F.S.A. (Virtue and Co.) The two hundred and ten engravings on wood with which this work is illustrated are in every way worthy of the narrative, and the narrative is in every way worthy of the engravings, and, both taken together, they are in every way worthy of being given away. Whether they are equally worthy of the Stately Homes which they set forth we shall prefer to leave "to the true nobility of their owners" to decide.

Trotty's Wedding Tour and Story Book, by Elizabeth Stuart Phelps, (Sampson Low and Co.) Some of these stories of life in the United States are pretty enough and some even are touching. Yet Miss Phelps does all she can to spoil what she can do well by her jerky and disjointed style of writing. She brings in names of people and of places, and gives no explanation as to who or what they are. Moreover she delights in phrases which may be very good American, but are very bad English.

A Manual of Domestic Economy, by J. R. Walsh, F.R.C.S. (Routledge). This is a new edition, carefully revised, of Mr. Walsh's well-known work. It is a sign of the times that "the lowest range of income to which the book extends has been raised from 100*l.* to 150*l.* a year, while the highest is now 1,500*l.*, instead of 1,000*l.*" While the book certainly contains a great deal of information, and enters very fully, among other matters, into all that relates to the healthiness of a house, we are surprised to find no signs in this revised edition that the author is acquainted with that exact and most important knowledge which has been accumulated by the officers of the Medical Department of the Local Government Board in reference to the purity of the water in the house-cistern, the proper arrangements for sinks, and the ventilation of the drain-pipes. While thousands of lives are lost yearly through the ignorance of architects and builders, in a book like this it should have been brought home to heads of families by the plainest directions how, by the expenditure of a very few pounds, two great inlets to diphtheria and typhoid fever might at once and for ever be closed.

Routledge's Every Boy's Annual (Routledge). Some of the stories in this Annual would be a great deal better if they were written in far simpler language. We trust that the somewhat arrogant title to which it lays claim is scarcely correct, as, if this is really Every Boy's Annual, we may expect in the course of a few years to find the *Daily Telegraph* Every Man's Newspaper. On the first page we have a picture of the death of Admiral Byng, and the beginning of a story by Lieutenant Low. Byng was very harshly treated, no doubt, but it was scarcely necessary, in showing how ill-used an English admiral was, to ill-use the English language at the same time. What a full course of athletic sports will in time do for boys we do not know, but we trust that they have not yet come quite so low as to read with pleasure such language as the following:—"In this category of bells I do not allude to such humble productions of human ingenuity as the household implements which lie in rows in the basement floors of all modern houses; though, doubtless, were the tongues of many such to give utterance to their feelings, they could tell some unpleasant truths of the opinions of 'their betters,' freely ventilated by the servant-kind, who 'live and move and have their being' in the kitchen, and the regions that 'thereunto adjacent lie.'" Mercutio, by the way, at his loosest, finds himself in these quotations in somewhat strange company.

Leslie's Songs for Little Folks, by Henry Leslie (Cassell and Co.) This is a collection of pretty little songs, set to very pretty airs. We hope that some day Mr. Leslie will allow a cheap edition of these songs to be published, so that the Little Folk of our elementary schools may have a chance of coming within the refining influence of such music as his.

Professor Pepper—what, by the way, is the scientific definition of a professor?—sends us four manuals entitled *Science Simplified* (Warne and Co.) He treats of chemistry, light, magnetism, and electricity. Though these are popular treatises, yet happily they show none of that carelessness which is so common in treatises written for the people. Professor Pepper knows his subject thoroughly, and has the art of putting it in such a way that his readers may know it too.

AMERICAN LITERATURE.

WE opened Mr. Gilpin's work on the *Mission of the North American People** with much interest, and in the anticipation of finding in it much instruction and practical information. The high position which the writer has held in that which may be called with greater propriety than Pennsylvania—in reference to geography at any rate, and to future, if not present, politics—the "Keystone State" of the Union, the very considerable reputation which he enjoys among his neighbours and fellow-citizens, and his connexion with the early history of the territory and organization of the State of Colorado, led us to anticipate from him a work which would deal in a practical temper with practical facts, and perhaps exhibit in a rational light the grounds of the extravagant hopes and the less commonly expressed anxieties with which the statesmen and thinkers of the Union contemplate the future of their country. Instead of this, we have what may be described as a geographical rhapsody; an attempt to establish from the geological formation and physical characteristics of the American continent the destiny of the United States, in the sense in which that phrase is used by Fourth of July declaimers. For example, because the formation of North America is alleged to be concave—that is, because on either side the two great mountain chains or lines run near the coasts, and the central portion of the Continent is broken by no insurmountable geographical barriers like the Himalayas, the Alps, or the Ural Mountains—it is destined to be for all time the possession, not only of a single race, but of a single empire. Mr. Gilpin ignores all the political considerations, all the distinctions of interest and character produced by situation and climate, which are nowadays so much more powerful than so-called natural frontiers in dividing nations. He forgets that slavery was not the only cause of alienation between the pure English people of the South, with the addition of Louisiana's French and Spanish blood, and the mixed population of the West, with the dominant Puritanism of New England modifying its ideas and controlling its policy. He refuses to see that nowadays mere mountain-ranges and water-channels can be crossed with almost equal ease, while race distinctions and opposing interests present greater obstacles to amalgamation than was ever the case before; or that the admixture of negroes in the South and of Chinese on the Pacific coast, with the opposite interests of the maritime and manufacturing East, the agricultural West, the mining group to which his own State belongs, and the Pacific States looking Asia-wards, as well as the wholly separate tendencies and feelings of the South, may divide America quite as effectually as the great central plains of Europe have been divided between Germans, Poles, Hungarians, and Russians. The valley of the Mississippi must, in his view, be inhabited by a single race, and ruled from a single centre; and the valley of the Mississippi includes the whole Union between the Alleghanies and the Rocky Mountains, if not Canada and the North also; and to this empire the two coast-lines—each of them larger than most Old-World monarchies—must, from their situation, be mere appendages. There is much that is very curious in his speculations upon the influence of isothermal lines in directing the course of settlement; much that is yet more entertaining in his ideas about the distribution of the precious metals, masses of which he supposes to lie, unmixed or nearly so, underneath the mountain-sides where miners are now digging out the tiny flakes they have left behind in settling down thither, just as rice leaves tiny particles floating in the water wherein it has been boiled, after the mass has settled to the bottom. His notions are illustrated by maps which are by no means without a value of their own. But neither these geographical and geological dreams, nor the absence of the political reflections we should have expected from the man whose political aptitude was shown in so adjusting the boundaries of Colorado as to make her a link between the Pacific and the Central States, which could hardly separate without tearing her in sunder, tend to give the work any real value as an illustration of the probable future of America. It is one of those eccentric rhapsodies which are often produced on paper by men who have shown no little practical capacity, elevated by the very tendencies which here find vent into something like political genius when confronted with the limited problems of practical administration.

Dr. Scadding's *Toronto of Old*† contains a good deal of curious and interesting information regarding the early history and actual monuments of a place which has risen within a century from the rank of a French trading post to that of a provincial capital of the Canadian Dominion. It is also replete with anecdotes, historical and personal, very characteristic of colonial life in its various stages, from the first advance into the wilderness down to the combination of old-world civilization with the abundance and roominess of a new country which characterizes Canada and Australia at present. But the enormous size of a volume which deals only with a single century and a single town is deterrent to ordinary readers. Even the most patriotic citizens of Toronto will, we fear, be rather proud of the book as a literary monument to the honour of their city than inclined to read it through; and

* *Mission of the North American People, Geographical, Social, and Political*. Illustrated by Six Charts, delineating the Physical Architecture and Thermal Laws of all the Continents. By William Gilpin, late Governor of Colorado. Philadelphia: Lippincott & Co. London: Trübner & Co. 1873.

† *Toronto of Old: Collections and Recollections illustrative of the Early Settlement and Social Life of the Capital of Ontario*. By Henry Scadding, D.D. Toronto: Adam, Stevenson & Co. London and New York: Routledge & Sons. 1873.

to Englishmen the notion of reading a volume of nearly six hundred pages concerning the capital of Upper Canada is hardly likely to occur as a serious possibility.

Professor Hadley's Lectures on Roman Law*, though necessarily somewhat elementary in their character, and though the law with which they deal is of course that of a period long subsequent to the date of the latest literature studied as classical at our schools and universities, may well be recommended to the attention of all students who wish to understand ordinary Roman histories or Latin authors. They trace the later *jus civile* back to its earliest origin; they show the changes which gradually took place, both as facts of legal and as incidents of political history; they explain the manner in which the edicts of the successive Prætors introduced a sort of Roman equity by a process not wholly unlike that by which our own Chancellors gradually superseded the antique feudalism which pervaded our common law; and they present a view of the method and spirit of the earliest Roman jurisprudence, as well as of its gradual development, more simple, clear, and coherent than schoolboys or undergraduates can easily gather from the best histories and dictionaries within their reach. The book is so free from technicality, so lucid and terse in its expositions, and so interesting to those who really care to understand that law which is so remarkable and so prominent a feature of Roman history, that no boy in the upper forms of our great schools will have any difficulty in understanding it, or will be disposed to repent the time he has given to its study; while it contains enough to make it a very suitable manual for the earlier studies of undergraduates who may intend afterwards to master the *corpus juris civilis* at first hand, or at any rate to obtain a more thorough knowledge of it than could be given to the law class of Yale in a course of twelve lectures.

The *Medical Jurisprudence* of Wharton and Stillé† is far too large a work to be recommended to any student of law or medicine who cannot make it the chief part of his reading in that particular subject; and this, we fear, it can never be to Englishmen, owing to the very considerable differences between English and American law. In truth, however often judges on both sides of the Atlantic may repeat the old dicta on the subject, the practical law of insanity, as now administered by juries, is a growth of the years which have elapsed since the separation between the two countries, and its development in each has been distinct and independent. Still, American and English common sense tend to much the same conclusions; English decisions are quoted in the courts of each State with more respect perhaps than those of courts in the next State; and American jurists do not hold a widely different language from our own. But in any case a young barrister having no briefs, no examination to cram for, and plenty of leisure, will gain much by a careful study of the first of these three volumes—"Wharton On Insanity"—and especially of the preface, in which the fundamental principle of the American law of insanity is expounded. Most, if not all, American States recognize two degrees of murder, according as it is with or without real (not constructive) premeditation. Now, partial insanity, or what our "mad doctors" call "irresistible moral impulse," does not exempt a man from all penalty for murder; but it is regarded as rendering him incapable of that intelligent premeditation which is essential to murder in the first degree, and saves him from capital punishment. The body of the work develops this idea—incapacity of premeditation—through the whole list of crimes and the various forms of temporary or abiding insanity. It deserves to be noted that in America (we presume, from Dr. Wharton's language, in all the States) drunkenness, when so frequent that a jury finds it "habitual," is equally with actual insanity a ground for issuing a Commission *de lunatico inquirendo*, and, in case of conviction, depriving the drunkard of the control of his property and even of his liberty; and Dr. Wharton appears to imagine that the same is the case in England—at least his language seems to bear that interpretation. As regards the invalidation of wills on the allegation of lunacy or imbecility, both the practice and the law of America seem to resemble our own; the law requiring clear proof of mental delusion affecting the subject-matter, or of weakness and undue influence, while in practice almost any "inofficious" will is liable to be set aside by a jury on pretexts which would be wholly disregarded if the will itself were approved.

Another work which touches on legal questions, though in a more popular manner, is Mr. Thompson's *Church and State in the United States*‡. The writer is unfortunately a man of strong prejudices, which appear both in the historical and the political portions of his work. The former deals with the relations of Church and State before the Revolution; and, while making the most of every charge of persecution that can be alleged against the Episcopalians of Virginia and the two States to the southward, endeavours to palliate or justify the infinitely more atrocious and more systematic severities inflicted by the Pilgrim Fathers—so ridiculously held up to admiration as champions and patterns of religious liberty—upon Quakers, Catholics, Churchmen, and dissenters of

every kind. In the latter part of the volume a similar bias against the Roman Catholics prompts the writer to menace them with the hostility of the Government and of the people, as a Church engaged in a political conspiracy against the Union; the meaning of the charge being that in America, as in our colonies, the Roman Church is a political as well as an ecclesiastical organization, and that the spiritual influence of the hierarchy enables them to direct the Catholic vote in its entirety in favour of any party which will give them what they want. The particular object on which their minds are bent, and to which their influence is devoted, in America, appears to be the extortion of endowments for hospitals, schools, and other institutions of a sectarian character; whereas all the Protestant Churches consent to work together in such matters, and the general policy and practice of the States is altogether anti-sectarian. Mr. Thompson, however, shows that the law of the States is, as a general rule, unfavourable to Churches organized on a plan other than congregational, and vehemently resents the efforts of the Romish hierarchy to evade it. The Churches there are amenable to the civil law just as are non-established sects here; that is, where property is concerned, an appeal always lies to the secular Courts, and their decision is final. Now nearly all American sects hold a great deal of settled property, but this must be held as a rule by the several congregations as incorporated bodies, or by trustees in their name. Thus the endowments of the Episcopal Church are, like those of our own Establishment, parochial, not general or diocesan; and a congregation seceding from the general body would take its endowments with it. To defeat this rule, it is the practice of the Roman Church to make the archbishop, bishop, and priest a majority of the trustees of each several congregation. However, the American Courts pay much regard to the regular decisions of established Church tribunals; and where a majority of an Episcopalian congregation have supported their pastor against a duly authorized sentence of a diocesan court, the law has held that the minority are the real representatives of the original congregation and the beneficiaries of the church trusts. Under a congregational system, the majority would generally be able to modify their creed and yet retain their chapel and its property; as was done under the Dissenters' Chapels Bill, in England, by those Presbyterian Churches which gradually lapsed into Unitarianism. Mr. Thompson's general statements and particular instances will serve to enforce on the more ignorant champions of Liberation the lesson we have often insisted upon in vain—namely, that no disestablishment can liberate a Church possessed of property from the control of the civil law, whose tribunals may even have to pronounce, practically, what is the true interpretation of its original formularies. Instances are even cited in which the State has interposed to protect citizens against the tyrannical enforcement of purely ecclesiastical sentences, such as excommunication. A case analogous to that of Mr. O'Keeffe occurred in Michigan, where a Catholic was frightened to death by the spiritual anathemas launched against him for suing his priest for moneys lent for ecclesiastical purposes; and the State Legislature passed a statute imposing a fine of from 200*l.* to 1,000*l.* on any clergyman who should threaten a church member with spiritual penalties for pursuing a civil claim.

Dr. Boyland's narrative of six months spent under the Red Cross* as a volunteer surgeon in the French army is well worth perusal on many accounts. It not only gives a lively sketch of the perils and privations encountered in such a service, and of the horrors of the battle-fields around Metz, and relates a variety of striking anecdotes concerning that memorable campaign, but it bears testimony to the disorders which prevailed both in the military and the hospital service, and contributes new evidence to the general mass of proof which has been steadily accumulating since the close of the war of the indiscipline and almost anarchy which prevailed in the Imperial army after its first defeats. Dr. Boyland also shows in how many cases the Geneva ensign was abused, sometimes by generals, sometimes by those who bore it; now sheltering movements of ammunition from place to place within reach of the enemy's guns, now protecting and securing a free passage for idlers, speculators, or mere plunderers. This being the case, we are not surprised to learn that it came in time to be almost as little respected by the enemy as by those who employed it, that ambulances were sometimes fired on, and surgeons frequently wounded and now and then captured. Only where there is thorough loyalty on both sides, and sufficient chivalry to produce mutual confidence, can a convention neutralizing particular places, persons, and conveyances in the midst of a battle-field or a beleaguered town be really effectual for their protection.

Mrs. Hooker's pamphlet, for it is little more, entitled *Womanhood*†, is a protest by a lady of the strong-minded school in favour of Mr. Mill's wild speculations, and against the Acts which have given so much offence to the shrieking sisterhood. This lady writes with much more temper and decency than most of her sect, and we are willing to believe that in the passages which deal with physiological principles, as well as in those which refer to sanitary legislation, she is chargeable with no worse offence than utter ignorance in the one case, and blind credulity in the other.

* *Introduction to Roman Law*. In Twelve Academic Lectures. By James Hadley, LL.D., late Professor of Greek Literature in Yale College. London: Sampson Low & Co.

† *Wharton and Stillé's Medical Jurisprudence*. Third Edition. Philadelphia: Tray & Brother. London: Stevens & Haynes. 1873.

‡ *Church and State in the United States; with an Appendix on the German Population*. By Joseph P. Thompson. Boston: Osgood & Co. Berlin: Leonhard Simon. London: Trübner & Co. 1873.

* *Six Months under the Red Cross with the French Army*. By George Halstead Boyland, M.D., ex-Chirurgien de l'armée française. Cincinnati: Clarke & Co. London: Sampson Low & Co. 1873.

† *Womanhood; its Sanities and Follies*. By Isabella Beecher Hooker. Boston: Lee & Shepard. New York: Lee, Shepard, & Dillingham. London: Sampson Low & Co. 1874.

If she is, as her title-page suggests, a member of the Beecher family, we may congratulate her on having taken so very mildly the infection of recklessness and bad taste which is associated with the name.

The *Perfect Horse** is a treatise on horse-breeding, from the American point of view, which differs somewhat from the European, both in the fact that the ideal horse of the States is a trotter, not a racer, and that pasturage of the best quality is practically unlimited in the States; also, that steam has made more way, at least in the Northern States, in superseding horse-drawn for agricultural and travelling purposes.

Buttmann's *Grammar of the New Testament Greek*† is translated, with a good many corrections and additions, from the pen of the author himself, by Mr. J. B. Thayer. We mention this book here, contrary to our usual rule, because it is an authorized translation of an extremely valuable work which might not readily become known to English readers.

Among fictions the *Fair God*‡, a tale intended to describe Mexican life before the Empire of the Aztecs was overthrown, and deriving its plot and motive from the Spanish conquest, the incidents of which are closely interwoven with the story, is really novel, original, and worth reading. *What Can She Do?*§ is a tale of domestic life; the motive in this case being supplied by the sudden reduction to poverty of what we should call, as they would probably call themselves, a "genteel" rather than *gentile* family, whose mother is above all things anxious that her daughters should keep "white hands," unsoiled by work, and does not see that she is plunging them into imminent peril of far worse stains than the hardest toil can leave behind. *South Sea Idylls*||—in prose—is a collection of pretty, fanciful, not wholly natural or probable stories of Tahiti and the Pacific Isles. *The Boy's Book about Indians*¶ is a disappointment; there is a good deal about the Indians in it, but very little of that kind of adventure and enterprise which might make the book really a special possession of "boys." *A Baker's Dozen of Humorous Dialogues*** is a collection of little household comedies, which the children of a single family might well perform to amuse the leisure of their long winter evenings; some of them clever and pointed, none requiring elaborate preparation or "properties."

Saxe's *Poetical Works*†† are chiefly humorous or comic; and W. D. Howells's verses have a strong flavour of American scenery and character.‡‡ Miss Donnelly has produced half-a-dozen really vigorous and spirited pieces §§—especially those which versify the painful incidents of a civil war—and twice as many that are weak and second-rate.

* *The Perfect Horse: how to know him, how to breed him, how to train him, how to shoe him, how to drive him.* By William H. H. Murray. With an Introduction by Rev. Henry Ward Beecher; and a Treatise on Agriculture and the Horse, by Hon. George B. Loring. Containing Illustrations of the best Trotting Stock-Horses in the United States, done from life, with their Pedigrees, Records, and full Descriptions. Boston: Osgood & Co. London: Sampson Low & Co. 1873.

THE PRESIDENT'S MESSAGE.

THE Message of the President of the United States to Congress confirms the statement that the Spanish Government has agreed to comply with the American demand for reparation in the matter of the *Virginius*. The conditions imposed were equitable, moderate, and consistent with the honour of Spain. The atrocity of the wholesale bloodshed of Santiago would excuse a demand for even larger concessions; but the Government of the United States has done well in treating the question as one of international law. The *Virginius* was well known to be the property of the Cuban insurgents; but nevertheless the vessel had an American register, and sailed under the American flag. The captain of the *Tornado* captured her at his own risk; and he or the authorities of Santiago were bound in the first instance to disprove by sufficient proof the presumption of American nationality, which had been accepted by the English authorities at Kingston. The summary proceedings at the trial were incompatible with a legal inquiry into the ownership and character of the vessel, and consequently the American Government is justified in claiming the surrender of the vessel as a condition precedent of any amicable arrangement. The authorities in the United States are pledged to ascertain for themselves whether the *Virginius* was entitled to the use of the American flag; and it would seem that, if the capture is proved not to have been a violation of the rights of the United States, the apologetic salute to the American flag will not be enforced. The mode of proceeding which has been adopted involves the unavoidable inconvenience of being to a certain extent founded on conventional fiction. The indignation which is justly provoked by a gross act of inhumanity finds expression in a protest against a technical breach of international law. If the Cuban insurgents had possessed and used a recognized flag, the Spanish cruiser might have seized the *Virginius* without giving offence to any neutral Power. The accident that the rebels had not attained the rank of belligerents rendered the capture irregular; but it could scarcely have affected the moral quality of the transaction but for the judicial massacre which ensued.

The telegraphic summary of the Message contains two passages relating to the affair of the *Virginius*. The President appears to have stated in the early part of the document that the dispute "is now happily in course of satisfactory adjustment in a manner honourable to both nations." If American State papers were drawn up in accordance with the diplomatic customs of other nations, it would have been thought discourteous to enter at greater length into the merits of a question which had been satisfactorily settled; but the President, emulating the candour of his predecessors, afterwards recurs at much greater length, not only to the untoward event of Santiago, but to the policy of Spain and the condition of Cuba. He perhaps remembered that the controversy was not necessarily closed with the acquiescence of the Spanish Government in the American demands. It appears more than doubtful whether the local authorities at Havannah will or can surrender the *Virginius*; and the chances are against the punishment of the Governor of Santiago and of his accomplices in the execution of the prisoners. It is evident that, if the Government of Madrid is unable to comply with its undertaking, the American government will revise its policy, and it will have acquired additional force by the fact that it will have been officially acknowledged by Spain. It is difficult to understand how even the most civilized of nations can be so weak enough to defy the power of the United States.

States, it is known that the execution of the prisoners was made the occasion of popular rejoicing, and that the strongest feelings of hostility to the United States have been expressed both at Havannah and at Santiago. Some allowance must be made for sufferers by civil war who know that for several years New York has been the base and headquarters of the Cuban insurrection. It is perfectly natural that the Spaniards should dislike the allies and abettors of their enemies; but prudence prescribes moderate language and conduct where revenge is impracticable or dangerous. If the perpetrators of the slaughter at Santiago escape with impunity, the President will undoubtedly urge upon Congress the adoption of hostile measures.

It is easier to reconcile the President's reference to the question of slavery with American usage than with the principles of international comity. The United States are not concerned in the maintenance in a neighbouring island of the institution which was abolished in their own country ten or eleven years ago. Only a few years before that time an American President publicly threatened to annex Cuba for the avowed purpose of securing the maintenance of slavery. It seems scarcely to be the business of General Grant to complain of the conduct of "slaveholders who are vainly endeavouring to stay the march of ideas which terminated slavery in Christendom, except Cuba." It may be perfectly true, though the proposition might have been stated in simpler language, that the pro-slavery party in Cuba "seizes upon many emblems of power under professions of loyalty to the mother-country. It exhausts the resources of the island, and does not act at variance with the principles of justice, instead of giving a character of nobility to the Republic." It might have been thought sufficient for the President to give a character of nobility to his own Republic, without troubling himself about the resources of an island which belongs to another nation. It may be conjectured that his invective is intended to prepare the way for armed interference in Cuba if the promises of the Spanish Government are, through colonial obstructions, not fully redeemed. It is difficult to judge how far his personal disposition to interfere is supported by public opinion. The strong language of speakers and journalists proves little; but a meeting lately held at New York to urge the adoption of vigorous measures was attended by the Governor-General Dix, and the principal speaker was Mr. EVANS. A short time must elapse before the feeling of Congress is expressed; and the policy to be ultimately adopted will probably depend on the decision of the Senate. The President has already used his legal power to the fullest extent by placing the navy on a war footing as far as the funds appropriated to the service were sufficient for the purpose. It is doubtful whether the Spanish fleet in the waters of Cuba is not superior to the despicable American force; but the result of a conflict would nevertheless be certain. If war should unhappily commence, it will end only with the complete victory of the United States.

The soundest and most prudent American politicians are doing their utmost to calm the prevailing excitement; not because they fail to sympathize with the just indignation of their fellow-citizens, but on account of the complicated inconveniences which would result from interference in Cuba. The loudest declaimers against the inhumanity of the Volunteers and of the local authorities at Santiago can scarcely affect to believe that the insurgents in the Eastern part of the island are more humane or more civilized than their adversaries. In Cuba, as in Spain, prisoners are as a general rule treated with extreme brutality;

and if an American contingent were to join the rebels, its commander would have to check the atrocities of his allies in much the same manner in which officers on the Gold Coast try to prevent their native auxiliaries from cutting off the heads of prisoners. An American intervention must be either temporary or permanent; and if it is limited in duration, it must end with the establishment of a Government of the Creoles now in insurrection, in the midst of a large number of liberated slaves, who have not acquired the rudiments of civilization. The new Republic would probably be even worse governed than the Colony; and the Government of the United States would be in a great degree responsible for its inevitable miscarriage. Sooner or later it would become necessary to resort to annexation, or, in other words, to add a million and a half of mongrel Spaniards and barbarous negroes to the governing community of the United States. It would be much better to patch up the quarrel on decent terms, and to leave to Spain the hopeless task of civilizing and governing Cuba. It may be collected from the Message that the PRESIDENT holds the contrary opinion.

THE EXETER ELECTION.

THE electors of Exeter have been informed by a local enthusiast that they have now the eyes, not only of England, but of Europe fixed on them, so intense is the interest of the whole civilized world in the momentous question who is to succeed Chief Justice COLERIDGE in the representation of the city. This may be so; but if it is so, all that can be said is that England and Europe are fixing their eyes on a very small matter. The Government will not be much helped or harmed whichever way the election turns, and the rest of the world will be still more slightly affected by it. It is an accidental election to return a member to an expiring Parliament. The contest lies between two second-rate candidates; it will be decided apparently on trivial issues, and it is being conducted with an amount of personalities, local bitterness, and bad jokes which must make a few fantastic people in Exeter wish that England and Europe would look in some other direction. Sir EDWARD WATKIN, if he represents anything, represents the railway interest, which certainly does not require strengthening in Parliament; and although the history of his Yarmouth election is now an old affair, and it would be too much to say that what he did or did not do at Yarmouth ought to disqualify him for public life, yet the memory of this Yarmouth business is a serious drawback to him. Still, of the two, he seems the better candidate. He has at least energy, fluency, good-humour, and a power of putting something into what he says. Mr. MILLS is feebleness itself. He has no opinions about anything. He keeps telling his hearers that he has a Devonshire wife, and that he thinks a man can do nothing better than obey the orders of his better half. He understands that under the present law, if two men blow their noses at the same time in church, they may be indicted for a conspiracy to annoy the parson; and if this is the law, as to which he owns he is wholly ignorant, he thinks the law of conspiracy ought to be amended. He has satisfied the publicans that they ought to vote for him by giving exactly the answers to a depuration which he saw they wanted. An amiable creature without any backbone is the spectacle which he offers to the inquiring eyes of the civilized world. Sir EDWARD WATKIN talks and laughs and flourishes away, makes the very most of himself, goes in for every popular hobby, offers to give Mr. ARCH twenty acres of land in Cheshire at a nominal rent, describes the steps he has taken to get nice houses built for railway servants, and always shows himself capable of reaching the highest standard of Exeter bad jokes. The kind of thing that delights the electors of Exeter and makes them so pleased to think that England and Europe are looking at them is after this fashion. Sir EDWARD WATKIN talks so much better than Mr. MILLS that Sir STAFFORD NORTHCOTE, on behalf of Mr. MILLS, thought it necessary to lessen the effect of his superiority by calling him a parrot, while he likened Mr. MILLS to that quiet, meek, but excellent bird, a partridge. To this Sir EDWARD WATKIN replied, that if it came to talking of birds, Sir STAFFORD NORTHCOTE might remember that there was such a bird as an owl, and also such a bird as a goose; and finally, after a long criticism of Sir STAFFORD's public career and style of oratory, he got to calling him a

chirrupy, weak-headed bullfinch. Perhaps it might be thought that at Exeter, with the world looking at it, this would seem in rather doubtful taste. Not in the least. This is the regular Exeter style. Mr. BOWMAN, who has sat for Exeter for five years, and who came down specially, though suffering from illness, to help Sir EDWARD WATKIN, and who must know what his constituents like, and who being in a state of debility could not have made elaborately bad jokes without an effort, went on in this style through the whole of a long speech. He accommodated himself heart and soul to Exeter, and offered what this cynosure of neighbouring eyes really likes. He described a Tory alderman as a trusty Tory, or at least as a Turnpike Trustee Tory. He spoke of the policy of the Conservatives in waiting to see what lies hid in the pigeon-holes of their predecessors in office as not exactly a Brummagem, but a Rummagem, policy. There is certainly no harm in such sallies, and as candidates must stoop to conquer, it is enough excuse to say that such is the price of victory at Exeter; but it is absurd to describe a contest fought with arms like these as a battle of the giants.

Imperial politics occupy but a very small part of the attention of the Exeter candidates. There is indeed very little to say about them at present. Constituencies are sick of hearing Mr. GLADSTONE abused and praised. What he has done has been criticized until criticism can do no more, and what he is going to do nobody knows. If any question of Imperial interest is touched on at Exeter, it is treated from what may be termed the village pot-house point of view. All discussion on the Ashantee war has become absorbed into the one issue as to which party is responsible for the official career of Mr. POPE HENNESSY. You sent him to the Gold Coast, is the Conservative cry. But you first sent him to Labuan, is the Liberal retort. So utterly are the candidates out of the range of general politics that Mr. KNATCHBULL-HUGESSEN was had down special to give tone and dignity to the proceedings on the Liberal side. Mr. KNATCHBULL-HUGESSEN is a man with a mission, and his mission is to be in love with the Ministry. He sees no imperfections or shortcomings in the object of his affections. He is capable of writing sonnets to Mr. GLADSTONE'S eyebrows. He thinks Mr. LOWE never made any mistakes. He honestly considers the Zanzibar Contract a very creditable piece of business. Such a man is not often found, and when found it is natural that Government Whips should make a note of him, and send him down to far-away places like Exeter, where his romantic enthusiasm and innocent admiration may be supposed to be calculated to make some impression. To such a man, with such a mind, Mr. DISRAELI'S speech at Glasgow must have been inexpressibly painful. What lover could stand hearing it said that his mistress limped and wore false hair? At Exeter Mr. KNATCHBULL-HUGESSEN accordingly burst into a long denunciation of Mr. DISRAELI; and that there is much to be said against Mr. DISRAELI no one knows better than Mr. DISRAELI himself. But Mr. KNATCHBULL-HUGESSEN dealt one blow which strikes with more painful force on the hearers and readers of the Glasgow speeches than even on Mr. DISRAELI. He tried to take our pink fly from us. He declares that Mr. LOWE never said anything about a pink fly at all; and he appeals to *Hansard*, the pages of which he has, he says, searched through in vain for anything that could justify Mr. DISRAELI'S playful sentence. We can only remark with the French historian, so much the worse for the facts and for *Hansard*. At Exeter it will probably make no difference whether Mr. DISRAELI'S jokes are justified or not. They are not in the Exeter line, where a different sort of fun is found more comforting. What the Exeter elector really cares about is not the Ashantee war, or Mr. LOWE'S blunders, or the doings of Mr. GLADSTONE or Mr. DISRAELI, but the abolition of Schedule D of the Income-tax. If only he could get enough jokes made for him of the Trustee Tory and chirrupy bullfinch calibre—jokes that he can catch easily, and that seem calculated to give pain to some one he knows personally—and if at the same time he could make his little profits without having to pay anything on them, the Exeter voter would be a happy man. It is needless to say that both candidates fall in with his views in a spirit of delightful promptitude. Mr. MILLS thinks the best way is that no one should pay any Income-tax at all, although he modestly owns that it has struck him, so far as anything can be said to strike him, that this would cause a hole in the revenue which it would take a clever man to fill up. But then it is not his business

to try to think how clever men would fill up holes, and so he can go heartily with the Exeter shopkeepers and agree that there should be no Income-tax. Sir EDWARD WATKIN knows too much of finance and is too accustomed to business to talk in this way. He is not the sort of man to own that if he makes a hole he cannot fill it up. All he asks is to be allowed to make the hole after his own pattern, and to take the soil to fill it up wherever he can find it handy. He thinks that those people who do not grumble at the Income-tax, or who do not make their grumblings heard, should go on paying; but that discontented people like shopkeepers should cease to pay. This is the hole he digs, and then he fills it up by suggesting that there should be increased duties levied on the inheritance of real estate. This is a great stroke of art. It opens a sort of heavenly vision to the growling shopkeeper, and a parrot who suggests that an Exeter tradesman should not only pay no more Income-tax, but should also enjoy the spectacle of seeing a neighbouring county gentleman pay instead of him, may well expect to be thought a parrot worth a hundred partridges.

Sometimes, however, simplicity is wisdom, and Mr. MILLS has apparently got the licensed victuallers by merely saying Yes and No in the right places to their representatives; while Sir EDWARD WATKIN has lost them by resorting to an ingenious contrivance and attempting to get the Temperance people at the same time. He proposed that the whole subject of how much people ought to drink, and when, should be referred to a Committee of the House of Commons. Sir EDWARD WATKIN has been in Parliament, and knows what becomes in real life of subjects referred to a Parliamentary Committee; but how could he expect that humble Exeter voters should know anything of the sort? However, he miscalculated, and beer will have nothing to do with him. On the other hand he has got the railway servants, who have naturally been taken by the contrast between two pictures—one of the North-Western Board of Directors, of whom Mr. MILLS was then one, sternly refusing all compensation to the family of a most excellent guard who was killed by one of their engines; and the other of Sir EDWARD WATKIN, as Chairman of the Manchester and Sheffield Line, immediately on a guard having been killed, directing inquiries to be made and a handsome sum given to his bereaved family. The Bristol and Exeter Directors happen, it is said, to be mostly Conservatives, and anxious Liberals suspect that servants of this Company may possibly be exposed to some pressure. But, as Mr. EDGAR BOWRING explained, this will not signify. It is the beauty of the Ballot, as he told his humble friends, that a man may promise to vote Conservative, and then really vote Liberal. He will thus at once outwit his master and keep his conscience clear; and this is certainly a very considerable result for a mere piece of political machinery like the Ballot to have effected. In fact, except to the publicans, whom he just missed by a little over-finesse, Sir EDWARD WATKIN has made himself pleasant all round. It is needless to say that he is perfectly ready to give the franchise any day to women and agricultural labourers. There is nothing which the jovial type of Liberal would not give to any one. But Sir EDWARD WATKIN did more. He set himself to think what the actual women he had to deal with, the "ladies" who were waving their handkerchiefs to him, really cared about, and he was sharp enough to know that the franchise was not the uppermost thought in their agitated breasts. What they cared infinitely more about was the high price of coals and meat. He showed himself prepared to meet their views, and in fact it is impossible to conceive any one who could influence an election wanting anything without Sir EDWARD WATKIN being able to tell him or her how to get it. He explained to his fair listeners that coals might be made cheap by abolishing the law of entail, and meat might be made cheap by compelling landlords to compensate tenants for unexhausted improvements. This was not very philosophical perhaps, but it probably sounded to some willing ears as if it showed that by the simple expedient of Sir EDWARD WATKIN being returned for Exeter every scuttle would be filled and sirloins sold as cheap as shinbones. Perhaps, too, it may be said that exhibitions of jovial Liberalism are not very creditable to the party that seeks to profit by them. But then exhibitions of nerveless Conservatism are not more creditable; and the truth probably is, that an expensive contest for a seat that can only secure a place in Parliament for a few months is not very attractive to men of any kind of

mark. We have the comfort, at any rate, of thinking that on Tuesday next the contest will be settled one way or the other, and then we may rest our wearied eyes a little, and relax the tension of our gaze at Exeter.

FRANCE.

IF the Duke of BROGLIE's term of office lasts long enough, he seems likely to reject as a Minister every principle that he defended when in Opposition. Since the 24th of May he has been doing his utmost to discredit Parliamentary government. He has allowed an Assembly which is apparently at issue with its constituents to decide how France shall be governed for the next seven years, and it was only the Count of CHAMBRON that prevented him from allowing it to re-establish the Monarchy. He has not thought it incompatible with his former professions to proclaim that his countrymen are unfit to govern themselves, and that they ought to be thankful to Providence for ordaining that they shall be governed by a chance medley of deputies chosen for a different purpose. The political laws, which are to be discussed before the Constitutional laws—if indeed the latter ever reach a stage at which they can be discussed—have already furnished him with an opportunity of carrying the process of recantation a stage further. To the Duke of BROGLIE local self-government was once an object of almost as much reverence as Parliamentary government itself. The Orleanist Liberals were accustomed under the Empire to preach decentralization as a panacea for political disorders, and no longer ago than when M. THIERS was President it was only by the threat of resignation that he could induce the majority of the Assembly to assent to a law which gave the President of the Republic the right of nominating the mayors of the larger towns. The attitude of the majority upon this point was consistent and statesmanlike. The Government had just suppressed a formidable insurrection, and it had been enabled to do so in part by the accident that the Assembly was sitting at Versailles. This fact had impressed the majority with a keen sense of the importance of building up a power outside Paris which should be strong enough to prevent a momentary revolution in the capital from imposing itself as a matter of course upon the whole country. It was an object which had all along commended itself to outside observers. The changes of Government which France has undergone during the present century would never have been so frequent but for the smallness of the area in which the conflict that put down one and set up another had to be fought out. Even a NAPOLEON could not have made himself master of France in a day, had anything else been required except to make himself master of Paris. In that lucid interval of French Conservatism which lasted for about a year after the conclusion of peace the majority of the Assembly seemed to understand this. They went far ahead of M. THIERS, who represented the old centralizing tradition so dear to French Governments of every shade, and showed a real, though momentary, anxiety to foster political life in the extremities as well as in the centre.

By and by this new-born enlightenment was subjected to the test which sooner or later awaits all such manifestations. The majority found that it was one thing to diffuse a new spirit throughout the country, and another to secure its operating in the precise way which those who had called it into existence wished. The Communes had been left free to elect their own Mayors, in the expectation that the Prefects would by this means obtain more hearty and intelligent co-operation. Instead of this the Mayors have, in a great number of instances, refused to co-operate with the Prefect on any terms. The majority in the Assembly had meant to strengthen the hands of the Central Government by means of a spontaneous outburst of Conservatism in the provinces, and now it turns out that the only spontaneous outburst to be had is an outburst of Republicanism. Conservatives have been sorely put to it to account for this unpleasant fact. So long as M. THIERS was in power they set it down to the weakness of the Government in retaining M. GAMBETTA's prefects. Now they have tried what can be done by changing prefects, but things are as bad as ever. Republican candidates are still returned at every election, in spite of all that the officials can do to prevent it, and to the imagination of a French Conservative this is nothing short of anarchy. It is never pleasant to have to admit that the country

is against you, and the majority have preferred to find the explanation in their own policy of decentralization. It is the elected Mayors who are at the bottom of all the mischief. The machinery of Government cannot work unless the Prefect has a colleague—a colleague in heart as well as in functions—in every commune. It is a little difficult to reconcile this theory with the doctrine that, if it were not for Paris and a few other mutinous cities, France would be a Conservative paradise; but no practical politician will set logical consistency above utility, and when a particular end has to be attained, the question is not whether such or such means are in harmony with the previous declarations of those who mean to use them, but whether, if used, they will answer their purpose. The Duke of BROGLIE has not been above the temptation to reason in this way. Probably he still believes that decentralization is the true policy, and that in proportion as France learns to criticize and influence the acts of the Central Government, instead of simply acquiescing in them, the political fabric will rest on a sounder, because on a broader, basis. But he holds this belief with one unexpressed exception—provided that the Government to be criticized and influenced is not his own. During the time that he himself is in power the work of decentralization must be suspended, and a provisional law passed by which in the chief town of every department, arrondissement, and canton, the Mayors and their assistants will be nominated by the President, and in all other communes by the Prefect. The appointments will ordinarily be made from among the members of the Municipal Council, but whenever a Mayor shall resign or be dismissed, the nomination of his successor will not be subject to this restriction. It is hoped that when concord has thus been secured between the Prefects and the Mayors, the terrible results of the recent elections will not be again witnessed.

The Duke of BROGLIE will probably find that, in order to make the game safe, he ought to have gone a great deal further in the same direction. It is true that the scandal of a Prefect and a Mayor supporting rival candidates will be prevented; but what, after all, is this to the scandal of a Mayor being continually in opposition to the majority of his own Council? Antagonism between two officials may be an accident, but antagonism between an official appointed by the President or the Prefect and a Council elected by the inhabitants is tantamount, when it is a matter of constant occurrence, to a confessed antagonism between the Government and the nation. What the Duke of BROGLIE really wants is to suppress the free action of opinion until such time as it has become Right Centre; and to do this, he ought to have brought in a Bill to abolish partial elections to the Assembly, and to suspend Municipal Councils until farther notice. The boldness of such a proposal might have conciliated the Right, and there is no reason to suppose that the section of the Left Centre which deserts its colours in every critical division would have departed from its usual custom because the draft on its credulous timidity was a little larger than usual. Perhaps, however, the Duke merely holds this stronger measure in reserve. On Thursday he frankly told the Assembly that the state of siege which is now maintained in twenty-one departments will be continued until the Government has been furnished with all the powers it requires. These powers must apparently be of a kind to raise France to some point of ideal perfection which as yet exists nowhere but in the Duke of BROGLIE's mind. Commonplace politicians have been struck with the order and tranquillity which has everywhere prevailed under circumstances of a very exceptional and exciting character. An underhand attempt at a Restoration has been defeated only by the virtual refusal of the principal agent to have any hand in it, while the scheme for setting up a dictatorship as the next best thing to a monarchy has hitherto completely succeeded. In neither case was the country asked to give an opinion upon matters of the utmost moment to its political and social future; and in both cases the reason why its opinion was not asked was the certainty that it would be adverse to the designs of the accidental holders of power. Yet, notwithstanding these motives for irritation, France has never been more tranquil than under the rule of Marshal MACMAHON. This seeming inconsistency can only be set down to one of two causes; either the majority of the French people, confident that they must have their way in the end, are resolved to keep the peace, or the powers already possessed by Marshal MACMAHON are sufficient to ensure its being kept. Either way

there can be no reason for extending the state of siege over the whole of France, which is in effect what the Duke of BROGLIE asks leave to do.

THE ASHANTEE WAR.

THE gallant exploits of Sir GARNET WOLSELEY and his officers against the Ashantees suggest a feeling of regret and surprise that the General was sent out six weeks in advance of his army. A few years ago GARIBOLDI conquered Naples by entering the city in a postchaise, two or three marches in advance of his handful of troops; but the King of ASHANTEE can scarcely be expected to be as sensitive to public opinion and to fear of personal danger as the King of NAPLES. It had been conjectured that the despatch of the troops from England was delayed not merely that they might arrive at the least unhealthy part of the year, but rather to give time for the construction of a military road from the coast to the banks of the Prah; but it seems that only a few miles of the road have been completed; and it is difficult to procure sufficient native labour, in consequence of the fear that the working Fantees may be cut off by the enemy. A few English regiments could have afforded the protection which is required; and it is probable that with a trustworthy force of adequate strength Sir GARNET WOLSELEY might have intercepted the retreat of the main body of Ashantees. In the meantime he has probably displayed prudence as well as daring by his immediate and successful activity. With a few West India troops, aided by marines and sailors from the fleet, he has fought several petty actions, with the object, and probably with the effect, of satisfying friendly and hesitating natives of the superiority of the English arms. As is usual in modern warfare, every little expedition is accompanied by zealous and fearless members of the new profession of War Correspondents. The spirit with which the historians of the campaign collect information under fire is not less worthy of public recognition than the clearness and apparent accuracy of their narratives. They all bear testimony to the gallantry of officers, soldiers, and sailors, and to the utter pusillanimity of the native allies. Of late indeed there seem to be some faint signs of improvement, and possibly even Fantees may begin to fight when they are assured of victory. It is hoped that some of the more warlike tribes in the interior may take the opportunity of revenging themselves on the Ashantees for former wrongs; and the auxiliaries whom Captain CLOVER was to raise may perhaps become serviceable; but if any decisive result is to be obtained, it must be effected by English troops. If only the road to the Prah were completed, there could be little doubt of the feasibility of a march on Coomassie.

The General has naturally great difficulty in obtaining accurate information of the force or the plans of the enemy. At one time it was announced that the Ashantees were in full retreat, and some regret was felt that they should not have had sufficient temerity to wait for the arrival of the troops from England. It has since appeared that they retain their positions in the neighbourhood of Dunqua, where Colonel FESTING had again attacked them, unfortunately at the cost of the life of a gallant young officer. A large force had the audacity to attack a town or village called Abtrakampa, although it was held by an English officer with a few West India soldiers. The General himself thought it worth while to relieve the fortress in person, and his arrival with a reinforcement deprived the assailants of any chance of success. As might have been expected, the besiegers were unable to cross the open space which surrounded the town; but, on the other hand, the garrison could not prudently advance into the bush. The attack seems to have been made in resentment for some hostile action on the part of the chief of the place; and he is indebted to his English allies for the repulse of the enemy. On the whole, the prospects are more cheerful than at the outbreak of the war, when Cape Coast Castle itself was threatened, and when the enemy had free access to all other parts of the coast. The Commander-in-Chief indeed considers that he has done more than he could have expected within the short time since his arrival on the coast. Even before the arrival of Sir GARNET WOLSELEY, the English officers on the coast had begun to take the offensive; and in all the skirmishes which have occurred the enemy has had the worst of the struggle. The least satisfactory

part of the recent transactions consists in the excessive risk of life which is incurred by officers in command of native levies. They are easily distinguishable by the enemy's marksmen, and they are liable at any moment to be deserted by their men. It may be presumed that some miscalculation had originally been made at home; for it can never have been intended that a little war on almost equal terms should precede the more serious campaign.

According to a story which, if it is true, illustrates the fantastic restrictions to which barbarians voluntarily submit, Sir GARNET WOLSELEY'S letter cannot have reached the King of ASHANTEE, because a Royal messenger can only travel on the high road, which is at present blocked by English detachments. It is highly probable that such a form, if it is nominally established, is practically evaded by some convenient fiction, and that the English overtures are perfectly well known at Coomassie. A favourable answer, immediately preceding the arrival of the regiments from England, would be not a little embarrassing. The terms which have been offered to the King are not at present known; but even if he is ready to accept all the conditions which are dictated by the General, there will be almost insuperable difficulties in taking security for the performance of any contract which may be made. There are perhaps moral objections to continuing a war after the submission of the enemy; but the real object of the present expedition is not so much to punish aggression as to convince the invader that he is unable to resist an English army. The demonstration will scarcely be brought home by any treaty which can be devised to the minds of the King and his subjects; whereas the capture of Coomassie would satisfy the West African world of the irresistible power of England. There seems reason to believe that the Ashantees have up to a late period affected to have no quarrel with England; and, now that they have probably exhausted the resources of the country, they may perhaps not be unwilling to retire within their own territory. African kings and chiefs are in the habit of taking hostages for the performance of treaties; but hostages would offer no security to a civilized Power, which would not, in the event of the breach of a treaty, put hostages to death. A formal surrender of all claims on Elmina, and of pretensions to the Fantee territory, will naturally be exacted, if any treaty is at present concluded; but, on the whole, it would perhaps be better that the King of ASHANTEE should either refuse compliance or abstain from taking any notice of Sir GARNET WOLSELEY'S letter. The alarmists have of late ceased to accumulate proofs that an attack on the Ashantee dominions is impracticable. At the same time the controversy as to the future policy which is to be adopted is fortunately suspended. All parties feel that the experience which will be acquired in the ensuing campaign will throw much light on the possibility and expediency of maintaining a protectorate on the Gold Coast. The Fantees are probably not aware of the extent to which their indolence and cowardice may affect their future fortunes. If they are incapable of being taught to defend themselves, it is not improbable that they may be hereafter left to the mercy of their hereditary enemies.

There can be no doubt that the Government, which has the best means of information, is thoroughly convinced of the necessity of prosecuting the war to a successful conclusion. The Colonial Minister can only act with the sanction of his chief, and Mr. GLADSTONE has, in addition to his hearty dislike for war, an immediate reason for objecting to the pending expedition, if it had not become inevitable. When the PRIME MINISTER assumed the office of Chancellor of the Exchequer, he must have intended to render his administration memorable by some great financial achievement. Several of his colleagues would have been competent in ordinary times to conduct the business of the department; but Mr. GLADSTONE has no rival in financial genius. The surplus which would have facilitated any changes that might have been proposed must already have been endangered, if it has not been appropriated to the purposes of the war. An incidental discussion lately showed that the hire of a single transport for a year might cost the sum of 15,000*l.*; and the provision of shipping for the troops and stores is only one among innumerable items of expense. The medical and sanitary contrivances of modern military administration are highly valuable, and at the same time extremely expensive; and generally it may be said that every modern improvement has tended to make war dearer. It is undoubtedly right that no cost should be spared which may ensure victory and diminish the sacrifice of life. Soldiers

are incomparably the most expensive of all munitions of war; and it would be a foolish policy to fight savages on equal terms, instead of profiting by the mechanical superiority of civilization. Improved rifles and rockets offer a legitimate advantage in a contest with African warriors.

FROHSDORF AND SALZBURG.

A HISTORY of what went on in French Monarchical circles during August and the two following months has just been written by some one who was evidently a party to many of the principal transactions, and who knew perfectly well what was going on. It is of course written in the spirit of a partisan, and that it is a furious Orleanist who is the narrator is apparent at every page. Of the greatness and goodness of the Count of PARIS and of his brother and uncles, and of the genius, patriotism, and varied energy of the leaders of the Right Centre, he never wears. On the other hand, M. THIERS is the worst and most faithless of men, and everything done by any member of the Left shows a settled determination to ruin France. The country, too, is left out of consideration throughout, except as something to which a blessing like that of Monarchy may be conveniently given, and every manifestation that the country did not wish for a Monarchy is dismissed with contempt as an idle manoeuvre of the friends of anarchy. For any purpose except as a record of what went on in the inner regions of the Monarchical party the book is valueless; but for this purpose it is valuable; and it throws much light on the curious series of events which began in the meeting of the cousins at Frohsdorf, and ended with the manifesto of Salzburg. It is not exactly a new revelation, but the writer explains fully and authoritatively that the visit of the Count of PARIS was the fulfilment of an undertaking which he had given on behalf of himself and his family in return for the vote of the Legitimist majority in the Assembly by which the law condemning the ORLEANS Princes to exile was rescinded. What the writer wishes to show is that the Count of PARIS kept to his part of the bargain honourably and punctually, and this we think may be said to be established. The Count of PARIS abandoned altogether the position of a possible rival. He presented his homage to the chief of his House, and he made no reservation, insisted on no conditions, and in fact threw away the whole political principles of his father and grandfather at the feet of the man whom they had kept from his throne. There is no reason to doubt that in doing this the Count of PARIS honestly thought that he was doing the best he could for his country as well as for himself. Monarchy is in France a very tender plant, and after two Republics and the Second Empire it is not likely to thrive if its stem is divided. At any rate the partisans of the Count of CHAMBRORD must allow that the Count of PARIS did handsomely what he had engaged to do; but whether it was wise in him to fetter himself from the outset by a bargain, and to let his submission to his cousin seem, not a spontaneous act dictated by political sagacity, but the consideration for a vote rescinding the law of exile, is another matter. It seems to be the fate of the ORLEANS family that they shall think wisely, and act fairly, and be reasonable and thoughtful and rich, and make a good figure in the world, but never carry France with them. The significance of the reconciliation of the two branches of the BOURBONS was likely to be much lessened, and the respect for the sacrifice made by the younger Prince considerably impaired, when it was known that it was all a matter of barter, and that the Count of PARIS and his family had, as it were, discounted this sacrifice, and that it had enabled them to enjoy for a couple of years the pleasure of holding a high station in France, of benefiting by their vast possessions, and of substantiating their enormous claims.

The eminent Orleanist, however, who writes this volume makes it quite clear that, if the consequence of the visit of the Count of PARIS to Frohsdorf was that there was one Orleanist the less, there were a great many left behind, and that they were determined that there should be no Monarchy unless it were a constitutional one, with the tricolour as its flag. It was men with these views who were at the bottom of the movement for a Monarchical vote. It was they who approached the moderate Legitimists, and inspired them with the conviction that, if there was to be a King, it must be a King of the ORLEANS type. There was never any intention on the part

of those who had the conduct of the movement that there should be the white flag and the *ancien régime* and the supremacy of the clergy, and all the terrible things that frightened French Liberals when they heard of the project to put the chief of the Legitimists on the throne. The Dukes of AUDISSET-PASQUIER and DECAZES were the leading spirits, and they were in complete accord not only with their own immediate followers, but with a large body of the Legitimists. It is the consciousness of this which has made them so sore at the treatment which they then received and have since received at the hands of the Liberals. They were fighting as hard as they could for Liberal principles, and making the adoption of these principles the indispensable condition of a Restoration, and all the time they were being abused as the tools of the clergy, as meditating the revival of serfdom, and as forgetful of the old glories of the tricolour flag. Their actions were, as they think, unjustifiably misconstrued; and to a great extent this is true, and it is quite right that one of their party should now come forward to tell the whole story and to set them right in the eyes of France. That they all along meant to ask for something which it was not very probable they should obtain, and which in point of fact they did not obtain, does not at all throw any doubt on the wisdom of those who said that they must take the Legitimist Restoration as a whole and look at its very serious consequences at home and abroad. The country was dead against anything like a Legitimist Restoration, and those who represented the popular feeling were quite right in saying that the Restoration meant, in the minds of those most eager and likely to profit by it, a revenge for 1789. The Orleanist writer is obliged to own that the attitude assumed by the clergy was enough to terrify those who did not know the real character of the movement. But it is equally true that the movement was essentially an Orleanist one, and that those who were most anxious to secure a Restoration, and who were taking the practical steps by which they hoped to make it possible, had no other idea than that of setting up a Monarchy like that which exists in Belgium. They did not separate themselves from the Count of PARIS, or censure him for throwing himself without reserve into the arms of the Count of CHAMBORED, but they were determined not to follow his example. If they were going to give away a kingdom, they resolved that it should be given only on their own terms, and those terms were that the heir of CHARLES X. should behave exactly as if he were the heir of LOUIS PHILIPPE.

They had good reason to believe that they had succeeded. M. CHESNELONG went as their representative to Salzburg, and he reported that the Count of CHAMBORED was ready to make all necessary concessions. The evidence adduced by the writer of this volume seems to show incontestably that the Count backed out of an engagement into which he had entered, and that he backed out of it in a very unhandsome manner. M. CHESNELONG had several conversations with him, and the Count agreed that there should be a Constitution discussed between persons specially authorized to act for him on the one hand and the Assembly on the other, and that he would waive the question of the flag, salute the tricolour when he arrived in France, and would merely reserve to himself the right of proposing at some future time to the Assembly that some alteration in the flag should be made. M. CHESNELONG took the precaution of putting down in writing the results of his conversations with the Count, and before leaving Salzburg he got the Count to read over what he had written and approve it as an accurate statement of what had passed. But scarcely had M. CHESNELONG arrived in Paris when dark hints began to appear in certain journals that M. CHESNELONG was mistaken, and that the Count had not made the concessions which it was reported he had made, and that, in fact, M. CHESNELONG's mission had been entirely in vain. The curious thing was that these mysterious assertions appeared not only in the columns of the extreme Legitimist organs, but also in those of a Liberal paper. At first the leaders of the Monarchical movement treated these assertions with contempt. They had got the notes of M. CHESNELONG as approved by the Count, and people less well informed might gossip as they pleased. But at length the statements that there was something wrong at Salzburg got so definite and persistent that the confidence of the Orleanists was shaken, and they felt that there was no possibility of going further unless the Count himself issued a manifesto putting an end to all uncertainty. He

did issue such a manifesto, and it was the death-blow of their hopes; and not only did he do this, but he did it in a manner as mortifying and insulting to those who were working for him as possible. He took care that it should be published in a newspaper before they could get any tidings of its contents; and he did it in the shape of a letter to M. CHESNELONG, whom he had thrown overboard, and with whose communications the letter was in direct opposition; and the letter was so worded that the reader would necessarily think that, if M. CHESNELONG had ever reported that the Count was ready to make concessions, he was stating what was wholly untrue. No wonder that this eloquent draper exclaimed that he appealed from the King to God. The writer of this volume naturally asks how it happened that the Count came thus to change his mind and deny his envoy; and after much consideration the result arrived at is that the Countess of CHAMBORED was at the bottom of the mystery; that she heard what the Count had authorized M. CHESNELONG to say, that she at once found means of setting a portion of the Paris press to prophesy that the whole negotiation would fail, and then applied herself to fulfilling her own prophecy. Why should she have done this? The writer of this volume politely sees the reason in the excess of her conjugal affection. When the time of his leaving the safety and humble state of exile for a throne really seemed to have come, she was overwhelmed with two horrible fears—the fear lest after he had become King he should be assassinated, and the fear lest amid the splendours of the Tuileries, and the fascinations of Court beauties, his faithful heart should begin to wander. This may be only an idle fancy of the writer; but if it has any foundation, it is a curious instance of how small are the things that affect the destiny of nations; and it will be a sort of melancholy consolation to Legitimist French ladies to know that it was their pretty faces which made impossible the restoration of the Monarchy for which they are pining.

POLITICS AND MORALS IN NEW YORK.

THE financial crisis in the United States, and the excitement arising out of the capture of the *Virginias*, have, even in New York, diverted public attention from the results of two trials which nevertheless possess political importance. The murderer of the notorious Fisk has at last, on a conviction for murder in the third degree, been sentenced to imprisonment for four years. The man STOKES was originally an associate of Fisk, whom, on the ground of a private quarrel, he deliberately and publicly assassinated at an hotel in New York. The verdict of the jury, though it was entirely inconsistent with the evidence, nevertheless indicated a kind of perverted moral judgment. They half-consciously assumed that the issue before them involved, not only the act of STOKES, but the character of his victim. In a well-governed community rascals are not allowed to take the law into their own hands by putting one another, however deservedly, to death. In the particular case STOKES killed Fisk, not because Fisk was a swindling reprobate, but because he was the successful rival of STOKES for the favour of a mistress worthy of both. The jury apparently thought that no later opportunity would occur for the utterance of a moral censure on one of the most abandoned of mankind. A partial condonation of the guilt of his murderer seemed to be the only practical method of expressing the opinion that Fisk, with all his wealth and popularity, was nevertheless a social outlaw. The conviction of TWEED and the severe sentence of imprisonment for twelve years will be regarded by the respectable citizens of New York with more unqualified satisfaction. It remains to be seen whether the party which has lately recovered its predominance in the State will have the power or the inclination to relieve the popular demagogue from the merited consequences of his guilt. Even if the Governor should yield to the representations which he will certainly have to encounter, the honest part of the community will be reassured by the knowledge that the court and jury have done their duty. When the Constitution of the State was lately remodelled, the vicious practice of electing judges by popular suffrage was unfortunately retained; but perhaps the members of the judicial bench may at present feel that they are on their trial, and that they are especially bound to efface by their conduct the memory of recent scandals. A former prosecution of TWEED failed through the success of a sheriff, who was a satellite of the prisoner, in packing the jury-panel. On

the recent occasion it would appear that effectual precautions were taken against the repetition of the fraud. The apologists of American institutions are entitled to take credit for the ultimate retribution which has fallen on the perpetrator of crimes which were at the same time outrageous and characteristic.

It was the peculiar mission of TWEED to illustrate by an extreme case the moral and political consequences of universal suffrage. His respectable countrymen may fairly boast that the democratic system which rendered his frauds possible has finally provided the means of redress and punishment. Unfortunately no law can reach the accomplices who connived at TWEED's villainies when they were only suspected, and approved of them when they were fully exposed. Unless a criminal conviction disqualifies a member of the State Legislature, TWEED is still a Senator of New York. His last re-election immediately followed the discovery that he had embezzled for himself and others enormous sums belonging to the city. A dozen years ago TWEED became bankrupt as a small shopkeeper in New York; and since that time he has never been known to pursue any lawful occupation by which he could have accumulated a competence. Having failed in retail trade, he took to politics, and more immediately to the municipal business of the city. Having made himself popular with the rabble, and especially with the Irish voters, he became an Alderman of the city and a Senator of the State; and he at the same time became conspicuous for the lavish splendour of his establishment, and for his profuse benefactions to his humbler supporters. His admirers boastfully pointed to TWEED's stables as exceeding in magnificence the mansions of many wealthy citizens; and the impudence with which he displayed his ill-gotten wealth increased the enthusiasm with which he was regarded by his clients. It is perhaps a redeeming feature in TWEED's malpractices that he can scarcely be said to have committed a breach of trust. Sympathetic colleagues and applauding followers were perfectly aware that the colossal fortune which excited their reverential envy was exclusively derived from plunder of public funds; but the needy multitude felt no compunction for the spoliation of the taxpayers, who on their part both regarded the extortion of a tribute as an inevitable necessity, and cultivated a feeling of amusement at the cynical audacity of the triumphant and genial demagogue. The most rapacious of speculators was from policy, and perhaps from inclination, open-handed to the poor; and the majority, which, according to some political theorists, is incapable of oppression or injustice, valued TWEED as the conduit-pipe through which they received a share of the superfluities of their neighbours. As the constituency was the sole source, not only of political influence but of judicial power, TWEED with a just prescience raised some of his most unscrupulous accomplices to the judicial bench. The names of BARNARD and CARDOZO will long be remembered as patrons of the criminal class, and as invaluable confederates of more ambitious swindlers.

During the reign of TWEED the city of New York was practically an Irish Republic, administered on the principles which might be expected to prevail in such a commonwealth. The town was ill-paved, ill-lighted, and insufficiently protected by the police, at a cost, as far as could be ascertained, of 6,000,000*l.* or 7,000,000*l.* a year. The governing body consisted of beer-shop-keepers and persons of a similar station, with a sprinkling of prizefighters; and the more respectable Democratic politicians of the city and State were compelled to ally themselves for political purposes with TWEED and his associates. The ringleader himself never assumed the office of Mayor, which was habitually reserved for some more presentable member of the party, not directly implicated in pecuniary fraud. The inner circle of managers helped themselves almost at discretion to shares in the vast sums which they administered. The particular frauds which were afterwards proved were probably only casual specimens of their ordinary practice; yet, even if the rest of their career had been perfectly pure, the embezzlements of which they were ultimately convicted would remain without a precedent in magnitude and audacity. The *New York Times*, which has since rewarded itself for its patriotic energy by discountenancing all inquiry into the irregularities of Republican officials, commenced three years ago an active investigation into the outlay on a County Hall which had been erected under the superintendence of the city gang. It was shown that tradesmen had been encouraged to prefer absurd and impossible demands on condition of dividing the proceeds

with TWEED and their other paymasters. According to the official statements, the County Hall had been plastered at a cost of half a million sterling, and it had been provided with sumptuous carpets which would have served to cover the area of the city park. Nevertheless the floors were bare, or in parts covered with cheap substitutes for the carpets, of which a part had been supplied, not to the County Hall, but to a new hotel which TWEED had established. The Mayor and the Controller had been more or less privy to the frauds, though the Mayor was not supposed to have shared in the profits of the transaction. The detailed exposure of the monstrous robberies of the dominant faction provoked an indignation which had been dormant when it was but generally known that TWEED and his companions were living in splendour on the public plunder. The excitement was increased by the prospect of a political reaction against the Democrats, who had long controlled the city and the State; but in the first instance the better class of citizens exerted themselves to abate the scandal without regard to party. At the next election the majority of the delinquents were driven from office, though TWEED was elected a Senator by a constituency which adopted all his acts with full knowledge of the circumstances. After a time the judges who were the notorious creatures of TWEED and of FISK were forced out of office; and one of them had the grace to pass and execute judgment on himself by committing suicide. The Committee of Citizens has since pursued with commendable firmness of purpose the prosecution of TWEED, without allowing its attention to be diverted from the great offender by many minor scandals which have since transpired. The verdict and judgment which have not last been obtained must be highly satisfactory to the honest section of the community. Future experience will show whether any permanent improvement has been effected. Society is clearly a gainer by getting rid of TWEED for twelve years, or for any other period; but during the PRESIDENT's term of office the New York Custom House has been strongly tainted with corruption; and the Federal officers are closely allied with active local politicians. The Republicans have not been distinguished during their short term of power in New York by any extraordinary regard to purity. At the recent election they excluded from their voting-ticket the name of Mr. BARLOW as candidate for the office of Attorney-General, on the supposed ground that he had been too active in prosecuting official frauds. The Democrats who have now resumed power will not at once imitate the comic extravagance of TWEED's speculations; but they must still rely on the votes of TWEED's supporters. The friends of corruption in the city are perhaps not a majority, but they are a large, active, and vigilant minority of the whole constituency. Large masses of voters, being incapable of acting for themselves, are necessarily manipulated by professional managers, who are, with few exceptions, vulgar and unprincipled adventurers. Notwithstanding the murder of FISK, the suicide of BARNARD, and the conviction of TWEED, universal suffrage in New York is still on its trial.

MR. GLADSTONE ON EVOLUTION.

MR. GLADSTONE, while schooling himself admirably to political silence, has not cut himself off altogether from communication with the world on more private matters. On the eve of a general election, he is anxious that his views on the question of evolution should be understood by the constituencies, and he has also issued one of his periodical letters in answer to inquiries as to his religion. Somebody at Bodmin, it seems, had written to him to say that somebody else there had said he was in spirit a Papist and not a Protestant; and he has thought it necessary to answer this impertinent statement through his private secretary. He informs his correspondent that the allegations referred to are wholly and absolutely devoid of truth. We do not know how many times Mr. GLADSTONE has written or dictated other letters to the same effect, but one is published pretty regularly about once a quarter, and we should have thought that he would by this time have become rather tired of the amusement. More than once he has provoked a rejoinder by the capricious ambiguity of his language; and in any case there is no reason to suppose that his letters produce the slightest impression on the minds of people who are silly enough to believe the calumny which irritates him. It is obvious that those who think that he is a Jesuit in disguise would be very much surprised if he did not deny it. A Liberal

journal lately undertook to explain why Mr. GLADSTONE was hated—an assertion made on its own responsibility; but it is perhaps more easy to comprehend why he is at least distrusted by a large part of the community. People usually distrust a man whom they do not quite understand, and it is difficult to understand any one who is not very careful to understand himself. The letter which Mr. GLADSTONE has just written about evolution is vividly typical of his peculiar mental condition, and of the odd sort of relation which he occasionally assumes towards things he has said.

Mr. DISRAELI has started some curious cries in his time; but it may be doubted whether many seats at the next election are likely to be lost or won on the question of evolution; and there can hardly be any one who is more fully entitled not to have a matured opinion on such a subject than a Minister who is at once the head of the Cabinet and Chancellor of the Exchequer. It is a question upon which Mr. GLADSTONE is of course entitled like everybody else to hold any opinion he chooses, whether he has had time to study it and think about it or not; but he is certainly not responsible to Parliament for an authoritative solution of the problem. There are various matters as to which the country looks to Mr. GLADSTONE for enlightenment, but evolution does not happen to be one of them. Mr. GLADSTONE, however, is not an ordinary statesman; and having at present only a budget, a war, a famine, and a few other trifles on his hands, he has felt bound to add to his other insignificant duties the scientific education of his countrymen. In the course of this task he has been led into an explanation which is sufficiently characteristic to deserve attention. In a recent address he said:—"Upon the ground of what is termed evolution, 'God is relieved of the labour of creation; in the name of unchangeable laws, He is discharged from governing the world.'" This was taken up by Mr. HERBERT SPENCER in a recent article in the *Contemporary Review*, as an attack on the evolution theory, and Mr. GLADSTONE was exhibited as "a conspicuous exponent of the anti-scientific view." It is this which Mr. GLADSTONE now feels bound to answer. We have of course not the slightest intention of joining one way or the other in the controversy as to how far the world is kept going on the principle of evolution. Our interest in the matter is limited to Mr. GLADSTONE's mode of dealing with the question. Many persons would have thought it unnecessary to offer any explanation at all, and there can hardly be more than about one person in the country who, deeming it necessary to offer an explanation, would have given it in such a singular way. Taking the words as they stand, they certainly seem to bear out the interpretation which Mr. SPENCER put on them. As Mr. GLADSTONE spoke derisively and contemptuously of the evolution theory, it was not unreasonable to assume that he was opposed to that theory. Evolution of course means that a system of laws and forces has been set in motion which produces certain results, without any interference or assistance from a superintending power. But Mr. GLADSTONE dismisses with offhand contempt the idea of any "unchangeable laws by which God is discharged from governing the world"; and he also implies that He is still busy with the labour of creation, thus applying his argument both to organic and inorganic phenomena. Mr. GLADSTONE now comes forward not only to say that he has been misunderstood, but to express his amazement that he should ever have been imagined to have said anything which could be construed into "a condemnation of evolution or of the doctrine of unchangeable laws." Everybody will of course accept his assurance that he did not mean to express such a condemnation, but we doubt whether many persons who take the trouble to read his words will share his surprise at the interpretation put upon them.

Any ordinary person having to make an explanation of this kind would have said—"My meaning has been misunderstood; I did not mean to say what has been imputed to me. What I meant was"—and then he would have gone on to state as clearly as possible what he did mean. But this is not Mr. GLADSTONE's way. He does not tell us what meaning was in his mind when he spoke the words in question—which is the only point of interest in the matter—but confines himself to an inquiry whether the passage, taken literally, can be construed as a condemnation of a particular doctrine. "I submit," he says, "that it contains no such 'thing.'" He examines the passage as if it had been spoken by some one else, and as if he were quite an outsider who had by chance been called upon to guess its meaning. And even this inquiry is conducted in the

most strangely roundabout way. He does not say, "I said this and that, and what do you make of it?" But "Suppose I had said something entirely different, as for instance, so and so, what would you have made of that?" "What," he says, "if I wrote as follows:—Upon the ground of what is termed liberty, flagrant crimes have been committed, and (likewise) in the name of law and order, human rights have been trodden under foot. I should not in thus writing condemn liberty, or condemn law and order, but condemn only the inferences that men draw, or say they draw, from them." As far as we can see, there is really no analogy between the two sentences, and it is difficult to imagine what other meaning Mr. GLADSTONE can have intended to convey in his reference to evolution except that which Mr. SPENCER put on it. With that, however, we have nothing to do. We are merely pointing out the elaborate circumlocution and obscurity of Mr. GLADSTONE's explanation, and the impossibility of extracting a definite meaning from it.

Anybody who expected to learn from this letter what Mr. GLADSTONE really thinks on the question on which he voluntarily undertook to instruct the public must have been very much disappointed. Mr. GLADSTONE was not required to have an opinion on the question at all, or at least to place his opinion before his countrymen; but if he thought it necessary to make a public declaration on the subject, it would at least have been worth while to wait until he had thought out the matter, and was quite sure he had an opinion to express. He now says, "Before I could presume to give an opinion on evolution, or on unchangeable laws, I should wish to know more clearly and more fully than I yet know the meaning attached to those phrases by the chief apostles of the doctrines; and very likely, even after accomplishing this preliminary stage, I might find myself insufficiently supplied with the knowledge required to draw the line between true and false." We think this is very likely, but it is a pity that the reflection did not occur to Mr. GLADSTONE before he committed himself to loose talk on a subject which he avowedly does not understand. It will be observed that the PREMIER's scientific and political opinions are formed pretty much in the same way, and that, as usual, he starts from some broad general conclusion, and then goes about hunting for premisses to match. The common notion of a Jesuit is a man who says one thing and means another; but it would be an injustice to Mr. GLADSTONE to doubt that he means what he says at the moment when he says it. The unfortunate thing is that, as far as he is concerned, the meaning of the moment vanishes as soon as the occasion has passed; and he then regards himself as committed to the words he has used, not in any special sense, but only as words which he is afterwards at liberty to identify with any meaning which the utmost latitude of free translation will permit. The words remain, but only, as it were, as empty jugs into which any liquor can be poured which happens to be at hand. In a letter to Lord MACAULAY Mr. GLADSTONE observed that language has many bearings which escape the view of the writer at the moment the pen is in his hand; and it would appear that he considers himself entitled to adopt any meaning which may subsequently occur to him. This is the key to such puzzles as the *Elwelm* and *COLLIER* incidents, the varied and contradictory readings of the law as to the re-election of a Minister, and the marvellous interpretation of Mr. ODO RUSSELL's communication to Count BISMARCK. On the general question of evolution and unchangeable laws it might almost be presumed that there would be a predisposition in Mr. GLADSTONE's mind against the oppression of fixed principles. It can hardly be doubted that he would himself hesitate to accept the regulation of the world on such intolerable conditions. A Scotch preacher was lately called to account by his Presbytery for deriding the idea of a "fidgety and fickle God," who did not know His own mind, and was perpetually chopping and changing in His management of the universe; but he may possibly have been thinking of a terrestrial example of the misery and mischief of this mode of government.

THE LONDON SCHOOL BOARD.

THE results of the election for the London School Board have naturally drawn attention to the working of the cumulative vote. When it was first proposed that minorities should be represented on School Boards, the idea ap-

proved itself to many persons who had never regarded with much favour the application of the same principle to Parliamentary elections. They felt that one great danger to be feared in the working of the Act of 1870 was mistaken parsimony on the part of the ratepayers, and they looked to the cumulative vote as a means of securing on every Board the presence of some members who preferred education to economy. As things have turned out, the minorities represented have mostly been theological rather than educational. In London especially the cumulative vote has been largely appealed to to further an object which is as nearly as possible the reverse of that which it was hoped it would answer. It cannot be said that the policy of the late Board was in any sense a Secularist, or even an anti-Denominationalist, policy. There was a Secularist minority among the members, but it was not strong enough to influence the action of the Board on any important point. It might have been expected, therefore, that the candidates who came forward on the Denominationalist side would have sought to identify themselves with the policy hitherto pursued. Instead of this, they allowed themselves to be put forward as avowed opponents of that policy. The feature in it to which they took exception was the action of the Board in providing additional school accommodation before all the places in existing voluntary schools were filled. It is difficult to understand how those who used this argument can have read the Act of Parliament which it will now be their business to carry out. Whether it would have been wise or unwise to postpone the building of new schools until all the schools already open had been filled is a point on which different opinions may be entertained. But the time for putting them forward was when the 37th Section of the Education Act was going through Committee. When once the Act had been passed the question was no longer open. The language of the Clause is imperative, and obedience to it is to be immediate. "The School Board shall proceed at once to supply their district with sufficient public school accommodation." There is nothing said about waiting till all the places in existing schools have been filled, and then inquiring how many children remain to be provided for. The Board has nothing to do but to ascertain how many children there are who ought to be at school, and how many school places there are to hold them. The difference between these two estimates gives the amount of school accommodation to be supplied, and it is to be supplied at once. It is no question of "dealing generously and fairly by voluntary schools"; that is a consideration which may arise when the Board gets into the region of discretionary action, but can have no place so long as it is simply carrying out the express directions of Parliament.

Mr. PECK and Mr. CROMWELL have both disclaimed the thoroughgoing opposition to the policy of the late Board which has been attributed to them by some of their more enthusiastic supporters. Mr. PECK declares that his opposition "was not against the Board as a whole, but against those members of it who notoriously sympathized with the principles of the Birmingham League." The mere fact that he was himself endeavouring to become a member of the Board is enough to acquit him of the former kind of opposition; but if he and Mr. GREGORY meant only to resist any increase to the number of the Secularist minority, they might certainly have made their intentions somewhat clearer. Mr. GREGORY's name is specially associated with resistance to the course so properly followed by the late Board of providing at once as many schools as would be required if all the children who ought to be at school were actually there. This was not the policy of those members "who notoriously sympathized with the Birmingham League"; it was the policy dictated by the very Act of which Mr. PECK proclaims himself a warm supporter. The truth appears to be, that the Denominationalist candidates at the recent election found the temptation to appeal to the ratepayers' dislike to spend money greater than they could resist. They justly thought that there was a certain number of votes which could be won by that inducement, and by no other. If they had looked further ahead, they might have known that to link themselves with the niggardly and reactionary section of the electors was to risk a crushing defeat at some future time when the present cold fit shall have passed, and the ratepayers shall have again opened their eyes to the need and to the absence of elementary education.

Happily for themselves, and for London, their mistake is not beyond remedy. No one will think of preventing

them from turning existing schools to the best possible account, or from opposing to the full extent of their powers any attempt to go on building schools after the educational wants of the district have been satisfied. But they will only defeat their own object if they allow themselves to carp at every site which may be proposed for a new school. It must be remembered that the first effect of opening an additional school will almost always be to draw away children from some existing school. A new church does not at once start with a congregation who have never been to church before; it begins with a congregation composed in great measure of persons drawn from existing congregations either by curiosity or convenience. It is the same with schools as with churches. The persons most impressed by the knowledge that there is a school the more for them to send their children to are not usually those who up to this time have been content to send them nowhere. They will probably receive the news with the utmost composure, and with a mental resolution not to suffer their mode of life to be disturbed by it. The children who first attend will be drawn there by the curiosity or dissatisfaction of parents who want to see whether the new school is better than the old. In a sense, therefore, every School Board school will interfere in the first instance with neighbouring voluntary schools. But, as the compulsory by-law takes greater effect, the balance will be redressed, until in the end the old and new schools are alike filled. If the Denominationalists on the London School Board will agree to carry out the Education Act in its integrity, and to give voluntary schools that fair field and no favour which is all that can legitimately be asked for in their behalf, they will find that in the long run they have served their own interests as well as the interests of the public.

The London School Board will now have the advantage of watching the fate of the opposite policy in Birmingham. The "Liberal Eight" have signalized their victory in the recent election by imposing a strictly Secularist policy on the minority. As parties on the Board are divided in the proportion of eight to seven, the majority must have a profound confidence in its own cohesion, and in the unimpaired health of its members. The Chairman and Vice-Chairman belong, of course, to the dominant party, and care has been taken to give them the preponderance in every Committee. By a majority of one it has been resolved to discontinue all payments to voluntary industrial schools, and to take measures for setting up temporary Board schools wherever there are children whose parents are unable to pay the fees charged by voluntary schools. This was held to be enough for the first meeting, but notice was given of a motion to discontinue religious teaching in Board schools after the 1st of February next, and to refer to a Committee an expected application from a voluntary society to be allowed to supply religious teaching out of school hours. Thus the Secularist system will shortly be seen in actual work. Unless the fears we have often expressed prove groundless, the result of the experiment will be to create an atmosphere of controversy in which the fact that there are children to be educated will run great risk of being forgotten. The London School Board have now, therefore, an admirable opportunity of showing the pre-eminence of a system of reasonable compromise over a system of doctrinaire fanaticism which is not the less sectarian because it boasts that it is secular. If Denominationalists are wise, they will heartily co-operate in every scheme which promises to show that children are being got to school in London faster than they are in Birmingham. If they allow any shortsighted tenderness for the finances of this or that voluntary school to interfere with their pursuit of this object, they will be doing far more harm to the cause they have at heart than by consenting to any amount of expenditure on School Board schools. The real problem to be determined in the next three years is whether the Secularists or the Denominationalists can best carry out the end to which the Act of 1870 is but a means -- the education of every child in the country. If the Denominationalists allow the answer to be given in favour of the Secularists, they may be sure that they have prepared for themselves a certain, if distant, defeat.

BENGAL PAST AND PRESENT.

THE newspapers have very naturally been filled with facts and speculations about the sad calamity which is said to be impending over the oldest of our East Indian possessions, and every

kind of note has been sounded, from the highest falsetto to the deepest bass. Suggestions of course have been plentifully showered on the Government; some full of sound good sense; others well-meaning, but long ago acted on; others, again, childish and silly, and of about as much practical application as would be the advice tendered by a Liddesdale farmer to a vine-dresser in Spain. The tone of the daily and weekly press has, on the whole, been earnest and temperate, though here and there we have heard an utterance more like the ravings of Habakkuk Mucklewraith than the advice which ought to be tendered by those whose mission it is to brace official thought or to fashion public opinion. We propose in this paper, not gratuitously to lecture an Administration which is fully alive to the crisis, nor to harrow readers by dilating on a probable recurrence of the year which Macanlay has immortalized, but to put before them an accurate account of agricultural wants and operations in the Gangetic Delta such as they ordinarily are in an average season, and such as they cannot now be in that region until the middle of 1874.

To break up the clay or loam of Bengal, dried and baked by months of sun, to keep up the village reservoirs to their proper fulness, to prevent the smaller streams from running dry, to give the late rice plants that depth of water which converts a vast plain into one huge wet field of unbroken cultivation, and to enable the higher lands to produce two successive and distinct crops in one twelvemonth, some sixty to eighty inches of rain are almost indispensable. But Bengal, and indeed India generally, must have, to use a Biblical expression, the former and the latter rain in due season. The prospects of the finest year may be hopelessly ruined if the showers are not vouchsafed to the land at due intervals and with occasional breaks of sunshine. If an undue proportion of wet is gauged in May and June, the ryot cannot sow the best and deepest lands, or he sows them late and in haste, for the seed to rot or the young plants to be drowned. If the return of the periodical rains is delayed beyond the middle of June, the same result occurs; and before the rice can gather head, as it were, it is overtopped by a deluge in July and August, when the windows of heaven are sometimes opened for a week in succession. On the other hand, it is quite possible that everything may go on well till the middle of September. The rice sown on both high and low lands in May and June, strengthened but not overwhelmed by the heavier downfall of August, after a week or ten days of sunshine in September just wants several good inches of rain to keep the roots wet while the ear is developed. But the clouds hold off or do not dissolve; and the richest hopes are converted to blank despair by the mere omission of half-a-dozen inches at the close of September or the beginning of October. In fact, it is perfectly possible to conceive a scarcity with seventy inches of rain all confined to June, July, and August, and a year of unusual abundance with fifty inches distributed in timely and successive falls between the 1st of June and the 15th or 20th of October. Perhaps the happiest distribution is when there is never more than a fortnight or three weeks of sunshine without rain during that period, and the worst is when all the supply is exhausted before the middle of September. Better that the dry heats of May should be prolonged till the middle of July than that moisture should cease at the very time when the rice-stalks are two and three feet in length. In the years 1844, 1843, 1851, and 1858, Bengal was saved by a timely downfall which occurred at various dates in October. In the first mentioned year the whole country exchanged dearth for plenty, or escaped a famine, by three days of rain, which began, at the very nick of time, on the 11th of October. This is exactly what has been prayed for this season by editors and statesmen, by prophets and planters, by Brahmins and Sudras, and what has not been given.

Broadly speaking, the lands of Bengal and Behar, including, of course, all the threatened districts, may be divided into two classes, the higher and drier lands which produce two crops in the year, and the deep low-lying tracts which are only fitted for rice. Though some divisions are more subject to inundation than others, and retain sheets of water for eight months out of the twelve, yet both kinds of land are constantly found in the same village and in one and the same plain. A few inches more or less of earth, a greater or less incline or outfall, an exchange of loam for sand, and of viscous clay for loam, will make all the difference between a single and a double crop in the year. Cultivation on the high levels commences in March or April, and the ground is then tilled for rice, pulse, vetches, hemp, oil seeds, some vegetables, and indigo. In the space of from ninety to one hundred and thirty days all these crops are sown, grow to perfection, and are cut and carried. No sooner is one crop disposed of than the ground is ploughed for what is called, by Anglo-Indians, the "cold-weather crop." This may be wheat, barley, chickpea (termed *gram*), the poppy, and the coarser cereals in Behar; oats, barley, *gram*, mustard, pepper, peas and vetches, in Bengal. These crops, if sown when the ground is still soft and moist in the end of September or October, and if benefited by the parting showers which wind up the rainy season, will do perfectly well without irrigation till they are fit to cut. In Behar indeed, and in Upper India to a much greater extent, this crop is irrigated by wells and watercourses. In Bengal we have for years seen splendid broadths of mustard, *gram*, barley, peas, and pulse, which had very little other moisture than the dews of heaven from the day the seed was put in the ground in October to the time it was reaped in March. In most years the bright, exhilarating, and not oppressive sunshine of the cold season is now and then obscured by clouds, and rain generally falls for a couple of days at any time

between the middle of December and the middle of February. This visitation has nothing tropical about it. The drops descend pretty much as they do in moderate autumnal showers in England. The crops, if the rain be unaccompanied by hail, look better than ever. Ryots shiver in their scanty clothing of American or Manchester workmanship; and Englishmen encamped in the interior of districts for surveying, inspection, or sport, or for all three combined, draw round an extemporized fireplace, and dream for a day or two that their tents are pitched in Somersetshire or Cannock Chase, instead of by obscure streams and populous villages loftily named after Hindu deities or Mahomedan Nawabs.

The above statement must be understood entirely to apply to high-level lands and their crops. The winter or late crop of rice, as it is termed, occupies the land for a period rarely less than six, often eight, and sometimes even ten months in the year. The deep, marshy, clayey soil bears this one crop and none other. On it centre the hopes of the ryot, and to it is devoted as much continuity of strenuous exertion as can ever be expected from Asiatic muscles. The great object is to get the ground prepared and a good deal of this rice timely sown in May, June, or July, so that the young stalks may not be overwhelmed by a rainfall in August of six or eight inches in as many hours. Only let the stalks keep their heads above water, and they shoot upwards with the rising tide, showing that Vishnu, the preserving power in Hindu mythology, is quite capable of coping with Shiva, the destroyer. A large portion of this crop is sown broadcast, is never weeded, and with fine sunshine above and water below, measured by inches and even by feet, turns out, in January or February, a fulness of ear and a wealth of straw which would amaze the most skilful of Lothian farmers. We have ourselves counted as many as 376 grains on one stalk, and have plucked stalks twice the length of the tallest of men. But as the rice crops are divided into high and low levels, so there is a subdivision of this later crop. In tracts neither too high nor too low, where the water continuously tills the plain to the depth of a few inches, or at most a foot, the crop is planted out by hand. It is sown in small nurseries, in places under the close personal inspection of the ryot, and removed to fields carefully ploughed, scraped, weeded, and smoothed, at any time in the months of July and August. While the rice sown broadcast is rarely weeded, but takes its chance with the lotus and other aquatic plants, that transplanted is kept free from grass and vegetation with the most scrupulous care. The importance of the late crop may be estimated from the fact that, if harvested, it alone would feed a province. The early rice may be dried up without inflicting any serious loss on the resources of a division; but a failure of the late rice generally is tantamount to a failure of the cold-weather crop also, which succeeds the early rice. The critical time in India for these two crops, as we have pointed out, is the close of the rains. All turns on their not ending too soon. They may not commence until six weeks after they are due. When they begin they may continue for three weeks, rot seeds, sweep away crops, destroy houses, flood the railways, and reduce villages to the condition of inhabited islands in an inland sea. These disasters, however grievous, are confined to certain limits, and, even if irretrievable for the time, they leave behind them legacies of silt and water which are by no means ruinous. But a sky of copper during the month of September, and the failure of the parting gift of a few inches usually bequeathed, as the Hindu thinks, by Indra the rain-god, mean simply scarcity, distress, disease, and famine over an extent of country out of which the area of Lancashire might be cut without being missed.

To see what this rich alluvial soil can display under the simple ploughs and harrows of a people who have practised agriculture and nothing else for centuries, we should select two dates in the year—the beginning or middle of August, and the beginning of February. At the former date the rainy season is at its height. The early rice is just ready for the harvest; the late crop is sufficiently far advanced to cover with a green carpet plains of such vast amplitude that the village bounding them on one side seems to those on the other like land on the horizon to mariners at sea. These plains are at this time converted into the best and easiest of highways, and they are traversed for perhaps two months by the boats and skills of the planter and the missionary, the policeman, and the post. The dense foliage which abounds the dwellings of some millions of inhabitants is decked out in the verdure and brilliancy of a second spring. Cattle, no longer at liberty to pasture anywhere, are tethered on the very few spots not occupied with a crop of some kind or other, on the very homesteads, or on the sides of the village roads. The air is saturated with moisture, and with the perfume of "heavy-blossomed bowers" and "heavy-fruited trees." The small embankments which serve both for landmarks and pathways, overtopped by the ripening or the rising crops, are no longer visible, and the country presents two broad characteristics often for some hundreds of miles. These are long waving lines of tall palms and fruit-trees, which are identical with the villages, and watery steppes between, where hardly a single acre does not contribute its quota to rent, to consumption, and to exports. The climate to an Englishman is simply detestable; but the sight of the Gangetic Delta at such an epoch is one which for completeness of husbandry, intensity of colour, and luxuriance of crops and vegetation, is not easily matched, and which can never be forgotten. The change in six months, at the commencement of February, is in its way no less striking. The cold-weather crops, not quite ready for the sickle, recall the agriculture of temperate zones; the late rice crop, in many places borne down by

its own weight, lies flat on the earth, or on the top of the water, uninjured, golden, full of promise. Balloons, heavy with produce, make their own roads, and traverse the plains or skirt the marshes with the most perfect facility. Date-trees, cultivated not for their fruit, but for their juice, discharge the material for treacle and sugar in a steady flow. Flocks of quail are flushed in the pear and barley; snipe swarm everywhere in the rice-fields; and ducks in myriads darken the lakes and ponds, or any places where water still lies deep. The weather, though soon to be exchanged for drying winds and clouds of dust, leaves nothing to wish for or grumble at. The Zemindars are secure of their rent. The Ryots have only the prospect of harvesting the last crop of the agricultural year, and will have no more hard work to do till April, and few instalments of rent to pay before June. Englishmen are compressing as much as possible of active open-air work and enjoyment into the remainder of the cold season; fleets of native craft, under no apprehensions of cyclones or tornadoes, pierce the great and small arteries of the country; the last batch of magnificent merchant vessels has just left or is leaving the Hooghly; and, considered either from an official, a social, or a mercantile point of view, the Gangetic plains put on their best aspect, and display the most palpable evidence of their agricultural wealth.

Of course the coming February must present a picture in lamentable contrast to this. Not that Bengal will ever be reduced by failure of rains to the aridity of an African or Arabian desert. The ground, indeed, will become hard as iron, but verdure will still conceal the village, and all sorts of worthless herbage will spring up unbidden, from the copious night dews or from the slight winter's rain. But it must not be imagined that any timely fall at Christmas can enable the Ryots to recover their lost ground. The tropical downpour, which floods a vast area, has vanished with the departure of the sun to the Southern hemisphere, past recall; and under no possible combination of circumstances can it be again looked for before May or June. A couple of wet days in January may improve the barley, wheat, and pulse, and, by reviving the poppies of Behar, may make a difference of a million or two sterling in the April Budget. But not one grain of the staple commodity of the country can be put into the ground again before April, or be cut and carried before July; and when telegrams announce that the Indian Government will have to feed more than two millions of people for seven months, we must bear in mind that this unhappy period only begins from March next, and that it cannot by any possibility expire until September. Even then, under the most favourable circumstances for sowing, ripening, and cutting, new rice, fresh from the threshing-floors, will be no food for a weakly population kept alive on half rations during all this interval. Nothing would more infallibly produce spleen, dysentery, low fever, and divers other Indian complaints. Indeed the effects of this scarcity will be felt throughout India in more ways than one. It is grievous to think of thousands of peaceable, loyal, and industrious beings, deprived of food, of their natural occupations, and of all motive for exertion, crowding once a day round the official stores and kitchens, receiving just enough to keep soul and body together, and returning home to gaze with a look of dull resignation on their herds of lean cattle and their emaciated children. Perhaps a period of enforced idleness will demoralize a ryot of Bengal or Behar to a less extent than it would an Englishman or a Frenchman. But the effect of scanty diet and unceasing anxiety will render the population more dependent than ever on Government, and much less ready, for some time to come, to comprehend measures of progress, which mean taxation. Then it is certain, judging from the experience of former calamities, that our administrators must be alert to anticipate outrages, and that no activity can prevent an increase in certain classes of crime. Civil litigation, the recreation or political excitement of rich Zemindars and substantial sub-proprietors, will languish; but policemen will have their hands full and the criminal courts will be thronged. It may be fairly assumed, for instance, that as the pressure increases, grain merchants will live in constant dread lest their stores should be sacked by a crowd of excitable and half-famished Asiatics; that the convoys of grain sent by Government or by speculators into remote villages will have to be protected by strong detachments of guards; that the fortunate possessor of an acre of late rice or of standing barley will have to keep watch over it by night, with his sons and dependents, and even then that he may be knocked on the head by a bamboo or run through the body with a spear; that all the ornaments of women and children will be pawned to the money-lenders; that some men will die under the tyranny of caste, while others will get rid of it altogether; that native subordinates employed in the distribution of rations will have a dozen opportunities of making illicit perquisites; that future crops will be pledged before a furrow has been turned or an atom of seed scattered; that the old stock of cattle will be sold off for half its value or left to perish from sheer want of fodder. These and similar occurrences, the result of the national character, may strain the nerves of the Administration to the utmost, and may call forth all the best and the worst qualities of the Hindu; but it is not yet necessary to paint an alarming picture of twenty-five millions perishing from hunger, or to imagine the rivers Kosai and Purnabaha choked with corpses, and the vultures and jackals gorged to repletion with the carcasses of the unburnt or unburied dead. The calamity is quite grave enough to demand our attention without any stimulus of ghastly word-painting or diabolical prophecies of unutterable woe. As we have said, the scarcity must leave its mark in the bureau and the counting-house, as well

as in the rice-field and the bazaar. The outlay on benevolent measures must be stinted or stopped. Grants for education, for new buildings, for increased salaries, for improved agency, must be rescinded or withheld. The whole time of Commissioners, magistrates, and their subordinates must be given to form committees, to collect materials, to store grain effectively against damage from climate and avoid violence by robbers, to animate the rich by personal influence and practical example, to sustain the sinking hearts of the landlord and the cultivator, who will certainly call on the name of the Maharani for succour as they did formerly on that of the old Company.

We have endeavoured to place before our readers the probable condition of the people of some six or eight magnificent districts during the approaching time of severity and trial. But there are some considerations which afford consolation. In the first place, the means of communication, whatever may have been wildly dreamed or dogmatically asserted to the contrary, are ample. One railway has put Calcutta within eighteen hours of Patna, and it touches the Ganges at more than one place. Another avoids the long, circuitous, and dangerous passage of the Sunderbuds, and enables Government to convey stores almost to the banks of the same river, where it goes by the name of the Poddna, in less than a day. There is not a populous mart, not to say a hamlet, in any one of the threatened portions of the country, to which subsistence could not be conveyed in a week or fortnight at farthest, from railway station and river bank, by the common bullock carts over the common cross roads of the country. For the next six months Bengal and Behar are just as easily traversed as Somersetshire and Wilts. We have known five hundred carts at a time, laden with molasses, to start from a populous sugar mart in the interior over a mere track on which no engineer had ever expended a penny, with the absolute certainty of reaching their destination, one hundred miles off, at the rate of ten miles a day. This season, owing to the failure of rains, the plains on either bank of the Ganges must be open to carriage traffic at an earlier period than usual, and they will continue passable to the middle or end of May. The difficulty of internal transit only begins with the periodical rains; but the Indian Government need hardly be warned to commence purchasing and storing before that date. Then, although the rice crop has failed, the cold-weather crops of cereals and pulses may take off the edge of the calamity, and even fruit may be hoped for as a means of keeping the population alive. Behar can be fed on the cereals from Upper India, and Bengal on rice from Burmah and Madras. It is a fact placed beyond question that in the pressure of 1865, the population of Dinajpore, now afflicted in a similar manner, lived for the months of May and June and part of July on the produce of their mango-trees, and staved off famine till the beginning of the harvest. Something may be expected from the liberality and kind-heartedness of the Zemindars. To tell them gravely to reside on their estates and stop the famine, to trust to the laws of supply and demand, to hazard the lives of the community on private enterprise or on national impulse, would indeed be tantamount to telling a battalion of Rajpoots or Goorkhas that they must bear the brunt of a battle while the English soldiers formed the reserve. But the pious, and in this sense well directed, feelings of Hindus and Mohammedans may fairly be called on to supplement disbursements from the general treasury, and to form, according to their means and abilities, small social centres of relief. One native gentleman, in the famine of 1866, when the poor were flocking to Calcutta, to our personal knowledge, fed, out of his own resources, some thousands of his countrymen every day for two months. And his example in a minor degree was followed by many others. Lastly, we have the satisfaction of knowing that measures for relief are in the hands of two men the most qualified by character and experience to deal with a vast and complicated system of succour. Lord Northbrook is cautious, confident, full of activity and resource. Sir George Campbell was selected by Lord Lawrence to report on the Orissa famine, has the mechanism of Bengal well oiled and completely under his control, and is precisely in the position where his terrible energy, which is too much for some intellects in uneventful seasons, can do nothing but absolute good. Both have at their back highly-trained and high-minded subordinates, a full treasury, and ample warning. They are nobly supported by all the influence of the Indian Council and the Secretary of State, who, as we have just seen, has sanctioned by anticipation "any measures necessary for the saving of human life." If, under Providence, these men so warned, so encouraged, and so trusted, cannot solve the problem of keeping life in the bodies of even five millions, or twice five millions, of Asiatics, who can exist on rice and gruel without wanting more, the thing is hardly to be done by anything short of a direct miracle.

EXPERTS.

EXPERTS of all kinds have been gradually acquiring a footing in the courts of law, notwithstanding occasional remonstrances from the Bench; but the climax of expertism was probably reached in the recent action for libel by a dramatic writer against the *Pall Mall Gazette*. At least it is to be hoped that it was reached, for it does not require much reflection to see that the free use of this kind of evidence is likely to be attended with some amount of awkwardness. It was lately proposed to reduce the number of jurymen; but the jury might be abolished altogether

if experts are to be brought in to pass judgment on their behalf. We are familiar with experts in the form of mad doctors, chemical analysts, students of handwriting, and so on; but to be an expert in dramatic indecency strikes us as quite a new profession. We can imagine a chemist being asked to put a particular substance into a crucible, or to dip it into acid, or to test it in some other way, and then to report the result in court. But it is not so easy to understand the scientific detection of impropriety in a performance on the stage, and still less easy to understand a certificate by experts of the entire absence of impropriety. There are two ways perhaps in which the inquiry might be conducted. The expert might observe the effect of the performance on himself, or he might observe its effect on others. If it could be shown that most of the women in a theatre were sitting with flushed cheeks and downcast eyes, or that, on the contrary, they did not appear to be in the least disconcerted or ill at ease, this would no doubt be evidence of a certain sort. It would be more natural, however, that an expert should be allowed to give an account of his own sensations; but here we come upon one of the difficulties of the case. If we went to the dictionary we should find that an expert is a person of experience; but it is hard to say whether experience is desirable in determining a question of this nature. Experience may sharpen certain faculties, but it may also to some extent blunt perception. An actor of fifty and a dramatic critic of forty years' standing must probably in their time have seen or heard some very odd things on the stage, and it may be presumed that they would be rather past blushing on their own account. We are led into some curious speculations as to the training of an expert in dramatic decorum or indecency. A doctor does not learn his profession by studying the condition of people in perfect health, and an expert in indecency could not expect to qualify himself for his duties by confining his attention to works of a perfectly irreproachable character. He would of course have to "walk the hospitals." We can imagine him spending a year or two in close attendance at the Palais Royal or the Bouffes, perhaps with M. Ravel or M. Hyacinthe as private tutor. As he passed into a higher region, M. Alexandre Dumas might superintend his education, and pass him through a course of refined and elegant nastiness. There is, however, a limit to being shocked, and an expert would probably open his eyes less widely at the end of his training than when he first began. His professional value would of course decline as his capacity for being shocked diminished.

It has been said that the only definition which can be given of libel is that it is anything for publishing which a jury thinks men should be fined or sent to prison; and in the same way it may be said that impropriety in a book or a play is anything which a jury chooses to consider improper. It is very natural that an author or manager should consult experienced friends as to how far they think he can safely go in the development of a dangerously suggestive story; and there are probably experts who can gauge pretty accurately what the public will relish or endure in that way. But when a question is afterwards raised as to the propriety of a play, the opinions of experts are worth no more than the opinions of other people. It can hardly be pretended that decency or indecency is such an extremely abstruse and recondite matter that ordinary people cannot be expected to understand it. What has to be determined in such a case is not whether the work which has been challenged is satisfactory to certain actors and authors, or offensive to certain very sensitive and delicate-minded persons, but what is the broad public opinion on the subject; and this is very likely to be fairly represented by the twelve men who have to give a verdict. It is clear, however, that the jury ought to be left as far as possible to themselves in coming to a decision, and that the witnesses should be strictly confined to matters of fact. There is no reason to suppose that in the recent libel case the jury were much influenced by the opinions of dramatic experts, and therefore no harm was done; but it is a pity that judges are not more on the alert to check the introduction of a kind of testimony which is not only irrelevant and impertinent, but is practically an attack on the independence of the jury. There can be no pretext for bringing forward the views of experts except that the jury, without this guidance, would be unable to form a sound judgment for themselves; but if the jury cannot say whether a play is decent or indecent, it is difficult to know what sort of questions they are capable of deciding. There is another consideration which must not be overlooked. If this sort of evidence is to be allowed, where can the line be drawn? The defendant might have produced experts as well as the plaintiff, and a very nice question might have been raised as to who is and who is not an expert. Not long ago a well-known author was charged with having written an obscene book; but would he have been entitled to call as witnesses any of his friends who had read the book without being revolted by its contents? Surely the question in all such cases is simply whether there is or is not impropriety in the work which is challenged, and not whether certain persons have or have not been able to detect it. The detection is for the jury. One of the witnesses in the *Wicked World* case was the manager of the theatre at which the piece was produced; and on similar grounds the Court ought to admit the evidence of a publisher in favour of a book which he has himself published. And this starts us on another line of inquiry. If a manager may give evidence on behalf of an author or actor in his employment, it would seem to follow that the editor of a newspaper—who is of course an expert—should be permitted to

give evidence in favour of his contributors. Nor is there any reason why there should not be experts in libel as well as experts in indecency, and a jury may be supposed to be just as much, or as little, in want of this assistance in the one way as in the other. In short, if this kind of evidence is to be tolerated, it is hard to say where it will stop. What would have been said if counsel in the Tichborne case had called a lot of people out of the street to say that, having considered the evidence, they held that the Claimant was, or was not, Roger? Yet this is really not a whit more absurd than allowing witnesses to tell the jury what they ought to think of a book which is actually in their hands. In a nuisance case which was tried before Chief Justice Cockburn, experts were summoned to give an account of a bad smell, but the Chief Justice thought it better to take the jury to have a sniff at it themselves.

The circumstance to which we have called attention is trivial enough in itself, but it involves a dangerous precedent. The opening for the admission of the evidence of experts requires to be narrowed rather than widened. There can be no doubt that there has been a tendency on the part of medical men, and particularly of mad doctors, to abuse the privilege of appearing in the witness-box, and that they frequently attempt to pass off mere personal opinions as testimony to facts. There never is the slightest difficulty in obtaining any number of mad doctors to swear to the lunacy of any one—no matter how sane and sensible he may be in his general course of life—whose relations have an interest in getting him locked up, or in disputing his will. It is true that it is equally easy to get witnesses on the other side; but this is only an additional illustration of the worthlessness of scientific evidence which can always be obtained in any quantity on any side of a disputed question. Not long ago an attempt was made to prove that an old gentleman was mad because he did not like excursionists at the seaside, and said a great deal about the weather in his letters to his friends. It may be admitted that it is difficult in certain cases to draw the line sharply between evidence as to facts and evidence which is nothing more than an opinion or inference, and it is no doubt especially difficult to do so in medical cases. A doctor is asked whether certain marks on a dead body are not an indication that murder has been committed, or whether it may not be assumed that a man who does certain odd things is out of his mind. It may be said to be scientifically a matter of fact that certain appearances on a body indicate violence or that certain acts indicate insanity. Yet the Bench should be very chary of allowing a medical witness to sum up evidence in the form of general conclusions to be presented, cut and dry, to the jury. It is for the jury, with the assistance of the judge's summing-up, to draw its own conclusions from the evidence, and it is well that great jealousy should be shown of any encroachment on its special functions. It is a familiar remark that judges, as a rule, are by no means so strong in the back as they used to be; and that they allow counsel to conduct cases in their own way, both as regards length and as regards the nature of the evidence adduced, to an extent which would certainly not have been tolerated in other days. A vast amount of valuable time is wasted in hearing trumpery cases which ought not to be heard at all, and in listening to evidence which is really not evidence, but only personal opinion. It is absurd to put witnesses in the box to say things which, if said at all, should be said by counsel. The evidence of an expert should in fact be regarded with the same suspicion as the arguments of counsel. The expert has been brought into court to take a particular side just as the lawyer does, and it is known that he is already committed to a foregone conclusion. A trial by a jury of experts would of course be a very different thing. They would hear the evidence on both sides before they made up their minds, and would be free from prepossessions on one side or the other. A good deal might perhaps be said in favour of employing experts as jurymen or assessors, or even in favour of allowing them, under certain circumstances, to address the Court after the manner of counsel; but their employment in the witness-box should be watched with the greatest jealousy.

CHARITY ELECTIONEERING.

WE are glad to see that the question of charity electioneering is not to be allowed to pass out of sight. The unsatisfactory meeting at the Mansion House has been followed by another at which a Committee has been appointed to agitate for the reform of some of the worst abuses, if not for the radical alteration of the system. The case as stated by Sir Charles Trevelyan in a paper in *Macmillan's Magazine* is conclusive. A description of the system which has grown up almost unconsciously would be sufficient to secure its condemnation if matters of this kind were settled by reason. The arguments by which it is avowedly defended are indeed so significant as scarcely to need refutation. It is urged, for example, that the attack upon the existing evils will check the flow of subscriptions. This is an argument for saying nothing about any abuses whatever, however gross they may be. It amounts to claiming absolute irresponsibility for charitable institutions. We may content ourselves with saying that the very opposite principle is manifestly the right one. Charitable institutions have only too little responsibility; and the very first condition of preserving them in a healthy condition is that all grievances should be investigated as fully and as publicly as possible. The only effective check upon the

managers is the danger of diminishing their subscriptions. Their cry of indignation should encourage the assailants by proving that they are aiming at the really vulnerable point. We cannot wish for a better result than that the charities should be made to feel that the maintenance of their revenues depends upon the soundness of their system of management. If the charities in which the abuse flourishes decline in proportion to others, the flow of charity need not be diminished, the public will be clear gainers, and an improved system will gradually supplant the old. We could ask for nothing better.

But, it is said, every system has its disadvantages. That is an undeniable truth. It is as true as that all men are mortal, or that two and two make four; and is just about as relevant. Like the other argument, it may be alleged in favour of any abuse, and is therefore really in favour of none. If, however, it is meant to imply that every system has equal disadvantages, we must join issue with the advocates of the existing order. There are certain very simple and satisfactory tests which may be applied to any charitable institution; and it will not need many words to determine how far they can be satisfied by the electioneering system. In the first place, that system is the best, *ceteris paribus*, which tends least to demoralize the recipients. An ideal system would be one in which begging was altogether abolished, and the giver of alms sought for the most deserving objects, instead of waiting for deserving objects to come to him. The peculiarity of the electioneering system is that, instead of limiting begging, it makes at least ten beggars for every one that it helps. As Sir Charles Trevelyan tells us, there were in 1868 307 candidates for forty places in a certain hospital; and in 1871, 398 candidates for twenty places. In the latter case, many had been beaten at seventeen, eighteen, or nineteen half-yearly elections. In another case, one of the applicants at the age of seventy-six was making her twenty-sixth application. This is a regular result of the system; and we are not surprised to hear that poor women are frequently led into habits of idleness and dissipation by thus going about begging for years with all the misery of hope constantly deferred. Secondly, we may say that a system will be good in proportion as it secures the least possible waste of means. If a large part of the money subscribed is wasted without conferring any benefit on the applicants, the system is so far condemned. Here, again, the electioneering system seems to be expressly devised to secure as great a waste as possible. Every applicant, as we have seen, must count on a long course of expensive canvassing. It may often cost as much to get into an asylum as to secure a place on a School Board, or even a seat in Parliament. Sir Charles Trevelyan mentions a case, which we imagine to be anything but an extreme case, where a subscriber began a new canvass by sending 1,532 written (not lithographed) letters, inclosing 723 post-cards. An influential friend had issued 1,000 letters; and the widow had been furnished with 500 stamped cards. All the cumbrous machinery thus indicated was set in motion to secure a poor woman a trifling annuity; multiply the expenditure by the number of candidates, and compare the total with the actual amount of charity disbursed, and we are not surprised to find that more may be spent in agitating than in the legitimate purposes of the charity. We are told, for example, that in attempting to secure the election to a charitable institution of a woman named Mary Sadler, the sums spent amounted to 900*l*. This would brought in an annuity of 45*l*, and the capital would have remained to the poor woman's relatives on her death. The result of an election would have been to get her an annuity of twenty pounds a year, which would of course cease with her life. We are not surprised to find that in this case the friends of the candidate resolved, after many years' labour, to give her the money directly, and withdraw their subscriptions from the hospital. The working of the system may be still better judged from the fact that the best way of securing an election is to contract with a professional broker, who goes about touting, and collects money for postage, advertisements, and travelling expenses. These brokers sell votes, which, it seems, they have now a legal right to do, and a great part of the money goes into their own pockets. A third essential condition of a good system is that the best candidates should be elected as frequently as possible. How far that condition is likely to be secured may be guessed from what we have already said. Obviously the result of this cumbrous method is that the candidates are elected who have the highest and wealthiest friends; while those who add friendlessness to poverty are deprived of all chance of success. Anything like discrimination is simply impossible. A subscriber is every year deluged with letters, each telling its tale of distress, which he has no means of investigating. Naturally he is reduced to utter perplexity, and at last chooses to fritter away his votes upon cases in which some vague personal claim of remote acquaintance may enable him to pick out one instance from the mass. Actual fraud has every chance under such arrangements. A man of some literary genius succeeded in living for a long time upon a sister whom he described as suffering from a complaint which prevented her from lying, sitting, or standing, and who therefore supported herself by resting on a bar. He got her into the Hospital for Incurables, where she was found not to answer the description; but meanwhile he made a comfortable income by begging money for the purchase of votes and other expenses. He next proceeded to provide her with "surgical appliances," and afterwards started a younger sister, who was really a healthy and prosperous housekeeper, but who in his representations figured as a semi-paralytic. She kept him for several years, till the Charity Organiza-

tion Society fortunately succeeded in providing him with a six months' lodging in gaol. And thus a gentleman who might probably have been a popular novelist has become a common impostor. We should like to know, though we are not informed, how it came to pass that the discovery of his manoeuvres in the first case did not bring his career to an end. This suggests a fourth condition of a sound system. The persons who distribute the charity should be under a genuine sense of responsibility. The weak side of all charitable institutions is the transference of responsibility from the subscriber to somebody else. We cannot all pass our time in investigating cases of hardship, and we are therefore forced to do our almsgiving by proxy. This is inevitable, but we should guard as much as possible against the resulting evils. How far this is done by the system we are considering may be easily imagined. Each subscriber looks after his own friends, and may, if he pleases, sell or exchange his votes. There is not even the pretence that all the cases shall be investigated and the most deserving have the preference. The elections are merely the result of a blind scramble, in which any sense of responsibility that may exist is diffused till it becomes practically fugatory. And accordingly we are not surprised to learn that in most cases the management of the charity is practically left to a small clique, who are active on the Committees, and whose decisions are simply registered by the general meetings. At one great charity, for example, fifteen subscribers formed the quorum for a "general meeting," and twenty for a "special general meeting." It was found so inconvenient to get so large a number as twenty that the number was in this case also reduced to fifteen. Finally, we may reckon it as one more condition of a sound system that it should not supplant any genuine and useful charity. In former years, as Sir Charles Trevelyan remarks, an old servant of a family was probably pensioned by those with whom he had lived for many years, and were therefore familiar with his wants and circumstances. Now the ladies of the family get up an agitation, make hundreds or thousands of applications to strangers, and succeed by the purchase of votes and otherwise in getting the elderly dependent taken off their hands. The other subscribers, who imagine themselves to be helping the poor and needy, may thus really be taking a burden off a rich man's shoulders, and providing for persons whom it was his natural duty to protect.

We find then that the electioneering system tends to aggravate the faults to which all charity by proxy is more or less liable; as is, indeed, the natural consequence of substituting for the personal discharge of duties an elaborate machinery worked by something like an American ring, though, as we of course admit, without anything like the same amount of corruption. The system practically results, however, in producing many of the results which would be produced by corruption. It demoralizes as much as possible the applicants; it raises as much as possible the proportion of the sums spent upon irrelevant objects to those spent in real charity; it removes all guarantees for the distribution of the funds raised to the persons who most need and most deserve them; it supports a whole body of parasitical agents, whose interests are directly opposed to the avowed ends of the institution; it gives every opportunity for downright fraud; it releases the managers from all real responsibility; and it tends to substitute a mechanical and demoralizing system for the spontaneous work of personal charity. If this is not enough to condemn the system, it is hard to see how any system can be condemned. Every criterion by which we can judge of its working is directly contravened. The answer that all human systems have their faults amounts therefore to saying that all charity is demoralizing; and the logical conclusion would be that all charity should be stopped. Political economists of a severe school might possibly accept this conclusion. We do not accept it, because we hold that it is within the powers of human ingenuity to suggest a mode of operation which shall not be liable to these objections, or at least not liable to them in the same degree. And we add that the agitation will be of some value if it impresses this consideration on the minds of managers, and forces them to give up defending the indefensible. Instead of simply replying *Non possumus*, they will find it answer in the long run to attempt to discover some feasible solution of the problem.

The late meeting at the Westminster Palace Hotel decided, and we have no wish to dispute the soundness of their conclusions, that it was better not to attempt a root and branch reform of charitable institutions, but to aim at redressing some of the most palpable grievances. They proposed a system of regulations which should limit the canvassing system, and throw rather more responsibility upon the Committees. We have no doubt of the expediency of the palliations which they suggest; but we confess to doubting whether they will be adequate to meet the evil. The ingenuity of the persons whose interests or prejudices enlist them on the conservative side will probably be tasked to frustrate any efforts at a salutary reform; and we must confess that in such matters we fear that reactionary ingenuity is generally more than a match for the public spirit of reformers. However, we admit that there are great practical difficulties in the way of any sweeping change; and meanwhile any public discussion must do good, and, if it cannot break down a system so demoralizing, it will at any rate tend to keep within bounds some of the more palpable abuses.

POPE AND KAISER.

THE current saying that "history never repeats itself" is just one of those half-truths which for all practical purposes are almost wholly false. That the self-same events never recur in the life of a nation any more than in the life of an individual is of course so obvious as to be a truism, but that the same kinds of influences do act and react upon one another at different stages both of individual and social life, and often with very similar results, is no less certain. And this is what the proverb quoted above is commonly understood to deny. The denial was actually worked up into an elaborate philosophical—or rather theosophical—system by a great French writer of our own day, who aspired to reconstruct both the religion and the government of the world. Mankind, as he supposed, had slowly passed, in a long succession of bygone generations, through the theological and metaphysical phases of popular belief, and was now entering on the third and final age of purely physical speculation. There was just enough plausibility about the theory to give it a fascination for some minds, while it fell in too readily with many of the commonplaces of modern Liberalism—though Comte was removed poles asunder from being a modern Liberal—not to be eagerly appropriated and repeated as a convenient cuckoo cry by a host of superficial orators and writers, who had never given, and indeed were hardly capable of giving, any serious thought to the subject. Yet the author of the theory was himself so far constrained to admit its inadequacy as a solution of the exigencies of the present, that he became the founder of a new religion, which however—to do him justice—though it included nine Sacraments, did not include a God. Nor has recent experience at all tended to confirm the accuracy of his estimate. We might indeed, judging from the events of the last quarter of a century, apply to religion the famous line of the Roman satirist about nature. Though modern theorists may desire to expel it with a fork, it is always turning up afresh with apparently undiminished vigour. Not to dwell here on the war of the Sonderbund, which was a professedly religious contest, all the great European wars of the last fifteen years have been more or less mixed up with ecclesiastical controversies, and even the American struggle was avowedly carried on by the North as a war of religious principle. At this moment a religious contest seems imminent in Turkey, as the Porte has just resolved on secularizing the inalienable property of the Mahomedan clergy, which includes above half the landed property of the Empire. In short, to quote the words of a French journalist, "the religious question is the order of the day." It is therefore no matter for surprise if the heading of this article, though it refers immediately to the pending quarrel in Germany, should recall, as it is intended to recall, the Guelph and Ghibelline contests of the middle ages.

We could almost imagine ourselves to be still witnessing the progress of the great Investiture controversy which exercised so many generations of Popes and Emperors, from the time of Hildebrand downwards, when we read the latest ecclesiastical news from Posen. Nor are the weapons used on either side very different from those wielded so energetically by the Gregories and Fredericks of a former age. The *ultima ratio* of interdict and deposition is not, it is true, considered practically available, though the right is strenuously vindicated in the abstract, in dealing with Protestant or half-Protestant Governments and States. But excommunication and appeals to popular enthusiasm on the one hand, and fines and imprisonment on the other, are the rough-and-ready expedients of the combatants in the nineteenth century, as well as in the thirteenth. The last reports inform us that the lower clergy in Sarnatia, acting under the direction of their Archbishop, are inciting the people to resist the law; and an article in the official organ of the Imperial Government only the other day closed with the ominous remark that "the effect on the Roman bishops of incarceration promptly inflicted has not yet been tested." In our opinion, it must lead either to their yielding or to their voluntary expatriation. Either result will equally satisfy the State. And it is in fact pretty clear that matters are rapidly approaching a crisis in the archdiocese of Posen, where one party or the other must go to the wall. Archbishop Ledochowski, who had already incurred several heavy fines for disobedience to the new laws, has at last been publicly called upon to resign his see. He has of course peremptorily refused, and the case will now be officially investigated and reported upon, with the inevitable result of a trial before the new Appellate Court for Ecclesiastical Causes, which will as surely proceed to deprive him. And then comes the further question—what next? If my doubt could have been entertained of the policy of Rome, it would be sufficiently dispelled by the closing words of the Pope's recent letter to the Archbishop—of which more presently—where His Holiness supplicates for him, his clergy and people, "that unflinching unanimity which annihilates and exhausts all the power of the adversary, and thus procures a fresh victory for justice, and fresh glory for the Church." But what will the Emperor do? If he fills up the see, which in the eye of Rome has never become vacant, he can only fill it up by an Old Catholic appointee, perhaps by appointing Bishop Reinkens, whom the Pope has just excommunicated by name. How far such an arrangement would be feasible depends of course mainly on the disposition of the Catholic clergy and population of the diocese, which it may not be easy to gauge beforehand. On the other hand, if the see is not filled up, the victory will virtually remain with the other side.

Nor is the case of Archbishop Ledochowski by any means an

isolated one. Even if the Archbishop of Cologne and several other prelates had not already been involved in difficulties with the Government which can only have the same termination, bishops are not immortal, and the question of filling up vacant sees could not long remain in abeyance. According to existing Concordats, the process of appointing bishops in Prussia—where the Catholic equally with the Evangelical Church is established and endowed—is a very simple one. The Chapter of the vacant see selects a certain number of names which are submitted for approval to the King, who may strike out any one he pleases as not being *persona grata Regi*, or may, if he likes, cashier the whole list and leave the Chapter to make a fresh selection. But two names at least of those submitted for approval must eventually be returned, and from this remnant Rome has to choose the new prelate. It will be seen therefore that the power of the Government is far more restricted than in Catholic States, where the Crown usually nominates absolutely, a mere veto being reserved to the Pope, who can only exercise it on some specified canonical ground. But even this limited right of interference is intolerable to the Papacy in its present temper. A Bull has been issued under the title of *Pontifex Maximus*—the title inherited by the Popes from the Pagan Emperors—which does not so much abrogate as simply ignore the rights secured to the Crown in this matter by the existing regulations, with the express concurrence of the Holy See. With a sublime contempt for historical precedents, whether ancient or modern, it ascribes to "the Supreme Viceregent of God on earth" absolute and exclusive power to nominate all bishops throughout the world, without even a passing reference to any civil claims, if only for the purpose of rejecting them. The election of the Chapter may still be tolerated as an innocuous formality, but merely as a means of indicating local wishes at Rome, which may or may not be complied with. And English and Irish Roman Catholics have had abundant proof that, in elections to which any critical importance is attached, their wishes will not be taken into account. In both countries the present head of the Roman hierarchy was forced upon them by Rome, after all the nominees of the local clergy had been ignominiously set aside. Such high-handed policy is a perfectly natural result of the Vatican decrees, though it seems to reflect rather oddly on the infallibility of former occupants of the chair of Peter. But many of the bishops who voted for the new dogma are said to have imperfectly realized its retrospective application, and we may perhaps safely assume that the infallible Pontiff is more anxious to utilize his newly acknowledged powers in promoting the aggrandizement of his see than in vindicating the consistency of his predecessors. At all events, modern Governments have to reckon with modern Popes, whose claims must be taken at their own valuation, in considering how to deal with them.

We referred just now to the Pope's letter to Archbishop Ledochowski, dated November 3 last, which has just found its way into the newspapers. The language of the illustrious "prisoner" leaves no doubt that he at least will not flinch from the contest. Scarcely has he taken up his pen before the policy of the German Government and its ultimate results are delicately summed up in the observation that "the attacks directed by the powers of hell and the malice of man will be in vain." Soon afterwards we come upon a graphic description of the nature of these diabolical attacks:—"Contempt, calumny, laws and temporal superiority are arrayed against the Church; its professors are designated 'rebels'—we had really fancied it was the Pope himself who applied that designation to the most distinguished Roman Catholic Professors living—its bishops are condemned as agitators by courts of law, and persecuted with fines, deprived of their offices, and driven into exile. Religious Orders are prohibited, the clergy gagged, the education of priests in the spirit of the Church forbidden, in order that neither may the people be confirmed in the principles of religion, nor any hope be left of training able and faithful servants of the altar; property dedicated to the Church is robbed." And last, but not least, "the chief helmsman of the Church is kept in bondage"—a tolerably *libera custodia* to all appearance—"although already utterly despoiled," not of abundant supplies of money, as this very letter elsewhere testifies, "in order that he may not govern the Church freely according to his powers." The despoiled prisoner of the Vatican goes on to acknowledge the offerings sent to him from the afflicted diocese of Posen, which he professes some scruple about accepting from those who are so sorely tried at home—and likely to be still more so, if they mean to pay all the fines incurred by their pugnacious Archbishop—but which nevertheless he does not decline. So far then as can be gathered from their words and actions hitherto, both parties seem resolved to fight it out to the bitter end. And, in a struggle of this kind, where brute force is brought to bear on moral endurance, armed with the skill derived from an experience of centuries and the obstinate persistency of a power which boasts that it is patient because it is eternal, mere physical pressure, whether or not it assumes the form of direct persecution, is very likely to be worsted in the long run. It is only natural to assume that a statesman like Prince Bismarck has not entered on the campaign without first counting the cost, and he has of course far better opportunities than any outsider of knowing the precise nature and relative strength of the forces with which he has to reckon. But statesmen are sometimes apt to miscalculate the comparative strength of spiritual and material forces, and an over-reliance on the latter in the present condition of ecclesiastical affairs in Germany might prove a serious mistake. The issue of the contest between Church and State, which is now become an

internecine one, will really turn on the internal condition of the Catholics themselves. If the Old Catholic party among them, as distinct from mere indifferentists or nominal adherents, is strong enough to hold its own and supply a religious basis for an anti-Vatican policy, the Bismarck legislation may be a success, but hardly otherwise. And that is a question of fact on which those behind the scenes can alone be competent judges.

LOSS OF THE *VILLE DU HAVRE*.

ANOTHER "terrible collision at sea" has been occupying the newspapers of the week, and the result of the statements hitherto made appears to be that a steamer has been lost, with many of her passengers and crew, for want of a good look-out. We say nothing as to the conduct of the sailing-vessel which struck her, but we may say that a steamer can almost always avoid being struck. The *Ville du Havre* left New York with 313 passengers and crew on board. For several days a thick fog prevailed, which necessitated the most careful attention on the part of the captain and officers; but on the night of Friday, 21st of November, the fog had cleared away, and there was bright starlight. Passengers and crew felt relieved from the danger of the fog, and retired to rest, in hopes of a pleasant voyage to France. The captain, who had scarcely quitted the deck since the vessel left New York, went to his cabin about twelve o'clock, leaving the second officer in charge. About two o'clock on Saturday morning a dreadful crash was felt, and the bow of a large vessel was seen projecting over the deck. The *Loch Earn* sailing-ship had struck the steamer on the starboard side just about midships, cutting a hole in her deck twelve feet deep, and breaking in the iron plates of the steamer for twenty-five or thirty feet. From the force of the collision, the mainmast and mizenmast fell, smashing in their fall the two large boats of the steamer, and killing numbers of passengers; and from the rapidity with which the vessel went down, the crew were only able to launch the whale-boat and the captain's gig. In twelve minutes from the time of the collision the *Ville du Havre* had sunk. The *Loch Earn*, after getting clear, kept on her course for a mile, and then hove to, and launched her boats to pick up the passengers and crew. In all 87 persons were saved out of a total of 313 who were on board.

There is almost nothing to add to this statement of the known facts of the case. It is painful to assume that an officer of the *Ville du Havre* who perished with her neglected his duty; but it is more painful to assume that he fully performed it, because in that case there would appear to be no security whatever against collision if two ships unfortunately happen to approach each other at night. A survivor of the wreck heard from the man on the look-out, who it seems has perished, that the *Loch Earn* had no side lights burning; but whether that is true or not he cannot say. There may perhaps be conflicting evidence on this point, and we have no desire to prejudge it. Our object is to show that on any possible supposition the lives of passengers are in serious danger unless a degree of vigilance be exercised which in fact was not exercised on this occasion. Any law requiring lights to be carried at sea is liable to be neglected; and it is not many years ago that a Channel steamer with passengers came into collision on this account with a vessel in the Straits of Dover, and it was owing only to the unusual stillness of the night that the passengers escaped with life. If speed really is considered superior in importance to safety, this ought to be clearly understood, in order that those who prefer safety may exercise an option, if there be any—which there probably is not—as to the method of conveyance which they will adopt. Suppose you have to drive home on a dark night, and time is important because if you are late the house will be closed and the inmates will be sleeping the sleep which rewards the toil of a well-spent day. The road may be quite clear, and you may drive at a good pace without mischief; but, also, the road may be obstructed. If all carriages are driven on the assumption that there will be nothing in the way, some of them must come to grief. A railway train is driven on this assumption, but then a railway is specially constructed and reserved for the passage of trains. There is room enough in the Atlantic for all the ships that traverse it, but ships keep for the most part in certain courses, and there is no security against collision except vigilance. If the watch on board a ship cannot see far enough ahead to alter her course in time to avoid collision, she ought to proceed slowly, or not at all. But if they can, it is possible that their eyes would be quickened by the knowledge that they were going at a speed which must be fatal to life if they do run into another ship. The point to be urged against the *Ville du Havre* is that she, being a steamer, had the means of avoiding collision with the *Loch Earn*, if she had kept a tolerable look-out. A very slight change of course or quickening or slackening of speed would have made all the difference, and it is hardly conceivable that there was not time for this after the approaching ship was, or might have been, perceived. It is of little use to survey the ocean, and mark accurately all its rocks and shoals, if obstacles of which no sufficient heed is taken are scattered upon its surface. We are almost driven to think that what is gained in one way is lost in another. Some dangers of the sea are diminished, but others are increased. There are many more ships afloat than there used to be, and it has come nearly to this, that a ship managed as the ship which has been lost was managed is about as safe on one of the highways of the ocean as a foot passenger who should cross Fleet Street without looking to his right or left. The ladies and gentle-

men of the *Ville du Havre* would have doubtless grumbled very much if their passage to France had been, in their opinion, unnecessarily delayed. After a week of fog it was natural to desire to push on during a clear night. We don't say that speed is incompatible with safety; indeed we rather think that the fastest ships may be the safest, just as express trains on railways meet with fewest accidents. But when an express train does meet with an accident, it is generally of the kind to put the newspapers to a considerable expense in adjectives. The captain of the lost ship had been on deck day and night during the fog, and he had gone to rest under the apparent belief that only the ordinary perils of a night at sea remained. It is almost equally disquieting to assume that this belief was or was not well founded.

Regulations for preventing collisions at sea are sufficiently numerous and precise, and the only difficulty is to ensure their observance. Sea-going steam-ships shall carry at the foremast head a bright white light, on the starboard side a green light, and on the larboard side a red light. A sailing-ship shall carry the same lights as a steamer except the white masthead light. If two ships, one of which is a sailing-ship and the other a steam-ship, are proceeding in such directions as to involve risk of collision, the steam-ship shall keep out of the way of the sailing-ship. Every steam-ship when approaching another ship so as to involve risk of collision shall slacken her speed, or, if necessary, stop and reverse. These rules, or something like them, are, we believe, adopted in theory by all civilized nations, and they seem sufficient to prevent that which nevertheless occurred. If the *Loch Earn* had her lights up, she was justified in assuming that the *Ville du Havre* would give way to her. Indeed, it is a rule that, where one of two ships is, according to the rules already stated, to keep out of the way, the other shall keep her course; but due regard must be had to any special circumstances which may render a departure from the rules necessary in order to avoid immediate danger. Thus if the sailing-ship had seen that the steamer was coming at her with reckless disregard of all rules, it would have been her duty to alter her own course if she could, so as to avoid collision. If the sailing-ship had not her lights, and if she acted as she ought to have acted if she had lights, then indeed her culpability, both moral and legal, would be serious. But of course we can make no assumption on this point. We can only say that it appears to us that human life is sufficiently valuable to require the officer in charge of a steamer to assume the possibility of meeting an unlighted sailing-ship who will behave as if she had lights, and to impose upon that officer the duty of exercising vigilance accordingly. But we are quite aware that an opinion, or at least practice, prevails extensively which is opposed to ours. There are adventurous people who with or without inducement will brave unnecessary risks, but it is rather hard upon timid people to have to go to sea in the same ship with them. It is perhaps almost time that the timid people were allowed to exercise some influence on the management both of railways and ocean steamers. It is highly important to make a journey quickly; but it is more important not to be killed or wounded on the road. Such accidents as this of the *Ville du Havre* are disquieting not only for the loss and sorrow they occasion, but because they suggest doubts as to the soundness of our naval system, both for commercial and warlike purposes. The Royal Navy necessarily sets the fashion, if we may so say, to the merchant service; and if we find recklessness in the latter, we may suspect that vigilance is not the most strongly developed quality of the former. There is some reason to fear that our whole navy has departed from those habits of ceaseless watchfulness which were produced by years of hostility with our nearest neighbours. The lesson taught by Howe and Nelson to the seamen of their age was "out of the nettle danger to pluck the flower safety." The apparent facility with which the most brilliant exploits of our navy were performed disguised the habits of unvarying precaution which made those exploits possible. One of the best points about our present race of seamen is that when they get into a mess they show energy, judgment, and courage in getting out of it. But we would rather they should not get into a mess if they could help it. Speaking generally, the conduct of officers and crews in sudden and difficult emergencies has been of late years most praiseworthy. Still we had rather that so many of this kind of opportunities of exhibiting these virtues should not be provided. There is, we think, too much disposition to hold on a course and take all chances for the sake of a quick passage; and perhaps the spirit which thus displays itself is an inevitable production of a long peace. If seamen are not involved in real dangers, there is a disposition to contrive them; and of course life in the mercantile navy was much more exciting when a privateer might pop out of Cherbourg or Dunkirk, and capture an East India ship within sight of home. In the Royal Navy there have been some examples of loss through incurring danger without adequate necessity. The *Captain* was lost from a notion of keeping up her credit as a ship, and we do not believe that such a notion would have prevailed in Nelson's age. We shall hear in due time further particulars of this collision; but however the facts may ultimately shape themselves, we can conceive no explanation which must not be exceedingly disquieting to passengers by ocean steamers.

MR. HOLMAN HUNT'S "SHADOW OF DEATH."

WE may safely prophesy that no picture will in the coming season excite so much interest or provoke such warm debate as this startling apparition of Christ in the carpenter's

shop. And we may be sure that as to the merits and demerits of the work, both in its conception and its treatment, the diversity of opinion will be commensurate with the vast number of spectators. The picture is a performance which everybody must see and talk about. Perhaps the mind may be best prepared to receive this new reading of an old subject by recalling to memory the artist's previous pictures. "The Light of the World"—Christ with a lantern, knocking at a closed door—was a conception which arrested attention by its singularity and its hidden meaning. Again, "The Scapegoat" driven into the wilderness moved the imagination by its realistic truth and its suggested symbolism. In like manner, "The Finding of the Saviour in the Temple" was a subject thought out with singular independence and realized with the utmost detail. Passing to secular themes, "The After-Glow" and "The Pot of Basil" show with what fidelity and ardour the artist has of late been striving for brilliant colour illumined by dazzling sunlight. The remembrance of these works individually and collectively tells what we may now expect; in other words, "The Shadow of Death" is as a sequel which can be best read and interpreted by its antecedents. It comes as the mature fruit of an earnest and laborious life; it is the latest expression of an unfaltering faith; the creed of "pre-Raffaellism," in which the artist was reared, and of which he now remains perhaps the only unswerving disciple, has never found so thoroughgoing an exponent.

The picture admits of easy description; the characters are but two, Christ and the Madonna; the scene is laid in a carpenter's shop hung with tools and strewn with shavings. The accessories have been studied on the spot. Thus we are told that "the tools on the rack are from a collection of ancient carpenters' implements bought at Bethlehem"; in like manner the rounded arch of the windows, the draperies, and the design of the box supposed to contain the gifts of the Three Kings are substantiated by extant examples. Nothing is the creation of the imagination; historic truth is reached through selection of still existing facts, a process which is all the more trustworthy from the known permanence of Oriental forms. This carpenter's shop was indeed in part painted "in a carpenter's shop," and the figure and head of Christ were studied from living models in Palestine. The characters introduced are, as we have said, only two. The Madonna is the reverse of conspicuous; she is crouching down, she turns her back on the spectator, her face is not seen. One advantage of this unusual arrangement is the prominence gained for the principal figure, Christ, a full-grown man, at least six feet tall, stands in the midst of the small workshop; the day is done, and long toil brings weariness; the arms are up-stretched as if in relief from long tension, and the down-going sun which fills the room with light, and illumines the face with radiant glory, casts the figure in shadow upon the wall. The arms are uplifted, the shadow is the figure of the cross—"The Shadow of Death."

The choice of subject in itself indicates the dividing line which separates ancient from modern art. We can scarcely recall in Italy, either in pre-Raffaellite or in post-Raffaellite periods, the same theme. We have, of course, pertaining to the earlier days which preceded the years of ministration, the Flight into Egypt, the Dispute with the Doctors, and the Baptism; but seldom is Christ depicted in mundane work, one probable reason being that the character and mission of sacred art demanded that the human should be merged in the divine. It was not till the arts became secularized that we find the carpenter's shop freely admitted within the pale of pictorial narrative. The modern Germans, Carl Müller for example, have represented Jesus as a boy sawing wood, and Mr. Millais in his younger days painted an analogous subject. We do not make this statement so much by way of objection as for the sake of elucidation. We point to these historic distinctions in the pictorial representation of the life of the Saviour in order the better to determine the whereabouts of the work before us. One of the inferences we thus arrive at is that we are here thrown not so much within the domain of high art as of *genre*. This interior, with its accessories, pertains more to the literalness of Dutch art than to the high generalization of Italian schools. We do not speak in unconsciousness of many noble and redeeming traits when we say that the attitude chosen is that of a tired-out labourer in the act of stretching his weary arms. Yet it must be conceded that the hands are most studious in drawing and exquisitely subtle in expression.

But the painter has endeavoured, and not wholly in vain, to elevate his subject by means of symbolism. Not only does the shadow on the wall prefigure the agony on the Cross, but the tools, it is said, are so arranged on the rack as to signify the nails and instruments of torture. In the corner are reeds which refer to the mock sceptre of a king put into the hand at the time of buffeting. Again, the circular window which looks out on the evening sky is so placed as to surround the head as with a nimbus, while a smaller star-shaped opening is supposed to refer to the star which was seen in the East. We are not sure whether this ingenious elaboration of hidden meanings may be of the nature of milk for babes or of meat for strong men. Such art reminds us of the mysticism and symbolism which coloured our sacred poetry in bygone centuries; yet Crasshaw's "Steps to the Temple" leave the reader as far from heaven as when he begins a stanza with "O Mighty Nothing" and ends with nothing. It may be admitted, however, that the painter passes from arbitrary and artificial symbolism to natural significance when in the worn and weary figure, and in the heavy laden spirit, of the Saviour he gives a foretaste of agony and of death. We are not certain that we follow the artist so readily when the endeavour is made to exalt the dignity of labour by

representing the Saviour "gaining His bread by the sweat of His face." Yet, by way of apology, we are told that this is the only picture which has ventured to show "Christ in full manhood enduring the burden of common toil." The age may be taken as between twenty-five and thirty, that period concerning which the Gospels are silent, a significant fact which perhaps might teach our painters not to enlarge on what is little revealed. In fact it may be objected that this last contribution to sacred art is quite as much legendary as biblical, and that the spirit by which it is animated, though not the reverse of reverent, has more of the accent of mundane legends and of apocryphal books than of the tone of inspired writings. There is a curious tradition recounted in the so-called "Gospel of the Infancy of Jesus Christ," that St. Joseph "was not very skilful at the carpenter's trade," and that, among other blunders, he made a mistake in a throne which he had to construct for the King of Jerusalem. And the story goes that the Child Jesus set all right as by miracle. The process, be it observed, was not that of mechanical work, but of miraculous power. And though it may be equally hard to get warranty either for the narrative in the legend or for the incident in the picture, yet it would seem that the miraculous story is in better keeping with the accepted events and deeds in the life of the Saviour. In the "Dispute in the Temple" the idea certainly is that the wisdom was given from above, and there can be no doubt that the old painters were ever actuated by a like motive when they sought to embody the divine in the human. Even the Infant in the "Sistine Madonna" has a supernatural outlook in the dazzled and entranced eye. But it were too hard not to allow a painter the license which by common consent is accorded to the poet. The thoughts to which Mr. Holman Hunt has given such earnest expression may be open to criticism, especially as the picture is painted on the basis of literal truth; but though we criticize, we cannot wholly condemn. The attempt, as we have seen, is to elevate materialism by mysticism, and to make even the accessories of an inanimate realism instinct with spiritual symbolism.

The head of the Saviour and the figure, the greater part of which is undraped, have evidently, in common with every other part of the picture, received anxious thought. And the result is an independence of treatment which will throw the world into controversy. In the first place, we may remark that, though the idea of the existence of any trustworthy portrait of Christ has long been abandoned, yet there is, as we all know, a type which for centuries obtains acceptance. Mr. Hunt, throwing aside the traditional form, goes to nature and makes for himself a new type. To this there can be no objection, provided only he realizes the fundamental idea of the character, which is the divine residing in the human. We believe that two or more models have been employed, a practice for obvious reasons habitual with both painters and sculptors: the defects of one model are thus rectified by the others. In the present instance the torso and limbs have been studied from a man in Syria better known for his physique than for his moral attributes. The artist has articulated the form firmly; the anatomy has nerve and sinew; the modelling is sharp and even severe; the style and manipulation are somewhat between the early Italian and the early German; the colour is warm to crudity. The physical frame is that of a man well proportioned, strongly and compactly knit in bone and muscle, fitted by nature for skilled manual labour; and so far the artist gains what he aims at. Yet, judged by the highest standards, more might be desired. Winckelmann describes the steps by which the ancient sculptors ascended from heroes to gods; and Leonardo in the "Last Supper," and Thorwaldsen in the noble figure which stands in the Frauen Kirche, Copenhagen, endeavoured, in the words of Winckelmann, to realize "the prophetic declaration which announced the Saviour as the most beautiful of the children of men." And we are glad to recognize in our English painter somewhat of the same belief. The reading of the character is not that which prevailed in the early centuries under the misinterpretation of the words "There is no beauty that we should desire him"; it corresponds more to the opinion of M. Renan and others, who point to the manifest power of Christ's personal presence as proof of a physical beauty which may be supposed to approach the superhuman. Mr. Hunt, it is understood, met with an actual head which, with modifications, served him for a model, just as Leonardo is said to have used the study from the life now in the Brera, Milan, for his consummated wall picture. The Italian artist, it is stated, could not satisfy himself for a long time—a story which may well be believed when we contemplate the generalized ideal of the ultimate product. It is obvious that Mr. Holman Hunt has adhered more closely to individual nature; hence his type has more of the actual and less of the ideal. The head is crowned with auburn hair, which falls in disordered curls upon the shoulders; the beard is short, the mouth open showing teeth white as ivory; the eyes, liquid and lustrous as gems, are turned upwards. It is often written "And Christ looked up to heaven"; the artist has seized on such a moment, and in his upraised face we read not only the weariness of the flesh through labour, but the anguish of the spirit, and the prayer for divine aid. The conception is truly Christian.

It remains to say a word as to the position assigned to the Madonna. "Mariolatry" suffers rebuke; the Virgin's face, as we have said, is not seen; the figure is subordinate to the principal character. In this bold innovation on prescriptive practice we have yet another proof that modernism prevails over mediævalism. In conclusion, we repeat that there may be much in the picture from which many

people will dissent; but, if we mistake not, few, if any, will withhold deep respect. The work is the earnest labour of five years, the canvas shines under the sun of Palestine, the picture comes from the land in which the Saviour lived and taught; it is the unburdening of a mind that has long dwelt on the noblest theme that can tax or inspire a painter's genius.

THE THEATRES.

WHEN the *Road to Ruin* was first produced merchants lived over their counting-houses in the City. The first and best act of this play begins at two o'clock in the morning, and we see the elder Dornton seated at a table with candles lighted awaiting the return of his spendthrift son from Newmarket. In the range of modern English comedy there are no finer parts than those of the two Dorntons; but a play that depends on male characters alone for its attractions can hardly be permanently popular, and unfortunately one of the chief female characters is weak, while the other is detestable. But after performing the *School for Scandal* uninterruptedly for some fifteen months, the managers of the Vaudeville Theatre were almost compelled to make some change, and they certainly have not done wrong in giving to the successful performer of Sir Peter Teazle an opportunity of appearing as the elder Dornton.

The acting edition of this play has prefixed to it a short criticism by Hazlitt, who regards the character of the elder Dornton as "an admirable representation of that class of English merchants who to plain manners and an unassuming outside unite unsophisticated upright sentiments." The outside of the elder Dornton would not nowadays be considered unassuming, but when this play was produced it was expected that a rich merchant would dress more handsomely than his chief clerk. These remarks by Hazlitt offer one of the instances, which are by no means common, of a preface to a book being useful. If his description of Dornton be read before the curtain rises, it will heighten the reader's sympathy for this old man, "whose name stands at the head of his firm, and is written in the hearts of the distressed," when he is seen struggling between love for his son and anger at his son's vices. He charges his head clerk, if he sees his son begging or starving in the streets, not to give him a single guinea; and when the clerk assures him that he will be careful to obey his orders, he turns upon him with, "What, would you see him starve?" The clerk assures his master that there is no danger of that, and he hopes that the son will soon make a fine man. "Will!" says the father, "there is not a finer, handsomer, nobler-looking youth in the world." The clerk, getting sadly puzzled by the conflicting impulses of his master's mind, says that if his master will only tell him what his pleasure is, he will endeavour to act like a faithful servant. The master answers that he is a faithful servant, but he is not a father. At this point enters Mr. Sulky, a partner in Dornton's bank, with news that young Dornton had lost ten thousand pounds at Newmarket, had drawn bills for the amount two days before his name had, by his father's order, been struck out of the firm, and that this fact being publicly known will cause a run upon the bank, stoppage, disgrace, bankruptcy. The father's anger now flames up: he bids his head clerk call together all the servants, clerks, and footmen, tell them their young master is a scoundrel, and bid them shut the door in his face. But the son's influence is stronger than the father's order; and in the next scene Harry Dornton is in the house, and presently he encounters his father, to whose reproaches he answers, "These things are much easier done than defended." The father tells him that his name has been formally erased from the firm. The suspicions already incurred by the known profligacy of a principal in the firm, the immense sums drawn, the publicity, the run on the house, the consternation in the City—when the father has got thus far with his complaints, the son answers, "All very terrible, and some of it very true." The father rejoins that if he should happily outlive the storm thus raised, it shall not be to support a prodigal, or to reward a gambler. He tells his son that he is disinherited, and shows him the deed, which the son puts aside with "Your word is as good as the bank." The elder Dornton protests that he will no longer be the dotting father fascinated by the son's arts. The son answers, "I never had any art, sir, except that of loving you." At this the father almost relents, but he will not bid his son "good night." The son urges his request so eloquently that all fathers will forgive, and many would share, Dornton's weakness. "Sleep in enmity," says he, and who can say how soundly? Still the father perseveres, and when he goes off the son exclaims, "Why, then, my noble-hearted dad, I am indeed a scoundrel." But the father returns to say "good night" and the curtain falls on the first and best act of the play. The son, in courting Sophia, has met and fascinated Widow Warren, who is Sophia's mother, and when the run on the bank begins and lasts over the day, he resolves to marry the widow in order to gain command of her 50,000*l.*, and thus save his father's credit. Maddened at once by grief and wine, he proposes to the widow, and is accepted. But the father hears of the intended sacrifice, and by the help of Mr. Sulky, who has suddenly come into a fortune, he averts it.

Some of the scenes almost reach the solemnity of tragedy, but an air of absurdity pervades and spoils the whole. This handsome gay young man, about to marry a lady of forty years, is presented to us as an object of compassion like the pretty girl in the last number of the *Illustrated News*, chained to a stake and waiting to

be devoured by the crocodiles which are slowly moving down upon her. No doubt the parties to an incongruous match are to be pitied, but the subject is disagreeable, and not less so when the middle-aged woman intends to marry the young man with whom her daughter is in love. However, the marriage does not actually take place. A supposed clergyman who has undertaken to perform the ceremony turns out to be the elder Dornton, who returns the money which his son had borrowed of the widow. Young Dornton of course marries Sophia, while the widow receives back into favour her rejected lover Goldfinch. Besides the two Dorntons the play depends mainly upon Goldfinch, a "fast" man of the day, and Silky, a roguish lawyer, who "must provide for his family," and engages for a bribe of 50,000*l.* to destroy a will. The terror of Silky when the completion of his bargain is interrupted by knocking from a closet which contains Sulky is as near to farce as other scenes are to tragedy. But when the characters of Silky and Goldfinch are well acted, as they are by the managers of the theatre, it is irresistible. Mr. Farren sustains as Old Dornton the reputation which he has acquired at this theatre, and Mr. Charles Warner is perhaps as good a representative as could be found of the part of young Dornton. The ladies are acted as well as they deserve, and probably the general effect will be improved by a few more performances. In Hazlitt's time the character of Goldfinch gave "an almost unprecedented popularity" to this play. He was then, however, a picture of contemporary manners. But although he looks coarse and vulgar and talks horsey slang, we do not feel as if we expected to meet exactly him upon a race-course, nor is the house now electrified by his consigning dancing-masters and umbrellas to perdition.

Another and less hopeful revival of an old play has been made at the Strand Theatre. It has been said of the *Belle's Stratagem* that the method Letitia Hardy takes to disgust her lover is much more certain of success than is her contrivance to win him back; and we fear that this criticism is only too just. Yet this play will always please when a pretty and clever actress undertakes the part of Letitia. It is exactly what the *Road to Ruin* is not. Here everything depends upon the women; there all rests upon the men. It is more easy on the modern stage to find a Letitia than a Doricourt; but if the present fashion of reviving old comedies should hold, it will be absolutely necessary to recruit our theatrical companies with a few good-looking young gentlemen. The date of this play may be fixed by the compliment paid to Letitia on her entrance, "Staying to be shot at by such eyes is equal to a *rencontre* with Paul Jones." She has met Doricourt that morning at the chambers of the family lawyer, and he saw her charms unmoved. "A husband of fifteen months could not have examined me with more cutting indifference." Her friend Mrs. Racket reminds her that Doricourt has seen a thousand pretty women, and his romantic fancies have been over long ago. They have been engaged to marry from childhood, but have not met for years, and Doricourt has been travelling abroad. She fears that she was less agreeable in his eyes than he appeared in hers. Mr. Hardy assures his daughter that she is mistaken, "for I asked him, and he said he liked you very well." This, however, is hardly satisfactory. As he does not like her enough, she will make him like her less. "Because 'tis much easier to convert a sentiment into its opposite than to transform indifference into tender passion." Her stratagem consists in assuming the manner and talk of a rough country girl, so that the fastidious Doricourt may be thoroughly disgusted with Miss Hardy, and then putting forth all her charms of manner and conversation at a masquerade, so that he may become fascinated with a mysterious stranger, in whom Miss Hardy may ultimately be revealed. The scene where she plays the hoyden is, with good acting, very amusing, and it ought properly to be embellished with the song "Where are you going, my pretty maid?" but that is omitted at the Strand Theatre. She tells her astonished lover how she had flirted with the curate, and how at a certain point she checked her reverend admirer. "Look you, Mr. Curate, don't think to come over me with your flim-flams, for a better man than ever trod in your shoes is coming over sea to marry me." But she begins to think she was mistaken. "Parson Dobbins was the sprightfullest man of the two." It is delightful to think how an exquisite like Doricourt must have received these salutes of his affianced wife. The curate used to call her "Venis." We next see her at the masquerade, where Doricourt declares that "she dances divinely," and, as he says afterwards, "he saw her, loved her, died for her, without knowing her." The minutiae is omitted, and the masquerade is altogether a tame affair. Mr. Hardy pretends to be ill, sends for Doricourt, and begs that the marriage with his daughter may be solemnized before his death. Doricourt is bound in honour to consent. "Make haste," says he, "if I have time to reflect, poor Hardy will die unhappy." No sooner is he married than a strange lady arrives masked, and informs the company that a few hours ago Doricourt swore to her eternal love. At this moment Mr. Hardy, who has never been ill in his life, becoming tired of lying in bed among the physic bottles, gets up, walks in upon the party, and reproaches Doricourt for showing passion for the strange lady now that he is married to Hardy's daughter. Doricourt announces that he will leave his fortune and his name to his wife, but his person will betake itself abroad. Only he begs the strange lady to grant the favour she denied last night, and show what her mask conceals. She complies, and Doricourt kneels in rapture at his wife's feet. May all belles find their stratagems end as prosperously!

This pleasant, bustling play is tolerably well acted at the Strand

Theatre; but no member of the company displays any special excellence, and unless the leading parts are very well done indeed, the best scenes lose much of their effect.

REVIEWS.

COBDEN AND MODERN POLITICAL OPINION.*

MR. THOROLD ROGERS has many claims to attention as a political essayist. He is a vigorous and lucid writer, a learned and acute economist, and generally a fair representative of the section of the advanced Liberal party to which he belongs. Not always accurate, and occasionally wanting in justice and in generosity, he makes laborious and sometimes successful attempts to be candid to all opponents except periodical writers, whom, like Mr. Cobden and Mr. Bright, he regards with scarcely concealed aversion. By the most advanced body of modern reformers Mr. Rogers is perhaps regarded as timid and reactionary. A thorough-going democrat, and a theoretical Republican, he never tampers with Socialism, nor countenances the substitution of State control for personal freedom and independence. A less unusual merit consists in his indisposition to violent or revolutionary methods of change. It must be admitted that English promoters of innovation but rarely advocate an imitation of the Reign of Terror. There is indeed no obvious reason why an omnipotent numerical majority should prefer any irregular mode of obtaining its objects to the exercise of absolute legislative power. Mr. Rogers notices as an amiable and exceptional error of judgment the belief which Mr. Cobden at one time entertained, that he could convert to his economic views the class which possessed political power under the first Reform Bill. Mr. Bright, on the other hand, held that the first step to sweeping measures must be an extension of the elective franchise downwards. More elaborate organization will perhaps enable the voters under household suffrage to return a majority of the House of Commons; and they will perhaps shortly be strengthened by the practical disfranchisement of landowners and farmers in the counties. The Conservatives are disposed, as in 1867, to sell the pass which it is their business to defend; and the Liberal leaders will have no difficulty in overruling the conscientious repugnance of their moderate adherents. The suppression of small boroughs in the consequent rearrangement of electoral districts will complete the triumph which politicians holding the opinions of Mr. Thorold Rogers anticipate with well-founded confidence. In the prospect of uncontrolled democratic supremacy it sometimes seems but a waste of labour to dispute with the future masters of many legions of votes. If Mr. Rogers's opinions on land tenure and taxation were incapable of being supported by plausible argument, they would not be the less command the assent of a House of Commons elected by universal suffrage.

Perhaps it may be allowed, as an intellectual exercise, to question one or two of the assertions which, until they are affirmed by the logic of an irresistible majority, seem to border on paradoxes. Mr. Rogers states with unqualified confidence that "two influences alone cause war—namely, the ambition of princes and the interests of a privileged class." "It is," he believes, "a rule to which no exception occurs, that when perfect political equality is established in any community, and the whole machinery of government is brought under the control of the popular will and public opinion, war becomes an anachronism and an impossibility." "That a free nation should attempt to bring another nation into subjection, or attack it in order to vindicate its honour, is an absurdity." Yet Mr. Rogers is undoubtedly well acquainted with the history of the Greek Republics, and of the mediæval Italian Republics, which were almost incessantly engaged in wars undertaken for the purpose of bringing their neighbours into subjection. The responsibility of the war of 1793 is of course thrown upon monarchical and aristocratic England; but it ought to be as impossible for a free Republic to continue a war as to begin it; and the insolent rejection of Pitt's overtures for peace, when he was at last bent on terminating the struggle, was the work of orthodox Republicans. The Northern Americans successfully brought to a termination one of the greatest wars of modern times, although political equality had long prevailed among them. It is of course easy to maintain that they were justified in maintaining the national unity, or in suppressing slavery; but Mr. Rogers had stated, not that Republics conduct just wars, but that they are incapable of making war at all. The same nation conquered and annexed a large portion of Mexico on the shallowest pretexts; and for several generations the readiest mode of obtaining American popularity has been to threaten war against England. The quarrel with Spain or Cuba will happily not at present result in an armed conflict; but the President and the American people would be surprised to hear that their country could by no possibility engage in war either for the purpose of vindicating its honour, or, in certain contingencies, of reducing Cuba to subjection. It is perhaps needless to contradict for the fiftieth time the unwarranted and invidious statement that the privileged classes of England were eager to intervene in the American Civil War. If the privileged classes were fairly represented in the House of Commons and the House of Lords, they entertained a nearly unanimous resolution not to interfere, although their sympathies may have perhaps inclined to the

weaker party, in consequence, to a great extent, of the unparalleled vituperation of England by American speakers and journalists. In Mr. Rogers's opinion it was "a scandalous euhemism" to call the *Alabama* and her consorts privateers; but, for the purpose of another argument, he attributes the existence of the Southern privateers to the failure of the negotiations between England and the United States for the abolition of privateering. The designation of the Confederate cruisers as privateers is not a scandalous euphemism, but a blamable mistake of the facts of the case. The *Alabama* sailed, not under letters of marque, but in virtue of a Government commission; and throughout the long and angry controversy on the subject, though the Americans foolishly and passionately called her a pirate, she was never described as a privateer. The earlier negotiation would have been futile, if it had succeeded, for any Government may at its pleasure convert a vessel which might otherwise have been a privateer into a regular man of war. The prejudice which Mr. Rogers, like Mr. Cobden, feels against his own country, or rather against its Government, leads him into a serious misstatement of an earlier dispute between England and the United States. "The attempted enlistment of troops in the United States during the Russian war" was, he says, together with the collection at the same time of a Polish legion, the last instance of the old practice of enlisting foreign mercenaries. The Polish legion would seem to be a purely imaginative creation of Mr. Rogers's fancy; and it is at least certain that no attempt was made to enlist foreign mercenaries in the United States. The invitation issued by the Governor General of Canada, and sanctioned by the English Minister at Washington, was carefully limited to English subjects, although by inadvertence the temporary sovereignty of the American Government over Englishmen resident in its dominions was technically infringed. A friendly Government would have requested the withdrawal of the proclamation; and its demand would have been immediately conceded. The American Government thought proper to dismiss the English Minister; and Mr. Caleb Cushing, afterwards known at Geneva, and then Attorney-General of the United States, expressed a hope that the affront which had been offered to England would rebound against the throne of the Queen. A free and equal Republic, though incapable of making war, reserves to itself the privilege of insult.

One of the numerous objects of Mr. Rogers's indignation is the present Income-tax, or rather Schedule D. That grievance also will disappear when the owners of property cease to exercise an appreciable influence in the House of Commons. It cannot be said that Mr. Rogers makes any valuable contribution to a controversy in which he is apparently incapable of appreciating the arguments on the side which he disapproves. He seems to waver between the plea of exemption founded on the precarious duration of industrial incomes, and the claim of a meritorious origin. Although he quotes and attributes to Mr. Mill the conclusive and often-repeated answer that the tax lasts no longer than the income, he neither admits the force of the argument nor attempts to confute it. So consistent an adversary of legislative and administrative interference with private affairs might be expected to dispute the right of a Parliament or a Finance Minister to alter the relative wealth of persons or of classes. When there is no Income-tax, traders and proprietors enjoy certain incomes representing in one case a perpetuity, in the other a varying expectation of enjoyment. The Income-tax falls for ever on the fee-simple, and on the less secure income as long as it lasts. The most remarkable instance of Mr. Cobden's liability to bias, even in the economical investigations in which he excelled, was his failure to understand that theory of the Income-tax which has approved itself to the judgment of the great majority of impartial economists. Mr. Rogers ought to have suspected the soundness of doctrines which he shares with the great majority of those newspaper writers whom he so cordially detests.

In matters of opinion or deductions from experience it is difficult to test the soundness of a general proposition. According to Mr. Thorold Rogers, "the small purchaser in a wealthy and progressive country can always, and always will, outbid the large buyer, if facilities are given for easy purchase." Mr. Rogers is fully justified in complaining of the heavy expense of conveyances, which deters not only small purchasers, but purchasers of small lots of land, who may perhaps belong to a very different class. If Mr. Rogers is right in his belief, the general impression is unfounded. It is a common matter of complaint that large landowners are incessantly buying up small freeholds; although the cost of transfer can scarcely prevent a refusal to sell. Small purchasers and large get, at the most, from three to four per cent. on their outlay, and rich men can afford to make or to retain an unprofitable investment better than poor men. It is demonstrable that the investment of a given capital in the cultivation of rented land is more profitable than a division of the same sum into purchase-money and the cost of farming. It can scarcely be supposed that a skilled economist confounds the gross produce of small freeholds with the profits of the freeholder; but the doctrine which Mr. Rogers maintains requires explanation, if not correction. No objection can be raised to his more general doctrine that the law ought to encourage the utmost freedom of disposition of land, so that it should be held in small or large portions as economical experience and convenience may decide. It is at least possible that the result of the experiment would be a still greater accumulation of land in the hands of a few proprietors. Mr. Rogers is entirely opposed to all Socialist projects for making the State the universal landlord; but no other device for vexing and harassing landowners fails to receive his approval. He

* *Cobden and Modern Political Opinion: Essays on certain Political Topics.* By James E. Thorold Rogers. London: Macmillan & Co. 1873.

would afflict them with special taxes; he would give farmers permanence or perpetuity of tenure; he would prohibit the preservation of game; and ultimately perhaps he would torment them into making way for small proprietors, who would be less easy to tax or to persecute with agitation. A curious instance of the controversial impetuosity which sometimes diminishes the authority of philosophical writers is furnished by a wonderful confusion of the Tichborne litigation with a question of disputed title. "What can be said for the law of titles in a country where such a case as that of Tichborne is rendered possible?" The most obvious thing to say is that there has never been a dispute about Roger Tichborne's title if he were alive, or about the right of another owner if he were dead. A man claims an estate which would be undoubtedly his if his identity with a certain person were admitted. Exactly the same question might arise on a claim to a horse, to a picture, or to a diamond necklace. At the trial in the Common Pleas the title was never in dispute, and the verdict was a declaration by the jury that the plaintiff had not satisfied them that he was the person who, if alive, would be the acknowledged owner. The issue in the Queen's Bench is of a different character, and has nothing to do with land or with titles to land.

The plan of the book is well conceived, and it will be attractive to Mr. Cobden's numerous admirers. Mr. Thorold Rogers, though he is fully capable of forming independent judgments, concurred on all important points of politics and of economy with Mr. Cobden, who was connected with him by family ties as well as by friendship. A series of chapters on all the chief articles of the modern Liberal creed are severally devoted to a text consisting of a statement of Mr. Cobden's opinions, and to a sympathetic commentary by his friend and disciple. In a former publication Mr. Rogers claimed infallibility for his hero, but he is now more prudently contented with proving that Mr. Cobden was in each particular instance in the right. Perhaps he would have made one exception if he had known or remembered one of the oddest episodes in Mr. Cobden's political career. Mr. Rogers denounces with becoming indignation the existence in some places of faggot votes, and especially of some faggot votes which are, or were, according to his statement, held by certain Conservative Fellows of Colleges at Oxford. He is perhaps not aware that immediately after the repeal of the Corn Laws Mr. Cobden concentrated for a time all his energies on a scheme for creating on a gigantic scale faggot county votes, to be held by artisans and other residents in the large towns. He occasionally declared that he had never promoted a plan from which he hoped so much. The defunct League was virtually, though informally, reconstructed for the purposes of the movement; and a considerable number of tenements in Lancashire were purchased in small shares by a sham constituency. The attempt was so far successful that at one or two elections the ex-League nominated the county members; and at last the Chairman publicly announced a compact by which Manchester and Liverpool were henceforth to divide the county representation between themselves. It was the resentment provoked by the insolence of the League and by the marvellous project of Mr. Cobden that converted Lancashire into a Conservative district. No better illustration could be given of the justice of Mr. Rogers's attack on the corrupt usurpation of the franchise by means of faggot votes. On a more disputed question Mr. Rogers differs to a certain extent from his friend and leader. Mr. Cobden never desired the establishment of universal suffrage, which Mr. Rogers recommends by an argument which is forcible, if only it is founded on a true assumption. "Power in the hands of the many has never, and can never, be tyrannously exercised, while power in the hands of the few will always be, and has always been, exercised tyrannously over the many." The opposite proposition, though it would not be true, would approximate more nearly to the truth. The few are always held in check by a dread of the material force of the many, but the dominant majority has nothing to fear. Representative government, wherever it exists beyond the limits of the United Kingdom, is a copy of the institutions of England; yet no country has yet succeeded in reproducing the competence, or in conferring on its Legislature the supremacy, of that Imperial Parliament which has hitherto been returned by a limited constituency. The vestry meetings of the Colonies, the subservient Parliaments of France and Spain, and the Lower Houses of the Federal and State Legislatures in the United States, are one and all incomparably inferior in ability, in honesty, and in integrity to the House of Commons. In America, under the most favourable conditions, universal suffrage has placed power in the hands of professional politicians who are disliked and despised by the intelligent and respectable part of the community. The State Legislatures are almost universally guilty of pecuniary corruption, and the House of Representatives, which is not free from the taint, seldom contains a member who could even pretend to be a statesman. Mr. Stevens and Mr. Butler, who have been the most prominent leaders of the House during the last ten years, may be fairly compared in character and capacity to Orator Hunt and Feargus O'Connor.

Criticisms of a dogmatic, pugnacious, and even intolerant writer are, especially when they are necessarily compressed into a small space, unavoidably one-sided. It would be absurd to dispute the value and the soundness of many parts of Mr. Rogers's book, although it seems more immediately useful to show cause against that thorough revolution which he invokes with approving confidence. The partial spoliation of landowners, which might perhaps assume a more sweeping form in the hands of some of Mr.

Rogers's allies, the destruction of the Established Church, the increase of relative taxation on property, the abandonment of India, and the substitution of an undefined federal system for the Colonial Empire, are points which can scarcely be accepted in a mass on the authority of Mr. Cobden. These and many other changes are implicitly contained in the representative revolution which even Mr. Cobden hesitated to approve. If Mr. Rogers and his friends succeed, as they perhaps may, in shifting the centre of gravity of political power, they may save themselves the trouble of proving the other points of their case. While liberty, and the variety which is its indispensable condition, still exist, it may be worth while, at the risk of being exposed to contemptuous vituperation, to argue against the justice and expediency of general subversion. Universal suffrage and equal electoral districts will render further controversy as unprofitable as the continuance of the combat in *Paradise Lost* after its issue had been determined by an external will. A prudent defender of existing society may perhaps then pay the supreme multitude the compliment of pretending to be convinced, when he is simply overpowered. As long as Canidia confined herself to boasts of her supernatural attributes, Horace thought her a disreputable old impostor; but when he felt her irresistible power, he directed to deter her knowledge of the black art:—

Jam jam efficiet do manus scientie
Supplex.

Democratic arguments will in like manner defy refutation when the managers of the Trade Unions lead a congenial House of Commons. In that happy future it is doubtful whether Mr. Rogers, though his present opponents may be silenced, will exercise as much influence as at present. As a philosopher he finds an audience even among those who reject his conclusions; but it may be doubted whether he possesses either the qualities or the defects of a successful demagogue.

PROCTOR'S BORDERLAND OF SCIENCE.*

THE friends and the foes of Mr. Proctor will alike allow that he is a man of unwearied industry. The productions of his pen in the last few years must amount to many volumes, and there seems to be no danger of the supply ceasing, since the present season has seen two, if not three, works by him. Whether to be the most prolific of our writers on scientific subjects is a distinction to be coveted or not, the credit of being so must be given to Mr. Proctor. We suspect that few authors would desire to possess such a reputation; but that he feels proud of it can admit of no doubt. In the prefatory remarks to the present work (which consists entirely of articles that have appeared in magazines) he takes great pains to impress on the mind of the reader how vast a number of such articles he has written. He is grieved that the notices of the two series of his "Light Science for Leisure Hours" have given rise to the idea that he has republished therein all the articles that he had up to that date contributed to serials; and he assures us that three-fourths of his essays in serials "have not been published in a collected form, and will not be." Having thus asserted his right to be acknowledged as the author of a gigantic amount of soon-to-be-forgotten literature, he seems to become aware that his words are not calculated to give a very favourable impression of the value of the productions themselves; and he hastens, therefore, to tell us, with very questionable taste, that we need feel no doubt of the superior quality of those contained in the present volume, inasmuch as they are all reprinted from the *Cornhill Magazine*, and "Essays on Popular Science intended for the *Cornhill Magazine* are subjected to so careful an editorial process of 'selection and rejection' as can lead only to the 'survival of the fittest,' so that such essays as appear in that magazine may be regarded as the selected works of the author to whom they are due." These words can only mean that the editor of the *Cornhill Magazine* is in the habit of reading through the vast crowd of Mr. Proctor's essays in order to "select and reject," until only the fittest "survive" (publication in other journals seems not to be considered as a "survival"). The picture thus afforded of the industry and patience of the editor of that excellent serial is highly flattering to him, though it may not please equally the editors of such other publications as have been honoured with the presence of some of Mr. Proctor's essays. However this may be, the public cannot help feeling thankful that they are in the hands of the editor of the *Cornhill* rather than in those of Mr. Proctor; for though we may not feel enthusiastic about the results of "the survival of the fittest," we should be unwilling to exchange that principle for one of selection by parental affection. It is doubtless to this that we owe the pleasure of having a book on Popular Science from the hands of Mr. Proctor which is not devoted to the glorification of that grand discovery which he claims to have made, and which—to judge by the prominence which on all possible occasions he insists on giving to it—he esteems one of the most important discoveries of the century. But in this respect the public are respite only. He warns us that he is about to publish a book on *The Universe and the Coming Transits*. There we shall find the due honour paid to his brilliant discovery that there is no Pope in science, and that even an Astronomer Royal is fallible. To say that if astronomical infallibility be sought we must not go for it to the Astronomer Royal would perhaps be a more accurate statement of his views. We do not think that he

* *The Borderland of Science*. By Richard A. Proctor, B.A. London: Smith, Elder, & Co. 1873.

disbelieves in the existence of astronomical infallibility, but search must be made for it in the proper quarter.

It would be a serious mistake, however, to refuse to recognize the value of the work done by Mr. Proctor and his condutors in scientific essaying. It is of no small importance both to science and to general culture that there should be men of excellent scientific training ever on the look-out to announce to the public at large, in language intelligible to them, each new discovery of interest that is not too recondite in its nature to admit of the process. Such men act as the Special Correspondents of the army of scientific workers, and possess their share of the faults and the virtues of their profession. They do not always select the most important operations for the subject of their newsletters; the first requisite in their eyes is that the intelligence should admit of a piquant treatment. With a general preference for what is true, they have a genuine horror of what is dull. On the whole, however, they keep us fairly *au courant* with the events of the struggle, and of this we must not be unmindful. Among these popular scientific writers we should assign to Mr. Proctor a very high place. Few scientific favourites deserve their reputation so well. He possesses the advantage, so rare among such persons, of being himself a mathematician of no mean ability, and that implies a severe training in such parts of science as admit of a rigidly accurate treatment. Couple the indirect effect of such a training with the direct advantage of being able to take your science direct from the fountain-head, of needing no interpreters between you and the original discoverers, and it is not hard to see how such a man as Mr. Proctor can be a trustworthy guide in the most slippery places in the half-explored regions that form the borderland of science. Nowhere is this more obvious than in such parts of the present work as treat of astronomy. The author has to consider the causes of those wondrous cosmical phenomena the discovery of which will probably be considered in future ages as the greatest scientific achievement of the time in which we live. Each theory purporting to account for these phenomena is in turn subjected to the searching test of numerical verification; and though the process is too often fatal to the brilliant guesses that owed their origin too exclusively to scientific imagination, we are occasionally startled by seeing some specially wild and improbable theory changed thereby into something approaching to a demonstrated fact. Who does not remember the theory that meteors are stones shot out from volcanoes in the sun or stars? Years ago it was a favourite doctrine in semi-theological books on astronomy, and passed therefrom into being an accepted subject of merriment in scientific discussions. Yet not only is the truth of this apparently wild theory demonstrated in the present work, but a very important part in cosmical development is assigned to it. Indeed we think that Mr. Proctor allows himself to be carried a little too far by his enthusiasm for his favourite theory. He asks too much of it. We are willing to believe that suns and stars pelt one another with meteor-streams, and even that our bulkier brother-planets ape the ways of their superiors; but we shrink from endorsing the proposition that the "bulge" of the moon towards our earth (which renders its earthward side one great hill some seventy miles in height) is nought but a vast heap of stones which our earth threw at its neighbour in its early days. It is crediting this respectable earth of ours with too much youthful vivacity to assume that it flung away ninety-nine hundredths of its mass in such outbursts. This is, however, what the theory requires, even after a large allowance is made for the moon's attraction, unless we adopt the yet more wondrous theory of "design" on the part of our earth, and suppose that it was intelligent and malicious enough to take deliberate aim at its unfortunate companion, instead of distributing its favours impartially in all directions. Does the tendency of sunspots to cluster on those parts of the sun which are immediately opposite to Venus and Mercury point to the possible existence of some such preference?

When Mr. Proctor possesses such special capabilities for being an invaluable scientific teacher to the educated public, what evil genius is it that induces him to write such foolish and mischievous articles as those on a Voyage to the Sun and a Voyage to the Hinged Planet which appear early in the volume? They are worse than valueless—they would be pernicious if they were not unpleasant; and his reputation will suffer seriously if he makes more attempts in the same style. The public desire men in whose judgment it can fully trust to report to it on scientific discoveries. How else can it distinguish between the true and the false? Accounts of the sea-serpent and of the deep-sea soundings of Thompson and Carpenter appear in the same type in the *Times*, and are copied with equal avidity by the country papers. It does not wish to be credulous, and it appreciates the true scientific spirit sufficiently to be yet more ashamed of hiding its want of knowledge under a smearing incredulity. It turns, therefore, in such cases to its favourite teachers to know how it must receive these various announcements. Hence, in order to be such a teacher, you must convince the world at large that you are not one who will let prejudices prevent you from granting a fair hearing, and that you will not on the other hand announce as proven what is still merely conjectural. Above all they must feel that all the statements in your writings may be relied on as giving the truth so far as it is known. Why then does a man in a fair way to earn for himself this honourable position waste his energies in writing fanciful accounts of journeys through Space, wherein he mixes up fact and fiction so indistinguishably that, after an intermediate state of bewilderment, the reader passes on to more rational chapters, to save his conceptions of the true state of physical astronomy from becoming hopelessly confused. It is not that we object to the introduction of fiction,

if it be dressed in a sufficiently fanciful guise to enable us to recognize it. Mr. Proctor may people a satellite of Saturn with beings possessing a Heat-eye, if he will. No one can fail to perceive that we can at present know nothing of such subjects, and the statement can do no harm. But if he speaks of such a satellite as itself attended by five sub-satellites (a theory the truth of which is not only possible, but not unascertainable), the reader who takes up Mr. Proctor's book for profit as well as amusement is left in doubt whether this is a triumph of our telescopic or a mere fib. If we wish such entertainments, we go to the picturesqueness of Hawthorne or the brilliant mendacity of Edgar A. Poe. Mr. Proctor possesses neither, and such essays of his are scientifically more injurious than the *Arabian Nights*, and not one-thousandth part as entertaining.

It would not, however, be just to insist solely on the faults of a really valuable and interesting book. The great majority of the essays are well worthy of Mr. Proctor's reputation. No one contrives to make difficult and complicate ideas clearer than he, and no one surpasses him in his power of marshalling facts so that, without the reader feeling in the slightest degree bored, a complete account of the subject is given. And there is no one who, in writing on the impressive facts about the vastness of our universe, holds so just a course between the dry astronomical tone that seems to delight in reducing stellar dimensions to millions and billions of miles, to show that it is utterly unmoved by such matters, and feels neither surprise nor wonder thereat, and the still more offensive style which is ever striving to excite a blank and stupid wonder in its auditory, and which "uses infinity as a peg for a declamation." Mr. Proctor has a genuine love for astronomy, and the dignity of his treatment is a natural consequence. On mundane subjects he is almost as good. Those to whom the prophecies of science seem full of gloom will perhaps cheer up a little at the perusal of his well-directed argument in support of the theory that our coal is destined to last far longer than Mr. Jevons would have us believe. It is pleasant too to know that we may reasonably hope to make some progress in flying. But it would be useless to attempt to give an idea of all the topics touched on in a book which has one chapter on earthquakes and another on gambling. Occasionally the author may be caught tripping, as when (in page 331) he cites the kite as an instance of the supporting power of the air on a horizontal plane moving in a horizontal direction. But, as a rule, he may be safely trusted in both his facts and his deductions, and if he does not get into the habit of writing too hurriedly, or of stooping to unworthy tricks in style, or of suffering personal considerations to influence him too strongly in his choice of subjects, his reputation as a scientific writer will soon be second to that of no other popular expositor.

UP HILL.*

EVER since the creation of Becky Sharpe, the character of the pretty adventuress, partly good and partly bad, has been a favourite with those of our lady-novelists who have a liking for a shaky outline filled in with correct details. In *Up Hill* Lady Wood has manufactured another of the numerous representations of this rather hardly exercised type; but Miss Phoebe Philtre is such a composite kind of person, she has such excellent qualities, and her actions are founded on such a fine sense of dignity and duty as the story advances, while in the beginning threatening us with such an avalanche of faults, that we scarcely know where to place her. She begins with looking like a sinner, but she goes on and ends as a saint: and these moral marvels, compounds of demon and angel, are difficult to deal with. We cannot quite understand the angelhood. Just as it seems odd for flowers to bloom where there are no roots, so does it seem unlikely for noble actions to be performed where the elemental principles were decidedly ignoble, and where no sudden "conversion" is introduced as the spiritual solvent by which the rough is made smooth and the hard soft.

Miss Phoebe Philtre is presented to us in the opening chapters as about the most purely calculating heroine we have ever met with. From first to last no grace of self-forgetfulness, no girlish spontaneity of thought or feeling, breaks through the cold deliberation with which she weighs and measures and balances her chances. But with all this the end is not as the beginning, and in defiance of precedent the clay image has golden feet. We are introduced to her as an all but penniless girl, the daughter of an apothecary who has just died. She is very beautiful, with a good complexion, soft brown hair in long curls on her shoulders, light hazel eyes "in form and position higher towards the ears than at the nose," while "the mouth ran up in the same line." "She would be a beautiful woman," said a gentleman, "if she did not so nearly resemble the fox in expression"; "and his hearers laughed, for the resemblance was striking when once the idea had been started." She has moreover a lovely figure, and she knows that she is beautiful; but she has never been in love, and only considers her "personal charms as a commodity which might or might not be serviceable to her in her fight with the world." When she is offered the situation of daily governess to Miss Arria, the only daughter of the wealthy widower Mr. Brazazon, and goes to the house for inspection, she reflects that these personal charms will be unserviceable in this case, impediments, not weapons of conquest; she therefore puts on a thick crape veil, and makes her figure "clumsy":—

She laughed grimly as she thought of the falling shoulders, delicate waist, and full bosom; and how easily she might, by a worsted shawl under her

* *Up Hill*, A Novel. By Lady Wood, Author of "Sabina," &c. 3 vols. London: Chapman & Hall. 1872.

cloak, give herself shoulders which seemed to whisper to her ears; and one bladebone projecting beyond the other. This spoliation of her figure grieved her more than the disfigurement of her face.

She does more. She makes herself stupid; "a woman too clever by half might be objected to by the merchant; for, given youth and talent even weighted by homely features and clumsy form, and a widower is a lost creature if his clever governess determines to marry him." Such as she appears then she is engaged by Mr. Brabazon, who says to himself, "No fear of my falling in love with such a Hottentot!" and she enters on the onerous task of reducing Miss Arria, who is a savage, to the discipline and decency of ordinary life. This is not the first time that Miss Philtre has been engaged in the like work, having been what is called pupil-teacher in a Brighton school, where she had endured the slights and vexations lavished on her by the wealthy young ladies with unflinching sweetness; but where, "with the small children, she had the strength and venom of a serpent. She coiled herself round their lives. They dared not complain, for no one would have believed any accusation against one so gentle." She glared them into silence when "turning half delirious on their pillows, and shouting their wild fancies from one end to the other of the dormitory," as soon as she fixed her eyes on them; and now, when she leaves the house of the wealthy widower, she grinds her teeth with rage against both father and daughter, and says, "All in good time, miss!" Why she should grind her teeth with rage against Mr. Brabazon does not appear; for he has done all he ought to do—treated her with civility, and acceded to her terms; the child's offence is more intelligible, as "the lump of craze and bombazine" frightens her, and she screams, and will not go near her new teacher. This is a beginning surely suggestive of any amount of polite Brownriggism. But what do we find? A charming story-teller, who fascinates and tames her little savage by the most exquisite tact, the most fertile invention, the most unwearied patience, mingled with that quiet kind of unalterable firmness which all children like, and which the most ferocious respect. There is not a trace of the Brownrigg to be found—not a single strand laid of any after-web of manœuvring or decoit. When, after a while, she is taken into the house at an increased salary, she gets her footing there solely by the perfectness with which she has performed her duties; and though she does tell Mr. Brabazon a cock-and-bull story of her ancestry, and does make herself lovely in his sight, it is with no base motive after all. In short, Lady Wood has only seemed to play with a doubtful puppet when she made Phoebe Philtre like a fox; she would have made the outer and the inner more harmonious had she pictured her like a lamb.

Another event occurs to Phoebe of which the traditional adventuress would have made capital, but which she heroically declines to utilize. A handsome young man is run over before the door of the shop which was once her father's, and is now Mr. Reach's. Mr. Reach is not at home, and Phoebe, who is an excellent bone-setter as well as physician, sets the fractured arm with the skill of the most practised house-surgeon of a hospital, and takes her patient to his home, the address of which she has discovered by means of a tiny card-case which she abstracted from the young man's pocket and transferred to her own. Her patient is the Earl of Arden, and we have a rapturous description of the library of the young lord, "so luxurious in its furniture, so refined in its revelations," the following special bit of decoration standing out in high relief:—"On the mantelpiece, carefully guarded from London smuts by a glass, a beautiful figure in Parian marble, representing Pleasure, was crowning with flowers old Time, who carried the dial of the horologe." Would it not seem to be only natural that Phoebe should make use of this chance? She is almost starving, for her salary from Mr. Brabazon is not due, and she has not her meals with her pupil; but she takes as her sole fee the card-case she has stolen, and a fine cambric handkerchief which somehow has slipped into her pocket. Also, she claims no acquaintance with her desirable young patient when they meet in the park; and, as time wears on and the story develops, behaves in the grandest manner possible all through.

The Earl is of course desperately smitten with her. They meet again at Brighton, where she is installed as Arria's resident governess. He pays her marked attention, and she repulses him with dignity. It is not that he is spoiling her market, fouling her game, but that she respects herself, and prefers, when the time comes, death and starvation to his offer to become his mistress with so much settled on her for life. We remember a similar position in a novel called *Which Shall it Be?* where the heroine argues out a like position with calmness and shrewdness, without the faintest approach to indelicacy, but in just the spirit in which a girl cast on the world with only her own youth and beauty as her friends would argue such a point. But Lady Wood makes her fox-faced heroine far too high-minded to balance or debate. She sees only the shame, none of the advantages of such a position; and no saint in white muslin could come out of the ordeal with more unsullied purity than Phoebe Philtre displays. Again, when she has engaged herself to marry Mr. Brabazon, whom she does not love, and is asked in honourable marriage (this time) by Lord Arden whom she does love, she loyally refuses the coronet and the handsome young man, and keeps faithful to the merchant with his heart-disease and not enchanting maturity. All this is delightful—just as it should be; we do not want it different; but why then fly a dove and call it a kestrel? Why start a harmless household kitten and call it a tigress? Was Lady Wood afraid of her own first idea? But fear of the world's

opinion has never ranked as one of her characteristics; and even in this curiously patchwork book we have bits of clever incisive coarseness which prove that she has not been more dainty in her method of execution than she evidently was in her first sketch, through fear of outside judgment or because of anything like true perception of the higher life she makes a feint to portray. We fancy she found that Phoebe Philtre, carried out logically as she was begun, was more than she could well manage; and that, after all, propriety and swimming with the stream of old-fashioned notions is easier to work than the contrary.

The whole episode of Lady Brune and Alice her daughter, the made-up "picked turkey" whom Arria exposes with such dire results; the "superior" mother and daughter hunting men for marriage; and that of the inferior Mrs. Semple and Jessie, now fastening their claws in the casock and hand of the Reverend Augustus Toplady, now making frantic endeavours to clutch at the Earl of Arden, are both equally vulgar, offensive, and improbable. With these latter ladies, indeed, we have again the feeling that Lady Wood had an idea in the beginning of the work which she lost or set aside as she went on; for the mischief which Mrs. Semple tries to make between Phoebe and her husband is very feebly done, and comes to nought as a matter of workmanship, and her advocacy of the quack medicine has also no result. That final fight with the burglar, whom Phoebe shoots with the same masterly precision as she does everything else, comes in a little inharmoniously. It is too violent for the quieter colouring of the rest of the book, and decomposes the whole scale. Mr. Brabazon, with his heart-disease—which Phoebe diagnosed so skilfully the first time she saw him asleep—and his subsequent paralysis, might have been got rid of much more quickly; and the ghastly picture of the dead man, with the blood slowly oozing out on the floor of the library, is a revolting absurdity. We do not like the school to which Lady Wood, with so many others, belongs. It is vulgar, rude, fond of tampering with the unclean thing, superficial in its tenderness, and simply shocking when it affects, as it sometimes does, piety and a deep religious sentiment. We recognize such cleverness as its adherents possess; but cleverness alone cannot redeem faults so grave and tendencies so distasteful as those by which the whole body is penetrated.

RANKEN'S DOMINION OF AUSTRALIA.*

FEW middle-class families in England have not had one of their members or intimate friends, or one of some other household within their private acquaintance, gone to live in the Southern colonies of this country. Yet the literary provision for their natural curiosity about the real condition of those distant territories and communities has not until lately been of a satisfying kind. Books professing to describe Australia, before the recent work of Mr. Anthony Trollope, were too often limited to a mere account of the experiences of some individual settler who had tried to make his fortune or a home for himself in a particular district. The statements of these authors, referring to local and temporary conditions, could not afford that sound general knowledge of the subject without which its different parts and aspects were liable to be misunderstood. British Australia, using the term to denote such portions of the continent as have actually become the habitation of English people, exhibits a great diversity of circumstances, both in its wide geographical extent and in its rapid historical progress. It contains five provinces differently situated, each as large as one of the kingdoms of Europe, and each comprising districts where the favours of nature are variously dispensed, or in some cases apparently denied. Their industrial settlements are of different periods, and were formed under very dissimilar circumstances, though nearly all have been created during the last fifty years. The development of new material and social interests, almost every ten years, in the more advanced colonies, has further complicated the whole subject of the state of the Australian world. A compact body of well-digested information concerning it was therefore much wanted by an increasing number of readers here, but no returned emigrant or traveller was likely to supply this need. Mr. Trollope's entertaining mixture of personal narrative, of anecdote and adventure as a tourist, with statistical notes of matters belonging to the several provinces, is rather discursive than comprehensive. A more direct effort at instruction is made by the volume we have now to examine, in which Mr. Ranken presents a concise and summary description of the chief physical causes and the industrial development of the different sources of wealth in Australia, and of their results in its probable social and political future. His book is a very suitable companion to that on the *Canadian Dominion*, by Mr. Charles Marshall, which was published two or three years ago, and Mr. Ranken concludes by suggesting a possible confederation in Australia, like that of the British American provinces. This, indeed, is a suggestion which has lately found favour both with some colonial and some Imperial statesmen.

Before entering upon his review of the pastoral, agricultural, mineral, and commercial industries of Australia, the author, treating all these matters in the strict order of their practical connexion, gives a striking account of the physical geography and climate. It is only of the continent that he speaks, not extending his remarks either to Tasmania, which may be regarded as an appendage to Australia, or to New Zealand, which is extremely

* *The Dominion of Australia; an Account of its Foundations.* By W. H. L. Ranken. London: Chapman & Hall.

unlike it and sufficiently remote from it. The ingredients of Australian prosperity, beginning of course with the flocks and herds that may be fed, and the crops that may be grown on the land, must depend very much upon the degree of heat and of moisture in the atmosphere, and upon the amount and regularity of the seasonable rainfall. These conditions depend, as Mr. Ranken shows very forcibly, more upon the configuration of the surface of the country, and the distribution of its mountains and plains, especially with reference to their exposure to neighbouring oceans, than upon mere position in latitude. The entire continent of Australia is shaped as a vast basin, or slightly concave disc with a raised margin, like the rim of a common dinner-plate, round the greater part of three sides. The interior space is for the most part condemned to perpetual sterility by the coast ranges of highlands shutting out the vapour-laden winds of the sea, and by the want of inequalities of ground level to cause either the long and steady flow of rivers, or the formation of abiding lakes. Without any free play of air currents, and with no constant movement or permanent storage of inland waters, much of this land must ever remain little better than a desert. Only the monsoons blowing on the North-West coast are able to come sometimes five hundred miles inland. In the opposite quarter, again, only the river Murray, and its allied river, the Murrumbidgee, poured from the flanks of the highest Australian Alps, near the South-Eastern corner of the continent, have a considerable length of course and an unfailing stream. The interior is not always windless and waterless; but its most frequent wind is a parching sirocco laden with dust, and its fitful visitation of water is a sudden deluge repeated at uncertain intervals of many months; for two years may pass in some districts with scarcely a drop of rain. In happy contrast to this forbidding view of the void and waste expanse, still partially unexplored, which makes in our maps a doleful blank thinly dotted with lines of laborious travel, we contemplate the hilly and well-watered marginal strips of land fronting the ocean, with their deep river-valleys, their vigorous growth of forest, their cool high tablelands, and the fertile reverse slopes of their mountains parallel to the line of coast. Such are the habitable parts of New South Wales, Victoria, and Queensland; and if South and West Australia do not quite merit the same favourable report, they have yet some tolerable features. North and North-West Australia, when their time comes to be settled, will also be found capable of the sort of cultivation that is suited to a tropical climate.

A distinction is observed by Mr. Ranken between the occupation of these lands and their cultivation. Under the former head are described the operations of the squatter who takes up extensive runs for the grazing of sheep or oxen; and in this connexion, too, we have an account of the breeding of horses. The culture of those useful plants which yield grain and wine, sugar and cotton, in the different latitudes and climates of Australia, forms the second general division of colonial industries. Both these kinds of business, as we have remarked, are limited and locally determined by the unalterable facts of physical geography; and Mr. Ranken's entire review of the resources of Australia is based on this primary consideration. There is no country of the earth, he assures us, so good as the best parts of that continent for producing fine wool; and some parts of it are very good for producing beef as well as mutton, if any process can be perfected for preserving meat in a palatable state for the European market. The merino sheep, increasing since its first importation to the number of seventy millions, and improving upon the original type of its progenitor in Saxony and Spain, is the most perfectly successful result of colonial enterprise in the Southern hemisphere. But the economical and commercial progress of this interest has undergone violent checks and changes, which Mr. Ranken briefly relates; and he shows that its future extension cannot be great in area, but must be effected by a new system of management. After the occupation by squatting sheep-owners of the more accessible districts in New South Wales and Victoria, three successive waves of pastoral settlement, as he expresses it, swept over different portions of the continent. The first, occasioned by the demand for meat to feed the gold-field diggers, covered the great plain fantastically named Riverina, which is traversed by the Murray and Murrumbidgee and Darling rivers, with their tributaries, and which is now fully stocked, with the aid of dams and wells for storing its waters. This experiment was satisfactory to the pioneers of the colonial advance. It led, therefore, to other inland movements of a host of squatters, from Adelaide northward, and from New South Wales westward, or rather North-westward, into the great basin of the interior. The result was most disastrous to the South Australian adventurers, whose flocks mostly perished of drought in three or four years. It was scarcely more fortunate in the back country of Northern Queensland, where the expenses of a sheep-run and station were increased, while the profits were lessened, by the great distance; but in this region it is hoped that the failure of sheep will be compensated by other sources of wealth. A great improvement has lately been made in the system of keeping sheep, which are now fed in extensive paddocks fenced in with light iron wire, and tended by a very much smaller number of men than were required to watch them on the open plain. Their particular breed also is now more scientifically adjusted to the grass and air of the district where they are placed; and the wool is now more nicely washed, and sorted, and packed for the market. It has become worth while, instead of continuing the old practice of squatting at large with myriads or hundreds of thousands of sheep over a

vast territory held on lease as a run, to graze a moderate flock upon freehold land, and even to sow the land with imported grasses. This is the promising future direction of pastoral enterprise in Australia. Similar improvements will perhaps gain their reward in the care of oxen, which thrive very well in the moist warm climate of the North Queensland valleys near the sea-coast. But the commercial problem of bringing their carcasses to market is yet only coming near its solution; and the same may be said of the clever breed of Australian horses, which run wild in stray herds of little or no value, as on the South American Pampas.

Agriculture, the next concern of our Australian fellow-subjects, has, in Mr. Ranken's judgment, been very seriously misdirected by the rage for indiscriminate settlement of small landowning cultivators upon any plots they may happen to fancy at the uniform Government price. Mr. Trollope had told us of the bitter standing quarrel on this subject between the aristocratic squatter, who must see many useful bits thus cut out of his pasture-run, to his great inconvenience, and the intrusive purchaser, of a would-be yeoman class, too often lacking the capital and the intelligence that a farmer should apply to his business. The law granting every purchaser an unrestricted right of selection before the lands have been officially surveyed and pronounced fit for cultivation is denounced by Mr. Ranken as a mischievous contrivance of democratic politicians in Victoria and in New South Wales. He contends, with some plausibility, that it is not less delusive and injurious to the labouring class of colonists than prejudicial to the economic welfare of those provinces. Queensland and South Australia, which have not yet followed the bad example, are said to prosper somewhat better with their lands and their crops; but we may observe that their industry is less distracted by the temptation of gold-fields. South Australia, with a very deficient rainfall, grows wheat to supply the wants of other provinces which cannot raise enough bread for themselves, and it further exports a large surplus of its corn to Europe. Queensland has done a little in cotton, and is in the way to do a great deal in sugar-planting, with the help of imported Polynesian or Asiatic labour. We do not, however, understand Mr. Ranken to mean that this comparison of the different provinces would indicate the operation of their different land laws as the sole cause. But it is worthy of remark that, while Victoria has but one-tenth of her sold lands under cultivation, and New South Wales a twentieth part, with many holdings actually thrown up by their owners in despair, the proportion in South Australia is one-fourth, many of the agriculturists there being Germans, who are very steady settlers. Queensland, too, is wisely bidding for an intelligent middle class of small capitalists, by offering carefully selected estates of moderate size both for agricultural and for pastoral employment. But we are inclined to think that New Zealand and even Tasmania, having a climate more congenial to Englishmen, will be preferred by many of this class to any province of the Australian mainland.

The prospective greatness of New South Wales, and probably also that of Victoria, seems after all to lie chiefly in the mineral riches which they owe to happy geological accidents. Their gold-fields, which some years since attracted a rapid influx of population, have ceased to exhibit a wild scramble of isolated adventurers for the precious grains in alluvial gravel, and have become the seat of costly and scientific operations in mining the quartz-rocks to an immense depth. The yield of Australian gold is not likely to fall short within any period that enters into practical calculations at this day. But New South Wales and Queensland possess, in their border districts called New England, a valuable tin-field, besides which they share with South Australia the gift of plenty of copper. Still more important to these two provinces of the Eastern shore is their abundance of good coal and iron in the most convenient situations for working. The Hunter River coal-field alone, which has its port, significantly named Newcastle, to the north of Sydney, extends over an area of eight or nine thousand square miles; its coal, lying in thick seams at little depth, is of a quality better than any except the best Welsh, and can be sold for delivery on board ship at 9s. the ton. The iron ores of Berrima, eighty miles from Sydney, contain seventy per cent. of metal, which can be wrought into steel like that of Sweden. Here are the ingredients of a high degree of manufacturing and commercial prosperity, as well as the means of constructing and using at a cheap rate the lines of inland traffic which have already crossed the Blue Mountains, and have joined the sea-coast to the Riverina plain. Yet the principal export of the country, in the opinion of our author, will always be wool; and he expects that this will find new markets, particularly in North America, and possibly in China, added to the continued demand for its use in Great Britain. North indeed of the twenty-second parallel of latitude, it is not by wool, but by sugar and other tropical products, that Australian cultivation is to pay its way; and whether it will do so in the long run will depend on the feasibility of a well-regulated constant supply of labour. This, we presume, can only be got from India or from China to an amount sufficient for these vast territories of more or less fertile land. The scattered isles of the Pacific, which have been the scene of kidnapping outrages justly or unjustly laid to the charge of Queensland, are not so easily placed under official supervision, and are scarcely capable of sending hands enough for the present need. China has of late refused to permit the continuance of its coolie emigration to our West Indies. It is, therefore, to the Government of British India that the planters of North Australia will probably look for the provision of systematic facilities to

develop the natural resources of the Southern Continent, where the climate rejects the European labourer. This would seem to open a question worthy of Imperial statesmanship.

TACITUS.*

IT is, we fear, the fact that the powerful and sarcastic annalist to whom we owe the portraits of Tiberius and Nero has few readers in England, except among professional scholars. A few years back, in a by no means sleepy or unintellectual town of five thousand inhabitants, the single copy of Tacitus was found at the schoolmaster's. Perhaps his pregnant and thoughtful style is one which it is too much of a business to unravel; perhaps a more diffuse and perspicuous manner of setting matters before the reader is more congenial to a busy age and nation. At any rate there is much truth in Mr. Donne's remark that, whereas in France and Germany Tacitus is still revered, consulted, and written about, as an historian of his weight and eminence deserves, in this country he suffers from an indifference which was not felt by Bacon or Clarendon, and the sole English treatise worth reading on the History of the Annals is that of Dean Merivale. One object of the series to which Mr. Bodham Donne's volume belongs is to recall English readers to the ancient classics, and in this, as in other cases, it may be hoped that a popular and cursory sketch may be the means of attracting notice to a writer whose merits of conciseness, brevity, and compression of style might not be wholly unwelcome to modern historians be induced to revive them. Tacitus, if one desired to master all his remains, is anything but a life-task; and though the area which he covers is undoubtedly not large if reckoned by years, yet his style and manner, imitated judiciously, might be a good exchange for the prolixity and diffuse chronicling of our contemporary writers.

Into the volume of the "Ancient Classics Series" now before us Mr. Donne has thrown as much light and life as his limits could admit. He has dealt first with the historian's life, so far as it is known to us through internal evidence and contemporary notices, and then with his works, though not in their chronological order. The last chapter save one is devoted to the "Dialogue on the Orators," which, if it was written by Tacitus, as is generally admitted, was certainly the earliest of his works; and the Histories, which were written before the Annals, are discussed after them. To this arrangement, however, the student of Roman history can have no objection, as the course and order of events are thus rendered more consecutive; it is to the student of style and manner that, unless he is let into the secret, the "Dialogue on the Orators" seems an unaccountable departure from the principles of composition which prevail in the Annals. In the former there is an evident imitation of the rounded Ciceronian periods, and a youthful bias towards rhetorical display; though, as if to contradict those who would deny that Tacitus wrote this work, the sarcastic tone and the subtlety of psychological analysis, to say nothing of phrases and constructions savouring of identity of diction, bespeak the same author at an early period of his career. If the surface of the dialogue is pseudo-Ciceronian, the spirit that lurks beneath is quite that of Tacitus; and we cannot but think that Mr. Donne's readers will thank him for having drawn attention to a treatise so little read or known in these days, but yet so curious in the insight it gives into the Imperial system of oratorical training, as contrasted with that of the Republic. As in Cicero's kindred treatises, the dialogue in question is carried on by advocates and opponents of the oratory of Tacitus's day, and is concluded by an umpire, Curiatius Maternus, in much the same spirit as Palamond's "Et vitula tu dignus et hic," in the Third Eclogue of Virgil. The interlocutors, it should be added, belong to the reign of Vespasian, and Mr. Donne assigns the composition of the dialogue to the fifth year of that Emperor; there is force, however, in the surmise that, as the writer describes himself as "juvenis admodum" at the date of the dialogue, it was not committed to writing until he was older.

The Life of Agricola is a work always of interest to Englishmen, because of Agricola's connexion with Britain, and the likelihood that Tacitus had from his father-in-law, who was on the staff of Suetonius Paulinus, and who was afterwards, as pro-consul in Vespasian's reign, identified with the province, the most intimate acquaintance, consistent with hearsay, of the earliest history and geography of our island. As a literary performance the *Agricola* belongs to Tacitus's earlier and less historic style, which indeed would be better adapted to so warm a panegyric; as an indirect contribution to history, it acquaints us with Agricola's organization of the district between the Humber and the Tyne, his line of forts and roads along the East coast as far as the Firth of Forth, his sighting of Hibernia from the Mull of Galloway, his repression of the Caledonians and final rout of Galgacus and his army, and generally with the civilizing influences which Roman arms and institutions introduced into our island. Mr. Donne has found it convenient to throw into the last pages of his chapter upon Agricola, who was, if not the first circumnavigator, at least an explorer and a conqueror, of Britain, the sequel of Roman operations and conquests in this country so far as it is gathered from

other writings of Tacitus. It is a pity, perhaps, that this is necessarily very brief, particularly as regards the campaign of Ostorius Scapula, which we should have assigned to the year 50 A.D., and not to 47 A.D. But this campaign may be advantageously studied in the original, with the full and sufficient annotations of Mr. Frost's edition of the Annals, the title of which we have coupled with that of Mr. Donne's little volume, not so much because we can hope to do justice to so useful a work in a notice like the present, as because we desire to urge him to the completion of his edition of Tacitus, which would be a great help to the scholar's familiarity with that historian. In the passages of the Twelfth Book of the Annals (chapters 31-40) which relate to Caractacus, Mr. Frost will be found to have embodied in his succinct commentary all needful illustration and elucidation, whether of a geographical or of an exegetic character; and in his preface to the Annals he shows himself not only quite at home in the life and writings of his author, but also well qualified to discuss the peculiarities, which are by no means few or far between, of his style and diction. To return, however, to Mr. Donne, we must say in passing that we grudge the half-page which he has devoted to a meteorological parallel between Roman and Victorian Britain *quod* rain and fog, seeing that readers might naturally ask for more about Caractacus and Boadicea.

To the consideration of the monograph on the Manners of the Germans, which probably follows the *Agricola* in chronological sequence, Mr. Donne has added interest by discussing the old question as to the existence of a latent satirical element in it. According to this hypothesis, the German wife is a reproach by contrast to the more than "freaky" Roman matron, the virtuous German chief to the profligate and embarrassed patrician in the Imperial capital. This theory is worked out in the course of half-a-dozen lively pages through a series of antitheses, and the gist of it is summed up in the following paragraph, which will represent Mr. Donne's style as well as his argument:—

In these notes on the domestic condition of the Germans it is hardly possible to mistake the purpose of Tacitus. In the hardy lives and warlike activity of the Germans he glances at the extravagance and luxury of the nobles of his time. In their poverty, in consequence of their ignorance and indolence when at peace, in their chastity, partly because of their poverty, he saw an image, though a rude one, of those ages of Rome when cannals drove their own ploughs, or "roasted turnips on a Sabine farm." In many a German hovel might be found a counterpart of a Cato or a Sicius Dentatus, but not one of a Sejanus or a Tigellinus; in many a German swamp or forest dwelt a Cunctia and her young Gracchi, an Agrippina, a chaste and fruitful wife; but neither a Messalina nor a Poppea.

Although it is going much too far to consider the *Germany* as a prose idyl or a fiction, we are not prepared to dismiss this theory as an empty dream; and although it is true that in some passages the author is as Roman as his contemporaries could wish, it must be owned that the details of the strict marriage code, the female dress and morals, the large and fruitful families of the Germans, claim a larger place and importance in this treatise than the geography, which is given from hearsay, and limited in effect to the first few chapters. The materials for the *Germany* were derived, it is suggested, from the work of the elder Pliny on the German wars, and certainly it is in many respects a curiously readable treatise. Mr. Donne notes among salient points the Teutonic use of white horses for omen and augury. The heed given by the priests and people to the animals' neighing and snorting "has a very Oriental aspect, reminding us of the omen drawn from the neighing of Darius's horse" (*Herod.* iii. 84). He remarks also on the addition of the Germans, like the gods in Walhalla and the Slavonic wood and water spirits, to gambling and drinking; according to Tacitus, though their weightiest matters were broached and mooted in mid feast, it was a fixed rule that there should always be an appeal from Philip drunk to Philip sober.

There can, however, be no doubt that the Annals must be considered the masterpiece of Tacitus, in their distinctness from other annals or chronicles, their terse compression of matter and anecdote as well as narrative, and the byways wherein he leads his readers to beguile the tedium of the main road. As Mr. Donne puts it, "the keystone of the arch is indeed Rome and its Caesar, but the arch of description itself is wide in its span; the 'Annals' are the roof and crown of the mighty master's genius." During a good half of what remains to us of the Annals the Caesar was Tiberius, and of this human enigma, this Janus whose one face his citizens regarded with dialike and dread, while the provincials viewed its obverse with goodwill and devotion, Mr. Donne gives a fair and even-handed sketch. To achieve this, indeed, he is obliged at times to shake off the leading-strings of his author, whose prejudices occasionally interfere with his historical accuracy. Herein the annalist may have been biased by the perusal of private memoirs, such as that of Agrippina the younger, whose mother had been sacrificed by Tiberius at the instance of Sejanus, and who regarded the Emperor as a usurper of the rights of the Drusi. Or he may, as Mr. Donne agrees with Dean Merivale, have used too literally the reports of criminal trials and informations which Tiberius would have treasured up, however full of libels on himself, with the exactness of a pedant, to be ransacked and read to his disparagement in times of reaction such as the reign of Trajan. Mr. Frost in his preface admits that Tacitus is apt to use his authorities indiscriminately, as well as to have his favourites, one of whom was certainly not Tiberius. If this Emperor was not all that Velleius and Valerius Maximus painted him in contemporary

* Tacitus. By W. Bodham Donne. Edinburgh and London: Blackwood & Sons. 1873.

The Annals of Tacitus, with a Commentary. By the Rev. Percival Frost, M.A., late Fellow of St. John's, Cambridge. London: Whittaker & Co. 1872.

panegyrics, nevertheless the silence of the elder Seneca, the ascription of his worst faults to the influence of Sejanus by the younger, and the representation of his rule as mild and equable by Philo and Josephus, raise a suspicion that Tacitus was more or less led away by a psychological theory which imputed dissimulation to Tiberius even from the interval between the death and funeral of Augustus; whereas the charitable view is that his rule underwent a change when he yielded himself to the influence of Sejanus, and had removed one source of dread and jealousy through the death of Germanicus. Of this death, hastened, perhaps, by the vexatious coadjutor Piso's interference, Mr. Donne remarks that "when a man is laid low by fever, some extra vexation is not unfavourable—to the disease." To turn for a moment to the commentary by Mr. Frost, it may suffice to point to his annotations on the chapter which, at the opening of the Fourth Book of the Annals, narrates the early history of Sejanus, and the growth of his influence on Tiberius. The grammatical notes on the constructions "raptui erit" and "sui obogens," with the references to apt parallels in the same writer elsewhere, are everything one could wish; and the annotator does not fail, upon "quippe isdem artibus victus est," to show in a few words the superior craft of Tiberius, and the ruinous consequences to the State of the rise as well as fall of Sejanus. Mr. Donne treats this Emperor throughout in a spirit of fairness and candour, as, for instance, where it is shown that he was for a while averse to the introduction of such a social curse as "delation" and its agents, though he was borne along later by the current of the time, and the suspicions sown by his favourite. When we pass to the reign of Claudius, "the reign," as it was nicknamed, "of the freedmen"—which the aristocrat Tacitus writes with a pen dipped in gall, because the order alluded to awoke in him the old spirit which had made Sulla odious and Pompey less popular—Mr. Donne is careful to point out the allowances which we have to make for prejudice, and the claims to future fame as a statesman and a promoter of great public works, which the "idiot" Claudius contrived to establish for himself before he was taken off by Locusta's boletus.

At the Histories, which are unfortunately but a fragment, and which were composed before the Annals, we cannot here even glance, except to note that they approach nearer to the general standard of Roman historians, and that in composing them Tacitus writes more in the character and spirit, and with the authority, of a contemporary. Mr. Donne's summary does full justice to the rapid sequence of stirring events which these Histories describe; and both in them and in the reign of Nero in the Annals, he is careful to draw attention to the episodes which are a special characteristic of Tacitus's historical works. His notice of that one which relates to the Jews and the siege of Jerusalem is particularly good, considering the limits within which he is confined, and so is the story of Vespasian's miracles.

On the whole, we must pronounce Mr. Donne's little book a fair and temperate estimate of an historian whose merits were manifold and pre-eminent, though he was by no means free from party spirit, and failed to exclude from his Annals the untruths of rumour and scandal. Mr. Donne's interpretation of Tacitus's guiding spirit is certainly sound when he regards it as being of kin to that of Dante. Tacitus did all he could to consign Tiberius and Nero to eternal infamy, "though he had not the advantage of the Florentine in a sure and certain faith that there was a region of bale reserved for his political enemies, and accordingly could not exhibit Tiberius in a red-hot tomb like Farinata's, nor imprison Nero in a pool of ice, like the Archbishop Ruggieri."

CHRISTMAS BOOKS.

II.

BEAUTIES of English Landscape, drawn by Birket Foster (Routledge). In this handsomely bound volume we have, as the publishers' announcement tells us, "in a collected form specimens of the work of this justly popular artist, which have already appeared in their series of Illustrated Gift-Books." Though the engravings of course are not so sharp as they were when the blocks were fresh, yet these illustrations are on the whole very pleasing. With each picture is given a quotation from some poet, though whether the picture is meant to illustrate the poem, or the poem the picture, is in some cases doubtful. We fancy that it has happened now and then that Mr. Birket Foster has drawn a sketch, and that then some gentleman who is as familiar with the beauties of English poetry as the artist is with the Beauties of English Landscape has been set to find out what passage it is that has been illustrated. He is, we must allow, now and then unfortunate in his search. The picture, for instance, that faces Rogers' poem of "Mine be a cot beside the hill" is correct in everything save that it contains no hill, no bee-hive, no brook, no mill, no swallow, no pilgrim, no ivied porch, and no village church. A great many of the illustrations are of passages in Wordsworth. If Mr. Birket Foster really wished in his pictures to set forth the scenes described by the poet, it is curious that he should not have taken the trouble to go to the Lake district. It is somewhat daring in an artist to give fancy sketches of such well-known spots as the Pillar Rock in Finnerdale and Dungeness Ghyll. He may be forgiven, however, for having drawn on his imagination when he has given us three children sitting on some rocks on a sandy beach, as an illustration of the lines in Wordsworth's greatest ode:—

And see the children sport upon the shore,
And hear the mighty waters rolling evermore.

Lake and Mountain Scenery from the Swiss Alps. With twenty-four photographs from original oil-paintings by G. Oloos and O. Tervelicher, and forty-eight woodcuts by G. Roux. With text by T. G. Bonney, M.A., Fellow and Tutor of St. John's College, Cambridge (Bruckmann). Many a man who looks back to a summer holiday spent in the Bernese Oberland as the happiest and most beautiful part of his life will, as he turns over the pages of this handsome volume, find many a memory brought back and many a longing awakened up. He will begin to talk of what he has seen and done, and make plans again for that future in which we are all of us such great travellers. The artist and the photographer have done their part of the work with much taste and skill, while Mr. Bonney's narrative is lively and interesting. The little woodcuts which adorn the beginning and the end of each chapter show a good deal of spirit. Altogether this volume forms a worthy addition to that library of Alpine scenery which every winter, like the snow on the mountain-tops, steadily accumulates, not like it, however, to melt away.

Japan and the Japanese Illustrated, by Aimé Humbert. Translated by Mrs. Cassel Hoey, and edited by H. W. Bates, Assistant-Secretary to the Royal Geographical Society (Bentley). "Mr. Humbert obtained his copious materials for this work during a residence of two years in the country in 1863-1864 as Minister Plenipotentiary of the Swiss Republic; availing himself of the privilege of travelling outside the barriers of the foreign settlement at Yokohama, a privilege at that time exclusively accorded to diplomats of the Treaty Powers, to obtain subjects for his pen and pencil in quarters inaccessible to the ordinary inquirer." Though Japan is now thrown open to foreigners, Mr. Humbert's work loses none of its interest. The engravings are as interesting as they are numerous, and set forth more clearly than any other work that we have seen the every-day life of the Japanese. It would have been well, however, if to each engraving a reference had been given to the page which it illustrates. The picture of a Respectable Tea House, for instance, can hardly bear on the introduction of Buddhism into Japan, though the two subjects are illustrated, one by the pencil, the other by the pen, on the same page; while "Bakers Pounding Rice" can at the best only in a very far-fetched and symbolical manner be imagined to be connected with the invasion of the Mongols. The narrative is copious, and in itself very interesting, though it suffers greatly from its French dress still clinging to it in a very awkward manner. Mr. Humbert certainly deserved a translator who knows not only French, but also English.

The Life and Habits of Wild Animals. Illustrated by designs by Joseph Wolf; engraved by J. W. and Edward Whymper. With descriptive letterpress by D. G. Elliot, F.R.S., F.Z.S. (Macmillan). Mr. Edward Whymper, one of the two engravers of this interesting work, assures us in the preface that "scientific naturalists consider that Mr. Wolf's power of delineating specific characters is simply unrivalled," and that "Mr. Elliot, the author of the accompanying descriptive letterpress, is a citizen of the United States, and is well known among naturalists from his superb monographs." When Mr. Whymper so politely and so generously thus praises the German artist and the American author, it would have been only proper for them in their turn each to have written a preface by way of reciprocity, and each to have taken one of the brother engravers as the subject of his high praises. Mr. Whymper happily might very well have spared his praises, for the engravings at once speak for themselves, while Mr. Elliot's narrative is soon seen to be judicious and interesting. Though it seems as if photography would supplant the engraver's art, without however filling its place, yet we cannot but hope that, so long as there are found such artists as Mr. Wolf and the Messrs. Whymper to bring out such books as the one before us, so long there will be found a public with taste enough to reward them liberally for their efforts.

History of the Ceramic Art, by Albert Jacquemart. Translated by Mrs. Bury Palliser (Sampson Low and Co.). The illustrations with which this work is abundantly illustrated are very interesting, while the "twelve engravings in aquafortis by Jules Jacquemart" are admirably executed. All who delight in the potter's art will find in this treatise all the information that they could desire; for potteries of all ages and climes are treated of, from those of "Hamenkhepar, an honest public functionary of Egypt, dating 3850 years before the Christian era," to those of "Zachariah Barues, the last potter of Liverpool." The translator in her preface says "that the question arose whether to make a free or a literal translation. The latter has been decided upon, though at the risk of retaining much of the French idiom. Any attempt to modify the enthusiasm and nationality of the author would take from the spirit of the book." The author should have remembered that enthusiasm and nationality cannot help getting modified in a translation, in whatever way it is made. As for the spirit of the book, it has, we fear, almost disappeared in the literal rendering. May we not apply to the translator a motto which will come home to every potter:—

Amphora cepit
Institut, currente rota cur urceus exit?

The Book of Modern Anecdotes: American, Legal, Theatrical, edited by Howard Paul, John Timbs, and Percy Fitzgerald (Routledge). We have here, we are told, a collection of Humour, Wit, and Wisdom. Mr. Howard Paul, who edits the American portion of the book, ought to be a good judge of all three, as we read that he once made a remark in which, whatever humour there may be, there is just as much, we will undertake to say, of wit and wisdom. "Howard Paul," writes Mr. Howard Paul, "being

asked what was the first thing necessary towards winning the love of a woman, replied 'an opportunity.' Mr. Fitzgerald kindly assists his readers in their enjoyment of the jokes he provides for them. He quotes an epigram of Garrick's, and with much obligingness adds, "There is real 'fun' in these neat lines, and it is almost impossible to repeat them without a laugh." Mr. Timbs's portion of the work is the best done, but even here we have two stories about Lord Ellenborough given twice over, within two pages, though in somewhat different words.

Common Wayside Flowers, by Thomas Miller. With illustrations by Birket Foster; printed in colours by Edmund Evans (Routledge). This work is prettily written and prettily illustrated. We wish, however, that the process by which the printing in colours is performed could have been made to give just a hint of the scent of spring flowers. It is hard for the imagination to do full justice to Mr. Birket Foster's graceful designs, when there is so strong a smell of oil or naphtha. This, however, will no doubt soon pass away. We wonder, by the way, that Mr. Miller, in attempting to account for what he calls "the great mystery" of the luxuriant growth of colt's-foot in a new railway cutting, should ask "Is there something peculiarly attractive in these new soils, which draws down the myriads of seeds that are supposed to be continually floating in the air?" Before he makes up his mind to fall back on "peculiar attraction," he had better study the *Origin of Species*.

The *New Illustrated Natural History*, by Rev. J. G. Wood, M.A. (Routledge). We have given us in this large handsome volume an abridgment of Mr. Wood's *Illustrated Natural History* in three volumes. Though the work is an abridgment, yet it is large enough to contain a great amount of information. Mr. Wood's style is simple and clear, not too hard for the young, not too condescending in its easiness for the old. The work is abundantly illustrated "with designs by Wolf, Zwicker, Weir, Coleman, Harvey, and others; engraved by the brothers Dalziel." Few among the Christmas books which have as yet come before our notice would interest a larger class of readers than this popular book of Natural History.

The *Pet Lamb Picture Book*. With twenty-four pages of illustrations, printed in colours by Kronheim and Co. (Routledge). It is too bad to take Wordsworth's beautiful poem of the "Pet Lamb," and make it give a name to these gaudy daubs. If the illustrator had taken the trouble to read the poem, he would have seen that "the slender cord" with which the lamb "was tethered to a stone" was not a thick hempen rope, but a "woollen chain." By what stretch of the imagination, moreover, is Barbara's father, the Westmoreland shepherd, represented as wearing a bright Scotch tartan?

Poems, Songs, and Ballads of the Sea, compiled and arranged by Charles Bruce (Nimmo). This collection seems to have been judiciously made, and will, we have no doubt, be popular. Songs about the sea can scarcely fail to be attractive to English boys, or indeed to Englishmen.

Stories of Enterprise and Adventure (Seeley and Co.). This little book contains a very interesting "selection of authentic narratives." The editor has not, as editors so often do, given what has often been given before. He has evidently read a good many books of travels, and has picked out what he knew would be interesting, and at the same time, to most of his readers, quite fresh. He not only gives a short piece of pleasant reading, but he shows where pleasant reading is to be found. Any one who reads, for instance, "A Night among the Arabs" will have a strong wish to read Miss Hogora's *Domestic Life in Palestine*, from which it is taken.

The *Problem of Pythagoras*, by W. Marsham Adams, B.A., late Fellow of New College, Oxford (Mead and Co.). "In this problem," says the author, "the reasoning of Euclid in the 47th proposition of the First Book is brought directly home both to the eye and to the mind." A boy who finds Euclid very hard—and how few boys do not—would, we are sure, see some of his difficulties at once cleared away by the use of Mr. Adams's ingenious diagram. While it will be found to be very useful, it has all the merits of an amusing puzzle.

Pictures by Clarkson Stanfield, R.A. Engraved on steel, with historical and critical descriptions, and a short biographical sketch of the author by James Dafforne (Virtue and Co.). This handsome volume contains thirteen engravings from Mr. Stanfield's most important works. Mr. Dafforne tells us that, "for the sake of classification," he has divided them into "home scenes, marine views—that is, on the open sea—and foreign scenery." Of each of these styles he gives three or four specimens. The engravings are interesting and well executed, and Mr. Dafforne has on the whole done his part well, though the style of the biographical sketch would have been better if some of the sentences had been broken up into two or three.

Daily Help for Daily Need, edited by Mary G. Shipley (Seeley). This book contains "a selection of Scripture, verses and poetry for every day of the year." The selection seems to have been made with judgment and taste, so far as we can form an opinion, though we cannot pretend to decide whether the text and poem given for each one day are specially suited to that day. The editor, we notice, has the modesty to give one of her own poems as the proper reading for the 29th of February. She might otherwise have easily aroused the jealousy of some brother poet who would have found that one of his pieces was only thought worthy of being read once in every four years.

Messrs. Routledge have brought out a very handsome edition of the *Christian Year*, well printed, elegantly bound, and fully

"illustrated by Sir John Gilbert, Robert Barnes, W. B. Scott, H. O. Selous, Mr. Small, and other eminent artists." Among the other eminent artists, by the way, are Guido, John Jellies, and Raffiella. The illustrations are of course of very unequal power, and while some are very poor, others are all that could be desired.

Sketches of Highland Character, illustrated by W. R. (Edmondston and Douglas). The sketches are very dull, and the illustrations are very vulgar. The author takes as his motto the line, "A chief's amang ye takin' notes." We wish he had stopped short with his sketches as he has stopped short with his quotation, and had not gone on "to print it."

Half-Hours with the Best French Authors. With twenty-four illustrations, from designs by Emile Bayard (Seeley and Co.). In this moderate-sized volume are given "short passages from some of the most celebrated prose writers translated into English." The passages have been well selected, and the English much less clearly than usual betrays the fact that it is a translation. The designs, though by no means equal, are yet far better than we generally meet with in such volumes as these.

Aunt Louisa's National Album (Warne). "The National Album," we read, "has received its name from containing, first, two of our oldest National Nursery Stories, and next, two modern ones which are especially 'national,' because they relate to our children—the hope of the nation—and that faithful animal for which Britain has been famous ever since the days of Cæsar." Cæsar, we remember, does mention the goose. Perhaps in Aunt Louisa's edition of the Commentaries the dog comes in. Next year we may hope to see the Universal Album so called from containing first the story of the Cow jumping over the Moon, and next the song of Goosey, Goosey, Gander, which is especially universal because it relates to that animal which, with apple sauce, has been universally enjoyed in Britain ever since the days of Cæsar, when the Romans, as we may well suppose, first taught the Britons that it might be lawfully eaten.

Good Little Children, adapted from the French of P. J. Stahl. With thirty-two illustrations, from designs by J. Frölich (Seeley and Co.). Though the drawing of these illustrations is not very good, yet there is a good deal of humour in the designs. Good little children are led along the right path in the pleasantest of all ways. They are shown what they ought not to do. We trust that if this book gets into every nursery, no child hereafter will be found, like the naughty children in its pages, to drive nails into looking-glasses, or to set the house on fire by playing with matches.

As a companion to this book, the same publishers give us *Davie and Dot, their Pranks and Pastimes*, adapted from the same French author, with designs by E. Froment. The same moral lessons are taught in the same moral way. Poor little Dot has not as yet learnt that "it is really not proper to drink water out of shoes," and so tumbles into a brook, while Davie smashes Dot's fingers, his own toes, and the looking-glass.

The *Children's Pleasure Book*. With 250 illustrations (Virtue and Co.). The author of a set of papers in this book entitled "Pictures from History" says that "every one ought to be very careful to read history, because ignorance of it leads a great many people into serious blunders." It is useful not only to read history, we would observe, but also to understand it, otherwise all that the reading will do will be to render the blunders more serious than ever. This writer, for instance, has read deep enough to know of Soulac; but yet, when telling how William demanded that Harold should fulfil a promise to marry his daughter, he says that "two obstacles presented themselves," the second of which was that "Parliaments were now established, and a king could not marry a foreigner without Parliamentary sanction." Of a truth a little of Mr. Freeman's learning is a very dangerous thing.

FRENCH LITERATURE.

M. GARNIER PAGES has just published another volume* of his interesting History of the Revolution of 1848; it describes the insurrection of June and the events which led to the dictatorship of General Cavaignac. Although he is an uncompromising champion of the Republic and a firm believer in the vitality of Republican institutions on the other side of the Channel, M. Garnier Pages cannot, of course, refuse to acknowledge that the revolution which he himself so energetically helped to bring about was a signal failure. But he ascribes this failure to the timidity of some, and the wild theories of others. Whilst, he says, the Socialist school wished to push on the new Republic to the most subversive measures, many honest but over-cautious democrats almost dreaded the consequences of their own success. Want of unity among the victors of February thus paralysed their efforts, and at the same time left the field open for the Royalists on the one side and the Bonapartists on the other. M. Garnier Pages does full justice to the courage with which General Cavaignac crushed the insurrection; but he finds fault with him as a statesman for assuming that there was no other alternative for him but to lean for support upon what was called the "Club de la rue de Poitiers," if he did not choose to endorse the politics of Messrs. Ledru-Rollin, Caussidière, and Louis Blanc.

If it is difficult even now to write impartially the history of the events of 1848, the task becomes harder still when we come down

* *Histoire de la révolution de 1848*. Par M. Garnier Pages. Vol. II. Paris: Pagnerre.

to the years 1870-71, and to the days of the third Republic. Here the only safe course to follow is to collect from the newspapers every incident which may help to explain the situation of the country; the author must be satisfied to accept the position of a compiler, and to amass materials which may be worked into an artistic shape when the violence of party spirit shall have somewhat subsided. This is the view adopted by M. Maquert in the bulky and closely printed volume now before us.* It is a perfect cyclopædia of facts; it is a collection of cuttings from the newspapers, and a farrago of anecdotes borrowed from all quarters. The index and the tables which terminate it are extremely useful; without them it would be utterly impossible to find one's way through such an accumulation of details. M. Maquert is a Belgian, and his volume is published at Brussels.

The sketches collected by M. Scherer† deserve to be saved from oblivion much more than most volumes of the same kind, which were originally nothing but newspaper *feuilletons*. They are remarkable equally as criticisms of popular authors and as moral studies. The editor of the *Temps* rises far above the level of ordinary journalists, and he does not worship at the altar of success. We here allude chiefly to the essays on M. Alexandre Dumas, M. Veuillot, and M. Baudelaire. In describing the development of the Romantic school of literature and art, he has the great merit of saying plainly and unreservedly what many persons have thought long ago, but what they were afraid of acknowledging, lest they should be classed amongst the "Philistines." It is of no use to conceal the fact that the Romantic crusade must be looked upon as a failure, because the French of the present day are like the Romans of the Lower Empire, and no powerful manifestation in art or literature can take place when the public is reduced to an audience of *amateurs blâmes*.

If we must have *histoires goguennardes*, let us go at once to the fountain-head and procure the true masterpieces of the kind. Such is the idea which has suggested to M. Charles Louandre his *Chefs-d'œuvre des conteurs français*.‡ It is an excellent one; but the title of the book does not give a fair idea of its contents. Instead of placing before us a few complete specimens of the old *conteurs*, M. Louandre has aimed at something more ambitious; and as, on the other hand, he wished to limit himself to one volume, he is necessarily very incomplete. The scope of his publication included not only *fabliaux* and short tales, but metrical romances like the *Chanson de Roland*; for his design was to illustrate the whole history of imaginative literature from the earliest times to the seventeenth century, and the readers he had in view were the general public, who are not well acquainted with French mediæval literature. Accordingly he gives mere extracts of productions such as the *Roman de Renart*, always modernizing the language till he comes to the Reformation era. The biographical and critical notices, with the indexes and notes, are carefully done, and in some cases a full summary gives us an idea of the story from which the extracts are taken. M. Louandre has also written a very interesting preface on the history of French tales and romances. He begins with the large metrical compositions such as the *chansons de geste*, and the cycle of the Round Table; he then goes on to the satirical works of which Reynard the Fox is the principal representative, and he concludes with the *fabliaux* and *joyeux devis*, so amusing as evidences of the *esprit gaulois*, but often so thoroughly objectionable.

Italy also was tolerably rich in productions of the *joyeux et ébriés* class, especially during the fifteenth century. The clergy of those days in Rome, in Florence, and in Naples, were not so completely absorbed by their duties that they could not find time for the composition of *facetia e burle*, and we might easily make up a long list of such authors, even not including Ariosto, whose collection of anecdotes has been translated into French by M. Ristelhuber.§ We must here acknowledge that, compared with Poggio, Boccaccio, and Straparola, Ariosto sinks into decided inferiority; but his anecdotes must not be overlooked by the historian of literature, and if a translation of them was necessary, no one could be found more competent to the task than M. Ristelhuber.

M. Menier¶ seeks to reform the fiscal system now established in France. He complains of the routine which still prevails everywhere, and he is astonished that the Republican Government should persist in retaining what he pronounces to be the absurd and dangerous principles of the old financial *régime*. He does not object to a property-tax, an income-tax, or a tax upon furniture, but he violently denounces the stamp, customs, and patent duties as opposed to the most elementary laws of political economy. All these sources of revenue he would cut off at once, replacing them by a tax upon capital, which, he says, could be easily assessed without in the slightest degree violating the principles of justice, whilst it would bring into the national treasury much more than the sum collected at present amidst difficulties of every kind. Finance is certainly an easy science in the hands of reformers who begin with confiscation.

The little book contributed by M. Bertauld¶¶ to M. Germer-

¶¶ *L'ordre social et l'ordre moral*. Par A. Bertauld. Paris: Germer-Baillière.

Baillière's *Bibliothèque de philosophie contemporaine* rests upon the principle of the complete separation of Church and State, and of the most absolute freedom of conscience. The author's peculiar tenets place him, however, at an equal distance from the thinkers of the spiritualist school, and from the champions of what is called *la morale indépendante*, or ethics viewed as, not necessarily influenced or leavened by religion. With the former, he assigns as the substratum of all morality the reason and the justice of God; with the latter, he thinks that respect for human freedom is the origin of law, but he refuses to admit that liberty is the source of morality.

The new treatises published by Messrs. Clavel and Saleta are written from the standpoint of positivism, and endeavour to deduce from that system a code of morality and a system of logic. M. Clavel* imagines that the laws of ethics vary according to times and seasons; and he would fain make us believe that moral precepts which sufficed for the welfare of society in days gone by are no longer applicable. His sketch of history viewed in its connexion with ethical science is clever enough; but it is deplorably one-sided, and he shares the error of those reformers who accuse religion of crimes and errors for which it cannot be fairly held responsible. M. Saleta's treatise of logic not being yet completed †, it would be useless to attempt an estimate of it here. We may notice, however, that according to this writer, in the first place, induction is the only means by which we can acquire any knowledge of real and sensible things; secondly, this source of knowledge, by its very nature, can never give us absolute certainty, and its conclusions can only possess that so-called moral certainty which depends upon our feelings and inclinations. M. Saleta, we thus see, leads us to scepticism, and the second title of his book is amply justified.

We lately described the new Mantchu Grammar published by M. Adam; we have now to notice a similar work on the Japanese language ‡, for which we are indebted to M. Léon de Rosny. The author, in his introduction, speaks of the efforts made at various times to unravel the difficulties of that language, and he refers more particularly to the great work of Professor Hoffman of Leyden. The book before us is intended for persons who wish to obtain an accurate knowledge of Japanese as it is spoken now, and therefore its object is altogether different from that of the Dutch philologist; besides the grammatical rules, it gives us a few phrases by way of specimen, to show what are the peculiarities of the colloquial language, the written language, and the epistolary style—three forms so widely apart from each other that they have sometimes been considered as so many distinct idioms. Facsimiles of handwriting complete the volume, which forms the second part of a practical course of works on the Japanese language. M. de Rosny's present treatise was composed originally for the pupils who attend the lectures at the Government school of Eastern languages in Paris.

M. Maisonneuve has published a new edition of the Abbé Van Drival's *Grammaire comparée des langues bibliques*§, which first came out twenty years ago; or it would be perhaps more correct to say that he has begun the publication of this new edition. It may not be out of place to state briefly here the Abbé Van Drival's argument. Following in the footsteps of the late Dr. Lamb, Dean of Bristol, and of the late M. Prinsep, he traces back all Semitic languages to the hieroglyphic alphabet of Egypt. This is going further than the English scholars just named, who confined themselves to Hebrew, and limited to that language the theory so widely extended by M. Van Drival. The second edition of the *Grammaire comparée* differs from the first, not by the introduction of any fresh views, but by the development and further application of the idea maintained and illustrated in the first. Instead of a few letters only being shown to have been originally derived from the Egyptian, we find the identity of nineteen out of twenty-two confidently maintained, whilst that of the three remaining ones is treated as more than probable. The work before us also discusses the origin of writing, and forms a kind of introduction to the grammar, properly so called.

The history of geographical science, so ably treated by M. Vivien de Saint-Martin||, is one of the most useful books which the present month has brought before us; it begins with the earliest times and takes us down to the recent discoveries of Sir S. Baker and Dr. Livingstone. As M. de Saint-Martin remarks, geography is specially the science of the Aryan and Semitic races, for they alone possess the two qualities of assimilation and expansion which lead to geographical discovery through the natural tendency to emigrate and to colonize. Even the Chinese know little beyond the boundaries of their own empire, and the African tribes care for nothing outside the forests or marshes which supply them with game and other food. The ground explored by M. Vivien de Saint-Martin is very extensive, and the accounts given of so many celebrated travellers and geographers must necessarily be brief; but at the same time they are sufficiently complete. A concluding chapter is devoted to a brief summary of the present state of geographical science, its latest results, and

* *La morale positive*. Par le Dr. Clavel. Paris: Germer-Baillière.

† *Principes de logique positive, ou traité de scepticisme positif*. Par F. Saleta. Première partie. Paris: Germer-Baillière.

§ *Grammaire comparée des langues bibliques*. Par M. l'abbé Van Drival. Paris: Maisonneuve.

|| *Histoire de la géographie*. Par M. Vivien de Saint-Martin. Paris and London: L. Haebette & Co.

its desiderata; an historical atlas of twelve maps, beautifully drawn, adds much to the value of the work.

Dr. Fred. Höfer's *Histoire de l'Astronomie** forms part of a general undertaking which we have often had occasion to recommend to our readers. Not only does it give biographical details respecting the principal astronomers, but it explains their systems, discusses the additions respectively made by them to science, and ends with an interesting sketch of the present state of astronomical knowledge. Dr. Höfer combines the varied attainments of a scientific investigator with the qualities of a popular writer.

Books of travels do not abound so much this month as usual. We may notice, however, a very interesting one by M. Henri Johanet†; it is half scientific, half descriptive, and professes to give us an account of a journey to Naples and the neighbourhood—the locality where the approach to the infernal regions was supposed to be. Some of our readers may perhaps remember that Bonstetten composed so long ago as 1804 the narrative of a *Voyage pittoresque sur le théâtre des six derniers livres de l'Énéide*. Following the example set by the Swiss archaeologist, M. Johanet has written a picturesque commentary on the episode of the Trojan hero's descent into the abode of the dead. His book, which must have cost him a great deal of research, is completed by a chapter on Virgil's tomb and on the traditions connected with it; and finally Torquato Tasso finds an appropriate place in this unpretending but delightful duodecimo. M. Johanet could scarcely visit Naples without going on to Sorrento, and the two poets of ancient and modern Italy are thus pleasantly united. An elegantly engraved map shows the journey undertaken by Æneas in company with the Sibyl.

M. Jacoliot's *Voyage au pays des Bayadères*‡ leads us from Egypt to India and Ceylon. Anxious, no doubt, to secure as many readers as possible, the author has been lavish in his descriptions of the dancing women both of Cairo and of the far East, and he gives us a rather melancholy idea of the state of degradation to which the sex is reduced in those countries. Let us add that his account of the French settlers is more lamentable still; if we may believe him, they quickly become enervated under the influences of Eastern civilization and Eastern climate; they give themselves up exclusively to pleasure, and soon forget all the ties which connected them with Europe. M. Jacoliot is an intense admirer of India; according to him, the accounts we read about the cholera and its ravages are wonderfully exaggerated, as for the dangers which one runs from the bite of venomous serpents, they must be considered perfectly absurd. Next to this *engouement* for life on the banks of the Ganges is M. Jacoliot's hatred of the English. He acknowledges indeed that, taking the natives of perfidious Albion individually, they are honest and upright; some of them are his firmest friends, and in the ordinary dealings of society he has found them blameless; but as a nation, we regret to learn, they cannot be trusted.

The *Revue Suisse*, which sends forth its usual quantum of interesting and amusing articles §, serves to remind us that a number of writers exist who are scarcely entitled to the name of French, because they were not actually born in France, but who put the idioms of Racine, Molière, and Chateaubriand to a far better use than many of the *littérateurs* residing in Paris or its immediate neighbourhood. There is, for example, M. Ernest Naville, the learned editor of Maine de Biran, and one of the most distinguished representatives of spiritualist philosophy; and again, M. Marc Monnier, whose poems are so thoroughly stamped with the marks of genius, humour, and good taste. M. Rambert is another distinguished essayist well deserving a place in this class of writers. Under the title *Les Alpes suisses*||, he has already published several volumes of miscellaneous pieces both in verse and prose, and the fourth series, which is now before us, is a very fair specimen of his abilities. The greater part of the book is occupied by poetry, but we also remark two or three entertaining chapters of less ambitious pretensions, and one especially on the relations existing between Switzerland, Germany, and France. M. Rambert dwells at considerable length upon the causes which have tended to separate, intellectually, the native country of Voltaire from that of Rousseau; and he names as the principal ones, first, the rejection of Protestantism by France; and, secondly, the development of the spirit of centralization. On the other hand, the absence of these elements of discord has helped in a high degree to knit together Switzerland and Germany; the connexion has never been broken, and both Goethe and Schiller, to name only these two, reflect very strikingly in their works the moral atmosphere of Switzerland.

We receive from Germany a pamphlet¶ written in French, and which we consider therefore as legitimate game for us. It treats of the legend of William Tell, already noticed by us a long time ago *à propos* of Mr. Rilliet's volume, and the author, M. Sonnenschein, places himself at the same point of view. Discussing the origin of the legend, he shows its mythical character, and its utter want of historic truth. In the first place, between the time when the heroic act of William Tell is supposed to have occurred and the year 1470, when it was first recorded, an

interval of one hundred and sixty years elapsed; and, as M. Sonnenschein remarks, no tradition could have preserved itself for so long a period unaltered. The same may be said of the alleged cruelties of Gessler and Landenberg; moreover it would be absurd to suppose that the Swiss Constitution was the result of a conspiracy hastily got up by thirty men. It sprang from the combination of several causes, the majority of which did not even originate in the cantons, although the Swiss may justly claim the merit of having perseveringly carried out the idea of throwing off a foreign yoke.

The elegant volume published in *memorial* of Théophile Gautier* contains poetical effusions of unequal merit by authors some of whom are very little known beyond the limits of their native country. The most remarkable, in one sense, are the lines written in French by Mr. Swinburne; the skill with which he has caught the ring of modern French poetry is extremely noteworthy. As for Théophile Gautier himself, whatever may be at present his merits in point of mere style, what must inevitably lose much when quaintness of diction and metrical elegance cease to be regarded as the only essentials of poetry.

* *Le tombeau de Théophile Gautier*. Paris: Lemerre.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

THE BAZAINE COURT-MARTIAL.

THE long trial of BAZAINE has ended, and a Marshal of France has been condemned, by the unanimous voices of seven judges, to death, military degradation, and expulsion from the Legion of Honour. It is a terrible sentence, but no one has a right to say that it is not a just one. The names of the other judges are unknown in England, but the name of the Duke of AUMALE is a sufficient guarantee that the Court over which he presided would regard equally what was due to the accused and what was due to France. The sentence of death will not be carried out; but as it is the sentence prescribed by the military code, the Court, holding him guilty, had no choice but to pronounce it, and leave it to the PRESIDENT to commute it as he might think proper. Immediately after the sentence had been pronounced, the Duke of AUMALE proceeded to lay before Marshal MACMAHON the unanimous recommendation to mercy which the Court had adopted. BAZAINE's life will be spared; but he is a disgraced man, left to wear out the remainder of his life in the long sufferings of humiliation and forfeited character. The finding of the Court was, however, put in a technical form which affords little clue to the real degree and nature of the guilt imputed to him. There could of course be no doubt that BAZAINE capitulated in the open field, that this capitulation had the effect of making those under his command lay down their arms, and that he surrendered a fortified place entrusted to his care. That he had done all these things was incontestable, and the real question was, whether he had done them under the pressure of a necessity so overwhelming, and after such efforts to avert the catastrophe, that he was morally justified in capitulating. The Court must be understood to have pronounced that he was not so justified, that he did not do the best he could reasonably be expected to do with his magnificent army, and that he did not yield to the pressure of a necessity that was overwhelming. On what portions of the evidence brought before it the Court arrived at this decision it is impossible to know. On many of the most important heads of accusation the evidence seemed to foreign readers vague, conflicting, and insufficient, and the summary or version of the evidence given by the Government Prosecutor seemed distorted, bombastic, and unfair. But the Court heard the witnesses, could judge of their demeanour, and estimate their wish and power to tell the truth. It must therefore be assumed that the evidence adduced warranted the conclusion that the capitulation of BAZAINE was not justifiable. But what we do not know and cannot know is the precise ground on which this conclusion was based; and it makes an immense difference in the judgment which ought to be passed in fairness on BAZAINE's conduct according as this ground was one thing or another. Every one knows that BAZAINE was not a general of a high order, and few would doubt that, if MOLTEK had been inside Metz and BAZAINE outside, MOLTEK and his Germans would never have been kept inside the lines of the beleaguering French. BAZAINE ought never to have had the chief command of the Army of the Rhine, but a large portion of the blame for the consequences of his incapacity ought to be imputed to the system of government which had made such an appointment almost indispensable. What is to be remarked in his case is that all the generals under his command, including CANROBERT and CHANZONNIER, approved of his military conduct, and thought that what he did was right. It may even be true, as his Royal friends in Germany assert, that among the generals opposed to them he was the best of a bad lot. But the Court must have been that he did not

know how to do the best that could be done, that he made an insufficient defence, that he behaved in short as a second-rate puzzle-headed man might not unnaturally behave in circumstances of extreme difficulty, they were technically right in finding him guilty, for France is entitled to expect that her Commander-in-Chief shall do more than this. But in that case the guilt of BAZAINE is not really very great. This, however, is only one way of putting what happened. The prosecution gave a very different colour to BAZAINE's conduct. They accused him of not behaving honestly to those under his command, of concealing despatches from them, of hiding from them the negotiations which were the real cause of the capitulation, of doing little, not because he was incapable of doing more, but because to do little suited his schemes. If this was the ground on which the Court held him guilty, and if this ground is taken as established, then BAZAINE's guilt is most serious. What is due to BAZAINE is to notice that the finding of the Court is as compatible with the theory that, being honest but incapable, he did less than his country might fairly call on him to do, as with the theory that his bad generalship was the fruit of insincerity and intrigue.

There is, however, another head of accusation on which BAZAINE has been found guilty besides those above mentioned. The Court has pronounced that he negotiated with the enemy before having done everything prescribed by duty and honour. But here again it may be doubted what it is that the Court means. BAZAINE did not negotiate with the enemy with regard to anything but the terms of capitulation. He countenanced negotiations through the EMPRESS with the enemy, but he always left the conduct of all negotiations, except as to the treatment his own army was to receive, to that which he considered to be the only lawful Government of France. The Court may have meant nothing more than that BAZAINE negotiated for a capitulation before the contemplation of a capitulation was justifiable; and this is only another way of saying that he capitulated too soon, that his defence was not that of a good general, and was shorter and less strenuous than France had a right to expect. This, from a military point of view, is a very severe condemnation. The very best that can be said for BAZAINE is that he has been found guilty by a competent tribunal of not having done his duty as a commander. But what the prosecution asserted was something very different. The construction put on BAZAINE's conduct by his adversaries was that he betrayed his country by trying to make an arrangement with the enemy under which they should get terms of peace satisfactory to them, and he should be at liberty to use his army to restore the Empire. This was the gist of the gravest charge against him, and it was this which, if proved, would have stamped him with the infamy of a traitor. It is possible that the Court may have thought that it was proved, but it is impossible to gather this from the finding. The words of the finding are, indeed, opposed to the supposition that this was the meaning of the Court. BAZAINE is found guilty, not of opening negotiations of a traitorous character, but of negotiating before duty or honour sanctioned such negotiations. The element of time is the important point in the terms of the finding on this head. He negotiated sooner than he should have done. Had the time of capitulation arrived, had he first done all that honour and duty prescribed, then he would not have come within the language of the condemnation; whereas at no time, nor whatever had been his previous conduct, could he have been justified in bargaining with the enemy that a foreign war should be terminated

and a civil war begun. He no doubt ignored the Government of September as far as he could, and treated the Government of the *Express* as the only one existing for him. Even his prosecutors, however, did not call this treason; but they said that he failed to do what the *Express* herself did, and would not honestly assist the Government which, whatever its origin, was in point of fact carrying on the war. Is this true? Did BAZAINE wilfully fail to communicate with the Government of Tours, seek to hide his position from them, and capitulate without taking the trouble to learn what effect his capitulation would have, at the particular date when it took place, on the fortunes of the Army of the Loire? There was some evidence to show that he did make efforts to let the Government of National Defence know what was going on at Metz, although those efforts were faint and tardy. The general impression left by the perusal of the evidence on this head is, we think, that he did not co-operate with the actual defenders of the country to such a degree and in such a manner as he ought to have done. But then this is merely an impression gathered from the evidence as reported. There is nothing to show that the Court came to the conclusion that this was the result of the evidence as given before it. He might have communicated with the Republican Government and been willing to help them; but if he was so incapable and timid a commander that he did not know how to prolong an effective resistance, he might have negotiated for a capitulation before he had done all that duty and honour proscribed.

The trial has been to a great extent justified by its result, if it needed any justification. There were many drawbacks to the gain of having the judgment of a Court pronounced on a Marshal of France, but the gain, if he was guilty, vastly outweighed the drawbacks. We must remember what BAZAINE did. This Metz army was the hope and pride of France. It retreated so late from the line of the Moselle that it was stopped on its way westwards by the Germans, who had got round it. After two severe fights it was turned back into Metz. There it stayed for two months without any effective attempt at a sortie, and hemmed in by a force little superior in numbers to itself. At last it capitulated, and men, arms, guns, flags, all the army, and all that the army cherished, were sent off to Germany; and it so happened that this capitulation, coming when it did, had peculiarly disastrous effects, crushed the Army of the Loire, and ruined the possibly hopeless, but certainly noble, effort which France was making to repair her defeats. Let us put the charge of treason aside, for the finding of the Court does not involve its truth, and the evidence, we think, does not substantiate it. We will suppose that BAZAINE had never been suspected of anything beyond that of which the Court has found him guilty—neglect of his duty as a general. Is it wise in a nation to pass over, through a mere wish to cover its own shame and to spare the feelings of those in a high position, neglect of duty on the part of a general to whom it had committed so great a trust? It is impossible to think so. France had a right to ask that a charge of neglect of duty under such circumstances should be accurately and patiently investigated, and, if established, should be followed by some striking and memorable punishment. The Government of M. THIERS and the present Government were bound to prosecute BAZAINE. Of course, if the Empire had been restored before this, the prosecution would have been dropped; but this is only saying that if the Imperialists had had the power they would have screened a friend. As to the army, it will gain greatly by feeling sure henceforth that it will be led by men who dare not neglect their duty; and commanders will gain by knowing that they must let considerations of no sort whatever interfere with their doing what duty prescribes. The counsel for the defence attempted to stigmatize the prosecution as a political one, and no doubt it is highly satisfactory to the Republican chiefs to have it established that, if they failed, their failure is to be largely ascribed to an Imperialist Marshal having neglected his duty. But it was France, not the Republican party, that was primarily interested in knowing why its arduous efforts to retrieve the defeat of Sedan failed, and in bringing any one on whom a large portion of the blame of this failure could be justly laid to such punishment as he might deserve. We may pity BAZAINE, as we pity a man placed unhappily in a position far above his merits and capacity. But those who accept serious responsibility must take the consequences if they fail to do that which they are responsible for doing;

and all that BAZAINE was entitled to ask was what he obtained—the investigation of his conduct by a perfectly fair tribunal, under the guidance of a President equal to the difficult task of conducting such an investigation satisfactorily.

MR. HARCOURT AT OXFORD.

THE SOLICITOR-GENERAL'S speech at Oxford was by many degrees more interesting than the ordinary addresses by members of Parliament which occupy the dreariest columns in the daily newspapers. It is satisfactory to find that there are still Parliamentary speakers who are not ashamed to study epigrammatic terseness, to express elevated sentiments in polished and sonorous sentences, and to abstain from sophistical cant, not only on account of its unsoundness, but because it is commonplace and vulgar. Successful cultivation of the art of oratory is not the highest accomplishment of a statesman, but it is a proof of natural capacity, of well-applied industry, and of the taste which is as much a moral as an intellectual quality. Mr. HARCOURT properly repaid the considerate moderation of the Conservative portion of his constituents by disclaiming any intention of making a party speech. They had every reason to be satisfied with the moderation of his language; and it may be doubted whether they are disposed to quarrel with the substance of his opinions. On all material questions the SOLICITOR-GENERAL is utterly opposed to the projects of the extreme or revolutionary Liberals. He denounces with just indignation "the wild, loose, and impracticable stuff" which is uttered about the law of land; and he announces, not for the first time, that he will never be a party to the disestablishment of the Church of England. As one of the few remaining depositaries of the orthodox Whig tradition, he still repeats the profession of belief in those principles of "Peace, Retrenchment, and Reform" which were proclaimed on a thousand platforms at the time of the first Reform Bill. It is true that none of the three phrases represents a principle; for the expediency or possibility of peace must depend on circumstances; retrenchment is only justifiable where expenditure has been excessive; and reform, which has casually become associated with changes in the representative system, would imply a perpetual desire of change, even if the franchise and the distribution of electoral power were absolutely perfect. At present there is happily no question of war, except in a barbarous country; Mr. HARCOURT's colleagues and chiefs dissent from his belief of the possibility of reducing the army and navy; and he himself all but directly protests against the mischievous scheme of reform which seems to be contemplated by the Government. It is, in Mr. HARCOURT's judgment, "not the moment to embark in any great scheme for the redistribution of electoral power." If Mr. GLADSTONE raises the question for the purposes of the general election, he may of course count on the vote of his SOLICITOR-GENERAL, who nevertheless shares the repugnance to a wanton experiment which is felt by all moderate members of the Liberal party.

Mr. HARCOURT's reference to his own experience of life in an English parsonage was rather rhetorically suitable than strictly argumentative; yet a practical knowledge of the working of the Established Church in rural districts would correct the hasty judgments of many flippant theorists. The moral and the material uses of an Establishment, independently of the strictly theological functions of the clergy, are closely connected with the peculiarities which excite the envy and dislike of Nonconformist ministers. The social jealousy which, as Mr. MIALL admitted, stimulates the agitation would scarcely justify subversive legislation. On the narrower issue of the Education Act Mr. HARCOURT agrees with the Birmingham League, though on the expediency of combining religious teaching with elementary education he differs from the Secularists and Dissenters. In his opinion Denominational education is likely to be insufficient; and he remarked that, if the late ATTORNEY-GENERAL was at liberty to differ from Mr. BRIGT, the present SOLICITOR-GENERAL might say that he agreed with him. To agree with Mr. BRIGT is to differ from Mr. FORSTER, who on this question has the advantage not only of representing the Government, but of vindicating a policy which is at least definite and intelligible. Mr. BRIGT, in his speech at Birmingham, repudiated all responsibility for the acts or intentions of his colleagues. An unfriendly critic might have suggested that the profession of doctrines which were not to be

applied in practice was a cheap method of cultivating popularity; but, if Mr. BRIGHT is content to make extreme Radical speeches and to concur in moderate legislative proposals, his own section of the Liberal party have a better right to complain than their more prudent allies. Mr. FORSTER, unlike Mr. BRIGHT and Mr. HARCOURT, had not to make an election speech, but to provide for national education; and he has, while opponents and captious supporters were talking, accomplished a great part of his task. He may perhaps agree with Mr. HARCOURT that a system of schools supported by rates would be preferable to the present arrangement; but, if he had thrown over all the voluntary schools which he found in existence, he would have perpetrated an unjustifiable waste of available resources, and he would not have carried his Bill. Mr. HARCOURT is fully justified in regretting the consequences which one party attributes to the defects of the Education Act and the other to the sectarian agitation of the Birmingham League. The classification of School Board candidates and members according to their religious tenets or predilections is a new and uncomfortable symptom of political disorganization. Even at the last municipal election, the names of town councillors were unfortunately described in the newspapers as respectively Churchmen, Nonconformists, or Secularists. Constitutional government will be seriously endangered when the divisions of political parties habitually coincide either with social or with religious distinctions.

The SOLICITOR-GENERAL will necessarily suspend during his term of office the efforts to promote retrenchment in which he has hitherto but imperfectly succeeded. As he reminded his constituents, he moved in the last Session for a Committee on Public Expenditure, and he obtained a Committee of which the object was to help the Government in reducing the emoluments of some branches of the Civil Service. In the *New Whig Guide* a notorious politician of the day confesses that he had asked for the place of Secretary of State, and that he had accepted the appointment of Clerk of the Kitchen. Mr. HARCOURT's success scarcely bore a larger proportion to his original aspirations. He had made public in various forms his arguments, which were intended to prove that the nation might safely reduce its naval force, and almost dispense with a standing army. The Ministers prudently declined to enter on an inquiry of the proposed novelty and magnitude; and the opportunity of carping at a few items of the Civil Service expenditure probably furnished but a poor compensation for the disappointment. With much political knowledge, and with ability to supply any deficiencies which may yet remain, Mr. HARCOURT is still but insufficiently acquainted with finance. His confidence in Mr. GLADSTONE's financial skill is well founded; but there is no reason to suppose that it is possible to substitute for the Income-tax any more equitable source of revenue. His criticisms on the "busybody" character of much recent legislation were more just in themselves than complimentary to his colleagues and official superiors. There can be no doubt that the Parliamentary triumphs of the first two Sessions after the general election persuaded some members of the Cabinet that the condition of popularity and power was the production of an interminable series of sweeping measures. One of their members plainly stated that when the Liberal party had exhausted its list of measures, it must look for something more to do for the mere purpose of justifying its existence. Mr. BRUCE's first Beer Bill, with all its unequalled absurdities, was rashly introduced at a time when it could not have been passed even if it had been universally approved; and on the same evening Mr. GOSCHEN introduced a Rating Bill which was offensive and alarming to large classes, although he knew that it could not even be discussed during the current Session. The impression was until lately widely spread, both among friends and opponents, that the Government would neither resolutely defend any existing institution nor allow anything to be let alone. On one point they are now apparently prepared to make a stand, having learnt experience from many contested elections. Mr. HARCOURT is, as the publicans of Oxford know, thoroughly sound on the question of beer; and he refers with satisfaction to Mr. GOSCHEN's recent expression of a similar opinion. If in-
debtors, or College Fellows, or even landowners, were as powerful and as united as the public-house keepers, they also might perhaps enjoy a respite from hostile agitation. Mr. GOSCHEN's threat of a compulsory sale of lands held in mortmain will not be forgotten by the objects of his

gratuitous menace. Two months hence it will be known whether any new sacrifice is to be offered to the inordinate activity which excites the admiration of Mr. GLADSTONE's devotees. Notwithstanding the necessities of the general election, the Government will be well advised in profiting by the advice of the SOLICITOR-GENERAL; but the weight of his authority will perhaps be impaired by his unconcealed indifference to continuance in office.

SPAIN.

OF the many dangers and embarrassments which have lately beset the Spanish Government, the most imminent and formidable will probably be averted. It is not known whether there was any foundation for the rumour that the Captain-General of CUBA had at one time tendered his resignation on account of the alleged impossibility of surrendering the *Virginius* without causing serious disturbance. It now appears that even the dominant party in Cuba has become sensible of the folly of rendering American intervention inevitable. The *Virginius* has probably by this time been surrendered; and possibly the other demands of the PRESIDENT may be ultimately conceded. Some American jurists, as well as the majority of English writers on the question, justify the capture of the *Virginius* by the *Tornado* on the ground that the vessel had no right to the protection of the American flag. In 1856, when a part of the English squadron was transferred from the West Coast of Africa to the Mexican Gulf, the Government of the United States announced that no English vessel would be allowed on any pretext to search a vessel bearing the American flag; but in the confidential instructions to the American cruisers, their commanding officers were informed that protection was only to be given to ships which were *bonâ fide* entitled to use the flag. In other words, a foreign man of war might, at the risk of committing an act of war in the event of a mistake, detain a trader under the American flag if it were certain that the flag was fraudulently assumed. It is now argued that the policy of the United States was in 1856 controlled by slaveholders; but the Senate unanimously supported the PRESIDENT, and Mr. SUMNER, the leader of the Abolitionists, took, as might be expected, a prominent part in measures which were supposed to be offensive to England. As the English Government practically acquiesced in the rule as laid down by the Government of the United States, it may be regarded as a settled principle of law that an alien vessel cannot protect itself by the unauthorized use of a national flag. In the present instance it seems uncertain whether the *Virginius* belonged to the insurgents of Cuba, or whether they had merely chartered an American vessel for the conveyance of troops and stores. The local authorities and the American Vice-Consul at Kingston had given the vessel a clearance on the exhibition of American papers; and there is at present no proof that they were guilty of any irregular proceeding. The PRESIDENT of the United States might perhaps have been less peremptory in his demands if he had not been justly irritated by the brutal murder of a part of the crew and passengers. It was not unreasonable that everything should be presumed against the officials at Santiago.

It is satisfactory to find that the Spanish Government has thus far not suffered from its prudent acquiescence in the just claims of the United States. There is no account of disturbance or of extraordinary disaffection in Madrid; and the collapse of the threatened agitation in Cuba will probably satisfy the most turbulent patriots at home of the impossibility of resistance. Nevertheless the most difficult part of the task imposed on Señor CASTELLAR has yet to be discharged. It will be difficult to ensure the punishment of the functionaries who took part in the judicial massacre, especially as General BURRIEL, the principal offender, has returned to his post as Governor of Santiago. His criminality is rendered even more certain and more odious by the details which have been lately published. The American and English Vice-Consuls before the execution applied for an audience to the Governor, who both declined their request, and prevented them from sending during the day telegraphic messages to Havannah. On the following day, when the unhappy prisoners had already been put to death, General BURRIEL tauntingly informed the American Vice-Consul that he had been prevented from attending to business on the

previous day, because it was a religious festival, and "he was occupied in meditating on the divine mysteries." It will be difficult to reconcile the dominant faction in Cuba to the condign punishment of leaders who undoubtedly complied with the popular wish when they put the prisoners to death. On the other hand, neither the American nor the English Government can submit to the impunity of the principal wrongdoer. It may be taken for granted that Señor CASTELAR regards the conduct of the Colonial functionaries with serious reprobation, but he may perhaps be powerless to inflict on them the punishment they deserve, although his firmness has induced them to acquiesce in the surrender of the *Virginias*. The pretended desire of the Americans for war is happily altogether imaginary; and, whatever may be the ultimate result, there is no present risk of a rupture.

The Carthagena insurgents will probably be disappointed in the hope that the misunderstanding between Spain and the United States would effect a diversion in their favour; yet the most unaccountable of rebellions maintains itself with unexpected vigour. The attack on the place began many days ago; and English officers at the headquarters of the besieging army thought that the demeanour of the troops and the practice of the artillery were highly creditable. A part of the town has been destroyed by the bombardment; but it is not known that any of the forts have been destroyed or silenced. The Spanish fleet has during the attack been for the most part absent, and there is a rumour that the Admiral is afraid that the crews would mutiny if he were to take an active part in the siege. The rebelsquadron shows no disposition to engage an enemy who certainly offers little provocation; but one vessel, commanded by an English adventurer, has made several captures of Spanish merchant vessels, and has procured considerable supplies of provisions. The defenders of Carthagena are indebted to the humanity and gallantry of an Italian naval officer for the removal of a large number of women and children; and it is said that the leaders have since the beginning of the bombardment maintained comparative union among themselves. One of the oddest events of the strange civil war is recorded without any expression of surprise, probably because the capacity for astonishment has been exhausted in the course of the struggle. The general commanding the besieging force has in the middle of the attack returned with his staff to Madrid, and he has already had two successors. It is possible that General CEBALLOS may have been recalled in consequence of his failure to reduce the insurgent town, but a change in the command of an army during a decisive operation can seldom be expedient. If General CEBALLOS has voluntarily resigned his command because he may have been dissatisfied with the Government, his conduct would in any country except Spain expose him to severe censure and punishment. Among many difficulties, the worst of the Spanish Minister's embarrassments must be the impossibility of finding a general or an admiral whom he can trust.

No fitter illustration of the blessings of Spanish Republicanism could be given than the plausible conjecture that the obstinate resistance of the insurgents is encouraged by a hope of priestly support. The period appointed for the dictatorship of CASTELAR has nearly expired; and the Cortes, whose presence at Madrid made government impossible, will, according to the terms of the prorogation, reassemble in January. It is thought possible that the extreme majority may, with the aid of the anarchical rabble of Madrid, effect a revolution, or a change of Ministry, which would serve the purpose of the Federalists almost as well. If their friends were even temporarily in office, CONTRERAS and ROQUE BARCIA would at once cease to be rebels, while their adversaries would perhaps as suddenly find themselves denounced as traitors. The episode of a rebellion, or, as in this case, of a civil war, has frequently occurred in the career of Spanish Ministers and patriots; nor is there reason to suppose that the proceedings of the Carthagena insurgents are regarded by any class of politicians with extraordinary moral indignation. It is possible that Señor CASTELAR may become unpopular in consequence of his prudent assent to the demands of the United States; but it is scarcely to be supposed that he will allow the Cortes to meet, except perhaps for the purpose of a further adjournment. All the circumstances which justified his claim of dictatorial power exist in undiminished force. The Carlist civil war is still smouldering in the North, where

LIZARRAGA is still blockading Tolosa. It is impossible to conjecture whether a month hence Carthagena may still maintain its independence. Moderate and patriotic Spaniards would support the Minister in a refusal to transfer supreme power at a perilous juncture to an incapable Assembly which has little pretence to represent the nation. The eloquent speeches which did much to reduce the country to its present chaotic condition will be condoned if CASTELAR continues to prefer the discharge of indispensable duties to a selfish affectation of consistency. It may be true that the rebels of Carthagena are the genuine Federal Republicans; but their failure to procure allies or imitators in other provinces proves that Federation in Spain was only a mischievous rhetorical flourish.

THE EXETER ELECTION.

THE Exeter election took place on Tuesday, and ended in the defeat of Sir EDWARD WATKIN by a very considerable majority. The result is not very surprising, and the Liberals of Exeter may congratulate themselves on having kept the party so well together that over two thousand voters polled for Sir EDWARD WATKIN. He was a candidate good enough to suit those who were determined to get a Liberal in if they could, but not good enough to turn a single waverer. There is nothing very captivating in the thought of returning to Parliament a man who is already Chairman of three Railway Companies, whose time must be almost entirely absorbed, and whose interests on all railway matters must be opposed to those of the public. It is true that Sir EDWARD WATKIN made a good candidate in one way. He did his utmost to be popular, and in speaking he obtained an easy victory over a weak antagonist. But his Liberalism, attractive to those who by Liberalism simply mean letting every one do every foolish thing he thinks proper, was enough to terrify any one who might be inclined to look for thought, reflection, or political principle in his representative. Mr. MILLS, on the contrary, had faults which were mainly negative. He could not speak; he could not sketch out any Conservative policy on any subject; he seemed to belong to that section of his party which not only looks to be educated by its leaders, but humbly asks that its education shall begin with the alphabet. Conservatives, however, do not much mind this. They want a member not to be so very clever, but to be a good Conservative—that is, to be a man holding an ascertained position, likely to make himself locally useful, and pronounced satisfactory by competent clerical authorities. A weak gentleman is after all a gentleman, and, if he has no particular opinions on the details of politics, he is certain to rally round the Altar and the Throne and vote as he is bid. It was, too, in Mr. MILLS's favour that he contested Exeter at the last election, and was only defeated by a small majority, for, no doubt, there is some sympathy with a candidate who is so attached to a borough that he will stand for it time after time. Personal liking, too, goes a considerable way in elections when there is no great political excitement, and Mr. MILLS has in abundance the qualities which make men glad to do a friend a good turn at no great cost to themselves. A better candidate than Sir EDWARD WATKIN might possibly have polled more votes than he did; and it does not follow that because Mr. MILLS has been returned that a really good Liberal candidate may not succeed against him at the next general election. Still, under the present circumstances, Mr. MILLS's return was very natural, and does not need to be accounted for by the use of reprehensible means. That bribery and corruption had been employed, not of course by Mr. MILLS himself, but by his agent, was loudly asserted by some disappointed Liberals when the result of the poll became known. Even Sir EDWARD WATKIN is reported to have used language which implied that unfair means had been used against him. A defeated candidate ought to be very scrupulous in making such assertions; and if he makes them, he ought to be considered bound to prove them.

That the result disappointed some Exeter Liberals is certain, and there was heard, what under the Ballot we shall always hear, the statement that, if promises had been kept, the election must have gone the other way. But it was scarcely for Exeter Liberals to complain of broken promises when their sitting representative, Mr. BOWRING, had explained to them only a few days before that under the admirable system of the Ballot, to make promises, break them, and keep the conscience clear had become the easiest

thing possible. We do not believe that a majority of over three hundred is to be attributed either to corrupt practices or broken promises. Mr. MILLS has been returned because the larger number of voters wished to see a Conservative successful, or preferred Mr. MILLS to Sir EDWARD WATKIN. It is as legitimate a Conservative triumph as can be conceived. It is part of their strength as a political party that a candidate weak in himself is good enough for them, provided he is a gentleman and can be trusted; whereas Liberals have from the nature of their politics a difficulty in finding good candidates, as the class of candidates who can be most easily found, that of amiable, mild-spoken gentlemen with no marked abilities or political creed, are comparatively useless to them. The election can have, however, no immediate political effect. The Government will meet Parliament next Session unaffected by having lost this particular seat. If all the elections that have taken place in the recess had been adverse to them, the case would have been very different. Although they would have had a considerable majority, and might have counted on that majority on a critical division, yet, if one constituency after another had shown disapproval of the Ministerial policy, the Cabinet would have felt weak and disheartened, and the existing House of Commons might have seen itself subjected to the reproach with which the French Assembly is taunted, that it does not represent the country. But as the Government has merely won here and lost there, and as there is no general current of opinion against them, and no one is prepared to take their places if they were turned out, they have as fair a chance of carrying their measures next Session as a Government can have with a House of Commons on the eve of dissolution. The Exeter election is said to be a warning; but of what is it a warning, and to whom? It is indeed a proof of what is clear enough if the Parliamentary history of recent years is considered. The election of 1868 did not reflect the permanent strength of the two parties in the English boroughs. The Liberals have probably a majority in them, as Mr. DISRAELI confesses, but they have not so large a majority as the returns of 1868 would lead us to suppose. The election in that year was held in a time of great excitement, and Mr. GLADSTONE and his colleagues had then the advantage of being out of office and looked upon—justly, we think—as men capable of considerable things if they had a chance; whereas the Conservatives had recently stultified their past political lives by becoming the authors of a sweeping Reform Bill. It thus happened that the Liberals had an accidental advantage which raised their successes in the English boroughs beyond what accorded with their permanent strength. It is curious, in looking through the records of the elections in 1868, to notice how very small the majorities were in many cases by which Liberals were then elected; and a small majority is easily reversed. There are many boroughs of which it may be said with considerable confidence that they will return a Liberal after a Conservative Ministry has been some time in office, and a Conservative after a Liberal Ministry has been some time in office, parties being so evenly balanced that the inevitable grumbler can make his influence felt. Exeter is perhaps one of these boroughs, and the day may come when the tenure of office by his friends may, in the turning of the wheel of fortune, cost Mr. MILLS his hard-won seat.

It may perhaps happen before long, although no distinct signs of such a thing happening appear at present, that accidental causes will give the Conservatives a share of the representation greater than their permanent strength in the constituencies warrants; and this will be needed if they are to have a Ministry that can take office with credit. We may go so far as to say that, although there are no distinct signs as yet of such a thing happening, it is not difficult to see how it might happen. Taking the country all through, Denominationalism is evidently stronger than Anti-Denominationalism, and beer is stronger than temperance. Each constituency may of course have its special leaning on the subjects of education and licensing, and therefore what is true of the country generally may not apply to any particular borough. Or, again, the subject of education may not be exclusively important in the estimation of a constituency, and a member may be returned on the general issues of Imperial policy, or because he is a specially fit man to be in Parliament. But there is always a probability that the general opinion of the country will be reflected in the opinion of any one constituency, and therefore the chances are that Denominationalism and beer will make their influence felt in the

boroughs. It seems to many Liberals very hard that it should be to the cost of the Liberals only that this influence is felt. They say, truly enough, that it is the Act of the present Government on Education that is considered to be too favourable to Denominationalism, and that the Licensing Bill was passed with the concurrence of the Conservative party. All this is true, but ardent Denominationalists and irritated publicans do not trouble themselves to do justice or to go into the history of the means by which Acts of Parliament have been passed. They ask themselves the very simple question whether CODLIN or SHORT is their friend, and the Conservative or the Liberal the more likely to stand by sects and public-houses; and a rude but sufficient common sense tells them that it is the Conservatives. They observe that those who are working in favour of Anti-Denominationalism and the Permissive Bill are, in nine cases out of ten, Liberals, and they prefer the party which is free from suspicion. We must own that, if judged from their own point of view, they seem to us quite right. It is a matter of great regret that constituencies will insist on ignoring all but one or two pet questions, and are so apt to put out of sight that there are other issues of greater moment which they practically help to determine by forgetting them. But we must take men as they are, and it is absurd to talk as if political power in England was exclusively in the hands of wise and enlightened men. Constituencies will attach too much importance to the little things that specially interest voters for the time being, whatever we may do or say. The disestablishment of the Irish Church was not one of these little things. It was a great question of Imperial policy on which the constituencies were asked to pass judgment. But it had the effect of giving the Liberals a majority accidentally large. To-day is a day of little, not great, questions; but these little things may suffice, although, as we have said before, there is no trustworthy evidence that they will suffice, to give the Conservatives an accidentally large share in the representation of English boroughs at the next general election.

THE FRENCH ELECTORAL LAW.

THE Duke of BROGLIE evidently intends to make the Committee of Thirty useful. A short time back it was supposed that they were to confine themselves to the construction of a Constitution, and that the process of reforming the constituencies by the excision of Republican electors would be undertaken by the Cabinet. It now appears that the Government intend to obtain all the support that can be given by the vote of a Committee before bringing this extremely awkward question before the Assembly. The Committee of Thirty is composed of five Liberals, six members of the Right, and nineteen of the Right Centre; and upon the propriety, or rather the necessity, of a Reform Bill, the two latter sections are agreed. Perhaps a further impetus may be given to their zeal by the result of to-morrow's elections. Four deputies are to be returned by three departments, and should the extreme South, the extreme West, and the almost metropolitan district of Seine and Oise agree in electing Republicans, the case in favour of reform may be taken as proved. There is a little inconsistency perhaps in bringing on this measure while the Bill for regulating the election of Mayors is still under consideration, since one of the reasons given for taking the nomination out of the hands of the Municipal Councils is that they elect men who refuse to help the Prefects in getting the right sort of candidates sent to the Assembly; and it might be plausibly argued that the Government had better wait and see what efficient Mayors can do for them before weeding the constituencies. But the Duke of BROGLIE no doubt knows that after all the most well disposed of Mayors cannot do the Government much service in this way. Their co-operation is not to be despised, because where you have to deal with an adverse population no means of enlightening or persuading them should be left untried. However carefully the Electoral Law may be drawn, it must leave many Republican voters on the register, and as some of these may be open to official pressure, there will be something for the Mayors to do, even if the voters could be made as few as they were in the golden days of LOUIS PHILIPPE.

With twenty-five out of thirty votes in the Committee secured beforehand, the Government will come before the Assembly with the prestige of an immense majority. There is danger in this, however, as well

as safety. After all, the support of a Committee is only valuable in so far as it represents support which will be forthcoming in the Assembly itself, and the way in which the Committee of Thirty has been constituted makes it quite worthless for this purpose. On the question of a new Electoral Law the Liberal Opposition may count upon securing more votes than upon almost any other, and, if so, parties are likely to be so equally divided as to make the issue of the debate uncertain. In such a case as this nothing injures the chances of a Bill more than over-confidence on the part of its promoters; but it is difficult not to be a little over-confident when the Bill has at its back the recommendation of five-sixths of a Committee. There has been no opportunity for rehearsing those narrow divisions in which the capture of a single vote may turn the scale. A minority of one-sixth is almost certain to stick closely together. There is no room for calculation or combination. The minority learns to take being outvoted as a thing of course, and consequently makes no effort to avoid it. If the Committee of Thirty had been constituted on the principle of reproducing, with some approach to accuracy, the division of parties in the Assembly, this danger would have been avoided. It would have been possible to forecast how this or that section of the Opposition would stand affected towards the Bill, and there would have been time to devise compromises and arrangements by which their support, or at least their abstention, might have been secured. As it is, the temper of parties in the Assembly can only be guessed at down to the time when the Bill comes on for discussion. The fact that it will be presented by a very large majority of the Committee of Thirty will be nothing in its favour, because the circumstances under which the Commission was chosen have been more than commonly notorious. Everybody will remember the determination of the Right and the Right Centre in the first instance to admit no more than three members of the Opposition to share in their deliberations, and even at last to admit no more than five; and, with that little incident in the background, the Assembly will not be greatly impressed, even if the Committee adopts the Bill by five-and-twenty votes out of thirty.

The introduction of a new Electoral Law is tantamount to a confession that all the ordinary means of influencing elections which French Governments have at their disposal are unavailing in presence of the resolute preference of the nation for Republican institutions. Probably if the constituencies had any faith in the professions of the Ministerial journals that the prolongation of Marshal MACMAGON's powers means the continuance of the Republic for seven years certain, the issue of some at least of the partial elections would be less unfavourable to the Government. The really Conservative elements in the nation appear to desire a Republic, but they would be content with, or rather they would certainly prefer, a Republic of an exceedingly moderate type. M. THIERS saw this, and was anxious to frame a Republican Constitution in concert with the Conservative majority in the Assembly. The Conservative majority refused to be used for such a purpose, and from that hour they have been set down by the constituencies as Monarchists at heart. If the Fusion had never been effected, this suspicion would possibly have died away; but an avowed attempt to set up a Monarchy, following upon a refusal to set up a Republic, naturally confirmed and strengthened it. What is to prevent the Duc DE BROGLIE from acquiescing in a Monarchical intrigue next year, as he undoubtedly acquiesced in one this year? If he was prevented from placing the Count of CHAMORD on the throne only by an inopportune letter from the Count himself, the appearance of a letter of a different kind may revive his conviction that Monarchy and order are ideas which do not admit of being permanently disassociated. Or suppose that the Count of CHAMORD were after all to abdicate, and that the Count of PARIS were to give, as he would give, all the guarantees that the Right Centre wish to obtain from their King, would not the Duke of BROGLIE hold that this change absolved him from the obligation to keep the Republic going for seven years? It would be rash to say that the answers which those who ask these questions usually give to them are the correct ones. It is enough that they are the answers which are accepted by the greater part of the French people. The more the attitude of the constituencies is studied, the more evident it becomes that the existing Government is distrusted, not so much because it is reactionary, as because it is suspected of being Monarchical. There never was a time when French elections had so good

a claim as they have at present to be accepted as giving the real mind of the French people. The fear of offending the Radicals which has sometimes influenced the electors is, to say the least, neutralized by the fear of offending the authorities, and the failure of the Government hitherto to carry a single election is assuredly not to be attributed to any unwillingness to turn the last fear to account. A Reform Bill the object of which is to deprive large numbers of electors of the suffrage is unmistakably designed as a punishment for the manner in which they have used it heretofore. It is quite possible that it may fail of its object, even if it becomes law, because its success is bound up with the theory that the Republican feeling is only found in the lower strata of the constituencies, and that if these can be banished from the electorate all will go well. If it should turn out that the Republican feeling is distributed vertically, and that the higher classes of electors are equally Republican with the lower, the result of a new Electoral Law may be to lessen the aggregate of voters at each election, not the proportion given to this or that candidate. And that such a law will be passed even by the existing Assembly is an assumption of considerable boldness.

HOUSEHOLD SUFFRAGE IN COUNTIES.

THE advocates of the extension of household suffrage to county constituencies are naturally encouraged by Mr. GLADSTONE's assent to receive a deputation on the subject from bodies which profess to represent the agricultural labourers. They are probably justified in the inference that the Government will bring in a Household Suffrage Bill in the next Session. The long period of two or perhaps three years has elapsed since Mr. GLADSTONE formally announced that the change, however desirable, would not be proposed by himself during the remainder of his political career. When he pledged himself to postpone a new disturbance of the electoral system, he did not think that he should live to make household suffrage in counties one of the principal issues of the next general election. If the conjecture of the enthusiastic journal which divides its affections between Mr. GLADSTONE and M. CAMBETTA is well founded, the suffrage is to be given to the labourers as to model school-boys, by way of reward for good behaviour. It seems, according to the *Spectator*, that the artisans were enfranchised in consequence of their good conduct during the cotton famine; and the labourers have earned a similar boon by their sagacious adoption of Mr. ARCH's advice to strike for a rise of wages. Of course their laudable regard for their own interest is described as a solemn exercise of virtue. The labourers have displayed, among other qualities, "a dumb pathetic earnestness," and it is high time that, no longer dumb, "they should be permitted to speak" out their moving, slow-tongued eloquence on the politics "of rural England." Innocent theories of this kind would not deserve serious discussion if they were not likely to influence Mr. GLADSTONE's singular temperament. In the present instance it is more reasonable to attribute his policy to a more commonplace and prosaic motive. His gratitude to the labourers perhaps relates rather to the future favours which they may confer by their votes on the Liberal party than to the dumb and pathetic eloquence with which they have demanded three or four additional shillings a week. Mr. THEVELYAN and other representatives of ultra-democracy frequently assert that they have never heard a plausible argument against the equalization of the franchise in town and country. It is perfectly true that, if symmetry is the test of sound political organization, the whole country ought to be at once carved out into equal electoral districts, with a perfectly uniform suffrage. It is perhaps becoming an anachronism to object that a principal object of constitutional arrangements is good government, including freedom of opinion, security for property and order, and protection of the rights of the minority. At this moment the working classes, if they thought fit to combine their forces against the rest of the community, would have it in their power to return to the House of Commons a majority of borough members, who might possibly not have received the votes of a single proprietor, tradesman, or member of the educated professions. It has been truly remarked that "a low franchise in England is more really democratic than in any other civilized country. The majority of English householders live upon weekly wages, and own no realised property, except perhaps furniture, or money in the Savings Bank. English artisans receive larger incomes

than the members of the same class in any other part of Europe; but the elaborate and complicated organization of industry in this country assigns to workmen their share of the profits of production in the form of wages. They would probably be the first to suffer by revolutionary disturbance; but they are naturally indifferent to risks which seem to them immediately to affect the capitalist and the landowner. The vast majority of the borough constituency pays no direct taxes; and the inconvenience which might indirectly and ultimately arise to workmen through onerous and unjust taxation of property is not likely to be adequately appreciated.

Household suffrage in the counties means a large reinforcement of the most democratic element in the existing constituency. If the measure is passed, landlords and tenants may save themselves the useless trouble of attending the poll. The agricultural labourers have lately become the special favourites of revolutionary agitators, who justly recognize in Mr. ARCH, though his original objects were practical and economic, a valuable ally of the OGGERS and BRADLAUGHS. When the labourers have votes, they will be courted and absolutely governed by demagogues, who will teach them as a first lesson the expediency of combining against their oppressors who own or rent the land. Unscrupulous adventurers have wasted much eloquence in endeavouring to persuade the artisans of the towns that they are aggrieved by Game-laws with which they have nothing to do, and by the accumulation of landed estates, although they themselves could not occupy freehold farms if they were to be had for nothing. The labourer knows more about land, and the demagogue can consequently at any time offer him a tempting bribe. His protest against large estates and large farms would be more earnest, because it would be more selfish, than the vague clamour of dwellers in towns. Whatever may be thought of the proposed change, it is idle to treat it as insignificant. The Conservatives have already begun to tamper with the extension of the suffrage, because they fear that it will be carried, and hope by prudent conformity to conciliate the favour of the new electors. Some of the organs of moderate Liberalism have with culpable carelessness approved of the proposed equalization through unacquaintance with the condition of rural districts. Mr. DISRAELI's speech at Glasgow indicates a disposition to check his hasty followers in their servile imitation of his own former policy. As a professed patron of the working classes, and especially of the farm-labourers, who are the amiable peasants of his novels, Mr. DISRAELI carefully abstains from raising any direct objection to a measure which, as he has often and truly said, would increase the electoral power of the counties; but he calls attention to some of the collateral results which would follow a new scheme for the reconstruction of the representative system. The derangement of the balance of political power would absorb the attention of Parliament and of the country; and, until the question was settled, it would be difficult to proceed with other important measures. Mr. DISRAELI may not perhaps really regard with alarm an interruption of Mr. GLADSTONE's legislative restlessness; but an argument against any measure proves that the person who uses it is opposed to the project, although he may perhaps attach little weight to the reasons which he urges against it. Lord DENBY took his famous leap in the dark under Mr. DISRAELI's influence, but the consequences have not been so advantageous to the Conservative party as to recommend a repetition of the experiment.

It would be useless to approach Mr. GLADSTONE even with conclusive demonstrations that the equalization of the suffrage will not tend to the benefit of the country. The agricultural labourers are, as it is impossible to deny, his fellow-creatures and his flesh and blood; and the inference that his fellow-creatures and his flesh and blood ought to have votes for members of Parliament probably appears to him as unavoidable as it seems irrelevant to less inspired politicians. Some of the party, if not Mr. GLADSTONE himself, will be more inclined to listen to doubts whether the household suffrage in counties would be an advantageous question to dissolve upon. Mr. GOSCHEN and Mr. GLADSTONE himself promoted two or three years ago a Rating Bill, of which one object was apparently to sow dissension for political purposes between landlord and tenant. It is not improbable that for a similar reason, as well as for the public benefit, the Government may introduce a Bill in the next Session for some change in the law of tenancy, or perhaps for a modification of the Game-laws. The effect of any overture of the kind will be lost upon the farmers

if the Government at the same time proposes to transfer the electoral control of the counties from themselves to the labourers, who have already under the tuition of Mr. ARCH caused them serious alarm. They know better than Mr. GLADSTONE how the demagogue, in whom the new voting power would be really vested, would use their opportunity. Mr. GLADSTONE's announcement of his intention to receive a deputation from the Labourers' Unions has probably by this time alienated from his party even the farmers who have hitherto counted themselves Liberals. Household suffrage in the counties will not become law before the dissolution; and at the next election the proposal will probably be unanimously reprobated by the existing county constituencies. Another large and important body will be almost equally averse to the proposal. It seems to be generally admitted that uniformity of franchise would involve the establishment of equal electoral districts; and even if the connexion between the two measures is not strictly logical, the consequence would ensue, because readjustment would be promoted by the party which had already prevailed in the extension of the suffrage. The institution of electoral districts means the disfranchisement of all the small and moderate-sized boroughs; and when the constituencies understand the danger with which they are threatened, they may perhaps not be inclined to contribute at their own cost to the success of the Government measure. Mr. DISRAELI adroitly reminded them of their approaching annihilation with a graceful reference to the political antagonism between himself and a majority of their present representatives. There is yet time for Tories who confound cunning rashness with sagacity to profit by the hints of their leader. If the Liberal Government thinks fit to build a wall against which it may knock its own head, the Conservatives are not called upon to share in the work and in the result. Even if the Constitution, or what remains of it, is not worthy of consideration, the interests of any party which may attempt to disfranchise the farmers and the small boroughs will be gravely compromised.

THE POPE'S ENCYCLICAL.

ENGLISH Liberals are often disposed to deny the POPE a privilege to which events have certainly established his title. They quarrel with him because he finds in his present condition much matter for lamentation. Yet, if ever any man had the right to complain that he has fallen upon evil times, PIUS IX. has that right. He has been deprived of the temporal dominion to which he has persistently assigned an importance scarcely less than that belonging to his spiritual dominion. He has seen Rome, from being the home of the Papacy, become the capital of the chief rebel against the Papacy. He has contrived to quarrel with the German EMPEROR, the most Conservative, and consequently the most friendly to Catholicism, of the Protestant sovereigns of the Continent. If all these misfortunes coming upon him one after another are not enough to make him break silence, it must be on the theory that ecclesiastical persons are bound to show a Spartan power of endurance unknown to temporal sovereigns. The POPE's affairs are in a very bad way, and consequently it is perfectly natural that he should bewail the adverse fates which have brought him to so grievous a plight.

In the last Encyclical, however, the POPE says but little of his personal sufferings. It is the bitter griefs of his venerable brethren that now press upon him. It seems to have come upon the POPE by surprise that the same policy towards the secular authorities which in Italy has brought trouble upon his own head should in other countries have brought trouble upon the heads of the bishops immediately concerned in carrying it out. All that he says, for example, of the conduct of the Swiss Government may be true in fact; at all events we are not in the least concerned to defend either the banishment of the Bishop of HEARON or the revolutionary ecclesiastical legislation by which that banishment has been followed. But the Encyclical makes no mention of the unprovoked act which served as the pretext, to say the least, for what has been done. M. MERMELLOD might to all appearance have been exercising his functions undisturbed to this day if the POPE had not, in violation of an agreement between the Swiss Government and the Holy See, made him in effect Bishop of Geneva. It may be that the Swiss authorities were wrong in the means they took to vindicate what they considered to be their rights; but even if we condemn them on this ground, it is an important element in the controversy that the POPE

struck the first blow, and struck it without provocation. As regards Germany the POPE has a better case. It is not exactly a good case, because no one except the persons immediately concerned knows the real facts of the quarrel, but it is, at all events, a plausible case. We agree with Archbishop MANNING that the recent ecclesiastical legislation in Prussia constitutes a direct attack upon the Church in its spiritual character. The answer of the *Times* that the German EMPEROR is only doing what HENRY VIII. did before him leaves out of sight several important considerations. In the first place, in England the King and the Parliament were legislating for a Church to which they themselves belonged, whereas the German EMPEROR and the Prussian Parliament are legislating for a Church of which they are not members. The Tudor Reformation did so far answer to its name that it was effected by men who professed to be Catholics. The Prussian Reformation is being carried out by men who have no more right to remodel the Roman Catholic Church than Marshal MACMAHON and the Duke of BROGLIE would have to remodel the French Protestant Church. In the next place, the Prussian Reformation does not even claim to be a religious movement. There is probably quite as much religion about it as there was about the Tudor Reformation, but the superior honesty of the German statesmen puts them in this respect at a disadvantage. They avow that they are making ecclesiastical changes to serve a purely political purpose, and though their frankness may be respectable, it brings the arbitrary character of their acts into very strong relief. In the third place, it is exceedingly doubtful whether, if the Roman Catholic Church were prepared to abandon her official position in Prussia, her demand for freedom would meet with any other reception than it meets with now. Prince BISMARCK, we suspect, would frankly reply to any offer of such abandonment that he had no intention of relaxing the hold which circumstances have given him over the Catholic clergy. If the resignation of the stipends hitherto paid them by the Government would release the bishops from the obligation to yield obedience to the new ecclesiastical laws, they would probably be glad to give them up.

It must be confessed, however, that there is a good deal of mystery about the causes which have induced the German Government to take up its present attitude towards the Roman Catholic Church. The POPE asserts that the clergy are absolute lambs in the matter, and that the charges of conspiracy which the Emperor of GERMANY brings against them are merely the inventions of a wolf who is resolved to devour them under one pretence or another. He has at all events this in his favour, that no evidence has ever been brought forward in support of the German accusations. If the Roman Catholic clergy had repeatedly been convicted of conspiracy against the new German Empire, there would at any rate be this excuse for violent legislation, that it was designed to anticipate a danger which it had been found impossible to guard against by the usual precautions. As it is, we are reduced to taking Prince BISMARCK'S word—for on this point the EMPEROR can scarcely be regarded as more than the mouthpiece of the CHANCELLOR—that he has discovered a series of dangerous intrigues, not one of which has ever come to the surface or made itself apparent to other eyes than his. On the other hand, there is nothing in Prince BISMARCK'S antecedents that makes it likely that he should suddenly come forward in the character of a Protestant crusader, and there is good reason to believe that not very long before the introduction of the new laws he made the POPE a distinct offer of alliance. Archbishop MANNING attributes the action of the Government to a compact with secret societies, and quotes a passage from a Masonic organ to the effect that the EMPEROR'S letter to the POPE was dictated by the spirit of Freemasonry. It is natural enough that a newspaper which has in view the interests of Freemasonry should try to identify a series of popular measures with the views of the society it represents. But this fact only tends to derogate from the real importance of the Archbishop's extract. An alleged sympathy between the German EMPEROR and Freemasonry is rather a small foundation to support a whole system of policy opposed in many of its features to all that could have been expected either from the Sovereign or from his Minister. We put it to Archbishop MANNING whether it is not more probable that since the overthrow of Austria, and still more since the overthrow of France, the aggrandisement of Prussia has been an object of jealous dread, and, as a consequence, of underhand hostility,

to a clergy who have been trained to regard the restoration of the POPE'S temporal power as the end to which all their labours should be directed.

The POPE'S denunciation of the German ecclesiastical policy brings him by a natural process to a denunciation of Old Catholics. Upon this subject the POPE can only express himself in one way, nor have the persons against whom his curses are directed any right to complain of being made the objects of them. So long as the members of the Roman Catholic Church who reject the Vatican decree were willing to dispense with an ecclesiastical organization of their own, the POPE could affect to regard them as children who had not yet left their father's roof, however just might be the cause of displeasure they have given him. When they proceeded to set up a bishop for themselves, and to obtain consecration for him from the latest, and for that reason the most hateful, of European schisms, it was evident that the POPE would in future never open his mouth to them except for the purpose of excommunication. Rendered into commonplace English, the Papal abuse of "a certain notorious apostate" from the Catholic faith, JOSEPH HUBERT REINKENS," is simply an intimation that in future the Old and the New Catholics can have nothing to say to one another. Whether the former have been wise, from their own point of view, in pushing matters to this extremity, is a question which only the event can answer. The immediate prospects of the new community will perhaps be improved by the adoption of a decided course; but the chances of the breach being healed under some future Pope are certainly fewer than they were before Bishop REINKENS'S election.

RAILWAY DIRECTORS AND THE BOARD OF TRADE.

WHEN Mr. LAING'S letter to the PRESIDENT of the BOARD of TRADE, in reply to the recent Circular of that department with regard to railway accidents, was published, it was thought that it was perhaps intended, not only as a vindication of the Brighton Railway, but as a general plea on behalf of all the Companies. If this had been the case, the Companies on whose lines the greatest number of disasters occur would certainly have been open to the taunt that they were endeavouring to shelter themselves behind a comparatively innocent and well-behaved line. It appears, however, that the Companies are not disposed to confide their case to a single spokesman, and that there is to be a separate and distinct reply from each of them. This is certainly necessary, because the case of the Brighton Railway is very different from that of some of the others. Mr. LAING'S letter showed that the Brighton Railway is a well-managed and consequently safe line, but it did not in the least shake the arguments contained in Mr. CHICHESTER FORTESCUE'S Circular; indeed it might almost be regarded as an emphatic confirmation by an experienced Railway Chairman of all that Mr. FORTESCUE had said. The object of the Circular was to point out that railway disasters might to a great extent be prevented by improved methods of working and mechanical contrivances. The object of Mr. LAING'S letter was to show that accidents rarely occurred on his line; and he explained that the reason why they did not occur was because the Company had practically anticipated Mr. FORTESCUE'S advice, and adopted most of the precautions against accidents which he recommended. If Mr. LAING had had to say that accidents occurred on his line notwithstanding the adoption of precautions, that would have been, in one way, an answer to the Board of Trade. But the whole drift of his argument is that, where precautions are taken, accidents are prevented. And this argument of course cuts two ways, because, if we find that accidents do not occur when precautions are taken, it may be not unreasonably presumed that, when accidents do occur, it is because precautions have been neglected. Mr. LAING'S letter has been followed by one by Mr. CASTLEMAN, the Chairman of the London and South-Western, who writes to much the same effect. He pleads that there were only three accidents on his line last year, and none the year before, and he attributes this to the careful maintenance and working of the railway. The block system has been adopted on the South-Western, as well as on the Brighton Railway, and every effort is said to be made for providing adequate accommodation for traffic. Mr. LAING and Mr. CASTLEMAN both contend that continuous brakes cannot be adopted until further

experiments have been made on the subject, and that "absolute punctuality" in the departure and arrival of trains is an impossibility. On the first of these points the argument is a plausible one, but it is obvious that it might be used to justify the postponement of every kind of scientific improvement for an indefinite period. It is always possible that an invention may be improved, or that a better invention may be forthcoming; but common sense has to be content with the best that can be got at the time. It is highly probable that in a quarter of a century continuous brakes will be much nearer perfection than at present; yet even an imperfect brake of this kind would be a great advantage at the present moment. As to the impossibility of ensuring absolute punctuality, nobody expects it. All that is asked is that trains shall not be unreasonably unpunctual, so as to cause great inconvenience and loss to passengers, and perhaps to endanger their lives. An occasional delay of a few minutes would be nothing, but systematic delays of an hour or more could certainly be prevented.

Mr. Moon, on the part of the London and North-Western Railway, has undertaken the more onerous task of defending that railway against the strictures of the PRESIDENT of the BOARD of TRADE. He regrets that a charge of the gravest possible character—that of neglecting the means which may be at their command for securing the safety of the public—should have been made against the railway companies; and his argument amounts to a denial that, as far as the London and North-Western is concerned, anything is left undone which can be done to prevent accidents. This is a different line of argument from that taken by Mr. LAING and Mr. CASTLEMAN, who plead that they have scarcely any accidents, and attribute this to the completeness of their precautions. Mr. Moon cannot deny that a good many accidents occur on the London and North-Western; but he resorts to an ingenious argument to comfort the public on this point. He explains that the registration of accidents is more exact than it used to be, and that is the reason why there is apparently a greater number of accidents; so that, in point of fact—and he wishes it to be known for the honour of his Company—the London and North-Western has always been in the habit of killing and maiming a great many more people every year than was generally supposed. It does not seem to us that this helps Mr. Moon very much. The real question is whether accidents occur on this railway which might be prevented. Mr. Moon says No; but the value of this answer obviously depends on what he thinks it possible to do to prevent accidents. The Wigan accident may be taken as a very good test. Mr. Moon contends that this accident "has not been proved to result from any defective arrangements of the Company"; and on this ground compensation has been refused to the sufferers. When it is said that no defective arrangements have been proved, this must mean only that they have not been proved to the satisfaction of the officials of the Company, because it is known that they were proved to the satisfaction of the Board of Trade Inspector and of the jury at the inquest. Captain TYLER pointed out that a train of maximum length had been driven at an excessive rate of speed over "a part of the permanent way where the traffic and shunting were almost incessant, and where a high condition of maintenance was not preserved," through facing-points, the locking apparatus of which was in need of repair. The jury, in returning a verdict of "Accidental death," added that the London and North-Western Company were not justified in allowing engine-drivers to run through such a station at a high rate of speed, and that, in their opinion, the speed of fast and through trains should be materially slackened on passing such places. Yet, after this, we are told that travelling on this railway is made as safe as possible. There was an accident on this railway at Adderley Park station, near Birmingham, on Wednesday, in consequence of the shunting of a goods train in front of a passenger express. In this case the fog is suggested as an excuse; but it happens that a fortnight before there was a precisely similar accident at the same place. There can be no question that many of the principal stations on the North-Western Railway are altogether inadequate for the traffic; that the main line is consequently turned into a goods-yard; and that the perversity of the Company in running expresses at full speed through stations which are constantly blocked in this manner is as infallible a way of putting passengers in danger of being killed or maimed as can possibly be imagined. Mr. Moon asserts that his Company does not

run trains at high speed for its own advantage, that fast trains are very costly and troublesome, and that if Parliament would reduce the speed it would be a gain to the Company. To this it may be answered that it is not usual to find a Railway Company voluntarily sacrificing a legitimate gain in order to serve the public; and that, although a Company may lose in one way by fast trains, it gains in another way. The reason why trains are run at an excessive pace through dangerous junctions is simply because, if trains were not hurried on this way, the Companies would not get so much traffic as at present over the existing lines. Mr. Moon takes credit to the Company for having laid down additional lines and enlarged stations and sidings at various points, as if all this were a pure sacrifice for the public. It is not, however, exactly a sacrifice for a flourishing trader to enlarge his premises so that he may do a larger business, and this is simply what the North-Western has done. It could not by any possibility have carried its increasing traffic unless it had provided some further accommodation for it, and the quarrel which the public has with the Company is that it has not yet done enough in that way to provide for the safety of travellers.

LORD CARNARVON ON SCIENCE.

LORD CARNARVON has been delivering an address which puts into something like definite shape a vague but widely diffused prejudice. Some excellent people regard science as necessarily irreligious; and though we would hope that wider knowledge is beginning to dissipate that fear, many people still think, and not without some justification, that scientific study encourages a harsh, dogmatic, and prosaic frame of mind. We should be glad if we could altogether deny the truth of this imputation; but we are bound in conscience to admit that it is not entirely groundless. A one-sided development produces characteristic faults. A man who devotes himself entirely to art is occasionally wanting in respect for abstract truth, and tries to meet argument by unreasoning sentiment. The man, on the other hand, who devotes himself entirely to science is apt to despise any consideration which cannot be packed into a rigid formula, and sometimes carries into an inappropriate sphere the habits of positive assertion which he has acquired in the region of strict demonstration. All this is not only true, but important at the present moment. Lord Carnarvon had a very good theme in impressing upon a youthful audience the importance of a complete culture. The tendency of modern education, especially as fostered by competitive examination, is to make specialists of boys as well as of men. The lad who thinks no study valuable except as it is productive of marks is likely to develop into the man who thinks no piece of knowledge useful that cannot be expressed in a statistical table. And there could be no more appropriate occasion than a distribution of prizes for insisting upon the miserable nature of a training which encourages a youth to devote himself exclusively to some one branch of knowledge at the period when his mind is still most plastic. We could, however, have wished that Lord Carnarvon had taken a more complete view of his subject. He might have pointed out that science should be an essential part of a sound education, though it should not be pursued to the exclusion of others. We fear that at present the danger of turning out youths too thoroughly imbued with scientific notions is extremely remote, and that it is much more important to improve our methods of scientific teaching than to take precautions against its being pushed to excess.

Meanwhile, however, let us look a little more closely at Lord Carnarvon's argument. There runs through it an assumption which is tacitly made by a great many popular writers, though it is not very easy to put it into a definite shape. Science is frequently personified and regarded as a sort of dark power working on principles of its own entirely opposed to those which prevail in other spheres of thought. Science and religion, or science and art, are talked about as though they were antagonistic forces, and as though a proposition might be artistically true and scientifically false, or vice versa. It is therefore worth while to repeat once more that science is nothing except organized and accurate knowledge. We can talk scientifically about chemical questions because we have discovered certain invariable chemical laws, and can deduce consequences from them with what we call absolute accuracy. Sociology is not yet, if it ever will be, a science except in name, because we have not discovered such laws; and our knowledge is therefore empirical and unsystematic. Science therefore includes that province of inquiry which has been fairly conquered and mapped out; and though new regions are being daily annexed, there are still whole continents where we have to guide our course by guess-work, and not by rules worked into a definite system. The more thoroughly imbued a man may be with the scientific spirit, the more perfectly he will appreciate the limits within which his methods are really satisfactory. If scientific study teaches him to speak with absolute confidence in regard to mathematical questions, and with some approach to absolute confidence in many chemical or physiological questions, it should teach him as emphatically that

such certainty is out of place in the inquiries which still lie beyond the scientific region. This gives the real answer to some of Lord Carnarvon's complaints about scientific tendencies. He tells us, for example, that Comte proposed to erect an intolerable despotism by transferring all the powers hitherto wielded by priests to men of science. Lord Carnarvon's opinion is supported by Mr. Mill, and by almost everybody who is not a true believer in the "religion of humanity." But what is the vital error in Comte's social system? Lord Carnarvon seems to think that the fault was that the system did not make allowance for the "tender and softer feelings"; and therefore he appears to fancy that Comte's aim was to force all people to be mere mathematicians and physicists. Now the fact is that, on the very contrary, Comte had a wildly exaggerated view of the dangers of an exclusively scientific training. He proposed that the "softer feelings" should be most elaborately cultivated, and it is one of his most characteristic fancies that the progress of knowledge should be summarily stopped. He condemned all scientific inquiry which was not directly useful as "otiose," or unaccial. Such speculations, for example, as those of Mr. Darwin were to be abandoned, because they had no distinct bearing, as he thought, upon human happiness. Thus Comte's system, so far from being remorselessly scientific, was profoundly anti-scientific. And indeed, in a wider sense, this is one vital objection to his theories. Even if, for the sake of argument, we should assume with Mr. Mill that his earlier philosophy was correct, there would still remain the fact that his later doctrines were radically opposed in spirit to his earlier. He could not wait for the slow process of scientific generalization, and therefore proposed to construct the society of the future by an arbitrary and most unscientific method. Thus the true answer to Comte's scheme is not to attack science, but to insist upon scientific principles being logically carried out. His Utopia is constructed in absolute defiance of the scientific views of history; for they prove that new social forms must be slowly evolved out of the existing order, whilst he proposed to build up a new order on principles arbitrarily assumed, and therefore, as men of science think, fundamentally erroneous.

It is probable enough that Comte's dogmatism was, partly at least, the result of his scientific training. Men of science are very apt to be illogical, as well as their weaker brethren. Because they have a right to be dogmatical about the recurrence of an eclipse, they think that they may be dogmatical in forecasting the details of a social revolution. They forget that their confidence is in one case justified by discoveries to which there is no parallel in the other case. This tendency is much to be regretted; but the radical remedy is to be found in teaching science more thoroughly. Nothing can so forcibly impress upon a reasonable person the folly of dogmatism in social and political questions as a thorough appreciation of the nature of the process which has to be gone through before we are entitled to speak positively about matters far more accessible to scientific investigations. It is the scientists and smatterers in science who develop into dogmatists, and talk nonsense about the inexorable laws of political economy. The delusion is dispelled when a man really understands the conditions necessary for discussing new truths in any complex mass of phenomena.

If science, properly understood, should apply the best remedy to dogmatism, it is equally true that it need not be prejudicial to the development of sentiment. Lord Carnarvon's illustrations upon this point strike us as rather unfortunate. Italy, he tells us, in the middle ages was pre-eminently cruel and pre-eminently scientific. The reply that science in its modern sense did not then exist, and that such science as did exist was confined to a small number of educated men, is too obvious to be dwelt upon; and we might add that, if Italy was pre-eminent in science, it was equally pre-eminent in poetry. The connexion between Dante and cruelty might be made out as easily as the connexion between medieval "science" and cruelty. To reason, however, from a single coincidence is silly. Nobody can say that modern science is really provocative of cruelty. The study of natural history tends to increase our tenderness towards the lower ranks of created beings, as it makes us more distinctly recognize our relations to them. The study of physiology brings with it a clearer appreciation of the conditions of health, and, as it extends our power of treating disease, encourages us in efforts to improve the condition of our race. In fact, all extension of knowledge has a natural tendency to extend sympathy; and, if we may judge from the present, the characteristic of a scientific age is rather to make man humane to the borders of effeminacy than to make him more brutal. This, however, is but one part of the case. The tendency of science to suppress feeling was illustrated by Lord Carnarvon from the case of Mr. Mill. James Mill, he tells us, endeavoured to trample out everything approaching to feeling in his own nature. We need not now inquire at length how far this was true. Perhaps it would be more accurate to say that the father subjected his son to a puritanical rigidity of discipline which was not so much calculated to suppress feeling as to direct it along a peculiar channel. At any rate, if the attempt were made, it was curiously unsuccessful. The very last reproach that can be made against Mr. Mill is that his feelings were too feeble. On the contrary, they were so powerful as to lead him to weaknesses most remarkable in a man who could, in some departments of thought, keep his prejudices so far from his opinions. But, not to reason from a particular instance, what are we to say of the general principle? Does scientific training really tend to enfeeble the emotional nature? Undoubtedly it may do so. So also, we will add, may athletic training; a boy who only thinks

of developing his muscles, may allow his mind and his affections to run to seed. This would be an excellent reason for denouncing an excess of athletic training; and for a parallel reason, we should share Lord Carnarvon's objection to an exclusively scientific training. But, we will add, the same thing may be said of an exclusively literary or artistic training. The propensity to attach an exaggerated importance to art is as debilitating to the emotional nature in one direction as a similar exaggeration in regard to science is in another. People who shrink from dry investigation of hard facts, and wish to cultivate sentiment without regard to truth, become artistic voluptuaries. An excessive devotion to the beautiful unfits a man for practical life, and generates those forms of art which are corrupting in proportion as they are attractive. To banish all romance from our minds would indeed be a fatal policy; but it is just as fatal to encourage a habit of indolent dreaming without reference to action. The evils produced by this disposition are as conspicuous in modern society as the evils produced by a too great devotion to science. Much of our poetical and fictitious literature is avowedly composed upon hedonist principles—that is to say, with the single aim of giving pleasure without reference to scientific or to moral considerations. That whatever is pleasant is right seems to be its vital formula; and therefore much modern art becomes hopelessly effeminate and often directly demoralizing. The habits of mind produced by scientific study are a most useful corrective to the tendencies thus fostered. Mere bare knowledge of facts is not by itself elevating, but a profound respect for realities and an uncompromising love of truth are qualities which were never more needed than now, and which are encouraged most unequivocally by scientific inquiry. Instead, therefore, of reviling art or science, we should be disposed to insist upon the importance of constructing an educational system with a due regard to both elements, and to point out that the ideal human being is one in whom the faculties are properly balanced, and not one in whom one set has been developed out of its due proportion. Probably Lord Carnarvon would agree in this doctrine, and wished more or less to express it; but his dislike to certain scientific tendencies led him to put his statements with too little qualification, and to justify them by some very unsound and inappropriate arguments. Surely the thing which most needs to be impressed upon boys is not that scientific study is apt to be objectionable. They have quite sufficient prejudices against it already, without having a quasi-philosophical pretext provided as a cover for sheer indolence and intellectual inertia.

SIR SAMUEL BAKER'S ADVENTURES.

SIR SAMUEL BAKER has given the Geographical Society a spirited and stirring narrative of his adventures in Central Africa. It is quite as good in its way as *Robinson Crusoe*, and must have whetted the appetite of the public for his forthcoming book. There can be no doubt that Sir Samuel and his wife have gone through a great many perils, and have displayed remarkable courage and intrepidity; and it was perhaps unavoidable that he should make himself the hero of his story. Egypt, as he announced a few months ago in a Napoleonic despatch, now extends to the Equator. This appears to mean that Sir S. Baker himself reached this point, and that he desired the people of the countries through which he passed to consider themselves annexed; but it is just possible that his successor, if he should follow in his footsteps, may find it necessary to repeat the process of annexation on his own account. Sir Samuel, with characteristic magnanimity, has transferred his annexations to the Khedive, and has apparently no desire to revisit them. The principal fact seems to be that he pushed his way through a succession of swamps and jungles in the teeth of hostile tribes, and that he has come back alive. It is not everybody who could do this, and Sir Samuel has a right to be proud of his achievements. The object of the expedition, as its commander understood it, was the suppression of the slave trade in the distant countries which form the Nile basin. The Khedive, we are told, has the misfortune to be the anti-slavery sovereign of a country in which slavery is a great national institution, and the slave trade a lucrative commerce. It is also said that he is so unfortunate as to be a large slaveholder himself, of course very much against his own feelings, and only in deference to the prejudices of his subjects. The Abyssinian war directed his Highness's attention to the territories lying on the Egyptian border, and he was inspired with natural indignation at the thought of the atrocities which were constantly being committed in the great slave trade region of the Central Nile. If he could not put down slavery in his own country, he would at least try to put down the slave trade in somebody else's country. By this means he would satisfy his own conscience without offending public opinion in Egypt, of which, being only an Eastern despot, he naturally stands very much in awe. An expedition was therefore resolved upon, the object of which was to be the suppression of the slave trade; but it was foreseen, among other details, that this would involve the establishment of the authority of the Egyptian Government throughout the Central Nile basin. And to effect this, as Sir S. Baker frankly puts it, "it was necessary to annex the country." It does not appear to have occurred to Sir Samuel, when he was asked to take the command of the expedition, to inquire what right the Khedive had to annex a country which did not belong to him. It is obvious, however, that the philanthropic enterprises took the form of an invasion of independent territories with a view to annexation.

Sir S. Baker's account of the deplorable condition of this region in consequence of the slave trade may be readily accepted. Magnificent countries in the heart of Africa have been pillaged and desolated, villages burnt, the male population massacred, and women and children carried off into slavery. The home provinces of Khartoum have also suffered by the emigration of the inhabitants, who have abandoned their agricultural operations for plunder and vagabondage. Sir S. Baker describes thousands of acres of fertile soil bordering the Nile as having been forsaken by the Arabs. A country which he had seen on his first visit in a high state of cultivation had become a wilderness. Between Khartoum and Berber—a distance of some two hundred miles—gardens, water-wheels, flourishing villages had disappeared. The negro tribes of the Nile basin, always divided among themselves, and without a central government, fell an easy prey to the Arab slave-hunters of the Soudan. Delays occurred in starting the expedition which led to more serious delays afterwards. At latitude 9° 20 degrees it was found that the Nile had been converted from a great stream into a vast marsh. An attempt was made to cut through the dense vegetation, and to make use of the narrow channels; but it was impossible to do this before the rains set in. So the party had to wait till next year. At first Sir S. Baker had only 800 men—a loose ill-disciplined body of Egyptians, Arabs, and negroes, and a handful of English artisans. When he next started, he had a force of 1,200 men, but the numbers were continually reduced by disease, desertions, and casualties in fighting. The sympathies of the Egyptians were with the slave-traders, and they had little relish for the fatigues and perils of the campaign. Incipient mutiny had to be guarded against, as well as perpetual ambushes. With great difficulty the steamer, ammunition, and baggage were dragged through the thick mud-slush and tangled vegetation, and the expedition got afloat once more on the stream of the Upper Nile. At Gondokoro the negroes were found to be different from what they are depicted at Exeter Hall. The great object of the "man and the brother" is, it seems, to capture and make slaves of his brothers. Sir Samuel, however, felt that he was not only a general, but a missionary, and he was equal to the occasion. He preached a sermon against slavery to a chief who appeared to be extremely touched by it, but at the end of the discourse offered to sell his little boy for a good iron spade. At this point the troops mutinied, and insisted upon being led home; their leader, however, took no notice of their message, but caused a sudden alarm to be beaten in the middle of the night, and despatched his men, before they had time to reflect, against a hostile tribe who had been menacing the camp. The troops were successful, and got possession of corn enough for twelve months' consumption, and this put them in a better temper. Sir S. Baker, by the help of a friendly tribe who carried his baggage—he had been disappointed in obtaining camels from Khartoum—next pushed on to Fattiko, the capital of a pleasant country situated at an elevation of four thousand feet above the sea-level. The soil is fertile and well-timbered, and the people docile. Here there was a halt for the rainy season, which lasted for several months. With about four hundred men, leaving the rest at Fattiko, Baker made his way to Masindi, where the King tried to get rid of them by sending into the camp jars of poisoned cider. The leader had now to be a doctor as well as a general and a missionary, for many of his men were flat on their stomachs. He distributed emetics, and they recovered. Next morning the King attacked the camp in force with seven or eight thousand negroes, but the expedition, with forty Snider rifles and rockets, beat them off. This King—a very bad fellow, who had asked all his relations to dinner, and then murdered them—unfortunately escaped. The camp was now broken up, and the expedition made for a more friendly district. They were pursued for seven days through thick tall grass. The enemy cut long clear spaces in the jungle in which ten thousand men might be concealed, and "you only knew they were going to attack by hearing a peculiar whistle, like the note of a bird, which was their signal." After a brief stay with a friendly chief, with whom he "exchanged blood," each taking a drop of blood from the other's arm on his tongue, and thus becoming kinsmen, Baker was suddenly recalled to Fattiko by the news that his depot there was in danger. He arrived in time to drive off the enemy, and from that day, he says, the difficulty was to prevent the natives from attacking the slave-hunters. He confiscated the ivory belonging to the latter, worth 30,000*l.*, established a form of government, and imposed a tax which the negroes paid regularly, although he remarks that negroes, like other people, are fond of being protected, but are not very fond of paying for it. He then marched to Gondokoro in triumph, and, leaving an Egyptian colonel in command, set his face homewards.

It has been announced that Colonel Gordon of the Royal Engineers has accepted the command which Sir S. Baker has resigned; and it will be interesting to know, when he visits the annexed regions, how much remains of the Government established by his predecessor, and whether the natives continue to pay for protection, or have any protection to pay for. It is probable, however, that Sir S. Baker has at least left behind him in the nominally annexed countries an impression that the Khedive has very long arms, and is not a man to quarrel with; and no doubt the Khedive, if he cares about it, would not have much difficulty in establishing some sort of suzerainty in this quarter. However imperfect may be the civilization of Egypt, it may be assumed that it is at any rate superior to the primitive condition of the people of the Central Nile basin, and government by Pashas can hardly be worse than government by kings of the type of the monarch of Masindi. It appears to be beyond doubt that there is a large and

fertile area to be opened up to cultivation and commerce; and if the Egyptians can put steamboats on the lakes and rivers, they will naturally command the country. The extension of Egypt to the Equator, nominal as it is, is probably for the present more real than the suppression of the slave trade. We are told that there are at present only three persons in Egypt who entertain anti-slavery convictions, and these are the Khedive and two of his chief Ministers. Sir S. Baker, whose own sincerity is beyond question, vouches for the sincerity of the Khedive; but it must strike every one as strange that, if his Highness is really bent on putting down the slave trade, he should begin such a very long way off. If his Government had not connived at the traffic, it would by this time have been reduced to small dimensions, and it would of course be simpler and more natural to deal with the evil at home by closing the markets than by attempting to suppress it in a distant country. It may be assumed that, as long as domestic slavery exists in Egypt, a supply of slaves will be maintained; and, if the Khedive is anxious to convert his subjects to his own views on this matter, it is odd that he does not set them an example in his own household. If the Egyptian Government would undertake in earnest the extinction of this abominable traffic, it might give it a very good title to extend its authority; but it can hardly be supposed that the formulas of international law will be deliberately weighed in such a matter. It has not been stated in what direction Colonel Gordon is to direct his steps; but it is conceivable that the explorations in the South may have been sufficient for the present to satisfy the Khedive, and that his curiosity may now be turned towards the richer countries in the East. A claim to the sovereignty of the basin of the Nile and its affluents would include the Abyssinian kingdom; and we may repeat what we have said before, that the participation of English officers in an Egyptian invasion of that country—no matter how philanthropic the pretext—would not be popular or judicious. That, however, is still a question for the future.

BASILICAN CHURCHES.

THE shape and arrangements which, from the days of Constantine onwards, have been usual in churches throughout Western Christendom are in themselves the greatest of all cases of the triumph of the new creed over the old. We say creed, for the Paganism which Christianity had in the end to strive against and overcome really was a creed. Julian, Libanius, Zósimos, strove for a system which was to them no mere poetic fiction, no mere affair of State, but as truly a system of faith and morals as the creed of their Christian adversaries. Christianity had to strive at once against the superstition of the mere mob, against the political traditions of Romans of the old school, and against the convictions of those with whom Paganism was a real religion. These last hated Christianity, but they learned from it while hating it. The preaching of Christianity reformed Paganism, just as the preaching of the Reformation reformed the Church of Rome. Julian is to Caracalla or Gallienus what Sixtus the Fifth is to the Borgias and the Medici. An ordinary Roman Emperor or Senator had doubtless no such deep faith in Jupiter Optimus Maximus as Julian had in his Hellenic deities; but Jupiter Optimus Maximus had so long formed a part, as it were, of the very being of the Emperor, Senate, and People of Rome that it seemed to him that he who spoke against Jupiter could not be the friend of Cæsar. Christianity had to strive against both these forms of enmity, and it overcame both. Philosophic Paganism died out; it was soon found that Christianity itself supplied room enough for both the higher and the lower parts of such a character as Julian's. Political Paganism grew into political Christianity; the ideas of Christ and Cæsar became as inseparably bound together as the ideas of Jupiter and Cæsar once had been. It is indeed in the East rather than the West that this state of things attained its fullest development; in the West the absence of the Emperors from Rome allowed the Popes to grow as their brethren of Constantinople never grew. Still the real Roman feeling must have been stronger in Rome, Italy, and the West generally than it ever could have been in the East. And, in the West as well as in the East, Christianity in the end triumphed over both forms of opposition. And nowhere is the record of that triumph more legibly written than on the existing buildings of Rome itself.

The architectural monuments of earlier times which supplied the early Christian buildings with materials and models fall mainly under two heads, answering to the two classes of enemies against which the new faith had had to strive. These were the Pagan temples and the great secular buildings, the basilicas. The new builders made free use of both, but they made use of them in different ways. The temples were freely used for materials; their columns were constantly set up again in Christian churches; but the employment of an existing temple without change as a Christian church was decidedly exceptional, and it was only an exceptional class of temples which had any effect on the arrangements of an exceptional class of churches. Round temples, as well as sepulchral monuments, had probably a share in the parentage of that class of round and octagonal churches which, though at all times comparatively rare, have at all times gone on side by side with the more usual forms. The Pantheon and the so-called Temple of Minerva Medica, as well as the tomb of Cecilia Metella, doubtless had their effect on St. Vital and Brescia, on Aachen and St. Gereon, on the Temple Church and Little Maplestead, as well as on a long list of baptisteries and sepulchral churches, includ-

ing all the churches of the Holy Sepulchre, whether at Jerusalem, Bologna, Cambridge, or Northampton. We have the Pantheon itself consecrated as a Christian church, as if to show how little suited for that purpose the unaltered circular form was. We have the sepulchral church which goes by the name of St. Constantia, where the inner range of coupled columns and arches brings us many degrees nearer to Aachen and the Sepulchre churches. And we have the wonderful church of San Stefano Rotondo on the Coelian, with its three concentric circles—the outer one now shut out from the building—and the strange but bold triplet of arches built across the middle.

Still buildings of this kind, though numerous enough to be ranked as a class by themselves, were still always a minority. Among all the churches in Rome, among all the remains of temples, the Pantheon is the only temple which has been turned into a church without change or mutilation. Such cases as the Temple of Faustina and the neighbouring temple which forms part of the church of St. Cosmas and Damian are after all mere cases of adaptation of fragments; the dedication of small temples like the two, round and oblong, called each by many conjectural names, which stand between the House of Crescentius and the church of St. Mary in Cosmedin was really little more than a pious freak of later times. Though many churches in Rome, like those just mentioned, have risen on the sites of temples and have preserved parts of temples in their structure, there is no case of a large oblong temple in use as a church, as the Parthenon and the Temple of Theseus were once used at Athens. The fact is that the ordinary form of temple was not at all suited for the purposes of Christian worship; the Pagan temple was all outside, the Christian church was all inside. Temples were therefore freely destroyed to build churches out of their remains; but the use of an actual temple as a church was rare, and temple architecture had no direct effect upon the arrangement of Christian churches.

It was far different with the other class of buildings, the buildings which symbolized, not the heathen creed of the elder Rome, but the dominion of the Senate and People and their master. If the temple was unsuited to Christian purposes, the basilica, the Hall of Justice, was of all buildings the best suited. The basilica was, in fact, the temple turned inside out. As the temple consisted of a walled building surrounded by external colonnades, so the basilica consisted of internal colonnades placed inside a walled building. Exactly as in the temple, the colonnades in their various forms long remained the only architectural feature, and it was a standing difficulty to know what to do with either the outside or the roof. Both at Rome and at Ravenna we are constantly struck by the mean and shapeless look outside of buildings which are of a truth all glorious within. It is only in St. Apollinaris at Classe that we meet with the first feeble approach to the later Romanesque forms of external ornament. But the temple thus turned inside out became, in the form of the basilica, exactly what was needed for Christian uses. There was the long nave ready to receive congregations which needed to assemble within and not without their houses of worship. There was the apse or tribune with its rows of official seats, ready to become the official seats of the bishop and his clergy; there were the *cancelli* ready made to part off the holier part of the building from the less holy. In those basilicas which had the *chalcidice* or transept the symbolical form of the cross was already impressed on the buildings in heathen times. The basilica was in every point a ready-made church; it could at once be used as such, and it could become the model of new churches built after its likeness. And out of the basilica have grown all the usual forms of churches used in Western Europe. The main internal features of all are the same; the chief difference is that Northern architects learned to give their buildings an external outline to which Italy even in its best days, in the days of Pisa and Lucca, always remained a stranger. The bell tower, which in Italy stood apart, became part of the building, and was multiplied in number; the crossing, unmarked in the ancient basilica, was marked by the central cupola or tower. By these means the unadorned outside of the old basilica grew into the varied outlines of Caen and Ely and Lichfield, and into the outlines more varied still of Worms and Bamberg and Gelnhausen.

To have thus turned the basilica to Christian uses was almost a greater triumph than to have done the like by Pagan temples. To destroy the temples and to consecrate the basilicas was the most speaking expression of the facts that the Pagan worship had come to an end and that the Empire itself had become Christian. When the seat whence the heathen judge had spoken the sentence which handed over the martyr to the sword or to the lions became the seat from which the Bishop arose to celebrate the Christian mysteries, no more speaking embodiment could be needed of the triumphant climax, "Christus vincit, Christus regnat, Christus imperat." It was a sign that the Roman Empire was beginning to deserve its later title of Holy, a sign that the Chief Pontiff of idols was passing into the Advocate of the Universal Church. Whether any building now exists which has served as a basilica both in the heathen and the Christian sense of the word may well be doubted; but that the Christian church borrowed all its arrangements from the heathen hall of judgment there can be no doubt. They are as clearly marked, to the very *cancelli*, in the small but most elegant *Basilica Jovis* on the Palatine as in the most fully developed Christian building. The chief alteration which the basilican type received at the hands of Christian builders was one purely architectural—the great invention of Diocletian at Spalato, the discovery that the column might be used as the support of the arch. The heathen basilicas followed two

systems of construction; the division between the nave and its aisles might be made either by columns supporting an entablature, as in the Basilica Jovis, or by massive piers supporting arches, as in the Julian Basilica and in that of Maxentius or Constantine, whichever it is to be called. The latter of these seems the natural prototype of the more massive Romanesque forms of Germany and Northern Italy, but we do not find it used in the basilican churches either of Rome or of Ravenna. Its great advantage was that it allowed the building to be vaulted—witness the mighty vaults of the Basilica of Constantine—which could hardly be the case either when the building followed the Greek construction or when the arches rested on columns. This last, in its various shapes, became the received form, but it is wonderful how hard a fight the Greek construction made. At Ravenna there is no case of the use of an entablature; the columns always support arches, though always with that intervening still which is the characteristic of the local style of that city. But at Rome some of the greatest basilicas still kept the construction of the entablature. To mention, for the present, no other cases, it was so in the nave of the old St. Peter's, the Vatican Basilica, and it is so still in the great Liberian Basilica, better known as Sta. Maria Maggiore. But the arcade is so clearly better suited for the uses of a church, or indeed for the internal uses of almost any building of any kind, that this kind of construction seems to have remained in use only in Rome, where the architects must have been more than anywhere else under the strongest influence of classical models. Elsewhere the arcade resting on columns became the universal use, and even in Rome it became more usual than its rival. Gradually, as the architects became more alive to the capacities of the form of construction which they had now worked out, the columns no longer gathered so timidly together as they do in the earlier examples, but began to stand further apart, and to support arches of greater span, as we see in the basilican churches of Lucca as compared with those of Ravenna. At Lucca indeed some of the arches are so wide that we feel that we are on the way to the great fault of later Italian architecture, those broad sprawling arches which disfigure most of the churches of the Italian pseudo-Gothic. Still it is perhaps only because we have these in our remembrance that we are inclined to look with some little dissatisfaction on the width of the arches at Lucca; there is nothing which really offends the eye in the buildings themselves; and, constructively, a moderate increase in the width of the arch must be looked on as an improvement and advance. In some of the churches at Lucca also we find the columns supplanted by a square pier, having nothing in common with the massive square piers of the German churches, being hardly thicker than the column itself. Still it is the column—if possible, the marble monolith column of classical type—which is the proper support of the arches in a basilican church. The column, which had been brought into artistic being as the support of the entablature on the outside of the Grecian temple, had worked out for itself a use no less elegant, no less appropriate, when it became the support of the internal arcades of the Christian church. But so long as the arches rested on columns, so long the roof ever remained the great difficulty, and the weakest point of the building. It had either to keep its naked construction of tie-beams and rafters, which the architects of those days had not learned, like English architects of a far later day, to work into an ornamental form, or else the construction had to be hidden by a flat ceiling. The noblest form of roof, the stone vault, called for something more massive than the column as its support. The column and the vault could be used together only in cases like crypts, where a great number of columns support a vault and nothing else. In the main fabric of the church the vault and the column could not be used together, and, as the most perfect form of roof came more and more into use, the most graceful form of support for the arcades was necessarily laid aside.

We have said that all the later arrangements of churches grew out of the basilica. As long as round-arched architecture of any type remained in use, the round apse was the direct successor of the tribune of the basilica; and in a great number of continental churches the tradition of placing the seats of the clergy behind the altar has lingered on in various corrupted forms. It can of course retain anything of its primitive effect only when the altar is unencumbered by those monstrous excrescences of later times with which most French and Italian altars are disfigured. The change from the round to the polygonal apse was simply the necessary result of the change from the round to the pointed arch. In Germany the single polygonal apse, as simple in its ground plan as the polygonal apse of the basilica, remained commonly in use. We see it on a gigantic scale at Aachen. In France the habit of surrounding the great apse with smaller ones, which began in Romanesque times, and which was a natural result of the multiplication of altars, grew into such east ends as Amiens, Rheims, and St. Quens, and as Köln, Westminster, and Tewkesbury in other lands. We have now reached something widely different indeed from the tribune of the Basilica Jovis, and from the apses of St. Apollinaris and St. Ambrose; but the steps by which one grew out of the other are apparent enough.

In the like sort, the constructive choir, which forms so important a feature in most later churches, great and small, grew out of what in the ancient basilicas was a feature, not of construction, but of arrangement. While the Bishop and his priests occupied the seats behind the altar, the humbler ministers of the church had their places in the *chorus cantorum* in the front of it. As has been pointed out over and over again, we see this arrangement in per-

fection in St. Clement's at Rome, where the choir is fenced in by a low wall not stretching across the church. But it has not been so generally observed that a fashion set in very early of marking the extent of this part of the church by something in the architecture, by giving the columns or other piers at this point some character special to themselves, distinguishing them from those on either side of them. This may be seen in more than one church at Rome and at Lucca. The transition from this is very easy to churches like Westminster, Llandaff, Norwich, and St. Albans, and again to a vast number of our latest English parish churches, where the nave and the choir form one architectural whole, the distinction being made merely by screens and the like. And the more familiar form, in which the choir has a distinct architectural being, is again produced by a modification of another feature of the basilica type. The *chalcidice* or transept is always rather an awkward feature in a basilica; it is too distinctly at cross-purposes to the nave and apse, and it is in no way fused into one whole with them. The Romanesque architects, by moving the tower or cupola to the centre of the church, at once gave the transept a meaning and made it part of one whole with the rest of the building. It was a natural stage, when the choir had once begun to be a marked feature in the building, to make the transept and what the transept supports become the division between the nave and the choir. That is to say, the choir was placed east of the transept, as in most of our later cathedral and other great churches. The apse now became a mere finish to the choir, and in England it was commonly left out altogether. We have thus reached an arrangement which has gone very far away from that of the basilica, but the steps by which one grew out of the other are perfectly clear.

The same basilica is, both by mediæval and modern writers, often applied to churches of special dignity and antiquity of whatever form. The word however is wanted as a technical term, and it is better to confine its use to churches which still keep pretty closely to the arrangements of the ancient basilicas, a type of which Rome, Ravenna, and Lucca supply the best examples.

CATTLE AND MEAT.

THE Smithfield Club has again accomplished its annual success; and if the object of its existence be, as we presume it must be, to organize great Christmas Cattle Shows, right well is its purpose achieved. It would be a curious matter for inquiry whether the Cattle Show depends more for its receipts on visitors from the country or on Londoners. Certain it seems to be that no annually recurring attraction brings to London so many people from the country, except the Derby race week; and then between the two events, to use the sporting phrase, the distinction may be made that the Cattle Show brings up the country people proper, while the Derby draws more upon the town populations. The managers of the Cattle Show have great, and no doubt well-founded, confidence not only in the attraction of their prize lists for exhibitors possessing the best animals of the day, but also in the firm attachment of the public for settled institutions. And no one will deny that the Smithfield Club Show is one of the institutions of the country; for, although it is understood that the original reason for the exclusion of animals that have appeared at other recent shows—namely, the fear of contagious diseases—has to a great extent passed away, yet they continue to refuse to admit to competition animals that have been exhibited elsewhere. That their confidence is justified is apparent on a view of the well-filled prize list, and from the excellence of the specimens of the various races named in it. The impossibility of creating such buildings as the great Islington Hall in many country towns gives the Smithfield Club the assurance of almost a monopoly of such great winter exhibitions as theirs, for in our climate the gate-money of a cattle show held in an unprotected or partially protected ground in the month of December would hardly pay for advertisements. At Islington, however, we get, thanks to the care that has been bestowed on sanitary arrangements, not only protection, but comfort, at least in any weather except such dense fogs as those of this week; and thus, after all, it is perhaps only in a just reliance on their advantages that the managers insist that their bill of fare shall consist entirely of novelties even for enthusiasts or experts whose pleasure or business takes them to a round of country shows. Fog in the open air seems to have been less noxious to the animals than fog in the building; but, in spite of the fog, which was so dense as almost to put a stop to business and to the circulation of vehicles, the attendance of spectators was larger than could have been expected. That the Show should lose a large proportion of the "exhibits" by removal to avoid the danger of asphyxia is a contingency which could not have been foreseen, and for which there seems to be no remedy.

Too much has already been done, too great advances have been already made, in the art of breeding and rearing the animals that form the staple of human food, to leave any room for the expectation that astonishment will be created by the view of the specimens shown, or that they will demonstrate any great improvement on the animals of former years. It is well if the same of perfection as to symmetry of form and vigour of race be not already a thing of the past. Even if that be so with regard to the highest-bred specimens, yet it cannot be doubted that the good qualities which year after year have been demonstrated to belong to certain breeds and strains of blood have induced a general

carefulness in breeding our flocks and our herds, resulting in the possession by this country of a stock unrivalled, by any other country for early maturity and large average meat productions. It is almost strange that, with the great variety of climate which our islands afford, no more than four well-marked breeds of cattle have made them their home; but still we have in those four all the good qualities which can be desired, and to so great perfection has each been brought that from year to year, and between one show and another, the verdicts of the judges vary in awarding the palm of excellence now to the wild and shaggy Scot, now to the compact Shorthorn, now to the majestic Hereford, and again to the elegant Devon. In sheep the varieties are greater, and not to be so readily distinguished by laymen; and probably for this reason, and because they lack the grandeur which the great size of the cattle lends to them, the sheep-pens are always comparatively neglected. The swine attract admiring crowds, who brave the stench apparently inseparable from these animals; and they owe the multitude of their admirers probably to the fact that there are more people who own a pig or pigs in the country than there are people who own either oxen or sheep, and each pig-owner deems it to be his duty to see what can be done in stuffing this most greedy and "fatable" of all animals. After wondering that the digestive apparatus of animals of such tender age should have assimilated the vast quantities of material necessary to build up such mammoths, the next wonderments are, how the creatures were brought from their nurseries to Islington alive, and how they will get away again; and after all their heroic sufferings, if their unhappy state be a suffering to them, what can be their ultimate destination, and what manner of men they can be who eat them?

No one can go to a cattle show without thinking of his butcher's bills, and no one can be blamed for asking how it comes that nothing seems to check their tendency to increase in amount from year to year. A witness before the Select Committee on Contagious Diseases (Animals) rightly called the ruling prices fabulous, and justly said it was alarming when he found the Edinburgh butchers putting forth a notice in June of this year quoting their prices for cash payments at 1s. 2d. per pound for best roasting beef; 1s. 2d. to 1s. 8d. for steaks; legs and loins of mutton, 1s. 1d. to 1s. 3d.; chops, 1s. 4d., &c. Another witness, a butcher, compared the present rates with those which obtained twenty-two years ago, and told the Committee that what he could buy then for 1,000l. now cost him 2,500l., and that he then paid 3s. 4d. per pound for heifers, while now he had just lately paid 10d. All the information attainable seems to point conclusively to the fact that neither in England nor on the Continent has production kept pace with consumption. The witness we have just quoted said he "knew plenty of places twenty-five years since where the people used to get meat once a week, or once a month, but now they want it once or twice a day"; and they have become far more dainty as to quality, for it is now impossible to sell large coarse fat sheep, and mutton from small good sheep is preferred, even at an additional price of 2d. per pound. Another witness said that where we used to have a pound of meat consumed by the artisan class we have a ton now. And the statistics of the last three years show that the movement in prices is constantly upward for beef and mutton, though downward for pork; and although during the last three months quotations have apparently shown a decline, and there seemed to be some hope of relief, yet on closer inquiry it appears the fall has been only on inferior qualities, and the best sorts are as high as ever. It seems to be clear that it is not only greater quantities of meat that we require, but that the additional supplies must be of the best quality. There is a scruple of comfort to be gathered from the fact that the high prices of meat and of wool appear to have stimulated production; for the summary of the Agricultural Statistics for 1873 shows that we have a stock of nearly twelve per cent. of cattle and eight per cent. of sheep over what we possessed in 1871. In the case of corn there has been no difficulty in supplementing the deficiencies of this country by imports from foreign parts; whatever England has wanted she has always been able to obtain. From the difficulty of transit the import of cattle has always been restricted to those that can be brought from near ports; and it is discouraging to find from the evidence of the Secretary to the Veterinary Department of the Privy Council that our neighbours now want all the cattle they can raise for themselves, and that we cannot obtain any great importation further than we have now without going directly or indirectly to Russia for it, and that we must look forward to the time when the West of Europe, or Europe independently of Russia, and countries somewhat like Russia, such as Galicia and parts of Transylvania, will not breed more cattle than they want for themselves. Germany now imports from Russia as many cattle as she sends to us, and in the Secretary's opinion the time will soon come when we shall have Germany and France competing for the supply we take from Holland. Professor J. B. Simonds confirms this opinion, and adduces "the state of things as existing with regard to Spain as a proof; we found some time ago that all the animals which arrived in this country were old animals; they were keeping all their young animals in the country, using them for breeding purposes and for working and so on; now we have exhausted that supply, and we are bringing young animals from Spain, and also from Portugal." He is told by those who gather animals in Spain for export that "they have the greatest difficulty in getting them together; that all the old animals have been used up." The general statement he hears from importers from the Continent is, that, "with the exception of Schleswig Holstein, if you take Russia

and all central Europe, they have very few cattle to send us, and when you come to look at the fact that in Bohemia and Moravia animals come from Hungary, Styria, and adjacent countries to be fattened at the distilleries, he thinks it is pretty good proof that they have but little stock of their own to send." It is said that some few scores of bullocks have been brought to Glasgow from America, but whether the experiment will be followed up by any quantities sufficient to tell on our supplies seems to be doubtful. It would indeed be strange if, in the result, we should have to depend on Russia and America for what we lack in beef, in the same way that we now depend upon them to make up our deficiencies in corn. America already sends us the principal part of our salted beef imports as well as immense quantities of bacon and hams. What we want, however, is fresh meat, or meat preserved otherwise than by salting, and that may be used in substitution for home-killed meat. It is to be hoped that the failure of a recent attempt to bring meat from Australia in a frozen state may not be accepted as a final proof of the impossibility of carrying out the system, and that if future experiments are more successful, the meat brought over may suit our fastidious palates. It is, however, very satisfactory to observe the large increase in the preserved meat trade since its commencement in 1867.

After all, it remains doubtful whether we are doing all that we can do to help ourselves by increasing our home supplies. The animals that are to be seen at cattle shows are not supposed to be economically produced, or to be commercially profitable. But beef and mutton at the present scale of prices must pay breeders and feeders large profits, and our hope must be that capital and skill will be attracted to the business of meat-producing. There is a great, and, as we have shown, an increasing gap to be filled, and whatever may be done by the farmers of England and Scotland towards filling it, there is a great opportunity for Ireland; for there is no doubt that Ireland does not contribute to our wants what she may or what she might. Cattle-breeding and cattle-rearing ought to be Ireland's best business, and she could not desire a better customer than England. It is true that she sends us very large quantities of cattle—no less than about one-fifth of our consumption—but she might send more and better. Whether from want of capital or from other causes, the Irish do not give the necessary care to their animals in the early period of their lives, and consequently their export is chiefly composed of undergrown frames, which are distributed to all the grazing and feeding districts of England to be covered with good meat. More care in early days, better food and protection, would nearly double the value of these animals, and would enormously increase the profits of the Irish farmer, while the supply of meat of which England stands so greatly in need would be increased in a similar ratio.

ROMAN CATHOLIC UNIVERSITY EDUCATION.

IT is hardly a month since we called attention to the somewhat startling announcement of the intention of Archbishop Manning and his episcopal colleagues to found a Roman Catholic University in England. The language of their collective Pastoral issued last autumn from the Synod of Ware implied, to say the least, that no such step was at present in contemplation, but a fresh and more stringent censure was passed on such Catholics as sent their sons to Oxford and Cambridge, which may suggest the true explanation of this sudden change of tactics in face of what is evidently becoming an inconveniently pressing demand. Our readers may recollect that, since the abolition of tests at Oxford, Dr. Newman has twice been on the eve of returning there, in order to provide for the religious wants of Roman Catholic students; he had even gone so far on both occasions as to purchase ground for building upon, with the liberal aid of the Catholic laity; but the scheme was in either case defeated at the last moment by the machinations of the hierarchy, acting under Dr. Manning's guidance. Still more recently the Jesuits, who do not appear to share the Archbishop's opinion on the subject, obtained ground in St. Giles's for building a college, and the foundation-stone of their new church was laid with much ceremony a year ago in presence of Bishop Ullathorne. It was, however, observed at the time that Dr. Manning absented himself, and the reason is now obvious enough. The new church, we presume, will be completed, but it has lost its *raison d'être*. The authority of Rome has been successfully invoked, not indeed absolutely to prohibit Catholic parents sending their sons to Oxford—that might be too strong a measure to be safely ventured upon—but to do everything short of this. And to the fiat of Rome the Jesuits, powerful as they are, cannot choose but bow. If the laity choose to be equally submissive, they have only themselves to thank. The game is in their own hands; and if a steady stream of Roman Catholic students were poured into Oxford, the ecclesiastical authorities, who are not deficient in astuteness, might be trusted to discover the necessity of adapting their policy to the circumstances. When it was first rumoured some years ago that the Roman Catholic bishops were about to put a veto on Oxford education, a shrewd ecclesiastic of the old school, who has since passed away, is reported to have observed, "Then they won't be obeyed." It remains to be seen how far his prediction will be justified. All that can be said as yet is that a numerously signed lay address, deprecating any interference with the free use of the national Universities by Catholics, was sent to Rome about the time when Dr. Manning became archbishop, and that the growing dissatisfaction of the English Catholic laity with their virtual ex-

clusion, solely by the act of their own spiritual rulers, from all University education, has at length constrained the bishops to start the singular scheme just announced for supplying the deficiency themselves.

It was certainly rather startling, when we consider their relative numbers, to be told that the English Roman Catholics proposed to found a separate University; and it was still more amazing to hear that Mgr. Capel, who was himself educated at a Training College for national schoolmasters at Hammer-smith, was to be the head of it. But surprise yields on fuller explanation to something very like a feeling of amusement. It appears, after all, that the new University introduced with such a flourish of trumpets by the Ultramontane press is merely to consist of a sort of College at Kensington, to be affiliated to the London University, and that the fact of Mgr. Capel having already purchased ground there for another purpose, coupled with his well-known command of the purse-strings of a portion of the female aristocracy, suggested the expediency of utilizing his services as "Rector." To be sure those for whose benefit the scheme is ostensibly designed might fairly complain that it offers them nothing which they did not possess before. Several of the existing Roman Catholic colleges, such as Stonyhurst and Oscott, are already affiliated to the University of London, and if dangers to "faith and morals" are apprehended from a residence in Oxford, it is rather difficult to understand how the peril can be escaped or lessened by residing in the great Babylon of the metropolis. Perhaps it will be argued that the examinations and lectures at Oxford are especially dangerous to faith, but then Archbishop Manning declared not many months ago in a speech at Liverpool that the London University lectures were so deleterious as not only to pervert the intellects of Catholic students, but even to alter the structure of their brains. So that it is not very easy to see what advantages, spiritual or temporal, the proposed scheme will confer on the much-vaunted youth who are at present groaning under their ostracism from the higher education of their countrymen. The proposed remedy, when a little more closely examined, ceases indeed to be ambitious, but ceases also to provide any remedy of the alleged grievance. *Parturiunt montes*: is there not a semblance of the ridiculous about the result?

Meanwhile, English Roman Catholics, if any such there be, who are disturbed by this lame and impotent conclusion of the idea of a new University, may perhaps derive some consolation in their disappointment from a glance across the Irish Channel. The blessing which is still to be denied them in England has been enjoyed for the last twenty years by their co-religionists of the sister isle. "The Irish Catholic University" on Stephen's Green, founded with the express approval of the Holy See, and placed under the exclusive control of the local episcopate, "with Bishops at the head and tail of it," as Father Burke admirably observed the other day, has during that period dispensed to those who came to seek it—they have not been very many certainly—all those intellectual, moral, and religious advantages which no English University can supply. It was started, moreover, under the auspices of one of the ablest and most experienced masters of University education living, though he very soon found it necessary to escape from an atmosphere far too stifling for such minds as his. And now, after a twenty years' course, untrammelled by any sort of interference from without, what is the verdict pronounced upon it, not by Protestant or unfriendly critics, but by its own orthodox alumni, past and present, clerical and lay, who are only desirous of promoting its efficiency? They have just addressed Cardinal Cullen in an elaborate Memorial, which begins by roundly declaring that the defects in the system of the University are such as to endanger its existence, and that they feel it a solemn duty to raise their voices in the hope of rescuing it from its present unhappy condition. They dwell especially on the almost total neglect of scientific teaching, "which has afforded a very plausible argument to those who never tire of repeating that the Catholic Church is the enemy of science," and they quote a statement to this effect from a studiously temperate writer in the *Fortnightly Review*. "This popular account of the normal attitude of the Catholic Church towards science, they add, 'is of course a sneer; but we are sorry to say it is a sneer with a sufficient gilding of truth to give it currency.' Irish Catholics are, beyond doubt, 'miserably deficient in scientific education,' and the deficiency 'is extremely galling to us.' It involves at once commercial loss and social and intellectual degradation. The one scientific man of eminence on the University staff, Professor Sullivan (a nominee of Dr. Newman's), has migrated to Queen's College, Cork, and no one can be found to take his place. The lecture list does not include the name of a single professor of the physical sciences, which have not only become the chief studies of the age, but have furnished infidel writers with the weapons of their fiercest attacks on revealed truth. 'But the truths of science prove the truths of Scripture, and it is the duty of the Catholic University to impress this fact upon the students in a practical manner.' Dr. Newman, we think, has urged very much the same plea in his Lectures on University Education. The Memorialists go on to say that, if scientific training is unattainable in their own University, Irish Catholics will seek it elsewhere; and they refer to the significant fact that 'for twenty years a Catholic University has been before the world as an educational institution, and during that period not a single graduate of it has been appointed to any position whatever in the Faculty of philosophy and arts, or of science.' What seems still stronger is the absence of theological instruction from the curriculum; and here the Memorial refers with telling effect to Dr. Newman's masterly argument on the relation of theology to the

other sciences, in his lectures delivered at the opening of this very University; indeed it was mainly on that argument that he based the necessity of a Denominational, as opposed to a mixed, system of academic education. Yet it appears that in this strictly Catholic institution what he considered the keystone of the arch has been deliberately dropped out. The Memorial closes with a complaint that for some reason the publication of the University Calendar has been discontinued, which "has not unnaturally been construed into an admission that the Catholic University had no work and no results to show." This document was sent in a few days before the public "Commencement," at which Cardinal Cullen and most of the hierarchy were present, on December 2; but we vainly look for any reference to it or to the subject it discusses in the facile rhetoric of the speeches reported on that occasion. Nor is the subsequent transference of the Professor of Moral Theology at Maynooth to a chair of Natural Philosophy at Dublin likely to be accepted by the Memorialists as a satisfactory recognition of their demands.

We shall certainly not follow the example of an ingenious contemporary in making this Memorial the text of a discussion on the incompatibility of science and Catholicism, and on the assumed fact that the signatories, though they do not choose to avow it, have "discovered" that their religion is false. Sceptical writers have before now pressed scientific objections against every form of Christianity, and an uneasy distrust of the study of physical science is by no means confined to the ministers or members of any one communion. The lecture delivered the other day by Lord Carnarvon is little else from beginning to end but an elaborate exposition of this sentiment. Such reasoners would of course maintain that their opposition was not to scientific training, but to its abuse, and would argue with great plausibility—very much as the late Sir W. Hamilton was never tired of arguing about the Cambridge mathematical course—that an exclusive devotion to the physical sciences has a direct tendency to narrow and warp the intellect and disincite it to the reception of any other kind of truth. And there is a good deal to be said for such a view. The story of the Senior Wrangler who complained that *Paradise Lost* proved nothing is at least *ben trovato*. The Autobiography of Mr. Mill does not supply a favourable comment on the effects of a purely scientific method of education. But, after all due allowance has been made for such considerations—and we are far from saying that no weight attaches to them—it remains true that, as the Memorialists insist, the physical sciences have become the chief studies of the age, and for that reason, if for no other, cannot with impunity be omitted from any professed scheme of University education. It is equally true that these same studies have furnished sceptical writers with their most effective weapons of attack, and on that ground alone they have a further and special claim on the attention of those who aspire to direct the higher Christian education of the day. There is therefore something very ominous in the systematic neglect of the whole subject, whether springing from dislike or incompetence, in the educational system of the Irish Catholic University, and it can hardly tend to inspire confidence in any University scheme originated under similar auspices in this country. English Roman Catholics may perhaps find melancholy satisfaction in the assurance that, after all, no such scheme is held to be feasible at present. Mgr. Capel's proposed establishment at Kensington may or may not have its value as another feeder to the London University, but it cannot even profess, like the institution on Stephen's Green, to be a University itself, and we shall be much surprised if Roman Catholic parents are prepared to accept it as a substitute for Oxford.

MR. LOWE AND THE POLICE.

MR. LOWE, in his speech at the Fishmongers' dinner on Thursday, made some timely and reasonable observations in regard to the Metropolitan Police. He pointed out, as we have done repeatedly, that there are only some eight thousand constables for the protection of the metropolis, and that twice this number would be insufficient if the police were not assisted by the confidence and support of the public. The Home Secretary draws perhaps rather too rosy a picture of the order and security enjoyed by this great city; but there can be no doubt that, on the whole, the police have, for so small a body, done their work tolerably well, and the reason of this is that they have possessed the confidence of the public and have known that they had the great body of respectable and well-conducted citizens at their back. It is only, as Mr. Lowe says, by maintaining the confidence of the people in the police that so small a force can be made to answer its purpose, and whatever tends to diminish this confidence at the same time tends to diminish public security. All this is very true, and it is important that it should be remembered; but Mr. Lowe was not quite so clear as he might have been as to the means by which the good relations between the police and the public are to be maintained. He is very anxious that the police should not be disheartened, but he can hardly have meant to say that the proper way to do this is to hush up all charges against them. Indeed he has himself reversed the policy of the Commissioner on this point, and has ordered a number of prosecutions in order that the truth of various charges may be ascertained. The wisdom of this course has already been demonstrated. The result of the inquiry into the case of the constables who were concerned in arresting Mr. Belt shows that an investigation was required in justice to the police quite as much

as in justice to Mr. Belt. If Colonel Henderson had been allowed to have his own way, the police would have remained under the imputation of having made a false charge and supported it by perjury. The public of course knew nothing of the case except from the proceedings before the magistrate; and the evidence which was first produced left an impression decidedly unfavourable to the police. A second inquiry has relieved them from reproach. Sir T. Henry, initiating the verdict in a recent libel case, has found both parties innocent. It has been shown that Mr. Belt was undoubtedly sober at the time he was arrested; but he is a person of excitable temperament and eccentric manners, and his demeanour to some extent justified the suspicions of the police. The public is naturally more interested in the character of the police than in the character of Mr. Belt, and the result of the inquiry may be regarded as satisfactory. It is impossible altogether to prevent mistakes in cases of this kind, but a mistake is a very different thing from a deliberate conspiracy to swear a false charge. The weak part of the case of the police is undoubtedly the manner in which the charge was received at the station. It does not appear that a moment's consideration was given to it, or that any attempt was made by the superior officers to form an independent judgment as to Mr. Belt's condition. The constable who brought him had charged him with being drunk, and that was enough. The sergeant and the inspector at once took the drunkenness for granted. Sir T. Henry remarked that the sergeant should have inquired calmly whether the charge was really made out or not; and there can be no doubt that this ought to be the rule at every police station. Mistakes cannot be prevented, but it is of great importance that they should not be carried too far; and every charge should be carefully tested at the time it is made.

It may be presumed that the course which has been taken in this instance will henceforth be followed in all similar cases. The demand for inquiry has been hastily construed as an expression of hostility to the police; but it is the police who have the greatest interest in having an opportunity of clearing themselves from imputations on their honesty. It would have been very unfair to the constables who have just been exonerated at Bow Street if the matter had been left as it stood when the magistrate dismissed the charge against Mr. Belt, and it would also have been unfair to the force at large. If the police are in the right, they have nothing to conceal, and should be anxious for the fullest investigation. It is inevitable that in a large body of this kind there must be a certain proportion of black sheep, and it is for the advantage of the whole force that every means should be taken of detecting and expelling these black sheep, and also of enabling the respectable members of the force to clear themselves from any suspicions that may fall upon them. Unfortunately, however, the police seem to be possessed by the idea that they are bound to stand or fall together, and that a charge against any constable is an attack upon the whole body, and that even to inquire into a charge is an outrage on the honour of the corps. This is evidently the notion which prevails at headquarters, and it is not surprising that it should have gradually permeated through the rank and file. The constables have letters and numbers placed on the collars of their coats in order that they may be easily identified; but to take a constable's number has come to be regarded as an insult which must be resisted or punished. In several recent cases whenever this has been attempted the police appear to have lost all control over themselves. Looking over the General Orders and Regulations of the Police we find that even as far back as 1830 complaints had been made that many of the constables wore their capes in such a manner as to conceal the number and letter of their division; and superintendents and inspectors were therefore directed to be particular in observing that the numbers were visible when the men were marched off for duty. In another order of about the same date the police were informed that their interests and safety were best consulted by a check being given to unnecessary and vexatious prosecutions. It might be well that these orders should be distinctly repeated. The whole of the arrangements for taking charges, and generally for maintaining the discipline of the force, also requires revision. It is impossible not to see that there is a want of superior officers. The rank and file are recruited from all classes of the labouring population. They are able to read and write, but the education of most of them does not go much further; and if they are honest and attentive to their routine duties, that is about as much as can be hoped for. Mr. Lowe says very truly that it is absurd to suppose that we are to have accomplished lawyers, finished gentlemen, men of infinite tact and intelligence, and of fine medical diagnosis, for 25s. a week. It is certainly not to be expected that ordinary policemen should exhibit a high degree of intelligence and discretion. But a larger number of superior officers would help to supply this deficiency.

Setting aside the men employed in the Dockyards and various Government and private establishments, there are 22 Superintendents, 226 Inspectors, 903 Sergeants, and 7,997 constables for ordinary duty in the metropolis. The Sergeants may almost be reckoned with the rank and file; the Inspectors correspond to the colour-sergeants of the army, and the Superintendents to regimental sergeant-majors. At the head of the force are the Commissioner and two Assistant Commissioners, and between them and the Superintendents of divisions there are four District Superintendents, who may be regarded as holding the rank of colonel. In a division of the army there would probably be at least three hundred officers above the rank of sergeant-major. The police, which is numerically as strong as a military division, and which stands even more in need of intelligent command,

there are only four, or, counting the Assistant Commissioners, six, officers between the Commissioner and the Superintendents. We have no desire to say anything in disparagement of the present Superintendents and Inspectors, many of whom are men of fair education and capacity; but we certainly think that the position of a police Superintendent should be raised in rank and emolument, so as to secure a superior class of men; that his authority should be extended; and that there should be a larger number of such officers. In a similar way the office of Inspector should also be improved. At present there is too wide a gap between the chief authorities at Scotland Yard and the Superintendents. Too many questions have to be referred to headquarters because they cannot be safely left to the discretion of the local officers. There is probably work for four District Superintendents; but what is above all wanted is a larger number of Superintendents and Inspectors, with a better scale of pay and higher qualifications than at present. In this way a large amount of intelligent direction would be introduced into the force. The constables would be placed under careful supervision, and all questions of difficulty would be promptly decided by officers who could take a wider and clearer view of them than an ordinary policeman. There are many cases of doubt in which a constable is bound to take persons into custody; at the station, however, there should be a calm and careful inquiry into every charge, and it should be seriously considered whether it should be sent before a magistrate. The Inspector before whom the charge is laid should examine it in a judicial spirit, and he should be a man capable of exercising his judgment upon it. All charges taken by an Inspector should afterwards be reviewed by the Superintendent. It appeared in Mr. Bell's case that the sergeant who took the charge as acting Inspector had tried to pass as an Inspector, but had failed in the education examination, which is by no means severe. It is obvious that a man of this kind should not be placed in so responsible a position. It is urged on behalf of the police that it is often very difficult to distinguish between drunkenness and nervous excitement or sickness, but it might therefore be expected that great caution would be exercised in coming to a conclusion on such a subject. It appears, however, that a theory of drunkenness hastily adopted by a constable is endorsed as a matter of course by his comrades and officers. Colonel Henderson, in his latest report, states that, "as a matter of humanity and precaution, medical aid is called in in every case in which there is the slightest doubt," but it was shown at Bow Street that there is a rule that medical advice shall be taken only in cases of insensibility. We agree with Sir T. Henry that this rule ought to be altered.

It is obvious that the power of the police depends rather on moral than on physical force. It is the strength of *prestige*, and *prestige* is only another name for character. It is important therefore that every means should be taken of placing the conduct of the police beyond suspicion; and this can be done only by sifting charges carefully before they are sent before the magistrates, by cautioning constables to be very particular as to their evidence, and by putting on trial any constable against whom serious imputations have been made, so that, if unfounded, they may be publicly answered. If this were done the police would be entitled to the support of the public; and it is necessary that they should know they have their support. It is of course desirable that the police should observe a happy medium in their zeal; but it might almost be better that they should do too much than that they should do too little. Nothing could be more unfortunate than that they should be frightened by clamour from discharging their duties in a vigorous manner. The sort of work they have to do must often be rough work, and cannot be done with kid gloves or the civilities of the dancing academy. Trivial complaints against the police should be discouraged, and great allowance should be made for occasional infirmities of temper and errors of judgment. The public must take a common-sense view of the matter, and remember what sort of men the police are, and the delicate and difficult functions they have often to perform. The whole subject of the organization of the police demands careful consideration. It can hardly be said that eight thousand constables—of whom only a third are on duty during the day, and two-thirds at night—are enough for patrolling and watching an area of seven hundred square miles, including nearly seven thousand miles of streets. But if the numbers of the force are not to be increased, an attempt should at least be made to improve its quality. The force should be officered in a superior manner, and the discontent of the men at the mismanagement of the superannuation system should be appeased by a liberal arrangement. The Metropolitan police area might with advantage be reduced, and the duties simplified. It is also evident that a larger degree of legal knowledge and capacity is indispensable at headquarters. The changes which we have suggested will of course cost money, but the protection of life, order, and property is surely worth paying for.

LEICESTER SQUARE.

THE history of Leicester Square is written in the Law Reports. There has been repeated litigation on the question of liability to maintain the "ornamental" character of the enclosure, and it was probably under a sense of legal duty that the statue which the owner of the land is bound to "continue and keep in the same position" was lately adorned with dabs of paint. In the year 1865,

this enclosure being in a neglected and dilapidated state, the Metropolitan Board of Works conceived the idea of "taking charge" of it, and they put up a notice on the spot to that effect. The owner of the land hereupon brought an action of trespass against them and obtained judgment. It appears from the statement of this case that in 1786 two families, whom we will call for shortness Tulk and Perry, were owners in common of the lands and houses forming Leicester Square. The land was formerly what is called Lammas land, belonging to the parish of St. Martin-in-the-Fields; and the Earl of Leicester, whose house stood at the north-east corner of the square, paid yearly to the parish officers of St. Martin's a rent for the Lammas of the ground occupied by his house, garden, and field. A partition under decree of Chancery was made between Tulk and Perry; the houses on the north side of the square being allotted to the latter, and the houses on the other three sides with the garden being allotted to the former. The Commissioners who made this allotment certified that the lessees of houses on the north side should continue to pay to Tulk the sums reserved in their leases towards keeping up the garden, and that Tulk should for ever keep and maintain the garden in its then state as a pleasure-ground. A decree was made in pursuance of this certificate, and mutual conveyances were executed between Tulk and Perry, but there was no covenant on the part of Tulk to keep up the garden. The last of the leases which contained covenants in reference to the garden expired in 1847. A further partition took place in 1807, by which Tulk the father and Tulk the son divided between them the share which had been allotted to Tulk, and the son covenanted with the father to keep the garden in its then state and in good repair. The son afterwards conveyed the garden to a purchaser who covenanted to keep the garden in its then state, and that it should be lawful for the Tulks and their tenants inhabitants of the square, on payment of a reasonable sum, to have keys and admission at all times to the garden. In 1848 Moxhay, who had purchased the garden, was proceeding to cut down the trees, remove the railings, and build upon the land, when Tulk filed a bill in Chancery to restrain him from committing any such acts of waste, and particularly from taking down the statue. Moxhay, by his Answer, stated that a thoroughfare had been made through the Square by Act of Parliament, which greatly altered its character as a place of residence, that the piece of ground had long been in a ruinous and dilapidated condition, and had ceased to be used as a pleasure-garden, and that he intended to make two footpaths diagonally across the Square, and he claimed to exercise such rights over the land as he might think fit. In the elegant language of Moxhay's Answer, "this garden had become a disgrace and reproach to the neighbourhood, and boys broke in," and, said the Master of the Rolls, "I do not know what they did there." For a long series of years, said that learned judge, nobody would give a farthing to go into this garden, and they would be very anxious to avail themselves of the right to stop out of it. The defendant insisted that he need not keep the garden in a neat and ornamental style unless he pleased. But, said the Master of the Rolls, he cannot leave it in that foul and disgraceful state which he maintains; he has a right to leave it in if he pleases. He was making two walks across the Square, and intended to have gates at the entrance. The learned judge believed that if he made these walks across the Square he could hardly make a greater nuisance of the place than it was already. "Consider what they will be at night." The defendant also insisted upon his right to remove the statue, which is an ornament there, and to build as high as he pleased on the land. An injunction prevented these projects of Moxhay being carried out, and soon after another and more celebrated impropriety appeared in Wyld, who bought the garden from Moxhay, and entered into an agreement with Tulk which enabled him to erect and maintain during ten years his Great Globe or Model of the World. This building stood from 1851 to 1861, and after it was removed Tulk purchased back the garden, and in his hands it reverted to its former state of desolation. Then came upon the scene the Metropolitan Board of Works, but they were driven off by Tulk, who defeated them in the Court of Queen's Bench, and again in the Exchequer Chamber. Lately Tulk has conceived the idea of making profit from the garden by erecting a hoarding round it, upon which advertisements are displayed. We should have thought that placards were less hideous than the squalid ground which they conceal, but the owner of houses at the north-east corner of the square considers that the amenity of his property would be increased by taking away the hoarding, and disclosing to view the garden. Accordingly Webb, the owner, has filed a bill in Chancery against Tulk to compel him to keep this garden and the iron railing round it in sufficient and proper repair as a square, garden, or pleasure-ground, and a decree has been made accordingly, so that before long we shall once more enjoy a view of the interior of this garden and of what remains, if anything, of the statue.

Formerly Leicester Field was a convenient place for duels. Thackeray has described in *Edmond* how Lord Mohun and Lord Castlewood, with their respective friends, went to the Duke's playhouse and saw Mrs. Bracegirdle in *Lion in a Wood*, then to the "Greyhound" in Charing Cross to sup, where the two lords quarrelled, according to previous arrangement, and it was agreed to take chairs and go to Leicester Field. Colonel Westbury, second to Lord Castlewood, asked, with a low bow to my Lord of Warwick and Holland, second to Lord Mohun, whether he should have the honour of exchanging a pass or two

with his lordship. "It is an honour to me," said my Lord of Warwick and Holland, "to be matched with a gentleman who has been at Mons and Namur." Captain Macartney, the second second, if we may so say, of Lord Mohun, asked permission to give a lesson to Harry Esmond, who was then fresh from Cambridge and destined for Holy Orders. Chairs were called, and the word was given for Leicester Field, where the gentlemen were set down opposite the "Standard Tavern." It was midnight, and the town was abed, and only a few lights shone in the windows of the houses, but the night was bright enough for the purpose of the disputants. All six entered the Square, the chairmen standing without the railing and keeping the gate, lest any persons should disturb the meeting. After Harry had been engaged for some two minutes, a cry from the chairmen, who were smoking their pipes, and leaning over the railing as they watched the dim combat within, announced that some catastrophe had occurred. Lord Castlewood had received a mortal wound, and he was carried to the house of Mr. Aimes, surgeon, in Long Acre, where he died. The things that were done at night in Leicester Field formerly would at least bear describing, which is more than can be said of what goes on there now. The land belongs to Tulk, but he cannot build upon it, and his compulsory restoration of its ornamental character is not likely to come to much. The occupiers of houses probably desire a result which can only be produced by voluntary action. It will be the interest of Tulk to make the garden look as disagreeable as he can consistently with obedience to the order of the Court of Chancery, because, if the idea of an ornamental garden were finally abandoned, perhaps Tulk might expect to enjoy the land discharged from the obligation to keep it open and unbuild on. The occupiers of houses may be willing to pay money, but they cannot compel Tulk to receive and expend it. He of course will simply obey the injunction of Chancery. As regards the statue, we are not sure whether anybody has now the right to insist upon the maintenance of what is left of it. After the Tulks, father and son, had divided their property between them, the son sold the garden, and the purchaser covenanted to keep up the statue. But as Tulk has since bought back the garden, there can be no liability on that covenant, and perhaps, but by no means certainly, the statue is at Tulk's mercy. It would be difficult to convince the Court of Chancery that Webb, as owner of a house on the north side of the Square, is entitled to a view of the remains, if there be any, of this statue, as a necessary condition of the enjoyment of the garden as a pleasure-ground. But we shall watch with interest the gradual removal of the hoarding.

The householders of Leicester Square have held a meeting to consider this subject, which is to them highly interesting. Although lawyers are the most conservative of men, yet law is gradually influenced by opinion, and it may be that in some way the existing desire to protect open spaces may affect the hitherto insoluble problem of keeping this garden clean and decent. The only right which judges have hitherto recognized in occupiers of houses has been that particularly worthless right to have a key giving admission within the railings of the garden. It is remarkable that even the rights of owners on the north side were altogether overruled during the ten years that Wyld's Globe occupied the garden. As a learned judge said, "Without a complaint of the parties, without the inhabitants or any human being having interfered with it, Wyld was permitted to keep within the Square those buildings with which we are all pretty well acquainted from having seen them with our own eyes for a space of ten years, and during the whole of that time no attempt was made by any inhabitant to put a stop to this interference with what is now supposed to be his rights." The Tulk family agreed among themselves that this should be done, and the Perry family either did not interfere at all or did not interfere successfully. But the hoarding must be removed unless the injunction obtained by Webb can be disturbed, which is unlikely. It may be that the owner of the garden, when it clearly appears that he cannot make money out of it, may be willing to allow it to be made—we will not say ornamental, but as little of an eyesore as possible.

REVIEWS.

LEWES'S PROBLEMS OF LIFE AND MIND.*

IT is easy to foresee that there will be a disposition on the part of the public to treat this book in the light of a recantation. Mr. Lewes wrote the *History of Philosophy* from the point of view that "metaphysics were bunk," or, in graver language, that philosophy was an expenditure of the precious energy of the human mind on insoluble problems. Though this *History* was written thirty years ago, not only has Mr. Lewes not withdrawn it, but he has in successive editions rather emphasized than weakened the thesis upon which it was composed. The book has been one of the most popular on the subject, and most deservedly, owing to the consummate literary skill displayed in presenting a picture of each writer's personality in connexion with his system. But its wide circulation must have tended to diffuse among younger readers the doctrine of the historian as to the nullity of the pursuit of which he had constituted himself the chronicler. Indeed Mr. Lewes's voice

was only one among many in preaching this creed. It may be said to have been the prevailing, and all but universal, belief of the last thirty years that metaphysics were now at last exploded. It was not Mr. Lewes's *History*, not Comte, nor any one thinker or book, which can be pointed to as the author of this scepticism; it was the thought of the age. It belonged to no one more than another, it was in the air, epidemic, and influenced the reasoning of those even who argued against it. Nor was it a casual fashion, a passing wave of thought to be superseded in its turn by another; it offered itself as the latest birth of time, the outcome of all our past. Twenty centuries of speculation without progress had landed us in the inevitable conclusion that all speculation was a mistake. Science had always been the rival of philosophy; as science had waxed, philosophy had waned. The general cultivated mind rejected metaphysics from impatience at its no-result. The scientific mind began to repudiate it because of its faulty method. Nothing has yet been reached by way of philosophy, says the historian. Nothing can be reached by the *a priori* method, cries the man of science. They, the men of science, went on to declare that all the questions hitherto called philosophical related to mysteries beyond human ken. This magisterial declaration became a dogma, and is perhaps the received faith of thinking Englishmen in general. Against this prevailing belief Mr. Lewes comes forward in his *Problems of Life and Mind* to protest. Nor will he only protest; he will show that the belief is false, and that philosophical problems may be rationally dealt with, and even rationally solved. His pages are intended to show that these problems may be presented in a soluble shape, and affiliated to all the other soluble problems.

The inconsistency between the new theory and the theories of the *History of Philosophy* is patent. It is a very vulgar form of personality which in literature would throw up against any thinker change of view as a weakness, in the same way as politicians make capital out of an opponent's change of party. But in the case of Mr. Lewes any such objection would not only be inadmissible as a personality, it would be an error. For Mr. Lewes's shifting of ground in his present work is not a recantation of error, it is a growth of thought. His present view differs from his previous view because it is developed out of it. He proposes to reinstate metaphysics as a legitimate field of thought. But he proposes to rehabilitate it for the very reason for which he formerly proscribed it. A few words will explain how this can be.

Mr. Lewes brings forward the fact that, notwithstanding the excommunication which has been laid on metaphysics by the reigning system of thought, the tendency towards speculation is not extirpated. Contempt, ridicule, argument—all is in vain. Ours is no longer the age described by Mr. Carlyle as "destitute of faith, yet terrified at scepticism." We have lost our terror, and accepted scepticism, but only as provisional. We understand it now, not as a resting-place, but as a starting-point. The last generation persuaded itself that its curiosity after the "Unknown" was extinct. It changed the label to "the Unknowable," and put it away out of sight. Curiosity is awake again; it is irrepressible. Even great captains of science are seen ever and anon to cast lingering glances at those dark avenues of forbidden research, and are stung by secret misgivings lest, after all, those avenues should not be useless, but may some day open upon a grander plain.

This change in the tone of thinking is most remarkable, and has often been observed. But it is not merely because the general current of thought has been changed that Mr. Lewes has changed. He is not a man likely to be swept with the stream, and is too independent to be under the necessity of thinking as other people are thinking. It is the gradual course of his own studies which has led him forward to the conviction that the region called metaphysical is not only not barren, but is not, as had been ruled, inaccessible. He finds, and every scientific inquirer has found, that when physical generalization has been carried as far as it can go, it lands him in conceptions which have usually been called metaphysical, but by which are meant the highest generalizations of research. Bacon's scheme represented philosophy as a pyramid, having natural history for its basis, physics for its middle stage, and metaphysics, or formal and final causes, for its apex. For Bacon's formal and final causes substitute the conceptions Matter, Motion, Force, Cause, &c., and you have a province of inquiry which Mr. Lewes proposes to bring within the boundary of legitimate science. For metaphysics has been justly exploded not because its matter was unimportant, but because its method was incapable. It was not because the questions raised by metaphysics were not desirable to be answered that they have been laid on one side, but because the mode in which they were attempted to be answered could lead to no truth. If conceptions called metaphysical can be reached through logical extensions of experience, and if we can not only rise to metaphysics through science, but never forsake the method of science in treating such questions, they would then enter into science and form a rational branch of it. Mr. Lewes would divide metaphysics thus into two parts, and, while still leaving outside the "transcendent" element which is beyond experience, and therefore unknowable, would bring within the domain of science all those abstract conceptions which science employs, but does not analyse. All the metaphysical ideas, he thinks, such as Matter, Force, Cause, Law, Soul, &c., contain both elements—the elements speculatively knowable, and the elements that lie beyond all reduction to experience. For these latter elements Mr. Lewes proposes the name *metemprical*, to distinguish them from the province which he includes within the range of science. The province so included within the range of

* *Problems of Life and Mind*. By George Henry Lewes. First Series. The Foundations. Vol. I. London: Trübner & Co. 1874.

science, and usually treated as speculative or metaphysical, is now to be cultivated on the method of science, to accept all the tests and conditions of science, and to keep within the range of experience.

Having thrown down this challenge to scientific men, and undertaken to prove against them the possibility of a scientific metaphysic, Mr. Lewes goes on to show why this metaphysic should be constituted a separate branch of science, and not, in conformity with Comte's classification, distributed among the sciences from which its data are drawn. This separate treatment of metaphysics Mr. Lewes justifies on the general ground of the easier appreciation of abstract ideas when we regard them detached from their concrete. We know, and must carefully remember, that such detachment is a fiction; but it is convenient for the purpose of reasoning on them to regard these ideas as separable from their concrete manifestations. The mathematician, *e.g.*, detaches extension from matter, and motion from solidity, though perfectly aware that pure extension and pure motion are impossible things. All such abstract conceptions must have been framed from and express actual relations of things, must be reducible to sense, and be capable at all times of verification by sense. There is an order in things on which the order in thoughts depends. But the dependence is particular. Now it is only the general order in things with which philosophy is concerned, and which is expressed in laws. Philosophy seeks conceptions which represent the order in things, not at one instant and under particular conditions, but at all times and under varying conditions.

A science then of metaphysics is possible and desirable. Thus far we get in the present volume. This volume, which is only Vol. I. of the work, does not enter methodically upon the construction of the promised science. We have only general prolegomena, as they may be considered, to such a system of metaphysics. This preliminary portion, though, as the author seems to admit, of somewhat heterogeneous composition, comprises separate discussions of great interest. In a section of about ninety pages, headed "Psychological Principles," we have a programme set down dogmatically—that is, without, for the present, proof or illustration—of the psychology which Mr. Lewes assumes as the basis of his metaphysics. This programme embodies at once the results of previous psychologists, as well as those arrived at by Mr. Lewes's independent researches. The peculiarity of this psychology is that it is based upon a combination of the biological and sociological data. The organism and its medium must be studied together. Man apart from society is simply an animal organism. Restore to him his position as a social unit, and the problem changes. The soul of man has a double root, a double history. It passes out of the range of animal life, and no explanation of mental phenomena can be valid which does not allow for this extension of range. It is now universally admitted that the old method of studying mental phenomena in the cabinet of the metaphysician, by the aid of so-called consciousness, was unscientific. Mr. Lewes wishes to enforce the truth that the method is equally incomplete which seeks the explanation of intellectual and moral processes in the laboratory of the physiologist. The human intelligence Mr. Lewes affirms to be superior to, and distinct from, the animal intelligence. The difference is not one of degree. It is one of kind, and its root lies in the social medium in which man exists, and in which the animal does not exist. This social organism is a real agent, which explains all that difference between man and animals which used to be explained by the old spiritualist hypothesis. Man's individual functions arise in relation to the cosmical medium in which he finds himself. His general functions arise in relation to the social medium in which he equally finds himself. Here the moral life emerges, and the animal impulses become blended with the human motives. This social medium exists as a fact. How it originated Mr. Lewes does not discuss. Not, it appears, in any psychical difference between man and the lower animals, of which difference the social organism is itself the cause.

The remainder of the book is occupied by a variety of discussions of a somewhat heterogeneous character, brought together under the common title of the "Limitations of Knowledge." The "Principle of Relativity," the "Sensational and *a-priori* Hypotheses Compared," the "Reality of Abstraction," "On Ideal Construction in Metaphysics," are suggestive and pregnant discussions, in which worn themes surprise us by becoming new and interesting. It is characteristic of Mr. Lewes's handling of such topics that he is perpetually trying to realize the objects of which he is writing, and that he thus never falls into the dry, scholastic, technical style of less realistic thinkers. Some readers may perhaps object that he, like Mr. Herbert Spencer, is too fond of employing technical terms where a common word would have done as well. And where Mr. Mill would have used the common word. Mr. Lewes has not, indeed, that peculiar gift of making philosophical questions intelligible to the uninitiated which places Mill by the side of Hume among the masters of the style which is simple without being superficial. Mr. Lewes writes for the public also, and not for the experts; but it is for that section of the public—a tolerably large one now—which has some training in abstract questions. Without some training in these inquiries, hardly any one would sit down to read through *Problems of Life and Mind*. But the varied nature of the discussions comprised in this volume leads Mr. Lewes to touch upon so many topics of general interest that even those who do not care to make out his system as a whole will find some point of contact with him, something thrown out which looks their way. Nor can it be foreseen

where such attractive passages will occur. In the middle of the chapter "On Ideal Construction in Science," *e.g.*, emerges a paragraph on moral types in which that question of ethics is considered—the objection, namely, against the conception of duty, that it is an unreal standard, an unattainable perfection. The mind of the reader receives a peculiar sensation of pleasure from the light thrown upon a moral question by its simple juxtaposition with a question of the metaphysic of mathematics, and the unexpected relation which is disclosed between the two.

While this varied, and what we may call unexpected, character of the contents of Mr. Lewes's book carries on the reader with ever fresh interest through its pages, we may perhaps save others from the slight shade of disappointment which came over ourselves on finding that the scientific treatment of metaphysics, or ontology, which we were promised and prepared for in the opening pages, is not to be met with in the after part of the volume. Here and there, it is true, metaphysical topics are touched upon incidentally; *e.g.*, on the question of the existence of the external world, Mr. Lewes takes an occasion to state his own view, and even to reason it out, or at least to reason against the rival theories. His view he calls Reasoned Realism. He considers that the reality of a not-self is proved by consciousness—that it is a fact of feeling to be accepted as ultimate. We know that an external not-self exists with the same assurance with which we know an internal self to exist; and, further, we know the manner in which these two are combined in feeling and thought. The Ding-an-sich, or Noumenon, is a phantom of the metaphysicians, which has no existence, and must be banished from the sphere of knowledge. The external world, when reflected in a sentence which has not acquired shaping reactions, is a confused chaos without order. But, as the sentient organism develops, order emerges. This order is not, as Kant made it, the creation of the organism stamped upon the chaos; but an order selected from the larger order of the real by the assimilating power, or shaping reaction, of the organism. As feeling becomes differentiated, qualities arise in the felt. Reasoned realism is thus a sort of compromise between the realist and idealist theories. The organism may be said to colour objects; but the organism itself, or at least the mode of its action, is a product originally due to the action of objects.

This is an example of a metaphysical question being started; but it is so only in connexion with the "principles of psychology." Of ontological speculation, properly so called, there is hardly any in the whole volume. Its chapters are, in part, psychological; but by far the greater part of the discussions in the part entitled the "Limitations of Knowledge" are logical in their character. It is not obvious how Mr. Lewes reconciles the character of his volume with the opening sections in which the large and tempting promise is held out to us that we shall now for the first time be presented with a science of metaphysics based upon experience, and reasoned out on the strict method of the other inductive sciences. The fulfilment of this programme is probably reserved for the volumes still to come.

THE FRIENDSHIP OF BOOKS.*

THIS book consists of certain lectures delivered by Mr. Maurice at different times to various popular institutions. It is introduced to the world by Mr. Thomas Hughes, and we are a little amused by the relation between the prophet and his disciple. As we read Mr. Hughes's pugnacious preface to the wise and kindly lectures which follow, we seem to be listening to a converted prizefighter introducing a Christian missionary. My revered friend is going to give you some excellent advice, Mr. Hughes appears to be saying, and if any one is not ready to receive it in a corresponding spirit of brotherly love, he had better take off his coat at once and have a round or two with me. Accordingly, just by way of showing his muscle, Mr. Hughes opens the proceedings by knocking down some half-dozen imaginary antagonists. He disposes in a few pages of Mr. Matthew Arnold; raps the knuckles of the Positivists and Mr. Morley; gives a blow in passing to Mr. Fitzjames Stephen, and playfully trips up Mr. Mill's heels in conclusion. Having thus made things pleasant, he allows Mr. Maurice to come forward and discourse according to his nature. As there is not a word in Mr. Maurice's lectures which could be offensive to any body of any shade of opinion, and as there is an entire absence of controversial writing, this little outbreak seems to be slightly unnecessary. There is only one of Mr. Hughes's remarks with which we need trouble ourselves. Mr. Hughes mentions the singular circumstance that nearly all persons who have valued Maurice's writings have agreed in accusing him of mysticism and want of clearness. Mr. Hughes assures us that this is an entire misconception. He is surely taking a rather untenable position. Unless he means to impute insincerity to these critics, he must take their word for it that they cannot understand Mr. Maurice. This, no doubt, may simply prove their stupidity, and give Mr. Hughes some cause for complacency in the superior lucidity of his own intellect, which has enabled him to see what is hidden from Mr. Arnold, Mr. Stephen, and Mr. Mill. But if Mr. Hughes would condescend to point out, the cause of this difficulty of apprehension, and explain why the writer who has "scattered more mists than all his contemporaries put together" is generally considered to be a singularly misty writer, we should be very much obliged to him. The gentlemen we have named differ from Dr. Newman more widely than they differ from

* *The Friendship of Books, and Other Lectures.* By the Rev. R. D. Maurice. London: Macmillan & Co. 1874.

Mr. Maurice; but none of them ever called Dr. Newman misty. Is it from sheer perversity that they have agreed to give Mr. Maurice an utterly inappropriate nickname; or can there be any foundation for their opinions?

Whilst waiting for Mr. Hughes's answer, we shall venture to give a partial answer of our own. We have no thought of discussing Mr. Maurice's general principles. These lectures take him fortunately into purely literary ground, where we can observe the character of his mind apart from any of his religious dogmas. And, if we are not mistaken, he shows very plainly why men of clear intellect have a certain difficulty in following him. There is indeed very little obscurity in these lectures, though there are some touches of the author's peculiar mysticism. They deal for the most part with popular subjects; with the uses of books and newspapers; with the right methods of studying history; with Milton, Spenser, and Burke, and with modern criticism. They are full of really profound sayings, and are animated throughout by a kindness which always endeavours to look at the best side of men and things, and to recognize the soul of good in things evil. Nobody combines a wider toleration with a more ardent admiration of goodness, purity, and justice. It is a favourite doctrine of Mr. Maurice that we do not understand a book till we know the man as well as the author. Applying that doctrine to his own case, we may say that nobody could read these lectures without feeling the better for association with a man of so singularly attractive a character. Mr. Maurice shows himself in these writings as distinctly as in his more elaborate works; and whenever we think of his personality, and put aside his opinions, we feel the singular charm which he undoubtedly possessed. There is, however, still a sense of something wanting; and we think that the secret is partly revealed to us here. If Mr. Maurice ever loses his usual amiability, it is in speaking of Utilitarians. Doubtless he did not hate even Bentham; but he had some trouble in seeing that a Bentham could be of any use except in the part of drunken Helot. One reason is, perhaps, that Mr. Maurice was very ill-fitted to recognize the special merit of the Utilitarian school. It is their claim—we need not inquire how far it is well founded—to have established a definite criterion for the settlement of moral questions. They provided a distinct external test by which all actions could be judged; whereas the intuitive school of moralists, appealing to their own internal sense as conclusive, seemed to be really setting up an arbitrary standard. Now the weak part of Mr. Maurice's lectures is mainly the want of any such definite standard, whether in historical or critical questions. His intellect is so strangely ingenious that his theories always seem to be unduly plastic. They are capable of changing and shifting as rapidly as Hamlet's cloud; and we find it almost impossible to pin him down to any distinct canons of proof. A very characteristic essay is the last in the present volume, in which he attempts to define the functions of critics. It may be described as an expansion of Pope's lines in the Essay on Criticism:—

A perfect judge will read each work of wit
With the same spirit that its author writ:
Survey the whole, nor seek slight faults to find,
Where nature moves, and rapture warms the mind;
Nor lose for that malignant, dull delight,
The generous pleasure to be charm'd with wit.

These lines occur in a poem which lays down a great many definite rules. Some of them are crude and barren enough; but Pope is quite right in asserting at once that a critic should be generous in his appreciation of the writer, and that he should be bound by certain distinct canons. Mr. Maurice, on the other hand, explains with great force and fulness the duty of being sympathetic and appreciative, but is quite unable to lay down any rules whatever. He begins by referring to the audacious criticisms of the *Edinburgh Review* in its infancy. He tells us that the young reviewers set up, according to their well-known motto, to be judges, and he urges that we should not begin by placing ourselves on the bench and laying down the law, but by endeavouring to enter into the spirit of the person at the bar. The critic, he says, may be a long time before he finds himself able to pass a judgment, and perhaps after a long consideration he may find himself less able than he was at first. For want of this reflection many rash and erroneous judgments have been pronounced. "Is there, then," he asks, "to be no criticism in style? Is there no such thing as style?" Yes, he replies, there is a great difference in styles; the style of Milton, for example, differs from the style of Burke; but each is the natural expression of the mind of a genuine and noble man. That is doubtless true, but it does not quite answer the real question; which should not be, Is there no such thing as style, but is there no such thing as a good or a bad style? Mr. Maurice comes to this question, but he does not quite answer it. Rules, he says, would be very useful if they could help us in this matter; but, he adds, "he that wants to be saved from this fault"—the fault of affectation—"will never be saved from it by looking for it in another." By studying good writers he may become conscious of the fault in himself. Surely this is a very lame answer to a very plain question. That you should not be anxious to find faults in another is true enough; that you should be insensible to the faults of others is simply to say that you should confound good and evil; but at any rate the question is whether the knowledge of good and evil, however obtained, is capable of definite statement in distinct though flexible rules, and to that question Mr. Maurice gives no particular answer. He goes on to tell us that we ought to be honest in our poetical tastes, and not to affect a liking which we don't feel; that in historical questions

we may find great value in records which hasty persons have rejected as mere worthless tables; both of which statements again are true enough, but yet signally fail to tell us whether any distinct rules of poetical or historical criticism can be ascertained or expressed. Then again in political criticism, we are not to be mere partisans, condemning all Whigs or all Tories, and we are not to mistake a cynical indifference for judicial impartiality. We are to recognize all the good on every side, and never to confound truth with falsehood. We are to do full justice to men in all times, and to recognize our common humanity whilst making allowances for differences in the standards of different ages. All this is true; much of it is very wise and very well said; but yet it leaves us in complete uncertainty as to whether there be any such things as ascertainable rules for distinguishing between good and bad, truth and falsehood. The general impression left is that we are to trust to our instincts, and that our instincts are to be good. We are to be very generous and sympathetic, and yet radically opposed to evil. As a protest against hasty criticism, and as a description of the right temper of mind, the lecture is admirable; but it does not even tend to clear up the question as to the possibility of creating a science of criticism.

It would be curious, if we had space, to follow out Mr. Maurice's application of his theories to particular cases; and to compare them with the judgments of other good critics who have more definite principles of judging. In one sense Mr. Maurice's criticism is excellent. He does his best to enter into sympathy with Shakespeare, Spenser, Milton, and Burke, and preaches very excellent sermons about them. But we are always haunted by an uncomfortable sense that his want of fixed rules, or, we may almost say, his abhorrence of fixed rules, enables him to see in these writers almost anything that he wishes to see. Sometimes he extracts too much out of a very obvious commonplace. Burke is highly praised for refusing to adopt Böllingbroke's principles. The fact is undeniable; but then we cannot forget that Burke was simply in agreement with all the other respectable writers of the time, and that it wanted no great virtue to repudiate sentiments which were universally condemned. In this case Mr. Maurice is at worst attaching too much importance to a particular sentiment; but sometimes he seems to distort a writer's meaning, as well as to add weight to it. According to M. Taine, Shakespeare was a profoundly immoral writer. According to Mr. Maurice, he was a profound moralist. *Macbeth* could only have been written at a time when men's consciences were struggling under a sense of moral evil; and the design of the historical plays is to show us that each reign may be "considered as an integral portion of a divine drama." In our opinion, each critic exaggerates, though we admit that M. Taine seems to us to have most to say for himself. There is, however, this difference; that M. Taine has at any rate a distinct theory which we can test for ourselves, and that if, as we hold, he often applies his *a priori* method very rashly and erroneously, it suggests some distinct issues. Mr. Maurice, on the other hand, trusting entirely to his instincts, and shrinking excessively from all approach to mechanical methods, really tells us, not what Shakespeare meant, but what Shakespeare's writings suggested to him. It is very interesting to know what Mr. Maurice infers from the story of *Macbeth*; but the knowledge enlightens us very little as to what Shakespeare meant to teach us, if indeed he meant to teach anything, by *Macbeth*. The same method applied in a number of other cases convinces us that Mr. Maurice is a very unsafe guide in such matters, for the simple reason that no man's subjective judgment, however acute may be his sensibility, and however noble his character, gives any satisfactory conclusions when not corrected by some objective test. And, as we might attempt to prove if it were worth the time and space, the same method produces obscurity because it constantly leads to a hopeless confusion between the different theories in each of which Mr. Maurice ingeniously contrives to see a reflection of his own views.

We must add one remark in regard to another matter. We cannot congratulate the editor of the volume on the way in which his minor duties have been discharged. For example, the table of contents omits altogether the Essay on Critics which we have noticed. The Essay on Newspapers, again, is said to have been delivered "about 1848." From a passage in it speaking of "Mr. Macaulay's" last volumes, we should infer that it was written between 1855, the date of their publication, and 1857, the date of Macaulay's elevation to the peerage. From another passage, however, about the American Civil War, we should infer that it must have been written after 1861. We should like to know which of these dates is accurate; or whether the lecture was rewritten at different periods? The matter is of no great importance, but it has some biographical interest; and if an editor undertakes to give us a date, he should take the trouble to make it reconcilable with obvious facts.

MORLEY'S STRUGGLE FOR NATIONAL EDUCATION.*

(Second Notice.)

WE have already endeavoured to show that Mr. Morley's indictment against the existing educational system fails in one essential respect. Even if it be granted that the instruction given is as bad as he describes it, he has not proved that its badness is the result of Denominationalism. To make good his case he ought to have shown either that Denominationalism is the cause of

* *The Struggle for National Education*. By John Morley. London: Chapman & Hall. 1873.

partial and irregular attendance, or that, if prolonged and regular attendance were secured, the Education Department would still be powerless to raise the standard of instruction in Denominational schools. Instead of proving one or other of those points, he has contented himself with asserting that it is of no use to apply compulsion until the character of the instruction has been improved; a statement which avails nothing against those who contend that the result of applying compulsion under the control of a Central Department would infallibly be to improve the instruction up to the highest point which the opinion of the country would accept as practicable.

We shall now carry the war into our opponent's territory, and endeavour to show that the system which Mr. Morley wishes to see put in the place of the existing system would, to say the least, succeed no better. We will frankly admit that Mr. Morley has stated the case in favour of free schools with much force, and, as opposed to Mr. Fawcett's unmeasured condemnation of them, we are inclined to say that he has the best of the argument. In one respect, however, he seems greatly to overrate their influence. "Unless," he says, "instruction is gratuitous, every occasion of bad times, whether local or general, is the signal for the interruption of instruction, and the child misses six months or a year—a loss which can never be replaced. . . . If primary instruction were free, bad times would make no alteration. The child's attendance would continue as regular as before." This would be true, provided that the child's labour were absolutely unsaleable, and that the only thing he now has to take with him to school is the school fee. But the cases in which a child's labour is worth nothing are not very numerous. If he could only bring back sixpence at the week's end, or worked for an occasional meal, he would still be doing something to lighten the family burden; and when times are bad, even the slightest help has its value. Again, a child wants clothes to go to school in. Some one has said that among the very poor education is more than anything else a question of shoe-leather, and certainly decent mothers do not like to see their children going to school in ragged clothes or in boots which have next to no soles to them; yet the first effect of hard times is usually to send the clothes of the family to the pawnshop, if they are good enough to raise money on, and to make the purchase of new ones impossible. Once more, hard times soon reduce the meals of the family, and when the children are crying for the breakfast which the mother is unable to give them, she will think it sheer cruelty to make their hunger keener by superadding to it a cold walk and a morning's schooling. If free schools were at once made universal, the need of a law to compel attendance at school would be just as conspicuous as it is now, and among the difficulties which would have to be surmounted in the application of such a law, the difficulty of providing the school pence is far from being the greatest.

Let us, however, put aside this and other obstacles in the way of free education, and imagine Mr. Morley's scheme introduced as a Government measure. He estimates the total cost of educating 3,000,000 children at 3,750,000*l.* Towards this he suggests that the Consolidated Fund should contribute 2,500,000*l.*, leaving the remaining 1,250,000*l.* to be raised out of local rates. This sum, assuming the rateable value of property throughout the country to be 100,000,000*l.*, would be exactly covered by a 3*d.* rate. By this means a sound elementary education would be provided at the cost of the community for every child whose parents were not sufficiently well off to give him instruction of a higher kind. What sort of reception would such a proposal as this meet with in the House of Commons? On this point we claim to speak with some impartiality, because we have long ago stated our conviction that the Denominationalist party, so far from being sufferers if such a Bill were passed, would be actual gainers by the change. They might have virtually the same facilities that they now have for giving religious instruction, and they would have time, money, and energy to spare for the improvement of religious instruction. The question we are considering, however, is not how Mr. Morley's proposal would affect the Denominationalists, but how the Denominationalists would stand affected towards Mr. Morley's proposal. Can there be any doubt about the answer to this question? The Church of England, the Roman Catholics, and a portion of the Wesleyans would find themselves on the point of being compelled either to hand their schools over to the School Boards, or to raise by voluntary subscriptions about five times the amount that they raise now, their subscribers being at the same time compelled to contribute their full share towards the maintenance of the Board schools. It is clear that, when exposed to such a strain as this, private liberality must break down, so that in the minds of the Denominationalists the success of the proposal would be tantamount to the absolute triumph of Secularism. No religious instruction would be given by the ordinary teachers in the Board schools, and the great majority of Denominationalists have for the present convinced themselves that, unless it is given by the ordinary teachers as part of the regular school work, it cannot be given at all. They would fight the battle therefore as though the whole issue between religion and no religion depended on it. On this point experience has shown that the Church of England is, with a few exceptions here and there, a united body, and, when united, the strength of the Church of England will probably be found very much greater than the Education League is disposed to admit. Nor would it fight alone. The ratepayers throughout the country would hear that a universal charge of 3*d.* in the pound was to be levied for the purpose of defraying an outlay which in a vast number of parishes is at present defrayed without the rates being raised by so much as a farthing. Mr.

Morley appears to think that the opposition excited by this consideration would only affect the immediate prospects of the measure. "It may be very well," he says, "for a writer of leading articles in the *Times* to insist on limiting his outlook to tomorrow morning, but surely there is no harm in occasionally considering a subject with a slightly wider horizon?" In matters of this sort everything depends upon degree. What amount of horizon will serve Mr. Morley's purpose? We suspect that he would have to stipulate for something like half a generation, and half a generation means two generations of children within school age. During that whole period educational progress would be sacrificed to the exigencies of educational controversy, and meanwhile millions of children would have grown up uneducated or badly educated because the Liberal party insisted on breaking with the existing machinery, instead of turning it to account for their own purposes.

Let us next assume that by some miracle Mr. Morley's proposal has become law, and that in every parish there is a school providing gratuitous elementary education at the cost in part of the Consolidated Fund, in part of the local rates. Mr. Morley holds that by this means a new sense of the value of instruction would be inculcated and diffused, and the salutary habit of local self-government would be deepened:—

All the objections [he says] in the mouths of the clergy and others against establishing School Boards in country parishes are simply objections to self-government, and a denial of its services exactly in those conditions where they are most needed. It is precisely in the rural districts that the consciousness of national life is feeblest, the sense of public responsibility most confused, the habits of collective action for public objects least formed and least on the alert. It is precisely in these districts that our present educational policy takes an important department of local affairs out of the hands of all but the clergy.

We do not dispute the abstract advantages of local self-government. On the contrary, we should rejoice to see all the parishes in England so keenly alive to the importance of education as to use the power they already possess of forming a School Board where the Education Department has not ordered them to do so. But before abolishing the whole machinery of voluntary agency, and trusting entirely to School Boards, we should like to see more evidence of a pre-existent sense of the value of education than is yet forthcoming. At present in country parishes the schools are managed for the most part by the clergyman and the squire, and over these the Education Department exercises a very powerful control through its powers of withholding the Government grant, and of creating a School Board in the event of its being dissatisfied with the education supplied by voluntary agency. Supposing School Boards were set up everywhere, and voluntary schools virtually closed, the parson and the squire would in most cases either remain aloof in angry indifference, or would throw themselves into the management of the School Board, with the hope of helping to bring matters to a pass which would force Parliament to retrace its steps. Either way, educational progress would be left to the care of the farmers or of the labourers. In spite of happy exceptions here and there, we do not believe that the former would be at all favourably disposed to a system which saddled them with a rate of 3*d.* in the pound, and, in proportion as it worked effectively, withdrew child labour from the fields. The labourers will eventually, no doubt, be the real strength of an educational system, because they are the parents of the children who are to benefit by it, and it will be to their interest to make it as efficient as possible. But the labourers must learn to appreciate education better before they will willingly rate themselves to provide it for their children, and the only way in which they can learn to appreciate it better is by seeing what it does for those subjected to it. At present in too many cases it does nothing. Upon this point all that Mr. Morley says is admirable:—

If an English peasant, for instance, knew how to read and count as a Scotch or an American peasant does, he would have a chance of finding out the monstrous percentage which the village shopkeeper makes him pay, and will continue to make him pay, until the victim has arithmetic enough, and can get from the papers knowledge enough of wholesale prices, to let him see the cost in hardly-earned cash of his present ignorance of his letters. . . . How is the man to be a co-operator, to watch accounts, to supervise transactions, when he left school at the age of ten in the Second Standard, and at the age of five-and-twenty could no more cast up a money column or calculate a percentage than he could solve a cubic equation? . . . Again, we are always chiding the labourer for not saving, and reproaching him for the constant breakdown of his clubs and benefit societies. What club or benefit society would not break down when most of its members are incompetent to supervise their own club accounts, or accurately watch the management of the club affairs? To have just scraped through in the Third Standard ten or eleven years back will do nothing to help a man here, and the result is that in most cases the village club is managed by the village publican, with breakdown for a consequence. . . . While, therefore, wholly repudiating the extravagant expectation of large classes of people, that mere spread of knowledge will transform the whole face of society, we contend that such an improved capacity of taking care of their own affairs as I have just described would be a most substantial social gain; it would be a most substantial social gain if our labouring class in England could all talk as articulately, as rationally, and as instructedly, and could take care of their interests as acutely, as you may trust the labouring class in Scotland to do.

But how is the labourer to know that six or seven years spent regularly at school will give his child these powers? He knows that the gentry have them; he may perhaps know that some of the workmen in the great towns, to which he occasionally goes to be dazed by the crowds and deafened by the noise, have them; but he associates the possession with the possession of money or with certain kinds of work, not with time spent in the village

school. But if the village school were all that it ought to be—were all that it would be, provided regular attendance for a sufficient number of years were made compulsory—the labourer would see by degrees that what he has envied or wondered at in others is equally within the reach of his own children. When once this fact has dawned upon him, he may safely be left to rate himself for educational purposes. The parson and the squire might stand aside from irritation, the farmers might stand aside from unenlightened self-interest; but the parents of the school children would know the worth of education, and might be trusted to see that their children had it. It is for the five or seven or ten years that must pass away before compulsion will have done its work that we should fear to leave elementary schools to the care of the ratepayers, because in these intervening years the labourer will not take in that he is a parent as well as a ratepayer, and that economy in the one character may be the worst kind of waste in the other.

There is a single passage in Mr. Morley's book on which we should be content to rest the controversy between us. It follows immediately after the passage last quoted:—

It may be urged that the Scotch training is penetrated with theology, and is Biblical and dogmatic in the highest degree. Very likely it is. That is no answer to those who think with me that, though education without theology is better, yet education with theology is better than helplessness and sudden ignorance. The Scotch Denominationalists at least do their work well.

Why do the Scotch Denominationalists do their work well? Because they do it for and in the midst of a people which sets a high value on education. The English poor can only be made to set an equal value on education by being made to see its good effects in their own children. The quickest way to produce these good effects is to drive every child in the country into the existing schools, and to take care that the education given in them comes up to the proper mark. Mr. Morley says that children will never be legally compelled to go to school "if the clergy can help it." We know of no evidence which bears out this statement; but even if it were correct, what is it that makes the opposition of the clergy to compulsion really dangerous? The action of the Birmingham League. If the Liberal party were united in supporting the educational policy of the Government, and in pressing forward that policy to its legitimate developments, the clergy, even if they wished to stave off compulsion, would lack the power to do so. Those who think with Mr. Morley that, "though education without theology is better, yet education with theology is better than helpless sudden ignorance," are bound to consider whether education with theology or education without theology can be had soonest and had easiest. If by refusing to entertain this question fairly they prevent education being had promptly, or lower the quality of the education which can be had with theology, it is they who will be mainly responsible for all the evil consequences that may follow. The question at issue can be summed up in a sentence. Whether the Denominationalists are really friendly to education or not is a matter of no moment, for they are entirely under the control of the Education Department; the persons with whom it rests to promote or impede education are those who, rather than accept any settlement except their own, insist on paralysing the Government, and thereby making the control of the Education Department over voluntary schools immeasurably less effective.

ONE LOVE IN A LIFE.*

MISS PEARSON may be congratulated on the selection of her title, for it indicates exactly the line she is to follow in her story. It is to ring the changes on the old tune of a woman's wasted love, and to expatiate on the cankering griefs of an unfortunate or misplaced attachment. A more ambitious subject is scarcely to be chosen; and although it is the choice of nineteen lady-writers out of twenty, the chances against success are so many as altogether to defy calculation. You have to begin by inventing a woman who shall be natural and yet out of the common; you must make her excite an absorbing interest in the course of an existence whose outward incidents are commonplace. You have to analyse with a master's hand the intricate workings of her innermost heart, so that a study of the feelings and passions that are the universal property of her sex shall supply the sensations of a life drama pregnant with unexpected incidents. In short, you should be gifted with such an intuitive knowledge of human nature as is but rarely given to a few commanding intellects; and if you join to that the advantages of an extensive experience of mankind, so much the better. Where qualifications like these are the elementary conditions of success, failure may be taken to be a foregone conclusion. As the reviewer reads Miss Pearson's first two volumes with a purpose, making conscientious efforts to stimulate his flagging interest, he naturally asks himself how many people are likely to persevere for sheer pleasure, and he repents of having been unduly severe on the ordinary novels of sensation. Not that Miss Pearson is by any means a dull writer; she is not devoid of cleverness, nor even of a certain power; but she dilates on a hackneyed theme which nothing but original genius can make piquant. She ought to be able to draw a woman and depict a woman's nature, and Muriel Gore, her heroine, is far the best of the figures in the book.

* *One Love in a Life.* By Emma M. Pearson, Author of "Our Adventures in the Wax." Hurst & Blackett. 1874.

But Muriel's heart experiences and love adventures are altogether insufficient to lend interest to a novel in three volumes, and, what is more, her conduct is intensely unnatural. In fact, the essential vice of the book is the all-pervading sense of unreality. As we shall show afterwards, most of the subordinate characters are caricatures of ordinary humanity, if they do not degenerate into positive monsters. Muriel herself, in spite of her native purity, delicacy, and womanliness, behaves as we should fancy that no self-respecting young woman can have done since the famous nut-brown maid insisted on following her love to the forest, although she knew she should find a rival in his bower. On the other hand, Miss Pearson has merits of her own, which cannot be attributed to some of her female contemporaries whose works are the most widely read. She always writes with the feeling of a lady. She writes good English. She is generally informed as to what she is writing about, and she steers clear of blunders and absurdities while she is treating of men and their everyday ways. Although she distinguished herself in good works among the wounded and the suffering during the calamities of the late war, she has views that are equally strong and just on the subject of woman's proper sphere, and she speaks her mind with sense and freedom on the epicene beings who go beyond it. And we can scarcely doubt that, if she had utilized those exceptional experiences of hers, she might have written a novel that would have been very agreeable reading. As it is, we can only deal with *One Love in a Life* as we find it, and attempt to set forth the reason why we have failed to enjoy it.

In her childhood and girlhood Muriel Gore is a very old acquaintance in a very familiar dress. She is the large-eyed little girl, of queer ways and few apparent attractions, who is to burst all of a sudden into the extraordinary promise of beauties, moral and physical, which will be more than realised when she shall attain her prime. Precociously and extravagantly romantic, she keeps herself very much to herself. In strict privacy she enacts those sensational dramas in Holy Writ or modern fiction which have most strongly laid hold of her infant mind. Now she is Joshua smiting the hosts of the uncircumcized Canaanites; again she is laying on with Ivanhoe in the lists of Ashby, making wild work among the plated dish-covers with the dining-room poker. No wonder that such a child should scarcely be appreciated. In her embryo capacity for an engrossing passion she grows up in the hope of falling in with an Ivanhoe of her own to whom she shall play the parts of Rebecca and Rowena rolled into one. As it chances, she meets with her Ivanhoe at her very first ball. He is a certain Caryl Trevor, young, handsome, and very winning in his manners; an officer in the regiment that is quartered in the quiet town of Ropley-by-the-Sea. At the ball she changes in a great transformation scene. She casts the slough of her girlish chrysalis, and emerges, in her pretty ball-dress and new-born feelings, a beautiful and spiritual butterfly, that all the men go hunting after. Trevor admires her with the rest, and, flattered by the undisguised partiality of the innocent *débutante*, would probably have fallen down and worshipped. But at Ropley there is a recognized belle and beauty, a certain Kate Kennedy. She has taken his fancy, and she piques his pride because he has a formidable rival in his attentions to her in a brother officer, Lord Beauvilliers. Muriel has met her fate, and it is natural that she should lend a willing ear to the whispers of the hero she has fallen in love with, when morning after morning he meets her on the beach in company of a confiding aunt, who benevolently watches the smooth progress of the love affair. What is less natural is that pride and jealousy should not have dissipated the glamour which her girlish fancy has raised around him. For she sees herself neglected on each occasion when Kate Kennedy deigns to smile upon the faithless one. But if love fed upon itself and was fanned by hope so long as the field was free to her, the way in which she bore Trevor's cold-blooded abandonment does violence to all our sense of the probabilities. A cooler head than Captain Caryl Trevor would never recollect to have encountered in fiction. He meets Miss Gore for the usual morning stroll the very day he has decided to offer himself to Miss Kennedy. He is sorry for the sorrow he is to cause, and seeks to console her:—

His looks grew very tender; his words had a lingering touch of affection in them.

"If I were ever to do anything you thought very unkind and cruel, would you forgive me, Muriel? I may call you so just to-day, may I not?—and you will this once only say Caryl?"

"How could you be unkind to me?"

"Cannot you guess? You may think so before many days are over," &c.

We can just conceive the possibility of her being carried away for the moment by his looks and language; she might still delude herself with the notion that a man who could so look and speak could never actually perpetrate the cruel and insulting outrage he was meditating. If she did succeed in deceiving herself, the reaction of feeling must surely have been more extreme when he unblushingly informed her of his faithlessness, within a very few hours. Because her passion had been born in her romantic nature so suddenly, we should have said that the subsequent disenchantment was the more likely to be thorough. Not a bit of it. It is not merely Spartan hypocrisy that makes her speak softly to her treacherous admirer, and take up the cudgels in his behalf. She loves him as much as ever, or more. This is pretty well; and if it is true to her strange nature, we cannot be surprised that she should accept Captain Trevor seven years later, when he at last gives her the chance. Miss Kennedy had jilted him at the eleventh hour for Lord Beauvilliers, and after seven years' service in India

he comes home to find his deserted Rachel as much in love with him as ever. She promptly accepts his proposals, and the wedding-day is fixed. On the very eve of it he runs up against the widowed Lady Beauvilliers in Charing Cross Station, and she carries him off to Paris, and marries him. She at least knew her man, and did not trust his second thoughts. It is not easily conceivable that a man so weak as Trevor, and a man of the world with all his weakness, should have consented to act like a fool as well as a scoundrel on such short notice, and all for a woman who had behaved to him as Kate had done. He must have known, as she must, that, lenient as society often is, it could never overlook conduct so flagrant as theirs. It is not very conceivable that such a man should have inspired two such passions, and that he should not only have made the earnest Muriel his own for life, but tempted the worldly Lady Beauvilliers to be guilty of social suicide. But will it be believed that Muriel's love lives through it all? Not only does she love him still, not only does she take pride in avowing her love, but she actually consents to elope with him later, when he has deliberately made up his mind to ruin her. To be sure, her religious feeling comes in to save her at the eleventh hour, when nothing else could have triumphed over her infatuation; and even then it was perhaps fortunate that a violent death should have removed her evil genius; for, had the Fates given him another opportunity, we should have been sorry indeed to answer for the consequences.

We think we may safely assert that the credulity of readers has seldom been so severely taxed, even in the very wildest of sensational romances. And some of the secondary characters are even less natural than Muriel; for, through all the mad extravagances of her diseased passion, she remains an attractive and womanly woman, whose fortunes we follow with a certain interest. There is Charlie Evans, her cousin and her good genius, who counterplots against the plots of her evil genius. He has loved her from early boyhood with a steadfastness of self-sacrificing affection that can only find a counterpart in her own. He does his utmost to hand her over to Trevor, although he reads that gentleman with rare perspicacity. As a boy he talks like a philosophical patriarch who has formed his style of speech on a course of the best sentimental fiction. There is Charles's mother, who is a religious fanatic of the strictest sect of the Calvinists; who, as Miss Pearson assures us, is rather weak than hypocritical; which we should never suspect her to be, although she is as narrow in her intellect as in her ideas. But as for her being no hypocrite, with religion always in her mouth she lends countenance to deeds or business which are rather atrocities than ordinary crimes. She ships two of her sons to an unhealthy climate because they cross her views with regard to the marriage of her favourite one. It is her desire that her favourite son shall marry Muriel, and, in order that he may do so, she not only abets him in shipwrecking the girl's happiness on two occasions, but actually declines to interfere when it is pointed out to her that the scoundrel is plotting for Muriel's seduction by the man who has twice discarded her. There is a Dr. O'Rourke, Mr. Evans's confidant and spiritual counsellor, the most barefaced of Turtletoves and the very shallowest of impostors. O'Rourke is always ready to play his part in Mrs. Evans's infamous family conspiracies, and he approves of the sins of her unredeemed son, because he fears that he is doomed to perdition at any rate. Yet Dr. O'Rourke, after fattening on the pew-rents of a proprietary chapel, actually obtains preferment as a bishop of the Church of England. So we might go on, analysing others of the personages; but perhaps we have said enough to justify our remark as to the pervading unreality of the story. Yet, consistently unnatural as it is, and although it often breaks down in sheer absurdities, we retain the impression we expressed before, that Miss Pearson is capable of writing a good novel. In *One Love in a Life* she has been writing throughout up to the false key she struck at the outset, and has been consistently employing a perverted ingenuity in evolving originality out of the commonplace. We think we discover the proof of her capacity for better things in the fact that, in spite of those daring improbabilities which offend us at every turn, we are sufficiently interested in the heroine's extravagant fortunes to read the last of the volumes with far more interest than its predecessors.

VINOY'S RISE AND FALL OF THE COMMUNE.*

EVEN had not the success of his former work tempted him, it would be very natural that General Vinoy should desire to tell the world how far he was responsible, as the military head of affairs, for the history of France during that unhappy interregnum of lawlessness which began with the armistice granted by Germany and culminated in the Commune. Not to mention his having commanded on the fatal 18th March, which gave Paris over for more than two months to the crew of bastard Socialists whose inner history Cluseret has recently unveiled for us, his position was a most important one for his country from the day that he was first named to succeed Trochu as commander-in-chief until his army was absorbed in that of MacMahon. This interval found the Commune gradually emerging out of the festering elements of disorder in Paris. It saw it triumphant over Thiers's attempt to close with it in its favourite den on the heights of Montmartre. It heard the motley band who struggled among themselves for a brief authority giving themselves out as a united and sovereign power, and inviting the world to follow the glorious example of the freed metropolis of France, which was to know no law but

their decrees, nor feel any taxes but their daily requisitions. It witnessed the reaction against this puny terrorism which aped the vices of the men of '93 without their force, as France poured her recovered legions into the camp before Versailles. And it closed when the agitators of the Hôtel de Ville were losing heart; the Cabinet of the President recovering confidence in the destiny of the country which, outside the one great seat of turmoil, proved loyal to order; and the troops which defended it throwing off the despondency of long defeat, and preparing, under the best general yet left to France, for the sustained effort needed to win her back her capital. Of all the phases of these eventful months General Vinoy gives us a narrative, confessedly from his own point of view, but candid in its matter, and written in the same clear style and with the same complete mastery over the military part of his subject that have made his former volume one of the most valuable contributions to the literature of the war.

The story opens on the 20th of January, when Trochu had reached the very nadir of popular opinion, after the failure of the huge, ill-managed sortie of the day before, the last and worst of the many military blunders of the defence. In the words of Jules Favre, the irritation against the Governor "was increasing from hour to hour." The man who in the fresh power of his nomination, more than four months before, had sought to flatter and conciliate the mob, had now to feel the Nemesis of his own weakness. The disheartened Cabinet of the Government of Defence, alarmed at the rapid growth of disaffection, betrayed its own irresolution and indecision by summoning the mayors of the twenty arrondissements of the city to consult with it; and these told Trochu plainly that he could no longer possibly retain the post in which he had so notably failed. This singular meeting took place late on the 21st, and was followed by a night sitting of the Government to continue the discussion. It was three o'clock in the morning of the 22nd before Jules Favre could carry the point he insisted on, and procure the nomination (which he had for some time advocated) of General Vinoy to the military command which it was plain would henceforth be a nullity in the hands of Trochu, and which the latter declared himself ready to resign, ostensibly in order that his successor might treat with the Germans. Vinoy might possibly have guessed what would be the result of the conference; but he knew nothing of it certainly until, an hour afterwards, he received M. Favre's official letter appointing him to the charge. "The Government" (this letter said), "having decided that the command-in-chief shall henceforth be separated from the functions of the President of the Council, has named you to it in the room of General Trochu. It would have desired to acquaint you of its intention before thus disposing of you; but the extreme urgency has obliged it to take its resolve without delay, and it counts on your patriotism and devotion."

No charge, says Vinoy very truly, could have been more onerous than that thus thrown upon him. The troops were demoralized. The boldest of the generals were fully agreed on the impossibility of prolonging resistance to the iron investiture that was bringing actual starvation on Paris. Nevertheless, that nothing might be left untried, a number of the smartest of the colonels had been summoned to a separate Council of War, and their opinion, as that of a younger and bolder class, had been taken before the necessity of treating was absolutely admitted. Vinoy of course knew all this; and so he replied that it was unfair at that moment to throw on any man but the one who had had the whole responsibility of the military measures of the past four months the pain of capitulating. But in reply to this objection General Le Flô, the Minister of War, urged the absolute necessity that existed for "a firm and energetic command" in order to protect Paris from the evil passions that were fermenting in her bosom. That night, he said, Mazas had been broken open, and Flourens, Millière, and the band of desperate Reds who were confined there had issued forth to join their friends outside. Well indeed might those whose power had sprung from the abrupt decrees of the mob of the 4th September dread the course of mob legislation in this hour of disaster. When passing from his conference with General Le Flô, Vinoy sought Favre himself to learn more exactly the conditions of the proposed command. He found the Vice-President of the Government agitated by the arrival of M. Cresson, its Prefect of Police, who, "convinced of his impotence to ward off, or control, or repress" the impending disturbances, had come to give in his own resignation of what he felt to be an office alike useless to the public and dangerous to its holder. This incident decided General Vinoy, and he forthwith accepted without further hesitation the command, which remained in his hands till he was superseded by MacMahon when the second siege was well begun.

It certainly was time that some one acted promptly. The city, or at least the many thousands in it who had nothing to lose, and who had been living at frugal quarters during the investment (free rations, and fifteenpence a day pocket-money being the rate of pay), were furious at the report of a capitulation; and Flourens and his party were guiding the agitation to their own ends. The insurrection dreaded by the Prefect of Police broke out that very afternoon, and the mob, without warning, opened fire suddenly on the windows of the Hôtel de Ville. Fortunately a trustworthy battalion of Mobiles from Brittany, which was moving southward across Paris, had been directed to halt at this important point. Indignant at the attack, and probably enough ready for conflict with the Reds, they returned the fire with such effect as instantly to disperse the mob. Detachments of the latter for some time indeed held houses which they had seized at the neighbouring street-corners, in preparation for the attempt on the Hôtel de Ville; but as they saw the

* *L'Armistice et la Commune.* Par le général Vinoy. Paris: Plon.

heads of the columns appear which Vinoy was directing to the support of the Mobs, they abandoned these one by one, and gave up their efforts for the time. A single alight act of vigour had put off the evil day of Commune rule, and averted the horrors that would have inevitably accrued to the unhappy capital from the prolonged resistance which the insurgents made their cry.

Although General Vinoy, as becomes one of his profession, passes on in his narrative at this point to give a detail of the military state of things at the crisis which brought him into command, and especially reviews the material means of resistance available for the defence, there is no necessity to follow him here. Indeed it is difficult to affect any interest at this point, when famine had done its fatal work on the defence. But the General does not forget to add that his survey is chiefly with an eye to the future; and he takes the opportunity of giving his own views, as drawn from practical experience, of the proper modifications to be made in the works round Paris to render it impregnable. We shall note but one remark which, though not made with such an object by General Vinoy, is indirectly the most complete condemnation of that inactivity of the defence in engineering operations which was the very worst side, in a strictly professional sense, of Trochu's conduct:—

It is not forbidden [he says] to those who have taken part in the struggle to draw from the facts, in a purely theoretical view, the conclusions they naturally point to. And, first of all, the defence of Paris has proved the efficacy, with the arms now in use, of works of counter-approach such as were first employed by the Russians at Sebastopol.

This has been from the first the view we have taken in these pages, though we are far from thinking with the General that this system was fairly tried; and if our former criticisms needed confirmation, they would find it in these words of his, which show that, had Trochu's genius been such as that of Todleben, it would have needed but a moderate use of it to give the Germans infinitely more trouble than they experienced at his hands.

The remainder of the first half of this volume carries us down to the Commune victory of the 18th March. A slight study of the pages will show that that successful insurrection was but the culminating point of a series of hostile demonstrations against the Government on the part of those who were using the armed mob within Paris for their own purposes. It is easy, no doubt, to imagine all sorts of fine sentiments hidden beneath the boiling mass of insurrection on which the scum rose in the foul form of the Commune. Of course there were simple theorists mixed up in it who had their own particular ideas of the triumph of labour, or the regeneration of the human race, or the special right of Paris as a sort of goddess among great cities to separate herself from the rest of France, and constitute herself the cosmopolitan centre of the civilized world. But such dreamers merely floated in, without really influencing, the elements of insurrection. These were in the main plainly two. There were at least a couple of hundred thousand of the armed National Guards who were either habitual idlers by choice, or, at the best, artisans who had been for months out of work. All these had been carrying arms, wearing uniform, receiving free rations, and drawing pay for the whole period of Trochu's command, without an attempt being made to bring them into any sort of order. So hopelessly incompetent indeed was the pretended military rule under which they carried their muskets, that the court-martial which sat on the insurgents taken before the Hôtel de Ville on the 22nd of January with arms in their hands broke up, declaring that it found it had no legal power under the laws of the Empire or the decrees of the Government of Defence to deal with these offenders. Of course this weakness above was felt below by every desperado that Belleville or Montmartre sent out. And to all these the disarmament which Thiers designed meant the instant loss of the dress, the "national canteen" dinners, and the beloved can-de-vie, with a return to that dull prosaic life of everyday work which novelists nowadays are never tired of representing as a special infliction on the working classes. So long as they kept their muskets these battalions felt that they could keep their other privileges. They wanted only leaders to show them how this pleasant life of out-of-door lounging, varied by exciting speeches at their clubs and drama at the *buvette*, could be made eternal. And these leaders they found in the demagogues of the International, and in the more tried chiefs of sedition whose names were already known as connected with barricades, who had flocked to Paris when it was thrown open. Ever the most congenial home to the enemy of order, it had never been so suited for his machinations as now. The revolutionists of Europe instinctively felt this and flew to the gathering. Whether to enrich himself at the cost of the rich, or to seize the brief joy of supreme power at the expense of the timid, each perceived that his moment was come. And so the revolutionary chaos received its second element of ambitious or greedy or order-hating chiefs, as soon as the railroads into the city were at work. What manner of men these were that governed it, what a mixture of swagger, of suspicion, and of incompetency gathered at the revolutionary centres, let their chosen general and favoured journalist, Cluseret, tell for us. He gives the inner story. In Vinoy's work we find, carefully and calmly traced, as seen from the outside, the progress of the coming struggle, even to the death, between order and disorder, of which the 18th March was the first scene.

Vinoy's own evidence before the Parliamentary Committee, long since reviewed by us, has told that part of his tale so fully that little can be added here. The General has of course still the excuse of the positive orders of his Government for undertaking the attempt on Montmartre which his better judgment told him to

be quite impracticable. He now shows it to have been even more desperate than it first appeared; for the greater part of his 35,000 men had been actually but two days transferred to their new cadres (in consequence of the dispersal of the soldiers claiming discharge on the peace, whose places they took) when he received the order to make the attempt. On the other hand, it appears here more plainly than it did before the Committee that the Government of M. Thiers was so rash as to count on the active co-operation of at least half of the National Guard. Surely a statesman sprung from the *bourgeoisie* should have known that class better. However, the Cabinet were resolved to have done with the attitude of open defiance maintained by the insurrectionary party, which every day grew more palpable and menacing. So they gave the instruction, and Vinoy did his best to carry it out. So good a soldier may be pardoned a soldier's error.

Interesting as the second half of his volume is, it is anticipated here by his own evidence, and, in its account of the second siege, by the more general narratives already published. The historian will naturally turn to it as a useful addition to these; but its chief worth must ever lie in the special light it throws on the state of things in Paris which preceded open civil war.

SIMMONDS ON WASTE.*

MR. P. L. SIMMONDS retains, it would seem, a pleasing recollection of the notice which we took at the time of his *Waste Products and Undeveloped Substances*, published eleven years ago. We must say that he has fully entitled himself to a renewal and even an enhancement of our good opinion by the pains he has been at to extend and supplement his work by the addition of such new matter as the progress of science or of social economy has made available for his purpose. It may not unfairly be set down in great part to the interest stirred by his researches and published papers, that a special section was set apart at the late Vienna Exhibition for the display of waste materials and their products, in which each country might have an opportunity of showing what it had done in this direction since the first International Exhibition of London in 1851. By the request of the British Commission, Mr. Simmonds was most appropriately delegated to bring together and to organize within the great building in the Prater a representative collection of this kind, illustrating the most conspicuous industries and utilizing processes which have sprung out of the reclamation of waste in this country. The example which Great Britain was the first to set on any extensive scale has since been followed largely on the Continent, in Australia, the United States, and even in the various States of South America, where numerous substances formerly neglected or thrown away have been systematically turned to purposes of use and profit. If that man is to be considered a benefactor of his race who makes one blade of grass to grow where none had grown before, we may pronounce him scarcely less deserving of the thanks of mankind who saves even a single ounce of matter from waste.

His former work having long been out of print, Mr. Simmonds presents us with a new one, reproducing in a great measure his former matter, which he is at the same time careful to describe as his own only in the capacity of a gatherer or disposer of other men's goods. Originality in such a case is indeed of less consequence than accuracy and fulness. Next to wealth and truth of detail, we must rank clearness of arrangement and classification, in which respects our author falls deplorably short, notwithstanding the claims which he puts forth to merit under this head. With the exception of a tolerably full index, there is absolutely no clue to the connexion or distribution of contents, the volume flowing on for nearly five hundred pages with no division beyond that into paragraphs. Even the heading of the pages is unvaried from first to last. Nor is there any such help to the reader's eye or mind as is given by more distinctions of type, if not by the wonted cutting up into chapters or sections. The smooth and equable flow of the book reminds us of nothing so much as of the way in which paper, by what is known as the continuous process, is reeled off in never-ending rolls, beginning from the pulping vat and ending with the cylinder or frame of type. It may thus serve to illustrate in passing one of the most conspicuous and familiar processes for the reclamation of odds and ends. The scarcity of materials to meet the growing demand for paper has at the same time set invention on the rack and given an impulse to household thrift. Whilst the world is ransacked far and wide for new kinds of vegetable fibre, the refuse heap at home is turned over with a heedful eye to a possible utilization of its motley and even frowy constituents. Above all, every scrap of paper already used is put by and hoarded with a view to a second existence and turn of service. In every thrifty household the paper sack has become an institution. A struggle has arisen with the housewife for the vested right in each bit of refuse paper, and all that can be wrotted from lighting the fire goes to swell the sack in some cupboard or spare-room corner, to find its way when bursting with fulness to the papermaker's. So far from finding, as of old, a nuisance in the piles of prospectuses and tradesmen's circulars which the post is for ever bringing, it is with a smug sense of satisfaction that the neatly curate or

* *Waste Products and Undeveloped Substances: a Synopsis of Progress made in their Economic Utilization during the last Quarter of a Century at Home and Abroad.* By P. L. Simmonds, Editor of the "Journal of Applied Science," &c. London: Hardwicke, 1873.

struggling clerk pops the tomping snare or mendacious puff into the yawning canvas mouth, thinking the while how nicely it is going towards paying his modest income-tax. Of the destination of each scrap which has already done its turn by way of correspondence, or sermons, or printed matter, he may satisfy his curiosity out of Mr. Simmonds's industriously drawn out pages, in which, for aught he can tell, may reappear particles of the very materials which his own thrift has given back to literary use. Our author, though in rather a rambling fashion, goes fully into the various sources in addition to paper waste from which the manufacture is supplied, as well as the processes by which these different materials are brought to their final state. Through each successive stage, it need scarcely be said, each substance deteriorates, the fine paper made from cotton or linen rags losing much of its quality as it passes through the state of waste, resulting after a turn or two in a very coarse and poor article indeed. But besides linen and cotton use is now made of old leather scraps, of which paper samples may be seen in the Animal Products Collection in the Bethnal Green Museum. Of new and undeveloped substances every day coming into use to supplement these more familiar materials there is absolutely no end. Paper is being made from maize and other straw; from oat-husks; from sea-weeds of many kinds, such as the *Zostera marina*, the *Cineraria maritima*, of the coasts of Southern Europe; the *Scirpus lacustris* of California; the *Eplobium*, or fireweed, of Northern America; the *Sida retusa* of Australia, as well as esparto grass and the bamboo and other canes. Even beetroot pulp and sawdust are largely pressed into the service. A process for making strong and fine paper or parchment from fish-fibre macerated in dilute sulphuric acid is also given by our author from a paper by M. Quatrefages.

Few discoveries have been more fruitful in results than that of the detection by Faraday of benzole among the residue of gas-making retorts. From this filthy oily refuse have sprung the most magnificent colours and the sweetest perfumes, and the means of illumination have been vastly extended, whilst from the investigation of its properties advances have been made far and wide into the domain of organic chemistry. Amongst the gains to utility or commercial profit which the modern chemist has had to announce, there are some in respect to which a natural prejudice has had to give way to common sense and scientific persuasion. Such is the extraction of sugar from the beet, originally taken up by Margraf as an unsightly weed growing wild on the shores of the Mediterranean, now forming one of the staples of culture and manufacture in France, though, mainly on fiscal grounds, not yet admitted among the industries of these islands. It will hardly be till civilization here has attained the culminating pitch of Laputa that we shall get over our present antipathy to processes so ingenious as that of turning out butter from Thames mud or engine-grease. A shudder which to future progress in science may seem absurd has been felt at the announcement of the great American process for making champagne out of petroleum; and now we have the equally terrible announcement of the concoction by certain ingenious Americans of currant jelly out of old boots. In Germany, we are told, many large factories find remunerative labour in making golden syrup out of sulphuric acid and starch. Our author's silence upon the subject exempts us from the necessity of agitating our readers' minds or stomachs by going into the secrets of the American manufacture of artificial oysters from kitchen waste. Would a fitting corrective, we should like to ask, be found in a sip of the brandy which an ingenious distiller at Malta, according to Mr. Simmonds, produces from shavings? That Hamburg has long been sending us port and sherry from potatoes is a fact too familiar to excite much horror now, though it may have been from the extra strength or dryness chemically imparted to some special brand of that otherwise harmless vegetable extract that a gentleman in the north of England died the other day from drinking a couple of glasses. With all our admiration for the ingenuity and patience which are put forth in utilizing waste and developing novel substances, we reserve a timid protest against having our stomachs made the laboratory for experiments of this kind. So long as the gentle and salutary chemistry of nature is made the intermediary stage, as when the loathsome refuse of the farmyard, the stable, or the street sewer becomes the agent in fertilizing our barren acres, yielding pure and wholesome vegetable growths, we wish God speed to as many bold and enterprising schemes as Mr. Simmonds may have to record for us in future editions of his work. In nature, as there is no waste, so is there no real impurity. Dirt, as Lord Palmerston pithily expressed it, is nothing but matter in the wrong place. It is for science to see that everything finds its fit and salutary place, and that nothing is thrown away. Commercially speaking, it may not be clear as yet that every saving brings its immediate profit, yet experience of the past should encourage the belief that everything may have a use and a profit found for it. "Will it pay?" is of course the question first inevitably put when any attempt is made to introduce a new product, or to utilize in a new way any residue from our established industries. And philanthropy itself has little chance of getting a hearing as long as it fails to show an equivalent return. It is some encouragement, at all events, to reflect that benevolence and enlightened self-interest have a common field in the reclamation of all waste, and the opening up of every mine of nature's wealth. What an amount of force is already busily employed in our midst in the utilization of waste material may be judged from the statistics put together by Mr. Simmonds. The last London Post Office

Directory shows that there are upwards of two thousand householders within the metropolitan district directly interested in the sale and application of refuse or waste, and the residues of manufactures. This enumeration includes some fifty different industries, proceeding alphabetically from "bladder and sausage-skin dealers," and "blood-driers," to "waste ivory, bone, and tortoiseshell dealers," and "yeast merchants." Among the subsidiary agencies which supply them with material, one of the most useful is the rag-collecting brigade of the London Ragged School Union, by whose operations, four trucks only being employed, no less than 82 tons weight of waste stuff—paper and rags forming the staple—were collected within nine months of the first year. Still more active is the *chiffonnier* army of Paris, where not less than 22,500 persons find their living in the collection of refuse. Many curious particulars of this characteristic phase of French life are given by Mr. Simmonds, whose pages contain some not less striking facts and figures touching the unwonted foods brought into use, and the manifold shifts of which necessity became the mother under the strain of the siege of Paris. The task he has set himself in picking up these multifarious and desultory bits of information may be said to be in great measure allied to that of the humble and not over-nice craft of the *chiffonnier*. But he is himself candid and retiring enough to admit as much. And this modesty of his in speaking of his labours is not the least of the merits which may fairly win for his book the favour and appreciation of the public.

WHITTIER'S POEMS.*

MANY of the best and most current sayings of didactic poets are wholly devoid of foundation in fact, and certainly none of them is more untrue, for our own time at least, than that of Horace concerning middling poets. We find existence abundantly conceded to them by men and booksellers, and there is no sign of the gods interfering. Indeed the favour of the public goes far beyond according them a bare right of existence, and maintains them in sufficient reputation to make their calling agreeable to themselves, and, we suppose, sufficiently profitable to enlist the booksellers' interest on the same side. We are often told that the popular voice, as expressed by the degree of permanent esteem which a writer obtains among posterity, will be found to justify itself in the long run. This is very possible, but we are now speaking only of the honour which poets have among their immediate contemporaries. The amount of paradox involved in the opinion to which we have committed ourselves depends on the meaning we attach to such words as "middling" and "mediocrity." They naturally and properly denote the quality of work which does not manifestly either exceed or fall short of the standard of ordinary skill and diligence, whatever that may be, in the particular matter in hand. In popular usage they have been taken as convenient euphemisms, just stopping short of the open assertion that something is in fact decidedly below what was expected, and they have thus acquired a certain invidious by-meaning, if we may venture to coin a less scholastic equivalent for the "connotation" of modern logicians. But in the meantime no other word has been found for that which leaves the judgment really neutral, that which does not excite in us any particular admiration, nor yet call for any particular censure. The greater part of the common objects and acts of life are of this kind; and now that we speak of middling poetry we desire to be understood in this sense and in no other. It is no doubt much disputed whether mediocrity in any sense be admissible in the fine arts; and there is the express authority of Horace for the opinion that poetry may as well be very bad as be not very good. But he rests his opinion on the ground of poetry being a luxury; wherefore, if we are to have it at all, we should have it of the best. And the supposition that poetry is a luxury is not true, except at a time and a place where literary tastes are really confined to a select few. Such was probably the case at Rome in Horace's day, but it certainly is not the case in the English-speaking countries of our day. Almost every one who can command a little more than the indispensable comforts of life indulges in some sort of poetical or artistic taste, though oftentimes a very strange sort; and the increased demand for poetry, as well as for all other kinds of art work, tends for the present to lower the average quality of the supply. For the persons among whom vague artistic desires have become diffused are not educated enough to be fastidious; and, indeed, they prefer, as a recent writer has justly remarked, to be entertained with something only a little above their own level. In this state of things, so far from there being no room for mediocrity to exist, it is plain that there is every encouragement for it. And as some such result is inevitable, so it is useless for criticism to expect anything different, or to be angry with people for not being ready for the highest gifts of poetry all at once. The most it can exact is that the mediocrity that ministers to their wants shall be respectable. The critic may rebuke positive faults; but he cannot well censure the modern writer of poetry merely for falling short of that excellence which confers lasting fame. In England there is at present a reaction against commonplace, or, perhaps it would be more civil to say, unambitious poetry. In America, however, its reign appears to be in full force. Perhaps this is because the general reading population of the United States is more crude and newly formed than our own; perhaps it is because the really competent readers of America, who are at least as discerning as those of England, do

* *The Poetical Works of John Greenleaf Whittier*. London: Macmillan & Co. 1874.

not hold so central and commanding a position. At all events the fact is so; or the large quantities of verse which Mr. Whittier has published in the United States at various times during the last thirty years and more, and which are collected in the volume now before us, would not be so popular as we are informed they are.

Mr. Whittier's complete poetical works make up a book a trifle bigger than the American edition of Mr. Lowell's, the form and type being almost identical. The print of both is uncomfortably small; but in size of margin, and we are inclined to think in legibility, there is a slight advantage in favour of Mr. Whittier's English publishers. It is a more material difference between the two books that, whereas Mr. Lowell's poems contain much that we believe is destined to live for many generations, we do not apprehend that there is any one piece of Mr. Whittier's that will survive the memory of those who are now living. This book of poetry is that which we should choose of all others to hold up to Horace as a visible confutation of his maxim. It is the triumph of respectable and successful mediocrity, that word being used, as we have explained, in a purely neutral sense. Mr. Whittier has a great fluency in writing verse, and he never writes any that is not passable; he also has enough versatility to be equally passable in several different styles. On the other hand, he seldom produces anything so good as to make us feel that the world would be the worse for its loss, and there is no one line of poetry in which he is not distinctly inferior to some one living or recent writer. His pastoral scenes and ballads, in which he is perhaps at his best, are still not so good as Mr. Longfellow's, and perhaps some readers will think that not a very severe test. His pieces on domestic politics, although he appears to have put all his strength into them, are not for one moment to be compared to Mr. Lowell's. They may have been effective, as leading articles are effective, at the date of the events they are concerned with, but they hardly bear examination at this distance of time. Nor is he much more successful with European politics. It is perhaps doubtful whether it is altogether in good taste for a poet to write in a spirit not of justice and judgment, but of violent partisanship and animosity, about other people's affairs in which he has no share; it seems better and more natural that each people should provide war-songs for itself. At any rate a poet who takes this course should justify it by very clear success. Mr. Whittier's voice is not strong enough for a volunteer prophet of European freedom. A comparison of his poem, entitled "The Peace of Europe" with Mr. Lowell's "Villa Franca" or Mr. Swinburne's "Song in Time of Order" will make this evident. Mr. Lowell is bitter but judicial; Mr. Swinburne is exceeding bitter, and as far as can be from judicial; but the very ferocity of his ballad carries it out of the poet's own self-assertion into the region of dramatic lyrics. Mr. Whittier's lines are only scolding and didactic. He is still less satisfactory in an address "to the Reformers of England," containing some nonsense about a "blasted Church" and a "State scaffold," which an educated American really ought to be ashamed of having written. Would Mr. Whittier prefer a Church out at elbows and an irresponsible private scaffold? His real meaning is probably that both a Church and a scaffold are absolutely bad, and the one as bad as the other. Shortly after this effusion comes a declamation against capital punishment, where we get the author's views on the scaffold more at large. This is entitled "The Human Sacrifice"; in thought it is Victor Hugo and water, and in style it is Byron and water. We have Byron and water pure and simple in certain Scriptural pieces, where the Hebrew Melodies are sadly diluted. Another singular eclectic manner occurs in the "Crisis" (a poem on the result of the Mexican war), whereof the first two stanzas run thus:—

Across the Stony Mountains, o'er the desert's drouth and sand,
The circles of our empire touch the Western Ocean's strand;
From slumberous Timpanogos to Gila, wild and free,
Flowing down from Nuevo-Leon to California's sea;
And from the mountains of the East to Santa Rosa's shore,
The eagles of Mexiltli shall beat the air no more.

O Vale of Rio Bravo! Let thy simple children weep;
Close watch about their holy fire let maid of Pecos keep;
Let Taos send her cry across Sierra Madre's pines,
And Agulones toll her bells amidst her corn and vines;
For lo! the pale land-seekers come, with eager eyes of gain,
Wide scattering, like the bison herds on broad Salada's plain.

It appears to us that much the same result would be obtained by mixing "From Greenland's icy mountains" and the "Battle of Ivry" in equal proportions. Further on there is a piece called "Ichabod," founded on the same idea as Mr. Browning's "Lost Leader," and Mr. Whittier's treatment of the subject makes it painfully certain by this crucial instance that there is more poetry in any three lines of Mr. Browning than in any three hundred pages of Mr. Whittier.

In one part of the collection the English reader is perplexed by some glowing funeral panegyrics (though they glow somewhat frigidly) on divers persons who perhaps ought to be known in these islands, but at any rate are not. He also has constantly to encounter false rhymes, such as *dawning* and *morning*, *woody* and *sturdy*, *Katahdin* and *garden*. But perhaps it is mere British affectation to think that an *r* more or less makes any difference. With all this Mr. Whittier, being a very fluent, practised, and respectable writer, does occasionally rise above his own average, and some of his tales in verse are really very pretty. His pictures of domestic scenery have also a certain grace and picturesqueness. The best known of these, though by no means in itself the best, is the ballad of Maud Muller, of which

the true final cause is Mr. Bret Harte's burlesqued but very probable sequel. We ought to have mentioned Mr. Bret Harte before as one of the contemporaries whom we should put above Mr. Whittier in serious poetry; witness Mr. Bret Harte's war-songs, and his lines on the fire of Chicago, a subject on which the two poets come into direct competition.

For the reasons we explained at the beginning we must resign ourselves to the existence of voluminous mediocrity. Mr. Whittier's mediocrity is harmless, and perhaps meritorious, and those who think it worth while to search through the heap will be rewarded by some scattered good things. We confess that, having done it, we do not think it worth while.

ROGERS ON SCOTTISH MONUMENTS.*

IN noticing the first volume of this work some time ago, we indicated an opinion that, to serve any useful purpose, collections of epitaphs ought to consist of careful selections, arranged according to their period and character. In this way we believe they may throw considerable light on the temper and feelings of different times, although it must be kept in view that inscriptions are not always to be regarded as expressing the natural emotions of those by whom they have been erected, since in their composition use was frequently made of the services of others, who adhered, with little variation, to a formula established in their neighbourhood; and we may add that the influence of local custom is in the same way to be seen in the employment of certain symbols in districts, to denote a trade or calling.

The present volume has about it much of the character of its predecessor, while it contains fewer inscriptions of an historical nature. The editor has drawn on the collections of Mr. Jervies so far as they have proceeded, but he has nothing to supply the place of the volumes of Monteith and Brown which helped so largely to swell his first volume. A somewhat inordinate prominence, as it seems to us, is given near the beginning, to a description of the monument of Sir William Wallace on the Abbey Craig, near Stirling, and of the steps which led to its erection. It appears that the editor himself acted as secretary to the originators, and that the duties of his office proved most irksome and arduous; "for, in addition to the ordinary difficulties of raising money for a public object, there had to be encountered and overcome the crude notions of one or more adherents of the enterprise." Much incongruous detail also is introduced connected with a group of statues at Stirling—originating likewise to some extent in the energies of Dr. Rogers—but the inscriptions copied from which are of yesterday, and give us nothing of the age of Knox, Melville, and Henderson, in memory of whom they were erected. It would seem that in the much debated matter of the Wigton Martyrs a compromise had been attempted, for the monument commemorates only one of the two—Margaret Wilson. Perhaps this will be regarded as a step in the right direction by Mr. Mark Napier, who thinks he has demonstrated that there was no martyrdom at all.

Of the inscriptions in the volume which seem characteristic of the men and the age we may indicate that of Andrew Carl, the great upholder of the Covenant. On his tomb he is described as "vir suo seculo summus, qui orbi huic et urbi ecclesiastes, vocis et vita inclinatam religionem sustinuit, degeneres mundi mores refoxit, ardens et animus, Bonnerges et Barnabas, magnus et adamas." With these expressions it is curious to compare the complaint which his patrons, the magistrates of Aberdeen, made against him towards the end of his career:—

Mr. Andro in his sermon did most unchristianly utter curses and imprecations against the complainers, vizt., that God rub shame upon them, and to set his mark upon them, which he declared to be his prayers in private, and calling us villains, and actors of villainies.—Aberdeen Records, vol. ii., p. 189. Burgh Record Soc.

The inscription of Archbishop Sharp ("Sacratissimi Antistitis, prudentissimi Senatoris, sanctissimi Martyris") is also deserving of notice. It portrays a character which affords curious subjects of contrast with that bestowed on him from the other side. On his monument we find that "pacis angelum, sapientie oraculum, gravitatis imaginem, boni et fideles subditi impietatis perduellionis et schismatis hostem acerrimum, Dei regis et gregis inimici viderant agnoverunt admirabantur." How vividly do we realize the divided feelings of the nation at that time when we turn to the writings of Sharp's opponents, where he is described with equal sincerity as a bloodthirsty perjured apostate, and when we find that on the monument of one of his cruel assassins some could place the following inscription:—

A faithful martyr here doth lye
A witness against perjury;
Who cruelly was put to death,
To gratify proud preties' wrath, &c.

Many of the inscriptions are of comparatively modern date, and their burdens in various forms of expression, is the uncertainty of life and the necessity of continual watchfulness. A favourable example of this class, dated in 1707, occurs in the parish of Barry:—

Mors tuo [tuo], mors Christi, fraus mundi gloria cecit,
Et dolor inferni, sunt meditanda tibi.

* *Monuments and Monumental Inscriptions in Scotland.* By the Rev. Charles Rogers, LL.D. Vol. II. London: Printed for the Grampian Club.

One of this sort, in the parish of Rayne, is the voice of the minister, who died in 1653:—

As late I stood in pulpit round,
And now I ly arow the ground.
When as you cross my corpse so cold,
Remember the words that I you told.

Of those which are either grotesque or quaint we may quote two to deceased wives—the first from the churchyard of Forfar, and the second (only partially intelligible) on a monument at Elgin, erected by Robert Dunbar of Grangehill, chief of clan Dunris, a clan of which we do not recollect any previous notice:—

Here lies my wife, when that she died,
She left her husband most aggrieved;
Her children sore do her lament,
Grant that all mankind may repent.
A holy virgin in her younger life,
And next a prudent and a faithful wife,
A pious mother, who with Christian care
Informed her children with the love and fear
Of God and virtuous acts. Who can express,
Alone reader by a volume from the press.

The following to a servant of the Rothos family has something of the same flavour:—

John Brown's dust lies here below,
Once saved a noble earl;
At his command he ne'er said No,
Had it been on his peril.
His days and years they were spun out,
Like to a thread most fine;
At last a period came about,
Snapt it at ninety-nine.
'Twas on the seventeenth day of May,
In the year forty-ix,
This honest man was called away,
To heaven we hope did fix.

There is a quaintness in the view of life expressed in these lines:—

This world is a city
Full of streets,
Death is the moort
That all men meet.
If life were a thing
That men could buy,
The poor could not live
And the rich would not die.

On a tomb in the parish church of Collesie, in Fifeshire, is an inscription which conveys a protest against burials within churches, more homely in expression, but identical in idea, with the canons of the mediæval Church on the subject and the regulations of later times:—

Defyle not Christ's kirk with your carion,
A solemn suit for God's service prepar'd,
For prayer, preaching, and communion;
Your burial should be in the kirkyard.
On your uprising set your great regard,
When savil and body joyneis with joy to ring
In heaven, for ay, with Christ our Head and King.

Many of the parishes are poorly represented. Thus of Lumphannan, in Aberdeenshire, all that is written is "The usurper Macbeth was slain at Lumphannan; a heap of stones denote his grave."

It is out of all keeping with the ideas of interment which had been established long before Macbeth's time in Scotland to associate him with Cairn-burial, but as in a previous part of the volume we learn that his body was laid in the tomb of the Kings at Iona, we may infer that the heap of stones was meant rather to point out the spot where the monarch fell than to indicate his resting-place. There would have been a special impropriety in giving pagan burial to a king whose regard for religion may be inferred from those grants to the Culdee monastery of St. Serf in Lochleven (recorded in the Register of the Priory of St. Andrew's), in which he was associated with his Queen Gruoch.

This volume, like its predecessor, contains a good deal of interesting matter, but we must express a hope that the efforts of the Grampian Club will hereafter be directed to the printing of materials more likely to be useful to the historical student, and quarried from a mine less commonplace than that from which the present work has been extracted.

In turning over the pages we have noticed a considerable number of inaccuracies which more careful revision might have avoided. Thus, the monument to the Marquis of Huntly on the hill of Mortlach, on Deeside, is transferred to the parish of Mortlach, in Banffshire (p. 358). At p. 12 we find "Stirich" for "Stiric," "Tarah" for "Tara": p. 47, "Stivilense" for "Strivilense"; p. 68, "Monanus" for "Monanus": at p. 209 John Erskine of Dun, the Superintendent of Angus, is gratuitously knighted; at p. 311 "Balfing" occurs for "Buldaig"; at p. 313 "Balquharn" should be "Balquhain"; at p. 317 "Auchen-chries" occurs for "Auchleuchries"; and at p. 324 "Auquhorsh" for "Auquhorshk."

The following description of sculptures on the stem of St. Martin's Cross at Iona strikes us as very extraordinary:—

On the stem appear a priest administering the right [sic] of baptism, two musicians, one playing the harp and the other using a wind instrument, and a man shaking hands with another on a stool.

The Latin of the inscriptions is occasionally rather shaky in the matter of construction and spelling, but this may be the fault of the original records.

CHRISTMAS BOOKS.

III.

ARLON GRANGE, and a Christmas Legend, by William Alfred Gibbs, author of "The Story of a Life," "Harold Erle," &c. &c. Artist's edition (Provost and Co.) Mr. Gibbs has a story to tell, and he wishes to be allowed to tell it in his own way. In an address to his reviewers he says:—

Dear critic, blame me at your will,
Condemn my style and want of skill,
Laugh at my limping, ambling verse,
Say "Nothing surely could be worse,"
My reasons doubt, my rhymes abuse,
Reject my efforts to amuse,
Cut up my lines, cut down my thought,
Cut out my heart as worse than nought,
Bar every road to "use" or glory,
But, prithee, "do not tell my story!"

If there were nothing in Mr. Gibbs's poem but his story we should certainly not trouble ourselves or our readers much about it. The plot is absurd, though perhaps not too absurd for Christmas. *Arlon Grange*, however, is written with a good deal of power, and contains many passages of not a little beauty, while the sentiment that runs through the story is thoroughly healthy. We notice, by the way, an advertisement "offering one hundred guineas for illustrations of this work." May we be allowed to hope that if the artists succeed in rivalling the binder, who has turned out so elegant a book that we hardly care to read it unless in a new pair of white kid-gloves, we shall in a future edition be spared the forty pages or so at the end of "abridged opinions of the press and official reports upon Mr. Gibbs's harvesting process." He has invented, it would seem, an ingenious method of getting in corn and hay in wet weather. Admirable though his plan is—and we have had the pleasure of praising it in these columns—we think that it scarcely is in its proper place between such highly ornamental covers. Might not Mr. Gibbs another year work his harvesting process into his Christmas story, instead of keeping it outside as at present? Might not a second poor hero fall in love with a second Baronet's daughter—we will betray as little of the plot as we can—and carve his way to fortune and her hand, not by finding a gold mine, but by getting in his crops during a succession of wet seasons in the finest condition, by means of Mr. Gibbs's drying apparatus?

Etchings on the Moselle, with descriptive letterpress, by Ernest George, Architect (Murray). Nothing among the Christmas books which have come before us is more interesting than these twenty etchings on the Moselle. When we have to criticize such a book as this, we feel that we do the artist but scant justice in classifying his work among a host of volumes which, meritorious as they are in a strictly Christmas point of view, and admirably adapted as they are for wedding presents or birthday and New Year's gifts, show no great original or artistic power. This book is scarcely a book to give away; it is something better—it is a book to keep. We have not, so far as we can remember, had the pleasure of coming across any of Mr. Ernest George's work before. We trust that another Christmas he may have found some other scenes equally worthy of his rare artistic power.

The Bernese Oberland: Twelve Scenes among its Peaks and Lakes. By Elijah Walton. With descriptive text by T. G. Bonney, M.A. (Thompson). This handsome volume is a worthy companion to those choice illustrated works which for the last few years Mr. Walton and Mr. Bonney have been bringing out together as regularly as Christmas has come round. We cannot say that these twelve scenes altogether satisfy our recollections of Alpine scenery and Alpine lights. It is hard, however, in England and in December weather to judge fairly how the Alps looked in August. The sketches, however, have no small beauty of their own, whether they are strictly faithful to nature or not; while the publisher has done all that a publisher can do to adapt them to the requirements of those who, having tolerably long purses, are moved by duty or affection to make a handsome present. We must not forget to add that Mr. Bonney's part of the work is done with taste and judgment.

The Works of James Gillray, the Caricaturist: with the History of his Life and Times. Edited by Thomas Wright, M.A. With over four hundred illustrations (Chatto and Windus). In this interesting volume we have a selection of the best works of the great caricaturist of the days when George III. was King, and an abridgment, if we understand the introduction, of Mr. Thomas Wright's explanatory memoirs. In many cases the caricature is given as a whole, in other cases "the most pungent parts only" have been preserved. If, as we read, the collected edition cannot at present be got for less than 10*l.*, the publishers have done a good service in bringing so much that is full of humour and of historical interest within the reach of a large class. To the student of history the caricatures of the period he studies are of the greatest use, and, more thoroughly perhaps than anything else, enable him to look upon each political occurrence in the way that it was looked upon by the average citizen. In addition to this, Gillray's sketches have extraordinary merit of their own, and can be enjoyed by a man who knows as little of history as the successful candidate at some competitive examination.

Children of the Olden Time, by Mrs. Henry Mackarness. With preface by J. R. Planché (Griffith and Farran). This little book is illustrated by twenty-seven "tracings from illuminations, paintings, and early prints" that bear on the life of children in past ages. While the illustrations are interesting, we cannot but regret that

the accompanying narrative is very poorly done. In such a work as this we are not going to be too hard on a writer who says that before the Conquest our forefathers "were called the Anglo-Saxons." Mr. Freeman can scarcely expect as yet to have reached the writers of Christmas books. But we should like to know how these Anglo-Saxons of page 4 considered Sunday the luckiest of all days, when it was the Anglo-Saxons of page 6 who first heard of Christianity. The author quotes "Mrs. Markham's amusing *History of England*." We hope that Mrs. Markham is not answerable for the amusing blunders which are crowded into the following passage:—"The young Prince Henry who lost his life to save his young sister Maud in that fatal wreck of the *White Ship*, which destroyed a nation's hope and broke a King's heart." The King, by the way, is generally said to have died not so much of a broken heart as of an overburdened stomach. Still more astounding is the statement that, great as were the difficulties which attended scholars before the Reformation, yet "the names of Michael Angelo, Leonardo da Vinci, Canova (*sic*), Palissy, Salvator Rosa (*sic*), Mirandola, give proofs of talent unsurpassed in these brighter days."

Marcus Ward's Picture Stories from the Japanese (Marcus Ward). This book contains, we are told, "the Japanese version" of four of the tales from the *Arabian Nights*, "told in brilliant pictures, drawn in the true Eastern spirit by native talent, with the stories in English rhyme." Without undertaking to say that there is much of the true Eastern spirit to be found in these pictures, yet we will allow that they are brilliant enough, and afford an agreeable change from the true Western spirit which has for years been set forth in the illustrations of these stories.

The Student's Treasury of English Song. Containing choice selections from the principal poets of the present century. Edited by W. H. Davenport Adams (Nelson and Sons). So far as we are aware, this selection is peculiar in giving extracts from the poets of this century only. We have not, therefore, to any great extent the space filled up by poems which every one knows already, but yet which no one would allow could with propriety be omitted. Mr. Adams has on the whole made his selection with great judgment. Yet, if Mr. Robert Buchanan is admitted, we think that Mr. Tupper should scarcely have been excluded. It is a pity that authors or publishers, we know not which, should have got it into their heads that no book can be published at Christmas time without illustrations. Mr. Adams would have done well if he had kept each illustration on a page to itself. In that case any one by the help of a pair of scissors could in a very short time have greatly improved this interesting selection.

A Handbook of Proverbs, Mottoes, Quotations, and Phrases, by James Allan Mair (Routledge and Sons). This Handbook is unusually copious, and has been arranged with a good deal of skill. Any one who would study its pages carefully, and commit to memory only one-tenth part of the proverbs given, might pass in his native village as a man of vast wisdom, and might even become the oracle of a country town. The easiest way to a reputation for wisdom is through a knowledge of proverbs. If any man has a fool for his son, let him not spare the rod in making him learn off by heart wise saws and modern instances, and likely enough his folly will escape notice.

The Illustrated Book of Poultry, by Lewis Wright. Illustrated with fifty coloured portraits of prize birds, painted from life by J. W. Ludlow (Cassell and Co.). We hope that what Mr. Wright calls the "poultry world" will be more than satisfied with this handsome, comprehensive, and ponderous volume. We knew from a somewhat painful experience that those who are smitten with "pure love of the gentle craft" of poultry-keeping have a great deal to say, but we little thought that if their talk was put into writing it could fill five hundred and eighty quarto pages. Let us hope that now they have it all in print they will show a little more mercy towards chance visitors to their country houses. We cannot pretend to much knowledge of a chicken, except when it is roasted or boiled. Nevertheless, so far as we can venture to judge, in utter ignorance as we are of "points," Mr. Wright's work and Mr. Ludlow's illustrations are in every way worthy of their subject.

Life Wanderings and Labours in Eastern Africa, by Charles New. With map and illustrations (Hodder and Stoughton). Wherever we have dipped into this book we have found Mr. New's narrative simply written and interesting. On one occasion he tells how a certain chief had pressed him to come to a village and spend the night there. "Finding that he could not move me, he said, 'Then you must give me your coat that I may take that home with me; for I must have the smell of you in my hut.' The coat was given to him, and away he went with it in triumph; but it was brought back early on the following morning and thrown at my feet." This volume will form an interesting addition to that library of literature on Africa which is added to almost every day.

The Western World: Picturesque Sketches of Nature and Natural History in North and South America. By William H. G. Kingston (Nelson). In this work a great deal of information about the Western World is conveyed in a lively and interesting manner. It would have been just as well, however, if it had been somewhere stated that not a little of the information and not a few of the illustrations are to be found in a work that Mr. Kingston published three years ago, entitled *On the Banks of the Amazon*. In most places the language has been considerably modified, but on the other hand whole sentences have been transferred with scarcely any change.

Lives of Labour, by O. T. Brightwell, author of "Annals of Industry and Genius" (Nelson). In this modest little volume are given "incidents in the career of eminent naturalists and celebrated travellers." It is interestingly written, though the words are at times rather bigger than the subject at all requires. The account of an Alpine adventure of Bishop Stanley's in the year 1818 will be enjoyed by every one but the members of the Alpine Club. To them, as the traveller does not set even a foot on the ice, and carries no axe, it will seem poor stuff indeed.

My Kalula: Prince, King, and Slave: a Story of Central Africa, by Henry M. Stanley, author of "How I Found Livingstone." With illustrations (Sampson Low and Co.). Mr. Stanley, to use his own words, has "woven fact with fiction" in the hopes of interesting "those boys and young, middle-aged, and old men who found his first book rather heavy." We could have wished that in his fiction he could have dropped his style of a Special Correspondent, which at its best is none of the most pleasant. Those readers who cannot enjoy accounts of strange lands unless they are "woven" with some still stranger story will perhaps read *My Kalula*. More sensible people will prefer to have travels and stories served up in separate dishes.

The Chase, a poem, by William Somerville. New edition, illustrated with fine steel engravings (Feger). This is an elegant reprint of a poem which, though it cannot be reckoned very highly, is yet much less known than it deserves to be. There are many passages in it of considerable vigour and of no small beauty. We have not much hope that it will find many readers among those who delight in modern sporting literature. And yet perchance on some day when the ground is bound by frost and there is no chance of a ride after the hounds, when they have read the last advertisement of the last page of their sporting journal, they might, for want of something better, find Somerville's *Chase* help them through a morning. We must not forget to add that the engravings, if not new, have considerable merit.

Little Loddie, by the author of "Little Mother." With twenty-four illustrations by L. Frolich; *the Life of a Bear; his Birth, Education, and Adventures*. With twenty-four illustrations; and *Strawberry Bank; or, Home from India*, by the author of "Busy Bee." With eight coloured illustrations (Seeley and Co.). We have here three pretty little stories, written in simple language and printed in a large clear type. Any of them, or all of them, would do very well to give to a child who has just learned to read alone. The illustrations in the *Life of a Bear* are, for a child's book, unusually good, though we cannot say the same for those of the two other stories. The eight coloured pictures of *Strawberry Bank* are mere daubs.

Waiting for a Crown, by the author of "Hetty's Resolve." With twenty-six illustrations (Seeley and Co.). We have here the early years of King David told in a hundred and ninety pages. Many houses are kept so dull on a Sunday that it is quite possible that there are children who will look upon such a story as this as an agreeable relief to a very long day. For our part, we must confess that we have a great dislike to see the Bible stories either cut down or drawn out.

Aunt Charlotte's Stories of English History for the Little Ones, by Charlotte M. Yonge (Marcus Ward). Before Miss Yonge wrote even for the Little Ones the story of the Great Rebellion from what we may call the *Heir of Redclyffe* point of view, she would not have done ill if she had first made herself acquainted with Mr. John Forster's writings. She might then have let the Little Ones hear something of the sufferings of Eliot as well as of the "good and earnest" Charles. It is wonderful that an author of Miss Yonge's ability and knowledge should write that at the beginning of the reign of Charles I. "for some years all went on quietly." This is a matter of fact which can be upset in a moment by a reference to any history worthy of the name. What she says about Cromwell's religious views is more a matter of opinion, and here we shall not take the trouble to argue against her. She says, "Cromwell was a religious man; but he chose to make out his religion from the Bible himself, instead of being taught by the Church, and so the very root of the matter was likely to be wrong with him." There are some writers who make out their history from their own imaginations, instead of being taught by the best authorities, and so the very root of the matter is likely to be wrong with them.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

THE UNITED STATES.

The Annual Subscription to the SATURDAY REVIEW, including postage to any part of the United States, is £1 10s. 6d., or \$7 50 gold, and may be forwarded direct to the Publisher, at the Office, 38 Southampton Street, Strand, or to Mr. R. F. STEVENS, American Agency, 17 Henrietta Street, Covent Garden, London. International Money Orders can be sent from any office in the United States, and Subscriptions, payable in advance, may commence at any time.

Nearly all the back Numbers of the SATURDAY REVIEW may be obtained through any Bookseller, or of the Publisher, at the Office, 38 Southampton Street, Strand, W.C., to whom all Communications relating to Advertisements should likewise be addressed.

The SATURDAY REVIEW is duly registered for transmission abroad.

The publication of the SATURDAY REVIEW takes place on Saturday Mornings, in time for the early trains, and copies may be obtained in the Country, through any Newsvender, on the day of publication.

Now ready, VOLUME XXXV., bound in cloth, price 10s. Cloth Cases for Binding all the Volumes, price 2s. each. Also, Reading Cases, price 2s. 6d. each. May be had at the Office, or through any Bookseller.

Copies of the SATURDAY REVIEW Bill of Contents will be forwarded every Friday Evening by post, prepaid, to any Newsvender in Town or Country on application to the Publisher.

THE SATURDAY REVIEW

OF
POLITICS, LITERATURE, SCIENCE, AND ART.

ADVERTISEMENTS.

CRYSTAL PALACE.—PARTICULAR ATTRACTIONS THIS DAY AND NEXT WEEK.

Saturday—(December 13).—Eleventh Saturday Concert.
Monday—Instrumental Music.
Tuesday and Thursday—Comedy by the Company of the Charing Cross Theatre.
Wednesday—Instrumental Concert.
Saturday—Production of Mr. E. L. Blanchard's New Christmas Annual, "Puss in Boots."
Admission, Monday to Friday, One Shilling; Saturdays, Half-a-Crown; or by Guinea Season Ticket.

CRYSTAL PALACE.—Production of the NEW CHRISTMAS PANTOMIME, written expressly for the Crystal Palace by Mr. E. L. BLANCHARD. On SATURDAY NEXT.

CRYSTAL PALACE COMPANY'S SCHOOL of PRACTICAL ENGINEERING.—Principal, Mr. J. W. WILSON, Assoc. Inst. C.E. The NEXT TERM, both in the Mechanical and Civil Engineering Sections, COMMENCES on Tuesday, January 6. Prospectus and all particulars in the Office of the School of Art, Science, and Literature, in the Library, near the Byzantine Court, Crystal Palace.
By Order of the Committee of Directors,
F. K. J. SHENTON, Superintendent Literary Department.

SIR EDWIN LANDSEER.—BURLINGTON GALLERY being required for the forthcoming EXHIBITION of the Complete Series of Engravings after Sir EDWIN LANDSEER, R.A., the EXHIBITION of ELIJAH WALTON'S OIL PAINTINGS and WATER-COLOUR DRAWINGS will CLOSE on December 23. Open from Ten till Dusk. Admission, with Catalogue, 1s.

ARUNDEL SOCIETY'S COLLECTION of COPIES from the ANCIENT MASTERS, including the celebrated Altar-Piece by Memline, at Luben's VIEW daily at 24 Old Bond Street, W.

FACSIMILES in COLOUR of the ARUNDEL SOCIETY'S DRAWINGS are sold to the Public as well as to Members. Prices from 10s. to 40s. Lists sent on application to 24 Old Bond Street, W.

THE PAYMENT of £1 ls. as an Entrance Donation to the ARUNDEL SOCIETY constitutes Membership for Life. Members can purchase the Publications at a lower Price than the Public. Circulars are sent on application to 24 Old Bond Street, W.

DORÉ'S GREAT PICTURE of "CHRIST LEAVING the PRÆTORIUM," with "Night of the Crucifixion," "Christian Martyrs," "Francisco de Rimini," "Neophyte," "Andromeda," &c., at the DORE GALLERY, 25 New Bond Street. Ten till Six.—Admission, 1s.

ELIJAH WALTON.—EXHIBITION of OIL PAINTINGS and WATER-COLOUR DRAWINGS, Alpine, Eastern, Norwegian, &c., OPEN until December 23, at Burlington Gallery, 161 Piccadilly. From Ten till Dusk. Admission, with Catalogue, 1s.

AUTOTYPE GRAND FINE ART GALLERY.—ON VIEW, AUTOTYPE FACSIMILES of the Oxford Drawings, Louvre Pictures, and Ancient and Modern Masters. Christmas subjects.—36 Rathbone Place (next to Winsor & Newton).

"THE SHADOW of DEATH."—Painted by Mr. HOLMAN HUNT. Now on View from Ten till Five. 308 Old Bond Street.—Admission, One Shilling.

THE SOCIETY of PAINTERS in WATER-COLOURS.—THE TWELFTH WINTER EXHIBITION of SKETCHES and STUDIES by the Members is now OPEN at their Gallery, 5 Pall Mall East. Ten till Five.—Admission, 1s. ALFRED D. TRIPP, Secretary.

INSTITUTE of PAINTERS in WATER-COLOURS.—THE EIGHTH WINTER EXHIBITION is now Open, from Ten till Six. Admission, 1s. Gas on dark days. Gallery, 51 Pall Mall. JAMES FAHEY, Secretary.

UNIVERSITY of LONDON.—The following are the Dates at which the several EXAMINATIONS in the UNIVERSITY of LONDON for the Year 1874 will commence:

Matriculation	Monday, January 12, and Monday, June 29.
First B.A.	Monday, July 29.
Second B.A.	Monday, October 21.
Branch I.	Monday, June 1; Branch II, Monday, June 8.
Branch III.	Monday, June 15.
First D. Litt.	Monday, June 1.
Second D. Litt.	Friday, October 13.
Scriptural Examinations	Tuesday, November 21.
First B.Sc.	Monday, July 29.
Second B.Sc.	Monday, October 20.
Within the first Twenty-one days of June.	
First L.L.B.	Thursday, January 8.
Second L.L.B.	Thursday, January 15.
Thursdays, January 15.	
Preliminary Scientific	Monday, July 29.
First M.B.	Monday, July 29.
Second M.B.	Monday, November 2.
Tuesday, November 2.	
Monday, November 2.	
Monday, November 2.	
Monday, November 2.	
Monday, May 1.	

The Examinations relating to the above Examinations and Degrees may be obtained on application to "The Registrar of the University of London" (Buckingham Gardens, London, W.) December 10, 1873. WILLIAM R. CARPENTER, M.D., Registrar.

UNIVERSITY of LONDON. MATRICULATION EXAMINATIONS. 1874.—The Course of PRIVATE and CLASS LESSONS for the next June Examinations, under the direction of the Rev. PHILIP MAGNUS B.Sc., B.A., will COMMENCE the 1st week in February.—Address: 2 Portland Road, W.

THE LONDON INTERNATIONAL COLLEGE.—Principal, Dr. LEONHARD SCHMITZ, F.R.S.E., late Rector of the High School, Edinburgh. The WINTER TERM will commence on Monday, January 19, 1874.—Applications for admission to be addressed to The Principal, at the College, Spring Grove, near Islington, Middlesex.

MALVERN COLLEGE. The next TERM will begin on MONDAY, January 26, 1874.

BRIGHTON COLLEGE. President.—The Earl of CHICHESTER.

Principal.—The Rev. C. BIGG, M.A., late Senior Student of Ch. Ch. Oxford. There are several Modern Forms including every new course, and also to be the Index in Aqueous Examinations. The School is well endowed with Exhibitions. FOUR SCOTLANDS, at about £200 a year, will be awarded by open competition in January.—Apply to the Rev. the SECRETARY.

MAGDALEN COLLEGE SCHOOL, Oxford, offers to the SONS of GENTLEMEN a direct Preparation for University distinctions and for the Scientific Branches of the Public Service. It has all the appliances of the best Schools, and special facilities for the study of modern subjects. The Terms are moderate, and include definite Preparation for Examinations. Numbers limited to 120.

Honours gained during the Year ending October 1873.

Classical Fellowship at Corpus.
Natural Science Fellowship at Magdalen.
Classical Fellowship at Magdalen.
Mathematical Scholarship at Magdalen.
Classical Scholarship at Magdalen Hall.
Open Classical Exhibition at Ch. Ch.
Open Classical Exhibition at Queen's.
Natural Science Scholarship at Worcester.
Indian Civil Engineering College.
Royal Engineers.
First Class in Natural Science.
Two First, one Second, Class in Mathematics.
Two First, four Second, Classes in Mathematics.

EXHIBITIONS.—CHATHAM HOUSE, Ramsgate.—An EXAMINATION will be held January 20, to award FOUR ENTRANCE EXHIBITIONS, value £25, tenable for Two or more years.—Apply to Rev. the HEAD-MASTER.

WOOLWICH and ARMY DIRECT.—Rev. Dr. HUGHES (Wraugh, Ann.), who, with Twenty Years' experience, has passed 300 (and last September, for Woolwich), receives a few PUPILS expressly for the above.—Castlebar Court, Ealing, W.

GARRICK CHAMBERS.—LECTURES will be RESUMED on January 2, 1874. The Honour List for the years 1866-72 contains the Names of 131 SUCCESSFUL PUPILS, appointed to the following Departments:—

57 to the Civil Service of India.
19 to Attachships in the Diplomatic Services.
14 to the Foreign Office.
21 to other Superior Offices of the Home Civil Service.
11 to the Ceylon Service and to Chinese Interpreterships.
3 to the India Engineering College.

Of this number 33 gained the First place in their respective Competitions. The List may be had on application by letter to the LIBRARIAN, Garrick Chambers, Garrick Street, London.

ARMY, CONTROL, COOPER'S HILL, &c.—Mr. W. M. LUTON (Author of "English History and Arithmetic for Competitive Examinations") PREPARES CANDIDATES for the above, at 9 Rathbone Place, Oxford Street, and at Leatherside House, South Hill Park, Hampstead, N.W.

CARSHALTON HOUSE, Surrey.—PREPARATION for Woolwich, the Line, the Navy, the Indian, Civil and Forest Services, as well as for Matriculation in Oxford, Cambridge, and London.—Terms moderate.

FOLKESTONE.—Mr. W. J. JEAFFRESON, M.A. Oxon (formerly Principal of the Elphinstone High School, Bombay) will continue, with the Assistance of a Cambridge Honour-Man, to prepare PUPILS for the Universities, Indian Civil Service, Woolwich, and all Competitive Examinations.—Terms and References on application.

ST. SWITHIN'S VICARAGE, Lincoln.—BOYS prepared for Eton, Harrow, Winchester, and the other Public Schools, by Rev. G. H. PRATT, M.A., Vicar of St. Swithin's, and O. TOWNSEND OLDHAM, Esq., B.A., Oriel Coll., Oxford. References to Parents of past and present Pupils given on application.

FRENCH.—Conversation, Reading, Special LESSONS on Pronunciation.—Translation.—Correspondence, by Dr. CLAUDON, Parisian, 443 Strand (opposite the Charing Cross Station). Dr. CLAUDON is M.D. of Paris, and M.R.C.S. of England, and has had ten years' successful experience in Teaching French in London. List of references sent free.

STOKE HOUSE, near SLOUGH.—The Rev. E. ST. JOHN PARRY (late of Tudor House, Durham Down, Bristol) has REMOVED to STOKE HOUSE, near Slough. Mr. PARRY prepares for the Public Schools generally, and also specially for the Scholarship Examinations at Eton, Winchester, and other Schools, as heretofore.—For further particulars apply to Mr. PARRY, Stoke House, Slough.

BURWICK GRAMMAR SCHOOL.—HEAD-MASTER WANTED.—There being a VACANCY in the HEAD-MASTERSHIP of the above School, Gentlemen who may desire to obtain particulars with a view to becoming Candidates for the Office are requested to apply to the Undersigned.

The Appointment will be made early in January next, so as the new Master may enter on his duties at the close of the Christmas Vacation.

By Order of the Trustees,
Ravensdowne, Berwick-upon-Tweed,
December 9, 1873.
H. J. WILLIAMS, Clerk.

THE TWO INFALLIBILITIES.

LORD RUSSELL will preside on the eve of the ensuing Session at a great Protestant meeting for the purpose of expressing sympathy with the German Emperor in his contest with the Pope and the Roman Catholic clergy. It is an arduous task to decide between two conflicting claims to infallibility. On one side the Pope asserts his jurisdiction over all baptized persons; and on the other Lord Russell is the acknowledged representative and prophet of civil and religious liberty. Only a hardened bigot would venture on the hobby of doubting whether the proposed meeting will be consistent with the Bill of Rights, the speeches of Lord Somers and Mr. Fox, and the Act of Settlement. Even if the authority of Lord Russell were not in itself conclusive, he reminds Sir George Bowyer that the Whigs have, like the Roman Saints, an accumulated capital of supererogatory merit on which they can draw in favour of the German Emperor or of any other client who may be entitled to their patronage. "You seem," says Lord Russell, in answer to the remonstrance of his Catholic correspondent, "to forget the part the Whigs took in remedying your legitimate grievances." Having fifty years ago supported Catholic Emancipation, Lord Russell may set off early tolerance against his present leaning to persecution. As in the case of his venerable rival, there is some difficulty in distinguishing doctrines proclaimed *ex cathedra* from those which need not be implicitly accepted as articles of faith. To the unassisted reason it would seem that two of Lord Russell's propositions are at first sight inconsistent. "The autonomy of Ireland is asserted at Rome: I decline the Pope's 'rule over Ireland.'" Even the Pope would hesitate to affirm in the same breath both that Ireland had no external ruler, and that he was himself the foreign ruler of Ireland; and indeed he might add that he had never made either of the assertions which Lord Russell denies. Even the potentate who is to receive the unnecessary support of the meeting at Exeter Hall might profanely object that he is not Emperor of Germany, but Emperor in Germany, or, according to English idiom, German Emperor. The great Whig Pontiff would reply to both Pope and Emperor that his infallibility extends to facts as well as to articles of political faith. If Jansenists were excommunicated, not for holding the doctrine of their supposed founder, but for maintaining, in contradiction to a Pontifical Bull, that Jansen had never affirmed the doctrine which was declared to be heretical. It is necessary to believe that Pius IX. has described Ireland as independent, and as wholly dependent on Rome. It would be irrelevant to enter on the further inquiry whether the relations between the Holy See and Ireland have been in any manner affected by the decrees of the Vatican Council. When the Whigs were engaged in redressing the legitimate grievances of the Catholics, it was considered a proof of *bona fides* to refer to Papal claims of supremacy in Ireland.

If Sir George Bowyer were not politically and religiously tainted, he would have to turn first to the conclusion that the German Emperor is in a position to force this country to accept the every-day rule and every party, and he would then be bound to come to the House of Commons with "contempt and disgust." It is neither necessary nor useful to express an opinion on the expediency of Prince Bismarck's domestic policy. To say that the suppression of ecclesiastical independence is essential to the safety and unity of the Empire, which is undoubtedly regarded by the Emperor and the Emperor as the Vatican. As Sir George Bowyer declares, the English realm has nothing to do with the proceedings which he describes as

measures of persecution. "Prince Bismarck does not 'want your Lord Russell's sympathy, and he will be 'amused and laugh at the applause of English Liberals.' The distinction between temporal and spiritual affairs is not perpetual nor necessary. There are occasions when it is necessary to deal with religious dissidents as political malcontents; but in England the indifference of the State to religious dogmas has long since been admitted." Sir G. Bowyer forgets the histories of Bohemia, of Spain, and of France, when he asserts that force has never ultimately triumphed over religious opinion; but the English nation has not the slightest inclination to make or to revive the experiment of persecution. If it were possible to believe that Lord Russell was mistaken, Sir G. Bowyer might have some ground for suggesting that the Anglo-German Non-Popery movement would be very unjust to the "Majesty's Catholic subjects and injurious to the peace and welfare of the country." It may be true that, as Lord Russell complains, "the Roman Church disclaims equality, and will be satisfied with 'nothing but ascendancy'; but when Prince Bismarck and Lord Russell have done their best, or their worst, claim of ascendancy, whatever it may mean, will be modified or withdrawn. The only justification of Prince Bismarck's measures, if they are to be judged by an English standard, must be derived from the fact that he is dealing with an Established Church, and Lord Russell abandons his only ground when he identifies the pretensions of Rome in Ireland with the grievances of the German Catholic Church. It must be admitted that he is perfectly consistent with the policy of the DUKAK letter and of the Ecclesiastical Titles Bill. In 1851, as in 1873, it seemed intolerable to the typical Whig that the ecclesiastical pretensions of the Catholic hierarchy should exceed their legal powers. The consequence was an abortive Bill which was silently repealed by Parliament after it had remained inoperative, except as an offence and provocation, for twenty years.

There is perhaps still time to enlarge the scope of the resolutions which will be passed at Lord Russell's meeting. As Mr. MAX MILLER has recently stated, there are other proselytizing Churches in the world besides the Roman Catholic. The GRAND LAMA is perhaps too remote to create alarm in the minds of English Protestants, but the Sultan of Turkey proposes to inherit the prerogatives of the Caliphs, who were bound to offer infidelity the presumptuous alternative of conversion, of death, or of payment of tribute. Lord Russell indignantly denounces the ascendancy of the Pope over baptized persons, "and therefore including our Queen, the Princes of Wales, and our Bishops and clergy." He would scarcely regard with greater complacency the subordination of the Emperor and the bishops to the modern COMMANDER of the Faithful. Sir George Bowyer truly remarks that every bishop of the Established Church makes the same claim within his diocese, and every clergyman within his parish. Nonconformists are sometimes impatient of the pretence though it does them no practical harm. Ordinary Protestants dismiss their business and their money without ever remembering that the Grand LAMA has become a phantom great in the East. Progress still affects to stop this way. The No Popery meeting, if they cannot manage to antagonize one of their countrymen, might be directed to show that in proceeding against Roman Catholics they are simply helping the cause. Not a single Englishman, however, will be restrained in future by the Emperor or the Pope, and the English realm has nothing to do with the proceedings which he describes as

measures of persecution. Prince Bismarck does not 'want your Lord Russell's sympathy, and he will be 'amused and laugh at the applause of English Liberals.' The distinction between temporal and spiritual affairs is not perpetual nor necessary. There are occasions when it is necessary to deal with religious dissidents as political malcontents; but in England the indifference of the State to religious dogmas has long since been admitted." Sir G. Bowyer forgets the histories of Bohemia, of Spain, and of France, when he asserts that force has never ultimately triumphed over religious opinion; but the English nation has not the slightest inclination to make or to revive the experiment of persecution. If it were possible to believe that Lord Russell was mistaken, Sir G. Bowyer might have some ground for suggesting that the Anglo-German Non-Popery movement would be very unjust to the "Majesty's Catholic subjects and injurious to the peace and welfare of the country." It may be true that, as Lord Russell complains, "the Roman Church disclaims equality, and will be satisfied with 'nothing but ascendancy'; but when Prince Bismarck and Lord Russell have done their best, or their worst, claim of ascendancy, whatever it may mean, will be modified or withdrawn. The only justification of Prince Bismarck's measures, if they are to be judged by an English standard, must be derived from the fact that he is dealing with an Established Church, and Lord Russell abandons his only ground when he identifies the pretensions of Rome in Ireland with the grievances of the German Catholic Church. It must be admitted that he is perfectly consistent with the policy of the DUKAK letter and of the Ecclesiastical Titles Bill. In 1851, as in 1873, it seemed intolerable to the typical Whig that the ecclesiastical pretensions of the Catholic hierarchy should exceed their legal powers. The consequence was an abortive Bill which was silently repealed by Parliament after it had remained inoperative, except as an offence and provocation, for twenty years.

sionate amusement; but a wanton revival of No-Popery agitation will furnish new weapons to Irish demagogues, and quicken the chronic discontent of the Roman Catholic clergy. The Ecclesiastical Titles Bill was from the first a dead letter in respect of its legal effect; but it nevertheless supplied a pretext for disaffection and clamour from the day on which it passed to the time of its repeal. Ecclesiastical will make every allowance for Lord Russell; but in Ireland he will be represented as the organ of English Liberal opinion. It is absurd to grudge the Pope any satisfaction which he may derive from a mystical claim to the allegiance of baptized or unbaptized persons. His adherents have long since abandoned all attempts to enforce his claims on the United Kingdom; and wordy pretensions are wholly innocuous. As Lord Russell answers Sir George Bowyer's temperate remonstrance by a reference to his former services to the Catholics, it would be useless to appeal further to his prudence and moderation. It may not be too late to express a hope that no other politician and no ecclesiastic holding a responsible position will be guilty of the impertinence of interfering in German affairs, or of the mischievous rashness of providing an excuse for Irish disaffection. Mr. WHALLEY might appropriately move, or second the resolutions which will be proposed at the meeting. That a veteran statesman of high rank should make himself ridiculous is a melancholy and unavoidable accident. It is not necessary that others should render his mischance more conspicuous by following his example.

COUNT DARU'S REPORT.

IT is long since a document has been issued in France so full of instruction, both with regard to the past and the present, as the Report which Count DARU has presented on behalf of the Commission charged to inquire into the history of France from the fall of the Empire to the constitution of Paris. It contains much that explains not only what took place three years ago, but a great deal of what is going on now—the attitude of parties to each other, the grievances they complain of, and the fears they entertain. The Report is drawn up with much moderation and good sense, and is as fair as any judgment on history so recent could be expected to be. Its general purport is to show that the Government of the 4th of September, being the fruit of a revolutionary movement, and coming into existence in defiance of the law, was from its outset tainted with the faults and weaknesses, not to say the vices, of its origin. The Revolution of the 4th of September was not premeditated by those who formed the new Government, and was really due to the agency of the leaders of the faction which ultimately set up the Commune. The only witness who acknowledged that he had contributed to bring it about was Count KÉRATY, who, the day before the outbreak took place, actually offered the post of Minister of War to General LA FLORE. JULES FAVRE, PICARD, and GAMBETTA all asserted that they knew nothing of it beforehand, and suffered themselves to be placed at the head of a Government which did neither more nor less than invent itself, mainly because they feared lest, if no one took the responsibility of giving a safe direction to the violence of the mob, there might be a frightful reign of licence which would expose the deputies attending the Corps Législatif to serious danger, and make impossible any effective resistance of Paris to the advancing enemy. TROCHU was induced to join the new Government on two conditions, one of which was that God, the family, and property should be respected; and the other, that he should be named President of the Council of the Government; and, having obtained the consent of those who were constituting themselves his colleagues, he proceeded to make an official call on General PALIKAO—a piece of politeness calculated, as Count DARU remarks, to astonish the object of Trochu's ceremonious respect. Meantime GAMBETTA had with his usual energy seized on the office of Minister of the Interior, and telegraphed to all the prefects the imaginary fact that the *déchéance* of the Empire had been voted by the Corps Législatif. It had been the intention of those who placed him in power that PICARD should be the Minister of the Interior, and when the nine members of the Government met on the night of the 4th to settle the distribution of offices, a very significant contest arose as to which of the two claimants of the all-important Ministry of the Interior should be recognized. By a majority of one voice the decision was made in favour of GAMBETTA, principally because he had already issued his telegram, and to replace him by

another Minister would be taken to show discord or hesitation among the new governors of France. But the issue was a most serious one; for PICARD represented that section of the new Government, to which TROCHU and JULES FAVRE also belonged, which held that the Government should be really a Government of National Defence, and no more; while GAMBETTA represented the section which held that the Government had not one, but two objects, to serve—to beat the Prussians, and to impose a Republic on France in the name of Paris.

It was owing to the ascendancy of GAMBETTA that from the outset everything was done to avoid connecting the new Government with the institutions of the country as lately existing, to insist on the Republic as a new beginning, and to treat France, apart from Paris, as a mere mass of force to be manipulated for the benefit of a party. Count DARU does justice to the sincerity of GAMBETTA's conviction that the institution of the Republic and the levy of the people in mass were the only effectual means of beating the Germans; but he says, with incontestable truth, that all the action of the Government was inspired by the same idea, and that resistance to GAMBETTA or dissension from his policy never succeeded in altering the essential character of the Government. Thus the new rulers of France fixed the seat of government at Paris, in a besieged city without means of communication with the interior, because Paris, although absurd as a seat of government, was really the seat, and the only seat, of the Revolution. GAMBETTA, in the same way, opposed the project of calling together a new Assembly. The more Conservative members of the Government had always an uneasy feeling that they were not dealing quite fairly with France, and that the want of any authority representing the nation constituted a most serious obstacle to success in negotiations with the enemy. But GAMBETTA never allowed them to do more than offer feeble and wavering suggestions; and when the news reached Paris that the Tours delegates had actually ventured on their own authority to order elections to be held, he immediately persuaded his colleagues to give him extraordinary powers, left Paris in a balloon, and on his arrival at Tours revoked the decree for the elections, and shortly after nominating himself Minister for War as well as of the Interior, became Dictator of France outside Paris. He had, while still in Paris, nominated eighty-nine Prefects in a day, and changed the staff in the office of the Interior until it had assumed a sufficiently revolutionary complexion. He had now full opportunity of trying his experiments of crushing what he believed to be the standing conspiracy of Legitimists and Clericals against the country, and of seeing what a levy in mass could do. With his proceedings his adversaries contrast their own. The graver Liberals of the Assembly were so apprehensive of the consequences of setting up a Government without a show of legality that M. GRÉVY went late on the afternoon of the Fourth to the Hôtel de Ville to see whether it could not be arranged that the new Government should take its commission from the Assembly and seem to be acting with its sanction. But it was too late; the Ministry had been proclaimed and had issued in its own name an address to the people. It is interesting, by the by, to hear how they manage these things in France. It appears to be, according to Count DARU, the traditional usage that when a revolution breaks out the gentlemen who propose to profit by it hurry into an upstairs room and write their names on little bits of paper, which they roll up and throw down to the mob outside. As the little rolls are picked up, they are opened, the names are read out, and a shout is given, and this process is turned nomination by acclamation of the people. As this ceremony had been successfully gone through before M. GRÉVY arrived, M. THIERS advised all the deputies in communication with him to go quietly to their homes in the provinces, to do all they could for their country, and to fight under the new Government rather than not fight at all. What the members of the present Assembly opposed to GAMBETTA say is that they acted on this sensible advice, that they thought of France and not of their party, and made the best resistance they could, although they had to range themselves under a dictator who was filled with a fanatical party spirit, and who sacrificed thousands of his countrymen to his absurd notions of the mode in which a successful war ought to be conducted. They wished for a legal continuity of the Government, for the submission of civilians to general guides in war, and for an Assembly which should represent France. He, as he himself said, claimed to govern France

after his own fashion, because he was inspired with the sentiments of Paris, and he audaciously seized on every means of power that came to hand, simply that the sentiments of Paris might prevail.

If we were called on to do justice to GAMBETTA, we might question whether Count DARU judges this black sheep quite fairly. Not that anything which the Report says is untrue or tainted with partiality; but Count DARU always assumes that such efforts as were made to raise new armies and send them against the Germans would have been made if the authority of Tours had been in the hands not of GAMBETTA, but of an Assembly elected suddenly in war time with many departments invaded, and Paris cut off from the rest of the country. This is by no means a safe assumption. It is also to be noticed that GAMBETTA gave a real impulse to Republicanism in France, and that, as election after election has recently shown, he was appealing to a much less factitious feeling than was commonly supposed at the time. But it is not with the verdict which history will pronounce on GAMBETTA that we are now concerned. It is because this Report throws so much light on the sentiments with which the more sensible members of the Right are animated that it is important for the study of current politics. They think that their case is complete against GAMBETTA, and against those like THIBERS who consent to act with him. They hold that it is he who broke with legality, placed a party before his country, stifled the voice of France, disappointed the hopes of those who were willing to fight at any cost, and made an earlier and a better peace impossible. In point of arbitrary measures for the benefit of a party, they are now doing exactly what he did; but then they say that he did it first, and that they must beat him and his friends with the weapons he used. Such a course seems to outsiders at once unpatriotic and foolish, but some allowance must be made for men who lately smarted under the evils they are now inflicting. But that he was tyrannous and final, and spoilt the chances of the war, is not all that they have to say against GAMBETTA. They say of him what they say of the whole Government of the 4th September—that the main responsibility for the insurrection of the Commune must be cast on him and them. This is, we think, fully proved by the Report. The Revolution of the 4th of September was really the work of the leaders of the Commune, and these leaders never ceased to try first to control, and then to supplant, the Government they had called into being. The members of the Government never really dared to resist their secret masters. They were always afraid of them, always ready to excuse them, and never ready to repress them. Even after the scandalous affair of the 31st of October, when the members of the Government were for some hours in the hands of the Communists, and when some of the principal Ministers were kept for hours in momentary expectation of death, the Government did not dare to punish the authors of the conspiracy, or even, after they had been arrested, to keep them in confinement; and yet the ease with which the outbreak was suppressed as soon as some firmness had been shown proved that the Commune might have been crushed in its germ without there being any reason to apprehend that an internal struggle would be excited that would have interfered with the defence of the city. For the culpable weakness thus exhibited Trochu is chiefly to blame; but all the Ministry must share the reproach, and that it was the parent of the Commune will always be the greatest domet of the Government of the 4th September in the eyes of Frenchmen.

THE FEDERATION OF EMPLOYERS.

THE expediency of establishing a "National Federation of Associated Employers of Labour" is doubtful, although the reasons which may be urged for trying the experiment are obvious and plausible. It is perhaps not a sufficient objection to the plan that it virtually recognizes the propriety of the combinations which it is intended to counterbalance. Since Trade Unions have been long established, and as they involve no violation of the law, it is a waste of time to continue the controversy as to their economic utility. A large minority of skilled workmen believe that the organization is beneficial; and in some parts of the country the agricultural labourers have lately been persuaded to form Unions of their own. The eulogists of Trade Unions are perhaps biased by political considerations; and some of them may be suspected of a desire to

court popularity with a class which has lately increased its electoral power. With few exceptions employers dislike and resent the influence of the Unions and their managers over the workmen; and although in some districts, and in certain trades, it has been found necessary or convenient to negotiate with the Councils which administer the affairs of the Unions, there is probably not a single manufacturer or large tradesman in the kingdom who would not rejoice at the collapse of the system. Even if the rates of wages were alone in question, the pressure placed on employers by the Unions would cause much annoyance; but the interference of strangers with the hours and the other conditions of labour, and their efforts to introduce an artificial uniformity of work and of pay, are still more vexatious and irritating. The wild theories of the demagogues who enjoy the confidence of the artisans as to the relations of capital and labour are well calculated to cause alarm. It would be surprising if plans for resisting the Trade Unions were not from time to time proposed; but there are grave practical considerations which have hitherto induced prudent capitalists to hesitate before resorting to a mode of defence which will be understood by the Trade Unions as a declaration of hostility. Experience has shown that large numbers and approximate equality of condition facilitate combination. A few intelligent mine-owners or iron-masters include among them more elements of disunion than tens of thousands of the workmen whom they employ. Intelligence and wealth tend to promote an independence which is scarcely compatible with discipline; and it sometimes happens, as in the case of the South Wales strike at the beginning of the present year, that an employer is compelled to choose between ruin to himself and loyal adherence to his neighbours who are engaged in the same business. The currency of a single large contract may render submission to the demands of discontented workmen the only mode of escaping bankruptcy.

If difficulties are found in the maintenance of combined resistance in a single trade, more complicated embarrassments will arise if the whole body of employers undertake to render one another mutual aid. It is scarcely possible that Lancashire cotton-spinners should be able to form a judgment of the merits of a dispute in the mineral business of Northumberland or of Wales. The institution of a general association of masters will draw closer the federal relations which already exist among the different Trade Unions; and it is possible that a strike might be organized at Manchester in support of a demand for higher wages at the other end of the kingdom. To a certain extent the workmen are justified in the assertion that organized union is more necessary to themselves than to the employers. In ordinary times capitalists engaged within the same district in any kind of business agree among themselves on matters of prices and of wages, although they have little power to control dissentients who may have special interests of their own. It is unnecessary, and perhaps undesirable, to substitute a permanent combination for temporary arrangements which are habitually made as occasion arises. A general federation of employers will be formidable in appearance, while it is not certain that it will be found practically efficient. The objects which are said to be contemplated by the promoters of the scheme are too vague to justify a formal organization. The proposal to fight working-men with their own weapons is little better than a figure of speech, unless it means that a common fund is to be raised by contribution to support employers in lock-outs and in resistance to strikes; and yet, for reasons which have been already stated, it would be neither just nor possible that a general body or council of capitalists should judge of the merits of every dispute as to wages or hours of work which may occur in any special trade.

The purpose of securing to education, intelligence, and capital their fair share of influence in the constituencies is strictly political, and probably it comes too late. It would be highly inexpedient that the impending contests on extension of the franchise and on redistribution of electoral districts should be conducted by two antagonistic classes rather than by two political parties. Many of the eminent employers of labour who take part in the new Association are Liberals either of the moderate or of the extreme section of the party; and probably they will continue to support the present Government even in the questionable attempt to give additional power to the working classes. In all recent schemes of reform, and especially in the plan of transferring the control of the county representation to the farm-labourers, nothing

is further from the intention of democratic politicians than to cultivate the smallest regard for education, intelligence, or capital. It may perhaps be possible, for a time at least, to defeat the proposed deterioration of the constituency, but the proposal would acquire new popularity if it were resisted by associations of employers acting professedly in defence of their own interests. The true reasons for opposing similar measures have nothing to do with the regulation of wages, or with the other questions on which employers and workmen have come into collision. The law of conspiracy and the law of master and servant will perhaps be altered more or less largely in accordance with the demands of the Unions, and it is not desirable that the matter should be mixed up with questions relating to the suffrage. The Trade Unions have hitherto only occasionally adopted the suggestion of Mr. BRIGHT that they should use their organization for political purposes. It is as well that no excuse for a noxious agitation should be furnished by the employers. One conclusive reason for not engaging in the struggle is that the masters would be outvoted by the men. Some of the promoters of the new Association possess considerable local influence, which depends on the maintenance of the distinction between politics and private business.

Although manufacturers and traders may perhaps not be well advised in formally accepting the challenge of the Trade Unions, they are not to be blamed for discerning the dangers to which they are undoubtedly exposed. The arguments addressed to Mr. LOWE by the deputation of employers are the more reasonable because the advocates of the Trade Unions have of late conducted a one-sided controversy. It may be hoped that the Government will not sanction any change in the law which affixes penalties to the ordinary modes of persecution by Trade Unions. The agitators who insist that combined workmen shall only be subject to the provisions of the ordinary criminal law well know that the modes of oppression which are now prohibited are exclusively practised by Unionists. Some of the members of the deputation properly reminded Mr. LOWE that the present law is necessary for the protection not only of masters, but of non-Unionist workmen, who probably form a majority of the whole body. In dealing with trade legislation the Association of Employers may probably exercise a useful influence. If the members can in their combined capacity do little directly for the defence of intelligence, education, and capital, they may at least, within their several spheres of influence, discountenance on all occasions the revolutionary spirit. There are industrial capitalists who listen with complacency to newfangled projects for transferring the property in land from the present owners to the occupiers, or of subjecting the land to special taxation on some fallacious pretext. The agitators affect to discover in land some peculiar quality which exceptionally fits it for spoliation; but those who have invested their money in mines or manufactories may be well assured that their rights will be exposed to imminent danger when property once ceases to be an ultimate and unquestionable fact. The associated workmen of the Continent denounce capital more fiercely than landed property; and even in England revolutionary demagogues have often hinted that the profits of the master justly belong to his men. Free land, whatever the phrase may imply, will involve similar freedom of dealing with capital, irrespectively of the discretion of its owners. No systematic combination is required to oppose socialistic schemes of subversion; but it is possible and prudent to abstain from all participation in revolutionary projects. The strongest argument for the establishment of the proposed Association is to be found in the names of the promoters; but even the authority of the greatest trading capitalists in the kingdom is not conclusive evidence that their plan is feasible.

MR. WINTERBOTHAM.

THE news of Mr. WINTERBOTHAM'S death has been received with general and sincere regret, and it is a satisfactory symptom of the spirit that prevails in English political life that the leading Conservative journal showed an honourable readiness to pay a tribute to the merits of an opponent. Mr. WINTERBOTHAM has died early, and has had but a short Parliamentary career. Latterly, too, his name has been little heard, as he spoke so well in the first years after his election that he was promoted with unusual rapidity to the silence and obscurity of a subordinate

appointment. While he was still free, he had given the promise of an oratorical success considerably beyond the usual level of speakers who speak well enough to be promoted. He had shown that he could be independent and yet conciliatory, and he impressed on what he said and did the stamp of earnest convictions and of thoughts produced by study and matured by reflection. But he very wisely gave up the luxury of thinking and acting for himself when a chance of office presented itself. It is very difficult for a young man of promise to get a seat in these days, especially if he is on the Liberal side; but if a member is elected at the age when Mr. WINTERBOTHAM was returned for Stroud, much the best thing he can do is to look on Parliamentary life as a business for which he must carefully train himself by helping to conduct an important department of the State. Under Lord ABERDEEN Mr. WINTERBOTHAM had certainly the opportunity of seeing how such a department should not be conducted, rather than of seeing how it should be; but both forms of experience have much to teach a thoughtful and capable observer. At any rate Mr. WINTERBOTHAM showed in his last public speech, made at Bristol towards the end of October, that he had learnt one great lesson from office, and that was the immense importance to the nation of the chief departments of State being administered in a satisfactory manner. As he pointed out, Parliament sits only five months in the year, and during the remaining seven months the chief of each office is practically uncontrolled. We are so accustomed to speak habitually of the supremacy of Parliament that we are apt to forget how much power each Minister has, and how many things he may do, and how many interests he may affect, without Parliament having any practical means of challenging or reversing his decisions. It is only when gross blunders or glaring faults are committed or exposed, such as the Zanzibar Contract and the misappropriation of the Post Office money, that Parliament can intervene and give a Minister a severe and salutary lesson. Ordinarily a Minister does very much what he pleases, and even in such a case as that of Lord ABERDEEN, all that criticism could do was to reduce him from the weakness of precipitate action to the weakness of helpless inactivity. Mr. WINTERBOTHAM shaped his observations so as to lead to the conclusion that, as the prevailing spirit of an Administration is sure to colour most of its acts, and as the prevailing spirit of a Liberal Administration is the only right one, it is desirable that a Liberal Government should be always in office. It is better that a young official should show an innocent enthusiasm on behalf of his party and his superiors than that he should be overwhelmed by the dry prose of small Ministerial duties without a ray of poetry to enliven them. No one, therefore, would grudge Mr. WINTERBOTHAM his ray of poetry if he were living, and now that he is dead it adds to the regret which his loss has occasioned that one of the few young officials capable of appreciating the romantic side of Parliamentary ambition should have passed away. But it is obvious that, if criticism were started on Mr. WINTERBOTHAM'S theory, there would be a wide field for it to work on. The spirit of a Liberal Administration, if Mr. GLADSTONE'S Administration is to be taken as a typical one, has shown itself as a spirit energetic, inventive, and ready to consider and meet the wants of the nation at any cost to individuals; but it has also shown itself as a spirit prone to premature changes, delighting in crude proposals, dictatorial towards the whole non-Ministerial world, and fond of an economy often sadly misplaced, while not wholly averse to indefensible jobs.

It will not be easy for Mr. GLADSTONE to find a new Under-Secretary of the Home Office of anything like equal promise and merit. There are no more young Liberals who have deserved promotion, and when we learn the name of the person selected we shall probably find that the name of any one among twenty or thirty other persons would seem equally fit. This is not at all wonderful. The Ministry has been five years in office, and the same House of Commons has been sitting all the time. There have been a great many appointments to fill up, and gradually Mr. GLADSTONE has used up the list of serviceable subordinates with which the elections of 1868 furnished him. Under similar circumstances this result must inevitably happen, whoever is in power; and what we are chiefly concerned with is whether there is any reason to prospect of the next general election providing a good stock of Liberal recruits. Very serious doubts on this head may be justly entertained. In the first place, the

constituencies are more and more showing themselves inclined to return candidates who could make no pretension to office, who are elected on very narrow issues, and who are returned to look after the interests of a locality, a trade, or a sect. In the next place, the supply of the right kind of men seems failing. Mr. WINTERBOTHAM himself seems to have been much struck with this, and in his speech at Bristol he set himself to inquire how it happened that he could find among his contemporaries so few men of his own type. He was a Nonconformist, believing in Nonconformity, with a mind deeply imbued with the literature of the first half of the seventeenth century, and yet honestly striving to see things in as broad and as true a light as possible. He regretted to observe that young Nonconformists had no zeal for Nonconformity and no interest in education. They no longer studied, thought, and fought for their principles, but gave themselves up to getting on in the world; and so powerful is the influence of the world that, as he said, it has passed into a proverb that no Dissenting family keeps a carriage for three generations. A pair of horses inevitably instils Anglican convictions into the minds of the grandchildren of the toughest Dissenters. No doubt some of the finer traits of the Puritan character have faded away simply because the air of modern society is not wholesome and pure enough for them. But Mr. WINTERBOTHAM might have traced other causes at work to produce the effect he deplored, if he had pursued his inquiry. As time goes on, Dissenters, unless they fan their ardour by busying themselves with working the machinery of their sect, are apt to grow lukewarm about Nonconformity, not only because the carnal influences of a pair of horses sap their spiritual strength, but because, when they come to consider why they quarrel with the Church, they find that they have uncommonly little to quarrel about. In the days when Dissenters were excluded from public life merely because they were Dissenters, they had something to quarrel about that was worth the trouble. They had to fight not for the proposition that some one of the Thirty-nine Articles is possibly wrong, but for the proposition that a man who thinks one of those Articles possibly wrong should not be treated by his countrymen as an alien and an outcast. Directly the political basis of Dissent was cut away, Dissent lost the serious enthusiasm which is excited by a fierce but honourable struggle, and was left to split little theological straws in face of modern criticism and modern literature. It is the Liberalism which Mr. WINTERBOTHAM so much admired that has withered the Nonconformity he so much loved.

The advent of an educated, serious, cautious Nonconformist like Mr. WINTERBOTHAM, a revival of the Puritan of the Miltonian type in the political world of the nineteenth century, is something too exceptional to warrant any hopes of its frequent repetition. Educated Liberalism in these days is apt to develop into two types, very different from that which Mr. WINTERBOTHAM presented. First, there is the type of the impulsive Liberal, who glories in starting blazing principles, the friend above all things of the people, thinking every democratic change justified simply by its being democratic, and satisfied to his heart's core if a mob approves him. Secondly, there is the educated Liberal, whose education makes him cautious and perhaps timid, who sees the worth of the work of preceding generations, who is oppressed with the greatness and perplexity of the issues offered to modern society, and who cannot bring himself to believe or say that all Conservatives are fools or useless, because daily life shows him that nothing of the sort is true. The first type suits constituencies, but is not adapted to office. The second type is adapted to office, but does not suit constituencies. The Liberal party therefore seems likely to run short of promising young officials, and in twenty years or less it will be seen how serious a loss this is to the nation. Mr. STANSFELD, who has spoken at Liverpool this week, and who amply recognized the merits of the colleague he had just lost, made an earnest appeal to the Liberal party to heal its differences, to show a readiness to accept compromises, and to think only of the good of the party and the nation. We have not a word to say against the general tendency of his remarks, for, unless what he recommends is carried out, the Liberal party must become every day feebler and more ignoble. But Mr. STANSFELD's speech itself showed how great are the difficulties that stand in his way. He attempted to surmount unpleasant facts by ignoring them. He touched on the charges made against the Administration, and said that he had no objection to them,

for, while they amused those who made them, they produced no effect on the Ministry. The audacity of such a statement is little short of sublime when it comes from the mouth of a member of a Cabinet which has just been shifted and reshifted in order to repair the mischief of old shortcomings, and to give it, if possible, new strength. Mr. STANSFELD also dealt with the Education Act, and strongly advised that peace should be once more made to reign in the Liberal party with regard to the thorny questions which this Act has called into life. But if what he said is to be taken to have its natural meaning, his real opinion must be supposed to be that this desirable result is to be brought about by Mr. FORSTER being induced to allow the policy embodied in his Act to be materially changed: Conservatives would see in this nothing more than another instance of the leaders of the Liberal party capitulating to the pressure of their extreme adherents, and probably would be very glad that a general election should be held as soon as possible after the Government had accepted such a position. It can scarcely be that the true means of recruiting the Liberal party and supplying it with the statesmen of the future is to be found in the Government laughing at the notion of its having made mistakes, or altering its education policy at the last moment to please its discontented allies.

THE FRENCH ELECTIONS.

THE French elections of Sunday repeat the same story that has been told by every election since the 24th of May, though some additional significance is given by the fact that even Brittany has now pronounced in favour of Republican institutions. The Conservatives have tried to find comfort in the reflection that nearly two-fifths of the voters were on their side, a gain which they attribute to the confidence inspired by the prolongation of Marshal MACMAHON's powers. This ingenious theory shows at all events that French Conservatives have the grace of humility. They are not above making a meal on the crumbs which fall from the Republican table. Nearly two-fifths is a highly respectable minority, except at election time; but it argues a singularly thankful spirit to be able to say grace over it at the moment that the poll has been declared. Nor is it by any means certain that the fact that the minority has proved somewhat larger than the Conservatives expected is as consoling as the *Journal de Paris* makes out. Even supposing that the prolongation of Marshal MACMAHON's powers has won some votes for the Conservative candidates, what does this mean except that certain electors who would not have supported the Government when it was supposed to be bent on re-establishing the Monarchy are willing to support it now that it is assumed to have identified itself with the Republic? This is not the thoroughgoing partisanship which French Conservatives desire. They have shown by abundant proofs that a Conservative Republican is as hateful to them as a Radical Republican. M. THIERS has come in for as much of their wrath as M. GAMBETTA. The knowledge that a fraction of the constituencies which formerly accepted M. THIERS as its representative is now inclined to see the same qualities in Marshal MACMAHON is rather calculated to excite distrust of the measure which has worked the change. Governments often take their colours from their supporters, and if Marshal MACMAHON should learn to regard himself as a Republican President, he might insensibly fall to the level of his predecessor. As yet, however, there is not much ground for fearing so melancholy a result. The recruits who come into the Government are too few to make any sensible impression on the mass of solid Conservatism which has attached itself to Marshal MACMAHON in default of anything better to cling to.

It would be too much perhaps to say that the elections of Sunday have strengthened the purpose of the Government to amend the electoral law, because even before this last manifestation of French opinion it had been determined that such a Bill should be brought forward. But they have shown, at all events, that it is not safe to trust to any alteration in the composition and character of the Executive for maintaining the Conservatives in power. The Duke of BUCCHIE must look with lessened confidence to his Bill about Mayors, since, if Prefects have proved useless in the departments, the magic of Ministerial patronage may prove equally ineffective in the Communes. There are only two alternatives, therefore, open to the Government. Either it must recognize that France has

become Republican, or it must devise measures for preventing Republican France from making its voice heard. From time to time there are rumours pointing to the existence within the Cabinet of a disposition to take the former course. They are usually contradicted as soon as they become public, but they reappear again with a persistency which seems to show that, if not true, they are at least consonant with what men who know the composition of the Ministry think likely to be true. According to these stories, the Duke of Broglie and the Duke Dezares are not agreed upon the policy which the Conservatives ought to pursue. The Duke of Broglie wishes, if possible, to win back the Right to the side of the Government. The Duke Dezares holds that fresh support ought rather to be looked for in the direction of the Left Centre. If this alleged difference of opinion is anything more than an imagination, it shows that the Right Centre is not so entirely led by its fears as might have been expected from its taking the Duke of Broglie for its mouthpiece. The marvel is that any considerable number of intelligent Frenchmen, not pledged, either by their convictions or by their antecedents, to the maintenance of an impracticable loyalty, should shut their eyes to such patent facts. All appearances seem to prove that France has become Republican, but at the same time there can be little doubt that the variety of Republicanism really popular in the country is one of an extremely Conservative character. The nation would seem to have made up its mind that the establishment of Republican institutions will do more than anything else to secure the kind of conditions under which it wishes to live; but, provided that such institutions were honestly created, it would be willing to all appearance to see them administered by men who have little or nothing in common with the traditional Republican type. If the Government of the 24th of May had been able to convince the electors that its Conservatism was compatible with a firm determination to maintain the Republic intact, it is quite possible that the elections would already have shown a change in the view taken of it. But, instead of even attempting to make the electors feel this confidence, the Government went out of its way to make it impossible. It played fast and loose with the project of a Restoration, until at length it became pretty well understood that, though nominally the Ministers of the Republic, the Cabinet was really only holding office until a Monarchy could be set up in its room. Even now it is probably not too late to adopt a different policy. The Duke of Broglie is perhaps too much identified with reactions and restorations to be trusted to carry out the change, even supposing that he could be brought to see the necessity of it; but if the Conservative majority knew their own interests, they would try to form a Cabinet with the Duke Dezares, or some politician of the same school, as Prime Minister, and a Conservative but honest Republicanism as its policy. Such a Government might command the whole of the Right Centre, and a very large part of the Left Centre, in the existing Assembly, and might even be able, when once its honesty was believed in, to secure the return of another Assembly differing much less completely from its predecessor than at present threatens to be the case.

The other alternative is the mutilation of universal suffrage. The Committee of Thirty are certain to bring this forward, and as yet the Government shows every inclination to make the measure its own. It is easy enough to construct a theoretical argument against universal suffrage, and M. CÉZANNE, one of the Liberal minority in the Committee, has frankly admitted the many objections to which it is open. But the practical argument against interfering with it, when once established, outweighs all that can be urged on the other side. If any large section of the population is excluded from the franchise when it has once possessed it, it is ticketed thenceforward as a party hostile to the established order of things. The object of all wise Reform Bills is to make the extension of political power go hand in hand with the growth of political consciousness. The object of such a Reform Bill as the Committee of Thirty will probably introduce is to restrict political power after political consciousness has been developed in a way which the authors of the Bill dislike. A measure of this kind is nothing short of an invitation to the excluded electors to take other than political methods to attain their ends. Hitherto they have gone peaceably to the poll, and given voice to their opinions by sending deputies to the Assembly. Are they now to be told that in

future the poll will be closed to them, and that the right of making themselves heard by their representatives will be theirs no longer? If these men were destitute of political opinions they might submit to this discipline without murmuring. But the motive for applying it is that they do possess political opinions; and in that case these opinions are likely one day to make themselves heard in some more revolutionary fashion than the return of a Republican candidate.

GENERAL GRANT ON THE CURRENCY.

THE full text of the American President's Message adds a little to the information contained in the telegraphic summary. The most laboured part of the document consists of a disquisition on the currency, which was unintelligible in the abridged form, and which is, if possible, obscure still when it is published at length. It is not for forebears to discuss the expediency of entering on controverted questions in communications between the Executive Government of the United States and the Legislature, but the introduction of a similar practice would be extremely inconvenient in England. A European Chancellor of the Exchequer or Finance Minister is supposed to be appointed with reference to his special knowledge, and it happens that at this moment, in France as well as in England, the most skilful and experienced financier of the day presides over the national Treasury. The American Secretary of the Treasury is placed at some disadvantage by the constitutional arrangement which excludes the President's Ministers from Congress. The Finance Committees of the Senate and the House discharge part of the duties which elsewhere belong to a Finance Minister, and they may at their pleasure disregard any or all of the recommendations of the Secretary of the Treasury. In the Report of his department, Mr. RICHARDSON naturally uses all the arguments which may be urged in support of his various proposals; and he also, according to custom, gives an account of the measures in which he has exercised a discretion. It is more worthy of remark that the President himself devotes a great part of his Message to the exposition of his personal views. It is probable that he never studied finance until he became simultaneously a politician and the first officer of the Republic; and he was certainly not elected to his first or second term of office through any confidence which could have been reposed in his financial skill. His only claim to attention in matters of currency, besides the respect which is due to his high position, is that he brings a fresh mind to investigations which have evidently a genuine interest for him; and yet the strongest common sense is as incapable of mastering the mysteries of the currency as of throwing light on the abstrusest of metaphysical problems. There seems to be no material difference of opinion between the President and the Secretary of the Treasury; but the language of the Message is more argumentative and more earnest than the text of the Secretary's Report.

Although the revenue has, as might have been expected, fallen off in consequence of the late financial disturbances, the President is inclined to hold that the panic has been a blessing in disguise. If he is right, it is perhaps scarcely consistent to recommend that measures should be taken to prevent the recurrence of a disaster which produced a balance of advantage to the community. The President practically explains his meaning by stating his belief that a long step has been taken towards the restoration of specie payments, which he rightly holds to be the indispensable condition of a sound currency. The process of reasoning by which he arrives at this satisfactory conclusion is left to conjecture; nor is the matter in any degree elucidated by the further remark that "a specie basis cannot be reached and maintained until 'our exports, exclusive of gold, pay for our imports.'" The obsolete delusion of the balance of trade still prevails in the United States, or at least at Washington; nor has it occurred to General Grant's mind that a specie currency would tend to retain gold in the country by making it an indispensable commodity. He next congratulates Congress on the past and probable increase in the domestic production of precious metals; and he expresses the opinion that, if half the gold produced could be retained in the country, the return to specie payments would be rapidly attained. It seems that "to increase our exports sufficient currency is required to keep all the industries of the country employed." A less confident theorist

would have reflected that many other conditions of price and demand affect the amount of commodities exported. It is difficult to understand the statement that "the impossibility of competing in our own markets for the products of home skill and labour, and the repeated renewals, give elasticity to our circulating medium." It might be supposed that the passage had been incorrectly reported or printed, if other parts of the same document were not almost equally mysterious. The purport of the PRESIDENT's argument becomes somewhat clearer when he suggests that a metallic currency would be necessarily elastic. Gold would leave the country when there was a superfluity, and it would be brought back when it was required by a high rate of interest. The disadvantages in this respect of an inconvertible paper currency were forcibly illustrated during the autumn panic. The issue of greenbacks was necessarily limited by law; and, as they were exclusively used at home, there was no possibility of drawing supplies from abroad. An influx of gold would not have served the purpose as long as specie commanded a premium in comparison with paper. If the PRESIDENT would always apply the term of elasticity in the sense of an increase or diminution in the supply of gold, his reasoning would be less perplexing. Notwithstanding his well-founded appreciation of the advantages of a specie currency, General GRANT appears to have been deeply impressed by the scarcity during the crisis of greenbacks, which were hoarded by the holders because there was nothing else to hoard. His strange remark that the actual currency of the United States is the best which has ever been devised seems to require explanation. There is no doubt that the credit of the United States is, since the rejection of former projects of repudiation, sufficient to sustain a circulation of paper which has become relatively smaller in consequence of the increase of population and trade; yet the PRESIDENT himself repeatedly expresses the belief that a gold currency would be preferable to inconvertible paper. Again reverting to the supposed advantages of elasticity, General GRANT complains that the irregular demand at different times of the year renders money sometimes cheaper and sometimes dearer. He has learned from his former Secretary of the Treasury the odd phrase of "moving the crops," which furnished Mr. BOUTWELL with a pretext for a wilful breach of the law. It would seem that the natural provision against inequalities in the demand for money or the supply was to allow prices to regulate themselves accordingly.

The frequent and rapid fluctuations of the rate of discount in England during the present year have furnished a striking illustration of the absurdity of contrivances for making currency elastic. The Bank rate has been altered, at irregular intervals, on an average once a month, and the variation has ranged from three to nine per cent. The highest point was reached in November; in June the rate was seven per cent., and in August it sank to three per cent. Early in the spring, when only a few moderate changes had occurred, an ingenious member of the House of Commons, who would have been more suitably placed in Congress, proposed that measures should be adopted for securing trade against the inconvenience of varying rates of discount; and although his suggestion met with little favour in the House, the delusion on which it was founded has never been permanently dispelled. A quarter of a century ago the so-called Birmingham School was busy with devices for making money cheap whenever it became, from any cause, naturally dear; and the PRESIDENT of the United States and his SECRETARY of the TREASURY are at present urging upon Congress the trial of a similar experiment. Their practical conclusion is that the banks should be prohibited from paying interest on deposits. The fancy that money, or any other kind of property, belongs not to the owner, but to the community, or to some abstract or imaginary body, has never been more crudely avowed than in the Presidential Message. "Elasticity in our monetary system is the object to be attained first; and next to that, as far as possible, a prevention of the use of the people's money and stocks in other species of speculation." It is wonderful that in the United States, where the functions and powers of Government are supposed to have been reduced to the lowest point, a President should imagine that it is the duty of the Legislature to prevent the investment of money in any kind of speculation which may suit the purpose of capitalists or borrowers. The people's money cannot be misapplied without the will of the people, but the President speaks of the people in its national or corporate capacity,

while the people or persons who have the deposits at the banks are private individuals. It cannot be said that the PRESIDENT's discourse on currency is instructive, but he and the SECRETARY of the TREASURY deserve credit for their refusal to repeat Mr. BOUTWELL's irregularities.

MR. BRIGHT IN A PASSION.

JUST now Mr. BRIGHT's temper and memory seem to be equally short. In the extraordinary narrative of the proceedings of the Government with regard to the Education Act with which he favoured his constituents, he forgot some rather important incidents which had happened, although he made up for it, it is true, by remembering some other incidents which never happened. On this subject, however, it may be presumed that he has accepted the corrections of the Cabinet, and has made amends to the VICE-PRESIDENT of the COUNCIL. It appears that Mr. BRIGHT has also forgotten the time when or the speech in which he used the word "residuum"; and this is the more remarkable because it seems to imply that he has also forgotten what he himself had to say about the use of a similar expression by Mr. LOWE. It is sometimes convenient to remember to forget, and, as Dr. KENNEL has observed, men seldom care to recollect passages in their lives of which they have reason to be ashamed. This may perhaps account for Mr. BRIGHT's oblivion in the present instance. As the story is an historical one, it may be worth repeating.

In 1866 Mr. LOWE, who was then doing his utmost to resist the Reform Bill which afterwards carried him into office, made some remarks with regard to a part of the lower classes of the population which, taken away from the context and twisted out of their obvious meaning, were construed by Mr. BRIGHT and his friends into an insolent attack on the whole working classes of the country. What Mr. LOWE said was simply that "venality, ignorance, drunkenness, the means of intimidation, and impulsive, unreflecting, violent people" were more likely to be found at the bottom than at the top of the constituencies. The remark is a commonplace, and is confirmed by familiar experience. It is not an attack on the working classes, but a simple matter of fact, to say that people who take bribes and get drunk are to be found chiefly among the poorer classes of electors. Those who are conventionally called gentlemen have no doubt faults and vices of their own; but they are not often found staggering in the streets, and a five-pound note is not much of a temptation to them. Mr. LOWE referred to abuses notoriously existing in many constituencies, and daily being exposed before the Election Committees which were then sitting. Mr. BRIGHT, however, chose to fasten on the sentence a meaning of his own. The Reform League, which derived its inspiration from Mr. BRIGHT, loaded Mr. LOWE with the most virulent abuse, and did its best to make him an object of hatred—perhaps, as he said, a mark for the vengeance—of his fellow-countrymen. Mr. BRIGHT lent his voice to encourage this persecution. He publicly suggested that a garbled version of Mr. LOWE's words should be posted up in every workshop and factory in the country, so as to keep alive a feeling of animosity and desire for vengeance against the man to whom the words were falsely imputed; and soon after Mr. LOWE was mobbed and hooted by the adherents of the League when going to and from the House of Commons. Mr. LOWE's defence was simply the reproduction of the language he had actually used, in its complete form; but he also pointed out that he had only repeated in substance what his most bitter and malicious assailant had himself said. In 1859 Mr. BRIGHT had observed that there were "some scores in very small constituencies, some hundreds in others, a few thousand, perhaps, in the largest, of a class of which there are unfortunately too many among us—namely, the excessively poor—many of them intemperate, some of them profligate; some of them, it may be, only unfortunate, some of them naturally incapable, but all of them in a condition of dependence such as to give no reasonable expectation that they would be able to resist the many temptations which rich and unscrupulous men would offer them to give their votes in a manner not only not consistent with their own opinions and consciences, if they have any, but not consistent with the representation of the town or city in which they live." Mr. LOWE put the idea a little more tersely, but the idea is the same. In 1867 Mr. BRIGHT toned down what he had formerly said into the qualified remark that there was in all, or nearly all, the boroughs "a small class, which it

"would be much better for themselves if they were not enfranchised, because they have no independence what-ever"; and he added, "I call this class the residuum of almost hopeless poverty and dependence."

This is one side of the story; and we have just had the other side presented to us. What Mr. BRIGHT seven years ago did to Mr. LOWE, a clergyman at Manchester is alleged to have now done to Mr. BRIGHT; and Mr. BRIGHT, without inquiring whether the report sent to him is correct, lashes out upon the unfortunate gentleman in the most fearful way. He can hardly find words to express his overflowing fury, and splutters in his rage and maledictions. He seems to leap on his enemy in his wrath; and one can almost fancy him chasing the unhappy priest round the churchyard and into the pulpit, rending the gown from his back, and then trying to stuff the shreds down his throat. "The statement of this slanderous clergyman," Mr. BRIGHT writes, "is false, and if he is not a singularly ignorant person, he must know it to be false." He is "a hot partisan priest, ignorant and scurrilous," and "his congregation should pray for him." It may be thought, perhaps, that this is rather the vituperation of gentlemen of the pavement than the sort of language which might be expected from a Cabinet Minister. It is not our business to defend the clergyman, who has, however, explained that he merely quoted Mr. BRIGHT's own words. But, we would ask, what would have been said if Mr. LOWE in 1866 had written in this way of Mr. BRIGHT, and had called him a slanderous demagogue, who, unless he was a fool, must know that what he had said was false, and a "hot partisan agitator, ignorant and scurrilous," who ought to be prayed for by the chaplain of the House of Commons? Yet Mr. LOWE had certainly much more cause to complain of Mr. BRIGHT than Mr. BRIGHT has to complain of the Manchester clergyman, for the latter only made a casual remark, whereas Mr. BRIGHT pursued his victim with systematic and persistent calumny. We now know, however, Mr. BRIGHT's opinion of the kind of offence which he himself committed in 1866, and the language which, he thinks, should be applied to the offender.

It is natural that Mr. BRIGHT should resent the supposition that he has ever spoken disrespectfully of the working classes, and nobody who knew anything of his political career could for a moment imagine such an absurdity. There is undoubtedly such a residuum as he referred to, and it is a fact which cannot be ignored, but neither Mr. BRIGHT nor any one else has ever suggested that this residuum includes the general body of working-men. So far from its being true that Mr. BRIGHT has disparaged and insulted the working classes, it would be much more true to say that he has invariably flattered and courted them; and it was only natural that he should do so, inasmuch as he has always endeavoured to make use of them as the necessary leverage for his political designs. Their assistance has been indispensable to him in his attacks on other classes; and indeed his flattery of working-men has been only a part of his invective against other people. If we look back over Mr. BRIGHT's history, we shall find that his enthusiasm for the artisan and the labourer has usually been displayed on those occasions when it furnished an opportunity of vilifying and denouncing other persons towards whom he cherishes a bitter and unflinching hatred.* Mr. BRIGHT's speeches during the Corn-law struggle show that one of the great objects of the agitation in his eyes was the discomfort and humiliation of the landed interest. He afterwards exerted himself to obtain votes for the working classes, and advised the Trade Unions to use their organization for political purposes; but this was of course on the assumption that this new power was to be exercised under the direction of himself and his friends, and for such objects as they approved. It may be doubted whether Mr. BRIGHT has much sympathy with the aims for which the Trade Unionists are now employing their influence; and though he has lately encouraged the agricultural labourers to believe that they are grossly ill-used in not being put in possession of large farms and large estates which at present belong to other people, we are not aware that he has identified himself with any similar proposals for putting factory operatives into possession of their masters' mills. Mr. BRIGHT appears to be extremely sensitive lest it should be imagined that he ever spoke disrespectfully of the working classes; but the working classes are not the only people in the country who are entitled to courtesy and decent consideration. There is no reason to suppose

that Mr. BRIGHT repents the slanderous language which he has constantly employed in regard to all persons who have ever happened to differ from him. He has accused the aristocracy of rushing into war with a view to personal gain, of keeping up the army and navy as a system of out-door relief for their poor relations, of pursuing their prey "like the jackals of the desert." He has taunted successive Ministries with being influenced by a lust for the emoluments of office, and has charged Conservative lawyers, as a body, with taking a particular course "for the sake of the patronage and plunder which in India is known as loot." Only last year he came out of the sick-room to denounce the House of Lords as the last refuge of political ignorance and passion, and deliberately to renew imprecations, which might have been pardoned in the heat of the conflict, against the "wickedness" of all who thirty years ago had taken a different view from himself on a question of political economy. It is surely an equivocal love of the lower classes which invariably takes the form of hatred and slander against another class. We can only hope that Mr. BRIGHT may find a lesson for himself in his letter to the Manchester clergyman.

MR. STANSFELD ON EDUCATIONAL POLICY.

THERE is something touching in the anxiety of the advanced Liberals not to be driven to make good their threat of leaving the Government in the lurch. They have been obliged to give up Mr. FORSTER, because, whenever he opens his mouth about education, he is careful to say that he stands by the Act of 1870, and that the persons who want it altered in the sense in which the League would alter it must find another Minister to take his place in the Council Office. But though nothing can be made of Mr. FORSTER, there are Ministers not specially concerned with education who have to speak to their constituents, and who find it difficult to keep clear of a question which has bred so much discord in the Liberal party. When a man is dealing with matters lying outside his own department, he naturally speaks with less of a present sense of responsibility than when he has in view his own special contribution to the Cabinet programme. It is not so incumbent on him to leave no doubt as to his meaning, because no reasonable politician expects a declaration of policy except from the Minister within whose department the subject falls, or from the Prime Minister. The advanced Liberals have made the most of the opportunity thus given them of shutting their ears to Mr. FORSTER's declarations. When Mr. BRIGHT said that the Act of 1870 was a bad Act, the Education League was immensely comforted. It is true that he added that nothing could be done to mend it until experience had convinced the public that he had described it rightly; but in their joy over his condemnation of the measure the Education League had no thought to spare for his warning that, bad as it might be, it would have to be endured some time longer. A similar crumb of comfort was supposed to be concealed in Mr. STANSFELD's declaration that he was glad to think that the three most debated among the educational problems of the day would next Session be discussed separately, instead of being, as in former years, mixed up in a single motion. Certain Liberal journals jumped at once to the conclusion that, if these three questions were to be discussed, it must be at the instance of the Government; and that if the Government meant to legislate on them at all, it would be sure to approach them in a spirit agreeable to the views of the more Radical section of the Liberal party. Both conclusions had very much the character of pure assumptions. It was known that motions exactly similar to those to which Mr. STANSFELD was supposed to refer had already been entrusted by the League to the hands of three private members; yet it never struck the journals in question that there was anything unusual in a Cabinet Minister's mentioning, incidentally and nearly two months before the opening of Parliament, the course the Government intended to take as regards these motions. The experience of last Session might have convinced these amiable optimists that it is possible to introduce amendments into the Education Act without necessarily modifying it in any of the ways suggested by the Birmingham League. Politicians who prophesy such things on such very slight provocation have no right to complain of being misled. So long as they choose to interpret every chance Ministerial utterance by the rule of their own wishes, they will continue to make similar blunders.

Mr. STANSFELD had good reason to be pleased with the prospect of the three questions of universal compulsion, Free Schools, and the repeal of the 25th Clause being separately debated. To combine them in a single motion, or to combine any two of them in a single motion, is to throw the whole discussion into confusion. One of the most weighty arguments that can be urged against the last two proposals is that the adoption of them would throw needless difficulties in the way of the first. It is very possible, for example, that the 25th Clause might be repealed without any serious violence being done to parental consciences. The general testimony of those who know most about the subject seems to show that, as a rule, parents choose a school for their children on grounds quite unconnected with theology. They take the school which is nearest, or one which is on the same side of the street as their house, so that the children escape the risk of being run over, or one which has the reputation of bringing its scholars on fast; and, provided that one or more of those recommendations can be secured, the Denominational quality of the school is rarely taken into account. It is the Education League that insists on crediting parents with a keen sense of theological differences, as a preliminary to attributing a similar sensitiveness to ratepayers. But though on this theory the excision of the clause need involve no serious shock to the conscience of the parent, the consequences flowing from the disregard to the convenience of the parent which such a course would entail might be very disastrous. As regards elementary education, it must always be remembered that compulsion will have to be exercised by the community upon the community, and if the conditions of school attendance are made more burdensome than public opinion thinks necessary, compulsion will certainly become a dead letter. If parents who are too poor to pay for their children's schooling are not allowed to send them to a school which is near, or to a school to which there is a safe road, or to a school which is in exceptionally good repute, there will be a general tendency to admit insufficient excuses for keeping children at home. Consequently, to mix up the repeal of the 25th Clause with the universal application of compulsion was to put a couple of contradictories in a single motion. The man who is anxious to make compulsion universal may be convinced that the maintenance of the 25th Clause is the only means of attaining his object. The man who insists upon repealing the 25th Clause at all hazards may feel a burning zeal for compulsion, but it must be a zeal which is devoid of knowledge. Free schools, again, constitute a question which requires to be considered by itself. Even if the abstract argument in their favour were absolutely unassailable, it is quite possible that the advocates of universal compulsion might be opposed to their introduction until a very much later stage of educational progress. Universal compulsion implies the provision of a large amount of additional school accommodation, and if in supplying this voluntary schools had to be disregarded—which if all Board schools were free, would almost inevitably be the case—the opposition of the ratepayer to any effective extension of compulsion would be very great. The inclusion, therefore, of universal compulsion and free schools in one and the same motion would prevent any satisfactory expression of opinion on either half of the proposal.

It is not difficult to predict the fate of two out of the three educational motions which are promised for next Session. Free schools will be put aside as at the least an expedient which neither Parliament nor the country is at present prepared to try. The 25th Clause will not be repealed unless the Government has by that time discovered some compromise which will secure the substantial liberty for which the clause makes provision. The universal application of compulsion is known to have a staunch advocate in Mr. FORSTER, but it is not equally certain whether he thinks the universal creation of School Boards an indispensable adjunct to universal compulsion. There might be no great difficulty in committing the enforcement of school attendance to some existing body, such as the Guardians of the Poor or the Justices of the Peace, if it were not that the religious difficulty is certain to present itself when it is proposed to drive children into Denominational schools. If Mr. FORSTER can convince the House of Commons that the Education Department is strong enough to make the Conscience Clause everywhere a reality, it would make the passing of a scheme of compulsion, apart from School Boards, a very much easier business. If the advanced Liberals would set them-

selves to perfect the Act of 1870, instead of abandoning it, they would show that elementary education is dearer to them than a sectarian triumph. But this, unfortunately, is just what they have pledged themselves not to do. Of course they have a right to set religious equality above the spread of education if they think fit; only in that case it would be more straightforward to avow the fact, and to acknowledge that, rather than English children shall receive secular instruction in Denominational schools, they shall go without secular instruction. That is an intelligible statement, and a statement which it is as open to the extreme Secularist to make as it is to the extreme Denominationalist to say that, rather than children should receive secular instruction except in Denominational schools, they shall go without secular instruction. But the faction which commits itself to either statement has no business to profess devotion to the cause of elementary education. In this respect the extreme Denominationalists have the advantage over the extreme Secularists. Men who take their stand upon the Act of 1870, as upon a binding and permanent compromise, would not deny that they put religious considerations above the extension of elementary education. The men who refuse to accept the Act of 1870, even as a temporary compromise, equally put religious considerations above the extension of elementary education, but they have not the candour to say so.

ART AT HOME.

IF Mr. Cole seeks a monument, he has only, like Sir Christopher, to "look around." He has quitted South Kensington, but he has quitted it with the honours of war. It is because his work is done that the hero hangs up his sword, and make his bow of farewell. Thanks to the chaos of pots and pans, of artistic litter, of prettyisms and oddities, over which he brooded through so many well-paid years, England has at last become a vast knickknackery. He can pass in a round of visits from town house to country house, and still fancy himself in the Boilers of his youth. He can hardly enter a drawing-room without recognizing some favourite "department." We have had so many passes of arms with Mr. Cole in the days gone by that we are bound honestly to own that he has beaten us at last. While we were laughing and jesting, he was conquering the world. Jest, indeed, was possible while we could still jest from a cozy armchair, while our sofas were comfortable, and domestic art was strictly limited to the sphere of the area railings. But art has come and comfort has gone. The cozy armchair and the comfortable sofa have alike disappeared. Knickknackery hunts us from floor to floor, and oddity winks at us from our very paperhangings. The age of decoration is around us, and even the partner of our joys and sorrows hints with a pretty disdain that we are behind the age. She flies from our foginess to the prattle of the "aesthetic friend." The aesthetic friend is the weakest, as he is the most universal, of the apostles of Cole. Like every other great master, the Prophet of the Boilers has formed his school. Critics, Mr. Diemel tells us, are simply men who have failed in letters, and the aesthetic connoisseur who carries South Kensington into our homes is simply a failure in art. He is the painter whose daubs have been damned by the Hanging Committee; he is the architect whose plans never pass from cardboard into stone; he is the critical amateur who has tired out the world with his vamped-up judgments on Academy after Academy. Of all the triumphs of Mr. Cole, the greatest, though the least recognized, has been the success of his design for rallying these failures, and turning them into apostles of knickknackery. It was the more successful because the number of failures is always pretty considerable, and the number of apostles will always be correspondingly great.

It is hard, in fact, in these days to find a home that has not its aesthetic friend, or to enter a drawing-room without catching phrases of the euphuistic rhapsody in which he is unfolding the perfections of a tea-cup. Life, he tells an adoring group, is not action, but art; and art is the delirious contemplation of the infinitely little. What he dotes upon is the quaint and the odd. He escapes from the consciousness of commonplace which haunts him before a torso of Phidias or a fresco of Tintoret by entrenching himself in the field of the grotesque. In his heart he prefers a Joss-house to the Parthenon. If Raffaele bores him, he can die into ecstasies over a Japanese fan. To be utterly delightful, too, his delight must be a little morbid. The beauty he loves is a beauty that springs from decay—the poetry of Baudelaire, the bronzes of Pekin, the faded graces of Madame de Pompadour. In colour, as in form, he shrinks from the grand and the intense. He revels in faded tints and subtle harmonies. He piques himself on his delicate appreciation of shades and tones. He screams with a pretty feminine horror at the mention of mauve or magenta. The sky is too blue for him, and the sea is too green. He likes to modify the daylight and to tone down the obtrusive vulgarity of the sunshine. There is something delicious about the littleness of his temper; we watch him with the same amused interest with which Gulliver watched a dapper Lilliputian; but it is this

pettiness of mind which makes him the despot of our houses. Women dote on his innocent prattle, and worship him as an apostle of art. His tone, indeed, as he preaches from the hearth-rug has something of an apostolic solemnity. He is an oracle upon chimney-pieces and cashmeres. He is infallible upon lace. He decides with a religious gravity the vexed questions of the texture of stuffs and the shimmer of silks. His judgment in edgings and furbelows is without appeal. The harmony of the chimney-piece and the fire-irons rises with him into the majesty of a dogma. As M. Jourdain was delighted to find that he had talked prose all his life without knowing it, woman learns with a singular pleasure that in choosing her bonnet and changing her coat-scuttles she has been for years an unconscious votary of art. Aesthetic study has hitherto meant to her lessons in perspective, and the five quartos of *Modern Painters*; and she listens with a thrill of exquisite surprise to the apostle of Cole as he sweeps aside this drudgery, and bids her associate art with gossip and shopping. His lectures, indeed, are the prettiest small talk in the world. He is always on the track of some inlaid cabinet which the death of a certain old maid will bring into the market. He glances at the carpet to deplore the advance of civilization and its effect on the fabrics of Smyrna. The chair he sits in becomes the text of a discourse upon "Chippendales." He dangles a paper fan with an air of despondency, and deplores the arrival of English pigments in Japan. He knows little shops in by-alleys where bargains may yet be picked up by the aesthetic and devout. He knows the exact meaning of Mr. Burn Jones's last allegory. He has a great scheme for facing the house with terra-cotta, and turning every street into a gallery of "ceramic art." He tells the story of his summer's tour, of his wonderful "finds" of bric-a-brac shops in the slums of Ghent, and his wonderful "catches" of point-lace in the slums of Naples. Even in town a day with him is a feast of shopping. He disinters bits of genuine Murano glass from the dustiest corners. He lounges for an hour over the counter in Vero Street, and tosses about ribbons and shawls with a gusto which startles the pretty milliners. He is more than a match for the forgers of Wardour Street. He knows the mysteries of Christie's and shakes his head knowingly over the sale catalogue. He dips into the studio of a pre-Raphaelite friend, who but for his difficulties about drawing would be the Leonardo of his time. He selects a bonnet on definite principles, and discusses, as the morning ends, the propriety of patches and the artistic possibilities of rouge.

There is so much to amuse one in the aesthetic friend that it is not till we enter our home that we realize his power. The study is crowded with crockery. Teapots of hideous form are perched on little brackets, and corners are occupied with dishes of hideous worms and yellow crayfish which make us curse the name of Palissy. The children who run in for a romp are ordered roughly back to the nursery, lest they should smash the Sevres saucers on the chimney-piece, or bring down a cascade of Dutch platters from the wall. Mr. Morris, the most inoffensive of poets, turns into a ruthless tyrant in the drawing-room. Councils are held with the aesthetic friend over the conflicting claims of the "daisy paper" and the "sunflower paper," and the paper full of willow-branches and cockatoos. But, whichever is chosen, the old family pictures go to the garrets. The new decorative school will have no trifling with its sun-flowers and daisies. The "Old Cromo" on which we piqued ourselves is voted "heavy." Not a print breaks the delicate monotony of the latticed birdcage-paper which surrounds us. The cornice, we are told, is "a difficulty," and the difficulty ends in a bill of rather startling amount for its bedizenment. As for the carpet, "Brussels" is "impossible," and after a faint struggle we resign ourselves to the wintry pleasures of a varnished floor strewn with casual rugs and odds and ends which make a walk over it perilous for the shortsighted and unwary. It is difficult to get into the room or to get out of it for the Japanese screens. A Murano chandelier hangs from the ceiling, in which glass is tortured into a complication of bellflowers and wriggling vipers. Even dinner is made bitter to us by napkins which we are expected to admire, and "opalized" wine-glasses which are cunningly contrived to turn the golden tint of our sherry into the colour of ink; while politics are set aside as un-aesthetic, and talk is drawn to the devices which mark the plates and the antique forms of the salt-cellars. It was our special weakness, we own, to enjoy our easy chair. We dwelt with a loving interest on its low deep seat, on the perfect correspondence of its height with the serene loll of a wearied head, on the exquisite adaptation of its cushions to a wearied back. In moments of philosophic repose it seemed to us the climax of modern civilization. The woes and ignorance of an earlier world seemed directly attributable to its want of armchairs. But the armchair vanishes before the sneer of the aesthetic friend. We are invited to rest in a kitchen-chair, lofty in the leg, straight in the back, hard, narrow, wooden. We curse our fate, and are told with a smile of triumphant condescension that the kitchen-chair we despise is "a Chippendale." We fly, battered and bruised, to the sofa of older lounges, but that inartistic object has vanished with the easy chair. A "Georgian" sofa has taken its place, as lofty in the leg and as straight in the back as the Chippendale from which we fled. We humbly point out that from its wonderful shallowness the chief object of a Georgian sofa appears to be that of propelling on to the floor any one who by delicate adjustment of his frame to its structure has contrived to fall asleep on it. We are told loftily that Georgian sofas are not made for people to fall asleep on.

Neither, we find, are windows made to look out of. The vulgarity of plate-glass has vanished, and a "subdued" light, which baffles us whenever we pass from the big type of the book we are reading to the small type of the notes, falls on us from a casement of green bottle-bottoms.

But the revolution in the house is small when compared to the revolution in the family itself. In pre-Colian times rooms were adapted to the people who live in them; but the great aim of the aesthetic friend is to make people adapt themselves to their rooms. Years of costume were determined on the fatal day when the daisy wall-paper was preferred to the parrot-and-lattice paper. The very servants are expected to harmonize with the furniture, and the housemaid is warned that her aprons must be in keeping with the general tone of colour which rules in the house. Its mistress yields herself up to the current of taste, and bows humbly to the criticism of its apostle. The young country wife whose fresh cheeks and rosy mouth went so well with the frank tints and gay contrasts of her rural finery, makes her appearance in faded silks and bonnet-strings of a subdued and melancholy hue. The vulgar suggestions of her spouse are treated with disdain. "Dress is a science," says the aesthetic friend, and the dressmaker's bill soon proves that it is an experimental science. The young enthusiast explores the annals of costume. She appears in a thirteenth-century robe with its girdle halfway down her skirt, and only a stern remonstrance from the husband, driven to despair, makes her abandon the horn on her forehead which gave grace to the lady of the middle ages. The disappointment over her horn drives her for comfort to the ruff and farthingale of Mary Stuart or to the patches and languor of the days of Louis Quinze. To-day she is vibrating between the contrasted styles of the early French Revolutionists and the peasant girls of the Cambragna. To-morrow she will be driving her dressmaker to madness with demands for a Georgian sacque, or a robe à la Nell Gwynn. The children are viewed in a purely artistic light. "Boy" comes downstairs in a velvet frock and with a little round cap pinned to the side of his head, and is told he is "a perfect Edward VI." But "boy" is the least patient of artistic martyrs; he demurs to the graceful lovelock which persists in getting into his eyes, and roars till the hot velvets are stripped off him again. And yet less patient, if possible, is the master of the house. To him the whole thing is a purgatory of utter woe. He declines to change the horrid shooting-jacket whose colour throws every tint out of harmony. He hates the hard Chippendales, and kicks the Indian rugs from one end of the drawing-room to the other. He is a brutal Englishman, without the slightest artistic sympathy or aesthetic taste. He wants children to play with, and not child-dolls to dress and look at. He wants a wife, and not a milliner's block. He wants chairs he can sit in, and sofas he can lounge on. He wants, in fact, a home, and not a chaos of uncomfortable prettinesses. But just now, so far as we can see, he is likely to get little of what he wants from the apostles of Cole.

FAMILY QUARRELS.

THE approach of the season in which it is proper to dwell upon the virtues of peace and goodwill naturally recalls the pleasures of quarrelling. That subject was never, so far as we can remember, treated by the poets who used to write upon the pleasures of hope, imagination, and memory. No reasonable person indeed would deny that much pleasure may be derived from a quarrel well designed originally and skillfully worked out by judicious persons. But to say nothing of a certain suspicion of immorality which attaches to a too liberal indulgence in the practice, it must be confessed that this is one of the pleasures which have lost their poetical associations in modern times. We have become too independent of each other and too close to each other too easily in the crowd. To keep up a good quarrel at the present day is almost as difficult as to play a game of football in the Strand. The true principles of quarrelling are suggested by the old Scandinavian game where a couple of men were lashed together, each with a knife in his hand. To make a quarrel contribute permanently to the pleasure of your life, you should have your antagonist steadily and closely before you. In old days one savage tribe was in constant contact with another; the Sioux might regard themselves and the Ojibbeways as constituting the whole universe for all practical purposes, and might therefore regard the extermination of Ojibbeways as the one pursuit really worthy of masculine energy. But it would be obviously absurd for anybody to maintain that the final cause of the creation of the Browns was simply the humiliation of the Smiths. The real old feud, or vendetta, which was the sublimest development of the quarrelling principle, belongs to an earlier social stage, and has retired into a few remote corners of the earth, or into the hands of historical novelists. It was a corollary from the code of morality appropriate, as Hobbes tells us, to the state of nature, in which the cardinal virtues are force and fraud. Our modern quarrels are but vapid remains of the old exciting system; and, as compared with the genuine spirit-stirring, soul-absorbing pursuit of old, are as a modern reptile to one of the ancient megalosaurs. Still this is no reason why we should not get as much amusement as possible out of the still surviving relic. Here and there one meets in modern society persons whose apparent object it is to keep a little fire alive in the dying embers by assiduous fanning. There is a masculine and a feminine variety of

the species. The masculine quarrel-maker is generally one of those persons of whom it is proverbially said that all their fingers are thumbs. There are men in whom clumsiness, spiritual as well as physical, approaches to genius. It seems as though they must be attended by some malignant goblin with a perverse taste for practical jokes. If there is an awkward subject for conversation in any society, they are certain to bring it to the surface; like the Yankee diplomatist in *Vanity Fair*, they cross-examine the nobleman about the health of his heir who is in a lunatic asylum; or they recount the witticism which one of the guests has recently made at the expense of his next neighbour. There are persons who thus go through life, always managing to explode the mine over which their friends would otherwise pass safely by help of studied unconsciousness. And, if they happen to meet with inflammable materials, they may produce very pretty little explosions. The feminine performer is generally too acute for blundering of this kind. She gets up a quarrel from pure love of excitement. She enjoys good lively emotions, and finds society generally dull. And therefore she contrives delicately to inform one friend of the kind remarks made about him or her by another friend; and throws herself with infinite gusto into all the subsequent developments of her little drama, and delights in nothing so much as those elaborate explanations which are dreaded by all sensible people. Simple blundering and more or less intentional indiscretion are common enough, and in skilful hands may lead to a certain amount of satisfactory quarrelling. And yet, as a rule, even these explosions turn out to be little more than a flush in the pan. They generate a momentary irritation rather than a settled antipathy. Few people can manage to hate anybody very seriously, not even the reviewer who has denied that their poetry was equal to Mr. Tennyson's, or their logic as accurate as Mr. Mill's. Here and there, undoubtedly, we may find an unpopular person who explains the general dislike which he excites by the malignity of two or three more favoured persons. Conceit is still a passion which shows few signs of growing weaker; and when it is possible to maintain our good opinion of ourselves by maligning somebody who excites our jealousy, he becomes a symbol of the general inappreciativeness of the world; and we can avenge upon his reputation all that bitterness which would be too palpably absurd if vented upon the world in general. This kind of discontent, however, from the absence of any specific antagonist, more generally takes the form of a grievance; and though a quarrel or two may arise from it by good management, the more ordinary result is to produce one of those unfortunate persons who pass their lives in demonstrating, by the help of blue-books and State papers, that the next Session of Parliament should be entirely devoted to the consideration and redress of their wrongs.

Thus, as a rule, the only tie which still affords a satisfactory foundation for a good permanent quarrel capable of resisting time and separation, with vitality enough to branch out into complex ramifications and allow its origin to become traditional and its development to assume the form of duty, is the tie of family. The highest class of quarrel is of course the quarrel between man and wife. But this is something which rises above the ordinary family quarrel. It is too serious a business altogether for purely artistic treatment; and it will probably retain its present features until the complete emancipation of woman. When matrimony is fully understood to be a purely temporary contract, terminable at the will of either party, the lady and gentleman will separate whenever they please, and what is now felt to be too dangerous an amusement to be rashly admitted will perhaps become a popular occupation. There is indeed another possibility—namely, that when a wife is legally free, the natural brutality of man will assert itself in the way common, if we may trust police reports, amongst certain classes of society; and the danger of a practical declaration of independence be averted by a summary appeal to physical force. That, however, is a problem which we need not at present discuss. We need only take into account what are generally known as family quarrels, regarded as a mode of spending time and finding a relief to the commonplace proprieties of modern society. It would be difficult to give anything like a complete system of rules for this fascinating game; but we may endeavour briefly to indicate some of the most obvious sources of the pleasure which it evidently gives; from which intelligent persons may discover for themselves how in any given case the greatest amount of pleasure may be derived by good selection of the original causes of quarrel and a skilful cultivation of its subsequent developments.

In the first place, there is one obvious remark. In regard to the ordinary family quarrel, we have to ask, not the well-known detective's question, Who is she? but the other great question about all human affairs, How much is it? Every good quarrel, every quarrel, that is, which is capable of a sufficient number of different views being taken and different interests engaged, is a question about money. The ordinary discussion about settlements which takes place on the arrangement of a marriage may be regarded as a means of providing for future quarrels. A dispute about money, once dexterously set on foot, is a dispute which can never grow old. Most people have had a chance, some time or other, of making their fortune. That it has also been a chance of losing it is a consideration which they naturally do not take into account. If only they had had the funds to invest in a piece of building-land, or to buy some depreciated shares, or, possibly, to purchase a partnership or a living or a commission, they or their children might now have been, comparatively speaking, rolling in wealth. This is a reflection which is being constantly brought before us; and which need never grow cold. Whenever you

want to change your house, to take a good holiday and visit a distant country, to buy a picture or to get up a carriage, you may always reflect that, but for the perverse selfishness of some of your relations, you might now have enjoyed the desire of your heart. To have a few hundred pounds at a particular conjuncture is not simply to have so much more pleasure for the moment, but to enjoy, as Johnson so well stated it, a potentiality of growing rich beyond the dreams of avarice. What you grudge is not the mere loss of a temporary pleasure, but the loss of a seed which might have developed, and of course would have developed, into a stately tree. Here, then, is a reflection which is forced upon you incessantly by every turn in your affairs, and which, so far from losing its importance, becomes more impressive as imagination enables you to magnify its proportions. Did we not learn at school how a single penny put out at interest in the days of Adam would by this time have amounted to eight hundred balls of solid gold (we forget the precise figure) each as big as this planet? And the rate of interest which is allowed upon the wealth of the imagination bears no proportion to that which is obtainable through ordinary flesh and blood bankers. Therefore it mathematically follows that the smallest pecuniary injury inflicted upon you in your youth may have had consequences entirely beyond your powers of calculation to assign accurately. Besides, a grievance of this kind, when properly dwelt upon, has a natural tendency to become more comforting the longer it is kept. It communicates a certain pleasing sense of personal virtue. The justice of your case rests, not upon some empty fancy which may come to look differently in after life, but upon hard undeniable facts and figures. Nothing, it is clear, but the most prejudiced and selfishness could have withstood the absolute demonstration which you offered. Moreover, you were far above higgling about a dirty pecuniary question from any consideration of mere pecuniary ruin. As you clearly pointed out at the time, the real question involved was one of principle, not of pounds, shillings, and pence; and your virtue was evident, inasmuch as you were thinking of your children rather than yourself, and possibly even—so great was your generosity—of the interests of unborn generations. The wretched perversity of your adversary cannot obscure that point in the eyes of any impartial spectator. And then this admirable adherence to principle has always been accompanied by an equal display of delicacy. You have not let any outsiders into the secret; at least you have not gone further than confiding the main points of the case to two or three intimate friends upon whose discretion you could count as upon your own. You have naturally stated the case even to them as favourably as possible to the other side; and have only incidentally allowed them to divine the extreme generosity which has marked your conduct throughout. With all your impartiality, indeed, it has been impossible not to assume some dignity in hinting at transactions of which the minor details are necessarily more or less wrapped in mystery. In every kind of family inheritance—whether it be a lauded estate, or an ancestral portrait, or a quarrel—there is a certain kind of aristocratic dignity. People in an inferior rank of life settle these matters offhand with the help of a poker and a policeman. The fact that you can quarrel about money proves, at the very lowest, that you have some money to quarrel about; and the fact that the quarrel can be kept alive for years shows that you may boast of a certain family continuity, and thus that your traditions are part of the general system of things, and possibly even of the British Constitution. In former days a quarrel about precedence might be kept alive for a long time; in proportion as our aristocracy tends to become a plutocracy, such disputes become identified with pecuniary disputes, and hand over to them something of their traditional dignity. If we add that quarrels of this kind may afford infinite amusement in working out all the collateral issues which naturally arise out of every subject in which accounts are involved, we have said enough to show that, in the hands of wise men, they may be, if not a possession for ever, at least a possession to be cherished by the first owners, and delivered to their children. We need not deny that there are some incidental disadvantages; but we may safely leave them to be dealt with by the preachers who are at present engaged in discussing such topics.

THE GREAT ROMAN BASILICAS.

WE spoke a little time back of the characteristic features of the ancient basilicas, and of the type of church which grew immediately out of them; and we showed also how all the arrangements of later churches, Romanesque and Gothic, even those which have gone furthest away from the original model, were developed, step by step, out of that one primitive pattern. We then dealt with the subject generally; but the churches of the city where the basilican forms were first applied to Christian uses, that is, the basilican churches of Rome itself, may fairly call for some special notice. At Rome the name "basilica" is commonly understood as the distinguishing title of certain churches of special dignity, without regard to their architecture or arrangements. But for our purpose it may be more convenient to extend the name to some other churches of the basilican type, such as we should freely give the name to elsewhere, whether it strictly belongs to them in Roman ecclesiastical topography or not.

The higher the dignity of a church in Rome the more unlucky has been its fate. The fury with which the Popes and Popes' nephews of the last four centuries have raged against the ancient buildings of their city, heathen and Christian alike, has reached its highest point in the case of the churches with which they have had

most to do. In the smaller and more distant churches something has been spared. Some Pope or other has commonly destroyed the character of the outside; his infallible taste has also in most cases gone a long way to disfigure roofs and walls within; and a boastful inscription is sure to record the often very obscure name of the doer of the mischief. But in the smaller churches the columns and the mosaics of the apse have commonly had some mercy shown to them. Otherwise the works of early Emperors and Bishops, works some of them which Alaric had spared and Theodoric restored, have perished, or worse than perished, at the hands of some Farnese, Borghese, or Barberino, or any other of the names which a visit to Rome teaches us to loathe. At their own gates of course destruction has reached its height. In vulgar estimation, in Papal estimation, the Vatican Basilica, the church of St. Peter, has eclipsed the Mother Church of the City and of the World. The Bishops of Rome have forsaken their ancient church and home, and he who visits the beautiful cloister of St. John Lateran may there see the patriarchal chair of Western Christendom cast forth as a useless thing, while he who should fill it sulks in a distant palace, refusing to be Bishop because he can no longer be King. But precisely because the Bishops of Rome have forsaken their proper home for their own church, for that very reason the havoc at St. John Lateran is one degree less than the havoc at St. Peter's. The metropolitan church has been diligently and elaborately disfigured in detail; but it does keep something like its original shape and proportion; the apsidal mosaic and some of the smaller columns have been spared, so that there is some kind of continuity between the church of Constantine and the building which we now see. But at St. Peter's all connexion with the past is lost; the crowning-place of the Emperors has vanished to make way for a pile devoted only to the glorification of Popes. Of that pile a thousand critics have spoken, and we perceive that in the tourist mind it is received as a kind of moral duty to look on the Vatican Basilica as the noblest church in the world. We saw a small book of travels the other day in which the writer, after going through several cities of Italy, is on the point of declaring St. Vital at Ravenna to be the finest thing that he had seen on his journey. But he checks himself, and puts in a proviso that of course he only means after St. Peter's. This is not a bad case of a man's natural sense revolting against the dogmas of his guide or his guide-book. Of course St. Peter's and St. Vital have so little in common that any comparison between them would be unfair; but the same limitation would most likely have been put in as a matter of duty if the rivalry had been between St. Peter's and the basilica of the brother Apostle beyond the walls. Now, assuming the modern St. Paul as a fair representation of the pile which it succeeded, such a comparison would be by no means unfair. Let us premise that we are not going to maintain any such paradox as to deny the real majesty of the interior of St. Peter's, the great triumph, both constructive and æsthetic, of its cupola, and the external grandeur of the cupola from without, wherever it can be seen—that is, when we have got a long way off from it indeed. But we must be allowed to hold that it is no triumph of art elaborately to hide such a structure when it is once made, and we think that Brunelleschi's cupola at Florence, rising boldly in the sight of all men above its supporting apses, is as far superior to St. Peter's without as it certainly is inferior within. The west—that is, the east—front of St. Peter's really might not be the front of a church at all. It would be unfair to compare an Italian church with Peterborough or York or Abbeville; but think of Verona, Lucca, and Pisa, and see what Italian art could come to under the patronage of a Borghese. But the point on which we wish specially to insist is one which concerns the inside. Everybody who goes into St. Peter's complains that the building at first sight does not look so large as he expected to find it, or as it really is. Everybody, expert or otherwise, makes the same remark. Now the regulation answer is that it is the perfection of its proportions which makes the church look small. Such an answer is nonsense. Proportions which take off from the apparent size, and therefore from the dignity, of a building are in their own nature disproportions. It is certainly hard, on entering St. Peter's, to believe that we are in a church longer than St. Albans and higher than Amiens. The reason is that the architects of St. Albans and Amiens knew what to do with their height and their length, while the architects of St. Peter's did not know what to do with theirs. It is all the difference between the *magnifying* and the *multiplying* principle. At St. Peter's four arches of enormous height and enormous span occupy a length which in an ancient basilica would have been occupied by twenty arches. The necessary result is that, while an ancient basilica, or a Gothic church either, does full justice to its own length, St. Peter's looks a great deal shorter than it really is. So with the height; the height which a mediæval architect would have cut up into three or four stages makes at St. Peter's only one stage; therefore St. Peter's looks a great deal lower than it really is. Lofty pillars, with little or no triforium and a low clerestory, will often give a great effect of height, as at Milan Cathedral and in many of our perpendicular churches. But at St. Peter's there are no lofty pillars, only enormous piers. There is nothing to carry the eye vertically; there is nothing to carry it horizontally. Nor is there anything for the eye to rest on as the expression of mere repose, as in the Norman and German Romanesque. Again, the colossal statues help to take off from the effect of size. So does the huge baldacchino of the misplaced high altar, while the apse, so glorious at Torcello, is thrown into insignificance. The fault

is indeed not peculiar to St. Peter's or to the style in which St. Peter's is built. This fashion of getting rid of the effect of vast spaces by dividing them among too small a number of members is one which the Renaissance inherited from the pseudo-Gothic of Italy. It is exactly the same in Arnolfo's nave at Florence; it is exactly the same in most of the famous pointed churches of Italy, save at Milan, where the German architect was able to produce so much nearer an approach to the true proportion and effect of a Gothic building. In the nave of Florence the effect of a positively great height and length is wholly lost by making the nave of a few broad sprawling arches, instead of double the number of narrower ones. And the effect there is even worse than at St. Peter's, because there is nothing at St. Peter's which specially reminds us of anything better, while the pointed arches at Florence force on us the comparison with the true pointed buildings of England, Germany, and France. But both at Florence and at St. Peter's every pains has been taken to give a really vast church an appearance of far less size than it really has.

What has been done in the Vatican Basilica has been done also, though not quite in the same fulness, in the patriarchal church itself. No one would think that St. John Lateran is anything like so long as it really is. Papal barbarism has destroyed the long unbroken range of its mighty columns, and the length is further intruded on by the huge high altar and its accompaniments. The consequence is that St. John's too looks smaller than it is. Still here the lover of antiquity may comfort himself with a few things in the retrochoir and the cloister; at St. Peter's a man must go underground to see the glorious objects which adorned the ancient church, but which the destroying Pontiffs of modern times thought worthy of nothing but to be stowed away in the dark. There is the exquisite sarcophagus of Junius Bassus, one of the loveliest specimens of early Christian art; there is the one Imperial tomb which Rome still shelters, the resting-place—we fear, the riled resting-place—of the second Otto, thrust down by Papal envy from his lawful place in front of his own Imperial church; there are the tombs of a long line of Pontiffs who had a history, but who seem to be deemed less worthy of memory than their obscure successors whose names flaunt on every ugly building of modern Rome. It would seem that to no human creature is beauty or antiquity so hateful as to a Pope or a Pope's nephew.

At the same time we must make one exception in favour even of the living author of the dogma of infallibility. One is disgusted at every corner in Rome with fulsome inscriptions in honour of Pius the Ninth, in some of which, as in the case of many of his predecessors, the mind of the flatterers seems to have been slightly confused between Jupiter and the Bishop of Rome, and the simple "Pærsul" or "Papa" of earlier times grows into the somewhat heathenish-sounding title of "Pontifex Optimus Maximus." Still we must not forget that the present Pope has had a hand in the great work of the restored basilica of St. Paul. We have a vague notion that some part of its vast length has been sacrificed, that the ancient building was an arch or two longer than the present one. Still, even if this be so, the reproduction is close enough to make us understand, better than we can anywhere else, what an arcaded basilica of the first class really was, and how glorious a type of church it was that the first Christian architects wrought out of their heathen models. St. Paul's is the exact contrast to the basilica of the brother Apostle. Here too something has been done in the way of disfigurement in the shape of a modern baldacchino overtopping the ancient one; but we still have the endless rows of marble columns with their arches, four or five of them answering to a single arch of St. Peter's. What is the result? Simply that not an inch of the length is lost; the building impresses the eye with its full majesty; no one complains that St. Paul's looks so much smaller than he expected to find it. Of course St. Paul's lacks the cupola; but the cupola and the basilican nave cannot be really fused together into a harmonious whole. Pisa itself proves this; where there is the cupola at all, it should be all in all, as in the three generations of St. Sophia, St. Mark, and St. Front.

But we can best call up the effect of the old St. Peter's, the place of the crowning of Charles and Otto, by looking at another of the great Roman churches, the Liberian Basilica or *Sta. Maria Maggiore*. Here, as in the central colonnades of the old St. Peter's, we find the purely Greek construction of the column and entablature applied to the inside of a church. To a Northern eye the arrangement is strange and displeasing, and it can hardly be justified on any principle. The Greek entablature was meant simply to support its own pediment, not to carry a wall as high as the columns themselves; yet the arrangement is not without striking effects. Nowhere does the effect of mere length come out as it does in *Sta. Maria Maggiore*, in defiance of every barbarous interruption—here an intercolumniation or so blocked up to receive big images of Popes—here an arch cut through the entablature because a Pope took a fancy to disfigure the building with a gaudy chapel—here the nave defrauded of its proper proportion by the intrusive canopy of the great altar. Still the strong horizontal line asserts its supremacy and gives the building that effect of vast unbroken length which is lacking alike in the new St. Peter's and in St. John Lateran in its present disfigured state. The Liberian Basilica is in fact the truest relic of the earliest type of church to be found among the great churches of Rome. St. Peter's is gone; St. Paul's exists only in a figure; the patriarchal church has been the victim of the barbarous sport of Popes and their architects; but the greater church of St. Mary is there to show what a Christian church looked like in the days of the first triumph of the

faith. Of course we speak only of the inside. No building was ever more barbarously disfigured by Papal abominations without. In short, for four hundred years, as an all but invariable rule, where a Pope has touched, he has destroyed. Why did they not stay at Avignon, where there was less to spoil?

THE WESTMINSTER PLAY, 1873.

THE representation of the *Phormio* of Terence by a company of gentlemen and scholars upon a stage hallowed by tradition is unusually striking at a time when the revival of old comedies is much in fashion, and seems even to have some intrinsic attraction apart from the actual merit of the pieces. It is possible that the *Phormio*, if produced now as a new piece, would meet with success; it had a long run on the occasion of its first production, having been played, if tradition tells truth, no less than four times in one year. This, too, was in spite of a certain amount of opposition from those of the audience who disliked innovations, who would not hear of their old favourite Lavinius being shaken in his monopoly of the stage, and preferred his broad effects of claptrap and stage-carpenter's tricks to the wit and truth of his rival's comedies. Nowadays, the fact of a play being adapted, not original, might weigh somewhat against its chance of success if the author's obligations to his original were confessed so candidly as they are by Terence; in his times the taste for Greek art and literature was so widespread and fashionable amongst the more cultivated portion of Roman audiences, that the fact of a play being adapted from the Greek rather added to than detracted from its merits in their eyes. Perhaps if the number of theatres, players, and authors at Rome had been equal to that in London, it would in time have become as little necessary to mention that a new play was taken from the Greek as it now is to speak of the French source whence the inspiration of an original English piece has flowed. Perhaps, too, if long enough time had been given to the development of this taste for foreign literature, the Greek Theatre in Rome might have become as established an institution as are now the French Plays in London. What is tolerably certain about the *Phormio* is that it was received with much approbation in spite of the difficulties we have spoken of above and others as well, such as the counter-attraction of the gladiatorial and athletic games, to which Terence is probably referring when, in the prologue to the work we are now considering, he begs his audience to receive his play with decent silence, and not to treat him as they did on a former occasion. Hadly enough this seems to have been, for he goes on to say that they all got up and went noisily away in the middle of the performance. The play which met with this very unmistakable mark of disapproval was the *Hecyra*, afterwards restored to the stage and represented, in spite of its first failure, with success, owing to the excellent management and acting of L. Ambivius Turpio, to whom the poet makes a graceful allusion in his prologue. The same kind of thing happened to Beaumarchais' *Figaro*, of which one is reminded by a certain resemblance between the characters of Figaro and Phormio; but the final success of the play in that case was more owing to judicious curtailments and alterations by the author than to anything else.

Instances of authors being saved from condemnation by the exertions and skill of a particular actor are by no means rare; but the case of Terence and Turpio is probably the earliest on record. Even if the actor had not come to the poet's aid, it does not seem that the poet would have broken his heart about it. He could apparently afford to write up to his own taste, and the presence of a lower, yet more powerful, rival drawing his whole audience away was of less practical importance to him than it was to poor Haydon the painter, who was nearly driven mad by seeing crowds pass by the entrance to his great picture and throng to see Tom Thumb. But in the picture there is probably less to appeal to the mass than there is in the *Phormio*. The finer touches of character, the more delicate strokes of wit, even the general power of humorous perception may be passed over unseen and uncared for; but the exquisite old joke of a father, guardian, uncle as the case may be (in this case it is a father), being thoroughly duped and set at naught by his son, ward, or nephew, and his friends will always be new and always appreciated. And it will be appreciated not only by boys and youngsters, but by elderly gentlemen, uncles, and fathers themselves, whom one might expect rather to tremble lest a like thing should befall them as they look at the young scapegrace's success than to gaze with delight. Why these things are so is a problem for the moralist. It has been suggested that the evil latent in every human heart must have some vent, and that it is for this reason that benevolent old gentlemen find happiness in contemplating the rogueries of a Phormio, a Scapin, or, to take a more humble instance, a Punch; but then what a terrible reflection to think that these things may come to an end before benevolent old gentlemen do! There is this consolation that, in the *Phormio* Chremes, one of the old men who are victimised, is a very naughty old man indeed, and thoroughly deserves to be punished. He has for years been successfully deceiving his wife at Athens, who has property at Lemnos, which he goes to look after on periodical visits. But there is something besides the property which he goes to look after, nothing less than another wife, by whom he has a grown-up daughter, named Phanium. At the opening of the play Chremes is away upon one of these visits to Lemnos, which place Phanium and her nurse have unfortunately left, her mother being dead, to

look for Chremes, whom they know under the name of Stilpho, at Athens. Thus, while he is hurrying back from Lemnos after them, they are wandering friendless about the streets of Athens. What more natural under these circumstances, what more in accordance with the laws of comedy, past, present, and to come, than that they should fall in with a young man who is charmed with Phanium, who is equally charmed with him? And who out of all Athens could this young man be except Phanium's own cousin, who was always intended to marry her? The knowledge of this relationship of course comes only at the end of the play, until which time Antipho, having married her without the knowledge of his father Demipho, who has gone to Cilicia to make his fortune, is in constant dread, taking her for a penniless stranger. Meanwhile Phædrus, the son of Chremes by his Athenian wife, has fallen desperately in love with a music girl, and cannot command the money demanded for her purchase by the "leno" to whom she belongs. It is to the solution of the difficulties of the two young men, Phædrus and Antipho, and the confusion of the two fathers, Chremes and Demipho, that the energies of Phormio the parasite, and Geta the slave, are directed. Phormio is the kind of ready, impudent, good-natured busybody whose place in the drama is generally elsewhere filled by a Scapin or Sganarelle, and in the plays of Terence by a Davus or a Geta. But the character of Phormio is less of a common type than are any of these. His independent position enables him to give freer reins to the play of his ready fancy and quick energy of action. There is a mixture in him of real good-humour and desire to help those who have been uniformly kind to him, with a keenness of eye for his own advantage, and a coolness of calculation as to consequences, which is excellently conceived. His reply to Geta, for instance, is admirable. Geta, although delighted at the readiness of his plans and the courage with which he carries them out, is a little afraid of their possible results, and the following dialogue takes place between them:—

GR. O vir fortis, atque amicus. Verum hoc aspe, Phormio,
Vereor, ne istæ fortitudo in nervum erumpat denique.

PH. Ah!

Non ita est: factum est periculum: jam pedum visa est via.
Quot me cense homines jam deverbasse usque ad necem
Hospites, tum clives? quo magis novi tanto sepius.
Cedo dum, en unquam injuriarum audisti mihi scriptam dicam?

This is the very acme of cool confident audacity, and only to be paralleled by Balzac's Mercadet.

The most remarkable thing about Terence's comedy as opposed to the comedies of modern days is perhaps the almost entire absence of female interest. In the *Phormio* there are many assertions as to the charms and beauty of Phanium, which are remarkably safe from contradiction as she never appears on the stage. So that the effect of the whole might be not inaptly compared to that of a *Barbier de Séville* wherein Rosina should be much talked of, but never actually heard or seen. Yet there is a force in the humour and diction of the Latin comedy which carries on the interest from beginning to end. Perhaps the cleverest scene in the play is that which Colman has pointed out for its combined terseness and humour; the scene in which Demipho asks the advice of his friends Hegio, Cratinus, and Crito, singly and in order, as to his conduct in the emergency which at the moment perplexes him. Each of the first two gives his opinion with great gravity, each entirely disagreeing with the other. Crito, the third, wise in his generation, replies that an affair of so great importance requires further deliberation. Hegio then gravely asks Demipho, "Numquid nos vis?" and the unfortunate Demipho replies:—

Fecistis probe:
Incertior sum multo quam dudum.

It is difficult to see how the varying emotions of Phormio can have been adequately represented under the fixed mask of the Roman comedy; but to a modern actor the part affords many opportunities which were made the most of by its interpreter at Westminster. The whole performance indeed was creditable and careful, but, as its principal weight falls upon Phormio and Geta, it may be specially remarked that the representative of Geta also delivered himself with excellent emphasis and discretion, and showed that he could act when silent as well as when speaking. His unavoidable absence on the third and last night of the performance was much to be regretted. If one were to venture on a suggestion, it would be that the airs of *La Fille de Madame Angot* sound a little out of keeping with stories of Lemnos and Athens, although for all we know they may be better worth hearing than the *modi* which Flaccus arranged for the piece on its first production, when L. Postumius Albinus and L. Cornelius Merula were curule ediles.

The Prologue, as usual, touched upon the prominent topics of the day, and contained allusions to the improvements in the auditorium of the theatre. The Epilogue, unlike its predecessors, did not rely mainly on hits at the follies of the day, introducing these only casually in the course of a dialogue among a somewhat heterogeneous set of people. Terence, Comedy, Tragedy, Ajax, and Falstaff meet and hold converse, and Falstaff, on hearing "alarms and excursions" without, falls as though dead, and Comedy asserts that his dead body is that of Ajax, and calls in three "causidici" to support her assertion. The conceit is perhaps far-fetched, but it is clothed in clever elegiacs, and the whole Epilogue, which concludes with a panegyric from Terence on the reign of Queen Elizabeth, was as well received as usual.

CONVERTED WINE.

THE conversion of wine is a form of missionary enterprise which even Mr. Max Müller would scarcely connect with the science of religion. Converted wine is, it seems, a polite name for forged wine; but there are different kinds of conversion. For instance, a man named Benoni le Blanc has just been sentenced by the Recorder of London to a year's imprisonment for having converted bad champagne into champagne of good repute by simply changing the corks and the cases in which the bottles were packed, and putting forged labels on the bottles. He forged the labels, and has been very properly punished for it; but what shall be said of those who forge the wine as well as the labels? If a milkman mixes a little water with his milk, he is liable to fine or imprisonment; but the wine merchants seem to fancy that they are at liberty to sell as wine a liquid which contains hardly any wine at all, and which in some cases contains absolutely not a particle of wine. At first sight one is tempted to say that wine merchants who do such things are liable to be prosecuted and punished under the Adulteration Act; but the question is not quite so simple as it appears to be.

Messrs. Gilbey, who have undertaken the defence of the trade, have thrown down a direct challenge on this subject. In their latest circular an assurance is given that the "purity and genuineness of every article in this list is guaranteed and can be ascertained by analysis in accordance with the Adulteration Act." But, then, what is purity and genuineness? In the circular we are told that "all the undermentioned sherries are purely of Spanish growth"; but in a letter to the *Times* Messrs. Gilbey deny that such a thing as pure Spanish sherry ever comes to this country. "Sherry possessing only the natural amount of spirit produced by fermentation may," we are told, "be found in Spain," but it never reaches England, or at least is not imported by Messrs. Gilbey. Messrs. Gilbey's sherries always contain "a sufficient preserving power"—quantity not stated—and this preserving power is alcohol. We are asked to believe that alcohol is a very expensive ingredient, and adds considerably to the cost of the so-called wine. Of course Messrs. Gilbey may make a point of invariably using the very best Cognac brandy for the fortification of even their pale sherry (three years old) at 1s. 6d. a bottle. It is known, however, that cheap sherries are occasionally fortified with alcohol which is distilled from potatoes, beetroot, maize, and other substances, and has no sort of connexion with the grape. This alcohol is a very cheap article, and it is simply because it is cheaper than real wine that it is so largely used. Messrs. Gilbey supply another kind of sherry at 1s. 3d. a bottle, which they honestly enough call "Castle Hambro' Sherry." "Hambro'," they mention for the information of their customers, "is not a place of production, but from its being a free port has more facilities than any other place for collecting, manipulating, and preserving the cheaper wines of many other countries." We do not happen to know anything about this particular Castle Hambro' Sherry—indeed we need hardly say that we are discussing only Messrs. Gilbey's arguments, and not their wines—but we are aware, in common with the rest of the world, that Hambro' Sherry generally has a very notorious reputation. We find the following analysis of a sample of it in a number of Mr. Ridley's *Wine Trade Circular*:—40 gallons of fine potato spirit, at 1s. 4d. per gallon on the spot; 56 gallons of pure Elbe water, cost nil; 4 gallons of capillaire, 12s.; 10 gallons, to be liberal, of luscious wine or grape juice, 2l.; charges for cask, work, labour, shipping, &c., bring the total cost up to 7l. 2s. The mixture was shipped as Elbe or Hambro' Sherry, at 7l. 15s.; and it is stated that a bottle of this stimulating beverage was found to contain 38 per cent. of proof-spirit. We are not suggesting that all sherry, or even all Hambro' Sherry, is as bad as this. All we wish to point out is that, if a dealer were to be prosecuted for selling this concoction, he would no doubt be able to prove that in the trade there is really no standard of purity and genuineness, that all sherry is more or less "manipulated," and that a great deal of liquor passes current as wine which is nearly, if not quite, as artificial as the Hambro' brew. A wine with 40 per cent. of alcohol in it is certainly not pure and genuine wine in the proper sense of those words, but then there is a technical sense in which the words may be applied to almost any mixture. Messrs. Gilbey, who go to Hambro' for sherry, also go to France for port; but it would be interesting to know what relation "French port," or Roussillon (1s. 4d. a bottle), bears to the genuine juice of the grape. M. Guyot says he has seen under his own eyes, and under the inspection of the Custom-House officers, 15 per cent. of maize spirit added to each cask of Roussillon. "It is true," he adds, "it was for exportation"; and there can be no doubt that a considerable quantity of this doctored liquor comes over here, and some of it is sold as real port. Of course we do not mean to say that Messrs. Gilbey's Roussillon is of this quality; but only that, if it were, it might still be contended, from the trade point of view, that it was a pure and genuine wine, because these words have come to be used in quite a non-natural sense.

In regard to sherry generally there are one or two facts which appear to be beyond dispute. In the first place, there is such a thing as pure natural sherry, or at least it has been known in other days, if it has now ceased to exist. By pure natural sherry is meant the juice of the grape, fortified only by the alcohol produced by fermentation. We have the high authority of Dr. Gorman for saying that, if the fermentation of wine is perfect, it produces sufficient alcohol to preserve the wine for a century in any country.

"Sherry," says Mr. Ford, "is a purely artificial wine, and when perfect is made up from many different butts; the 'Entire' is in truth the result of Xeres grapes, but of many sorts and varieties of flavour." The artificial character of the wine here referred to relates, of course, only to the mixing of different qualities of genuine wine; but in the modern process of manufacture the problem seems to be how to dispense with the pure juice of the grape as much as possible. First of all the grapes are plastered over with sulphate of lime, which removes the tartaric and malic acids, and substitutes sulphuric acid; and a further dose of vitriol is added by each butt being impregnated with the fumes of burning sulphur. Next, in addition to various ingredients which are intended to impart colour and flavour, the wine is fortified by the addition of spirit sufficient to raise the alcoholic strength of the liquid to 35 or 50 per cent. of proof-spirit. The ordinary sherry of commerce is, therefore, a mixture of alcohol, vitriol, and grape juice; but a great deal of it contains no grape juice at all, its place being taken by sugared water with a little flavouring. It is very hard to say what is genuine or pure about a concoction of this kind. It is assuredly not wine, in the proper sense of the word, because vinous ether is an important characteristic of wine; and, instead of ether, this manufactured sherry contains only a fiery and corrosive spirit. The wine merchants have been driven to admit that sherry is not, properly speaking, wine; they now call it a cordial or a stimulant, and plead that it is wine only in a technical and commercial sense. But this is exactly the argument of the milk-sellers, coffee-dealers, mustard manufacturers, and other traders; and the magistrates have refused to listen to it. It has been decided that milk and water is not pure milk, that coffee and chicory is not pure coffee, that pure mustard does not mean mustard, flour, and turmeric, and that alum is not a proper ingredient in bread. Why then should sherry wine, which contains scarcely any wine, but a great deal of alcohol and vitriol, be considered to be "pure and genuine" sherry? There is no reason why the wine merchants should not be allowed to sell this mixture, detestable as it is, if people with their eyes open are mad enough to go on buying and drinking it; but it is difficult to see why they should be entitled to sell it as wine without any warning that it is, in point of fact, not wine, but a strong spirit adulterated with sulphuric acid. It may perhaps be difficult to define exactly in all cases what is to be considered wine and what spirits; but there is a broad distinction between the two kinds of liquor which everybody understands. It is not immaterial to a man whether he drinks a glass of alcohol or a glass of wine; the effect on his nerves, on his stomach, and on his constitution generally is very different in the one case from what it is in the other. It does not seem fair, therefore, that when a man asks for a glass of sherry, a wine merchant or publican should be allowed with perfect impunity to serve him with a poisonous mixture of potato or beetroot brandy and oil of vitriol.

Wine merchants who wish to deal fairly with their customers should furnish an analysis of their wines by which they may be known and tested. There would then be some hold on the dealer. If he gave out that there was only so much per cent. of alcohol in his wine, that the alcohol was genuine grape brandy, and that the rest of the liquor was real wine; and if it were shown that this was not a fair description of the liquor, he could be punished for the fraud under the Adulteration Act. At present, whatever may be proved to be the character and composition of the liquor, the dealer can always turn round and say, "This is not perhaps what you call wine, but it is what we choose to call wine; it is the wine of commerce." A grocer who wishes to mix chicory with his coffee, or flour with his cocoa, can do so safely only by proclaiming frankly on the label what is the nature of the article; and there is no reason, as far as we can see, why a similar rule should not be applied to wine merchants. The principle of the Adulteration Act is that manufacturers and traders may adulterate if they choose, if they take care to let it be known that their goods are adulterated; and as wine merchants have twisted the nomenclature of wine altogether out of its original meaning, they might reasonably be required to give some idea of the nature of the liquors which they sell under arbitrary and unmeaning names. There is, however, another way in which the excessive adulteration of wines might be effectually checked. It is a fraud not only on the public, but on the revenue. Natural wine, which is supposed to contain not more than 26 per cent. of proof-spirit, pays 1s. a gallon duty; artificial wine, with from 26 to 42 per cent. of proof-spirit, pays 2s. 6d. a gallon; while spirits of proof strength have to pay 10s. a gallon. It is obvious, therefore, that the manufacture of highly alcoholized wines is really a form of smuggling. It is a mode of importing spirit under the disguise of wine, and at the lower duty; and this wine is, in point of fact, largely used instead of spirit for various purposes. The way to prevent this is simply for the Chancellor of the Exchequer to revise the duties, so that in the case of all wines over the natural standard of alcohol, spirit shall be charged as spirit. No plea can be advanced on behalf of the traders who would suffer from this measure. The production and sale of doctored and diluted spirits in the name of wine is in every way noxious and disgraceful. It is smuggling, cheating, and poisoning combined, and nothing better could befall the country than that it should be placed under the same restrictions as the sale of honest alcohol in its various forms. The wine growers too will perhaps some day begin to see that hitherto they have to their own ruin, been playing into the hands of the merchants. The object of the latter is to cheapen wines of an artificial character.

recter, because they are more easily manipulated and imitated; the more the juice of the grape is mixed and doctored, the less important it becomes as an ingredient; and indeed we now find that grapes are beginning to be regarded as an exploded superstition, and that sugar infusions and alcoholic mixtures are taking their place. The manufacture of sham wines has now reached a point at which the owners of vineyards may be expected to perceive that it is not exactly for their interest that the use of grapes should be entirely superseded.

SUNDAY FUNERALS.

A QUESTION has been suggested as to the right to be buried on Sunday. It is the most convenient day for numerous classes of the population to attend funerals; and, on the other hand, residents on roads leading to cemeteries are likely to regard Sunday funerals as a nuisance. It appears that the Commissioners of Sewers, who are the Burial Board for parishes within the City, have been taking advice on the question whether parishioners have a right to be buried on Sunday, and counsel "inclines to think" they have. The question has never been judicially determined; but a custom of burying on Sundays has generally prevailed, and the right appears to be recognized by a Canon of 1604, which proceeds on the assumption that the parishioners, and not the person, choose the day for the funeral, and give notice of it. "No minister shall refuse or delay to bury any corpse that is brought to the churchyard, convenient warning being given him thereof beforehand." It has been judicially declared that this warning must be convenient in reference to the time, distance, and various vocations of the clergyman, for that which might be a convenient warning in one case or in one parish might not be so in another. The word "thereof" must be taken to refer not to the fact of the corpse having been brought to the churchyard, but to the intention to bring the corpse, and the word "before" must be understood "before the corpse is brought." The canon being penal, a person proceeding under it against a clergyman would be required to show that everything therein mentioned had been strictly complied with; and it may be inferred from a reported case that a "convenient warning" must be such as would enable a clergyman to make his arrangements and prepare himself for his duty in meeting the corpse at the proper time and place, as well as to afford time for preparing the grave, or whatever else might be requisite. It must be remembered that the common law, as generally understood, cast the duty of providing burial upon the person under whose roof the death took place. Such person "was bound to carry the body, decently covered, to the place of burial," and it would seem that he ought to be allowed to perform this unpleasant duty with all convenient speed. In many cases prompt burial would be necessary, particularly as the person who would be bound to bury would apparently not be bound to provide a coffin. In time of pestilence even a day's delay of burial of the dead might be fatal to the living; and many stories attest the popular belief that sufferers from cholera and other epidemics have, under pressure of supposed necessity for prompt interment, been buried even before they were dead. These considerations make it probable that burial on Sundays would be held to be a common law right, and, if so, it may be doubted whether a Burial Board or Secretary of State could make a regulation closing a cemetery on Sundays. It would probably be held by the Court of Queen's Bench that such a regulation was in effect a prohibition, and therefore unauthorized by the statute under which it would purport to be made.

It is difficult to question the soundness of this opinion; and therefore, unless the Legislature interferes, the "scenes of drinking and riot" which are complained of at Sunday funerals must continue. It is doubtful also whether the Legislature would interfere to deprive the poor man of the opportunity of enjoying himself at a friend's funeral. It may be readily believed that Sunday funerals are as annoying to quiet people who happen to live near cemeteries as Sunday bands were to the dwellers near Hyde Park. A funeral party arriving at the City Cemetery at Ilford would be entitled to the privileges of *bona fide* travellers, and would not be likely to leave their privileges unimproved. But nevertheless a regulation prohibiting Sunday funerals could hardly be considered as made for the "maintenance of public decency" under the Act. Counsel remarked in his opinion that the indecency complained of would still prevail on week days; but this perhaps is hardly an answer to those who regard it as particularly indecent on Sundays. Of course fewer people would come on week days, because many could not leave their work, and therefore fewer people would get drunk; but then it would be said that funerals should be held on Sundays for the very purpose that people may come. It would be interesting to know something of the reasons which induced the Commissioners of Sewers to seek advice upon this question. To stop Sunday funerals because they are sometimes disorderly is in harmony with the ideas of a busy party which is always seeking to retrench the use of whatever is liable to abuse. But it may perhaps be desirable that a large number of persons should attend funerals, even at the risk of some of them being more than is good for them to drink. A funeral is usually a religious assembly, and those who value religion should do their utmost to bring the population into contact with it. Lawyers always hesitate to give an opinion without authority to rest upon, but it is easy to understand that there is almost nothing in law books to help towards a decision of this question of

Sunday funerals. For many centuries probably the question could not have appeared doubtful. The saying that "The better the day the better the deed" would have been held a sufficient answer to it. If quarter-day falls on Sunday, a tenant's duty is to pay his rent, and if he does not pay it, the landlord may detain on Monday morning. The ancient law was thus, and Sabbatarianism has not changed it.

In a case where an action was brought against an incumbent for refusing to solemnize a marriage, the Court seems to have thought that it was essential to the plaintiff's case to show that the defendant, at the time of the request made to him, was able to perform the ceremony and not engaged in the performance of any other duty. The action was brought by the man, and the woman had died after the refusal. If she had a fortune, this circumstance of her speedy death might perhaps have afforded ground for claiming what lawyers call "special damage" in the action. Formerly one might be married anywhere, but by an Act of George II. parties are confined to the church of the parish where one of them has resided for a certain time; and as an incumbent of a church might prevent any other clergyman from performing the marriage service in his church, it may perhaps be said that the duty to solemnize marriage is now cast on him. But the duty would be to marry on request, and the Court considered that, in the case before it, request was insufficiently alleged. "One party might wish to be married, the other not: the request must be by both." It was doubted whether the duty arose upon notice of the licence being given to the clergyman. He might be engaged in some previous duty before he had knowledge of the licence, and that would surely constitute a good defence. It could not be said that under all circumstances he was bound to address himself to the particular occupation of marrying these parties as soon as the licence was notified to him. It was assumed in the argument on this case that it is not optional whether or not a clergyman will bury; but all that the Court said as to notice and occupation in other duties would appear applicable to the case of burial. It was contended that an action would lie for refusing to administer the Sacrament; but that is doubtful. No action lies for refusing to celebrate Divine Service, because "there is no individual wrong."

The statutes forbidding certain things to be done on Sundays are evidence that under the common law these things were permitted. Thus a statute of Henry VI. enacts that all fairs and markets held on Sundays should cease, except on the four Sundays in harvest. A statute of Edward VI. enacts that Christmas Day, Good Friday, and all Sundays, shall be kept as holydays, but in harvest or any other time when necessity shall require, any kind of work may be done upon those days. It was declared by James I. that dancing, archery, &c. were lawful, and no such honest mirth should be forbidden on Sundays after service. The King says, and his words would be true now, that the prohibition of these games led to filthy tippling and lowliness. The practice of archery on holydays was enjoined by various statutes. But the influence of the Puritans now began to prevail, and under Charles II. a statute was passed which prohibits tradesmen and artificers from working at their ordinary callings, and which also prohibits the sale and hawking of wares and goods. This brief summary will suffice to show that the duty, if it existed at common law, to bury on Sunday, has not been affected by legislation.

The custom of feasting at funerals has always prevailed in England, and as Sunday is a convenient day for an excursion to a cemetery, so it is a usual day for a good dinner and plenty of drink. The reeve of the manor of Hinton spent, between the death of Lord Berkeley and his interment, seven bushels and three-quarters of beans in fattening one hundred geese for his funeral feast. It appears probable that this entertainment was postponed until the geese were fat; and perhaps a mediæval noble, at once hospitable and thrifty, might have endeavoured to die just when his larder was well stocked. In *Middlemarch* the duty is inculcated of keeping a good table during a mortal sickness of the house-master, and of course that duty would become even more peremptory after his death. It is said, in reference to those who attended the funeral of King Richard II., *non erat qui eos invitaret ad prandium post laborem*. The same may probably be said of many Sunday visitors to Ilford, but then they invite themselves. It is fortunate that the right of reading or saying any so-called religious service in churchyards has not yet been conceded; for, if it had, we should fear that between fanatics and rowdies the condition of that cemetery and the approaches to it might become intolerable. In the cemetery itself, order, or some approach to it, might be maintained by a sufficient force of constables, but sponters and their attendant crowds would be a grievous nuisance to the neighbourhood. We can hardly doubt, however, that Sunday funerals must be permitted, at least until Parliament gives power to interfere with them, and Parliament will be shy of doing that, however respectability and Sabbatarianism may combine to press it. The poor man's friends, or those who call themselves so, are certain to complain that one of his few pleasures, a Sunday funeral, has been taken away from him for the convenience of wealthy dwellers in suburban villas.

THE THEATRES.

OUR theatres are most amusing when they borrow most largely from the French. The "eccentricity" in three acts, called a *Wedding March*, which now delights full houses at the Court

Theatre, is an old and valued friend, *Chapeau de paille d'Italie*, altered to the modern fashion and trimmed with English flowers. It is, when well acted, irresistible, and no better example could be found of skill in constructing a play of sustained interest out of trivial and grotesque incidents. It is in length a comedy, and in nature an extravagant farce. The bridegroom hurrying over London in quest of a straw hat of particular make and trimming, while the wedding party in eight cabs follow fast upon his flying traces, and appear shortly after him in every scene, presents a sort of parody of *Orestes* pursued by the Furies. The bridegroom, taking a ride in Hyde Park in the early morning, became separated from his horse, which availed itself of its liberty to devour part of a straw hat which it found hanging on a bush. The hat belonged to Mrs. Major-General Bunthunder, who, having quitted the house of her distinguished and irascible husband for the ostensible purpose of buying a pound and a half of Barcelona nuts, avails herself of the opportunity to meet in the Park a young and dashing officer of the Guards. Having for the more complete enjoyment of his society taken off her hat and hung it on a bush, it is partly eaten by Mr. Woodpecker Tapping's horse, and of course if the lady goes home without it, her husband will be likely to ask more questions than she can conveniently answer. Her admirer, being in honour bound to see her relieved from the embarrassment which he has caused, assists her in tracing Mr. Woodpecker Tapping to his house, and requires with portentous threats that that gentleman, laying all other business aside, and ceasing every excuse, shall procure a hat like that which has been destroyed, and shall allow the lady and her lover the shelter of his house while he makes the necessary search among the bonnet shops of the West End. He is expecting at that moment the arrival of his bride and her friends, who are to call for him on the way to church; and indeed he has hardly time to conceal Mrs. Major-General Bunthunder and Captain Bapp in two closets when the wedding party enter in grand procession, and inform him that eight cabs are waiting at the door. The bride's uncle Bopaddy, who possesses the inestimable advantage for stage purposes of being impenetrably deaf, had arrived beforehand, and is helping himself to sherry at the sideboard in the dining-room. The bridegroom, driven almost to despair, pretends that he has lost the licence, and takes the whole party to the door of a fashionable milliner, which, as they come from the country, they are easily persuaded is the entrance to Doctors' Commons. The poor young man fancies that one bonnet is very like another, and that he shall obtain without difficulty what he requires; but, after surmounting a fresh complication arising from the fact that the mistress of the shop recognizes in him a faithless lover, he learns the appalling fact that there was only one of those particular hats in stock, and it had been lately sold to the Marchioness of Market Harborough. While this explanation is taking place in a side room, the wedding party, growing impatient, leave the eight cabs at the door and come upstairs. The milliner's book-keeper arrives at the same moment wet through, and wishes to change his clothes before beginning the business of the day. This he attempts to do behind his desk, while the wedding party, supposing him to be the Registrar, approach with profound bows and request him to inscribe their names and addresses *seriatim* in a book which lies upon the desk. The poor man, bewildered and shivering with cold, at last gathers his clothes as well as he can about his person, and makes a bolt of it, while the entire wedding party rush off in frantic pursuit of the supposed Registrar, whose assistance they deem indispensable to the solemnization of the marriage. The bridegroom takes advantage of their starting on a false scent to depart as quietly as he can for the mansion of the Marchioness, who is about to give a morning concert. The Duke of Turniptopshire, one of the guests, has already arrived in full dress, and wearing his ribbon and garter, and has just helped himself to a penny tart from the luncheon-table in an adjoining room. The consumption of this delicacy is interrupted by the arrival of the unlucky bridegroom, whom the Duke mistakes for a famous Italian singer, while he mistakes the Duke for a particularly swell footman. The Italian, having been asked by the Marchioness to sing two songs for 3,000 guineas, gallantly answered that he would sing three for a flower from her ladyship's bouquet. The bridegroom adroitly avails himself of his supposed character to say that what he really wants to make him sing his best is a hat of charming design lately sent from a particular shop. The Marchioness is all smiles and compliance; she brings him a hat in a box, but unfortunately it is not the hat he wants, and she at the same time begs him to favour the company with a song. She tells him that the hat he wants has been given to her friend Mrs. Major-General Bunthunder, and at the moment of his disappointment and confusion the wedding-party, who have made their way into the house and devoured all the luncheon, come upon the stage in a delightful state of elevation from champagne; and a wild dance of all the characters succeeds, in which the Duke, taking for his partner one of the bridesmaids, performs with surprising vigour. We learn afterwards that the bride's father mistook the mansion of the Marchioness for St. James's Hall, and is going to write to the *Times* to complain of the treatment he and his party received in being turned summarily into the street.

The bridegroom, still goaded onward by inexorable necessity, now arrives at the house of Major-General Bunthunder, who has been expecting from ten o'clock in the morning to half-past five in the afternoon the return of his wife from her purchase of a pound and a half of Barcelona nuts. The Major-General, suffering from

headache, is taking a footbath. He is sitting clothed as to his upper part in the fullest possible uniform, with a screen drawn partly round him, and a blanket covering the bath in which he has placed his feet. The bridegroom arrives, and after adding some more hot water to the bath, and shutting up the Major-General in the screen, he proceeds to search the house for the much-desired hat, which however he cannot find, for the simple reason that Mrs. Major-General Bunthunder is the strange lady whom he has left at his own house, and there was only one hat in all London of this pattern—namely, that which was devoured by his horse. The bridal party arrive at the Major-General's house just as the bridegroom quits it in despair, and they think that this is the bride's future home, where they may make themselves as comfortable as circumstances admit. The bride's father and the General exchange boots, and when the General starts in pursuit of the bridegroom, whom he supposes to be a burglar, his pace is happily checked by a misfit. Ultimately all the characters are assembled in the street between the bridegroom's house and a police-station. Exhausted with the fatigue of a long day's chase after the bridegroom, and denied admittance to his house, they sit down on the muddy steps until a member of the force appears and proceeds to run them all in. Recent events cause this part of the performance to be received with immense applause. The bridegroom becomes aware that the lady shut up in his house is the wife of the angry General, whom he has only just distanced in the race. The only resource is to get her to come out of his house and be shut up in the station. He drops a coin into the hand of a policeman, and charges the lady with being drunk and disorderly. The policeman exclaims, "I know yer; come along," and drags her off. Finally it appears that among the bridal presents is a hat of the exact pattern of that which the horse devoured, and as the lady appears wearing this hat, and declares that she never set eyes upon the bridegroom before, her irascible husband is pacified, and merely remarks that after all she has forgotten to buy the Barcelona nuts.

This "eccentricity" is preceded by a "comedy-drama," in three acts, called *Alone*, of which the basis of the plot is derived from an old French story. It is odd that the playbill which contains this acknowledgment does not refer to the French origin, which, however, is tolerably notorious, of the *Wedding March*. The "comedy-drama" is well written and well acted, and the Court Theatre seems likely to maintain the prosperity which the celebrated trio of the *Happy Land* created. It is remarkable that at the Olympic Theatre at this moment Mr. Gladstone's features are imitated in the burlesque of *Richelieu Redressed*, and it is even mentioned that the Prime Minister has written an article in a periodical bearing the familiar brown cover of *Good Words*. This burlesque is preceded by a new English version of the *Marriage de Figaro*, which is sufficiently well acted to make a very amusing piece. It is shortened to three acts, and much that made the original famous disappears, but still the situations remain as diverting and bewildering as ever. Noting the bills of the different theatres, a critic would be hard to please if he did not admit that the popular taste must be at least healthy when so many standard dramas are nightly presented with general efficiency, and some conspicuous talent. Even the burlesques have at least improved in this, that they no longer depend exclusively on classical legends for their subjects. The performance of the *Hypocrite* at the Gaiety Theatre, with Mr. Phelps and Mr. Toole in the leading parts, has been received with deserved applause. This is, we believe, the first appearance of Mr. Phelps in London for nearly a year, and his return is welcome. The success of this play is surprising when we observe that the same audience is capable of enduring an after-piece entitled *Seeing Toole*, which is, if possible, more inane than an average burlesque. The fashion for reviving comedies might be usefully extended to farces, of which dramatic literature contains an ample stock. A good old farce is certainly better than a weak new one; and even Mr. Toole cannot impart drollery to the act of asking for a programme.

REVIEWS.

BIRKS ON MORAL PHILOSOPHY.*

THIS volume is offered as "a small sheaf of first fruits" by the Professor whom the authorities of Cambridge competent in that behalf have chosen to set in the seat of John Grote and Maurice. As such it seems fitting that it should not pass unnoticed. Had it been a mere private lucubration, we should have been content to leave it in peace as the fancy of a well-meaning Evangelical preacher who had mistaken his vocation. If a clergyman holding no official position beyond that of a minister of the Church of England thinks fit to write a series of rambling sermons and call them moral science, it may add no particular lustre to himself or to the Church, but it calls for no public remonstrance. But the case is different when a clergyman who has been expressly appointed to expound moral philosophy as a science makes so little effort to discriminate between his two characters of pastor and professor as wholly to ignore the most elementary conditions of scientific treatment. This is what Mr. Birks has done; the result is that no one of his discourses is

* *First Principles of Moral Science.* A Course of Lectures delivered in the University of Cambridge. By Thomas Rawson Birks, Knighthbridge Professor of Moral Philosophy. London: Macmillan & Co. 1873.

satisfactory as a lecture, and we can at best only conjecture that in a more congenial place the materials might have been worked into respectable sermons. "This is the more to be lamented as a clear and vigorous re-statement of the ethical theories favoured by Mr. Birks is at present really much wanted. The old weapons of intuitive morality have never been properly re-fashioned to suit the exigencies of modern warfare. The developed utilitarian ethics of J. S. Mill are very different from the narrower, though perhaps more logical, system of Bentham. Mr. Bain and others have sought to strengthen their position by establishing connexions with admitted conclusions of physical science. Mr. Herbert Spencer and Mr. Darwin, by taking into account the accumulated experience inherited from ancestors, as well as the actual experience of the individual, have put the experiential theory of morals on an entirely new footing. Nothing like an organized defence has been made against these advances. The writings of the late Professor Grote, who excelled almost all his contemporaries in true speculative insight, are indeed full of valuable criticism and suggestion; but their want of form and finish prevents them from being known as they deserve to be. Mr. Lecky made some telling points in the introduction to his *History of European Morals*, but he neither worked these out sufficiently nor set up any counter case of his own; and there have been also review articles and other fugitive pieces by various hands, sometimes of considerable ability. But nothing has been undertaken on the proper scale or on a settled plan. Mr. Birks obviously has the success of intuitive morality very much at heart, and his appointment to this professorship gave him a splendid opportunity of doing service to his cause, which, as far as we can judge from his first course of lectures, he is doing his best to throw away.

The manner in which Professor Birks introduces his subject is in itself a little singular. A teacher appointed by a great University to expound an important branch of philosophy whose very foundation is still matter of active controversy might be expected to reconsider with some anxiety the thoughts he is about to publish, or at least to make sure that his controversial equipment is not obsolete. But the writer of these lectures enters on his campaign as light-hearted as any general of the Second Empire. Desiring to give "a pledge that the views held in the present volume, and others which may follow, are no hasty product of recent study," he prints as an appendix an undergraduate prize essay just forty years old, in which he apparently finds at this day nothing to alter. A man who takes pride in having learnt nothing in forty years raises at the outset some suspicion of his capacity as a teacher.

It is true that this volume is announced as handling preliminary topics, and that the criticism of opposing theories is expressly reserved for another season; and we cannot say it is impossible that Professor Birks should turn out to be stronger in detailed criticism than in general exposition. But a work put forth by instalments must be judged by instalments; and of this preliminary exposition we are forced to say that we fail to extract from it any distinct ideas whatever, we do not say of moral science, but even of Mr. Birks's opinions on moral science. All we can make out is that he holds some sort of intuitive theory of ethics, considers it absolutely essential to the welfare of mankind, claims for the science of morals, without ever telling us what it is or showing us what it can do, a pre-eminent rank and dignity, and assumes accordingly a large jurisdiction to warn off as a trespasser any other science or scientific way of thinking whose conclusions are inconvenient to him.

Thus we have a chapter on the relation of Political Economy to Morals, wherein Mr. Birks sets forth passages from leading economists who expressly warn their readers against misapprehending the object of their science, and then proceeds to repeat all the vulgar misapprehensions, crying out against the "cold hard iron selfishness of trade," and declaring that economical science must be moralized. By this last phrase he appears to mean that political economists, having told their readers how wealth is produced and distributed, should not be content to leave them to their own judgment on the further questions how far wealth is a good thing in a moral point of view, and what is the right way to use it, but should distinctly advise them to go to the Professor of Moral Philosophy for the higher instruction without which all knowledge already acquired is rather worse than useless. The like complaint might be made with equal reason of every other science; but as to political economy the fallacy seems inveterate. Mr. Birks vituperates that unhappy science almost in the same breath for ignoring morality and for meddling with moral questions which are above it. It really does neither. The fundamental assumptions are not that material prosperity is everything, and that selfish motives are the only motives in human affairs. They go no further than this—that material prosperity is of sufficient importance to make the scientific investigation of it worth undertaking, and that the motives known as selfish are in fact the prevailing motives in the sort of transactions on which material prosperity depends. All the questions proposed are questions of finding what are the proper means for attaining certain ends; there is no economical measure for the worth of those ends in themselves. Philosophy is in some senses better than wealth; but the labour of a Professor of Moral Philosophy, whether he lectures well or ill, cannot be called productive in the sense of political economy. If he lectures about things he does not understand, it may be impossible to call his labour productive in any sense; but political economy has nothing to do with that.

Professor Birks shows his appreciation of another kind of science

by denouncing the "purely literary and curious treatment" of moral and religious opinions—meaning, as appears by the context, orderly historical treatment—as "one of the most worthless and mischievous of occupations." He proceeds to announce that his own aim will be the exact reverse—namely, "to unfold on this subject some definite principles which may serve as waymarks to earnest minds." He has certainly succeeded in making his own method the exact reverse of what scientific method ought to be, but those who can find any definite principles will be more fortunate than ourselves. We ask for the bread of reason, and we do not get even the stone of dogma, but only a heap of sand. There is one science, however, to which Professor Birks is respectful enough, being himself a mathematician of some standing. His use of mathematical similes is so frequent as to be tiresome, and he relies, as many before him have done, on the analogy of mathematical axioms to support the universal and necessary character of the moral axioms which he will at some uncertain day enunciate. Now it is perfectly true that the universality and necessity assumed to belong to the propositions of pure mathematics have furnished the strongest arguments in favour of a knowledge independent of experience, and have been the most dangerous stumbling-block in all systems, whether of logic, metaphysics, or morals, which have denied any such knowledge. But the peculiar quality of mathematical truth is itself no longer undisputed. Several eminent mathematicians now hold the opinion, formed on mathematical grounds, that we cannot affirm the axioms of our geometry to be absolutely true. Indeed it has been shown to be possible to construct a consistent geometry with other axioms. Mr. Birks as a mathematician is probably aware of this, but as an intuitive moralist he takes no notice of it. As he seems to think it had enough already that undergraduates should ever hear of the perverse people who have cast doubt on "eternal and immutable morality," perhaps he also feels bound not to shock their tender consciences with the desecration of eternal and immutable geometry. It seems worth while to observe that the late Professor Grote (*Examination of Utilitarian Philosophy*, p. 298) distinctly repudiated the notion of making ethics "an exact quasi-mathematical science."

As for philosophical criticism, there is a chapter on "The Doctrine of Utility" in which the crudest misunderstanding of utilitarianism is expressed in confused and involved paragraphs, of which we give a specimen for the reader to disentangle if he can:—

There is a further disproof of the doctrine that a calculation of consequences is the only source of morals, from reflection upon the nature of the calculation itself. It is a moral act, and subject to moral laws. The power to foresee consequences, to remember the results of past experience, to compare and analyse the causes of events, and to trace the probable effects of a particular course on the minds and feelings of others, is a high and noble faculty. Man did not create it for himself, it is the gift of God. If actions themselves need moral rules to be calculated for them, how much more the faculty by which these calculations are to be made! But who can learn, by calculating alone, the methods and principles on which all right calculation must depend? *Quis custodiet ipsos custodes?* Surely the gift is one of which the exercise needs some guidance, since on its right or wrong performance, by the hypothesis, a life of vice or virtue, of wisdom or guilt and fully, must naturally ensue.

"The doctrine that a calculation of consequences is the only source of morals" would certainly astonish any utilitarian we ever heard of. But, letting the language pass, Mr. Birks has omitted to observe that he has proved too much. The only meaning we can attach to these sentences is that it is impossible ever to begin constructing any system of ethics at all. For inquiry into the first principles of morals, says the Professor, is a moral act, and you cannot tell whether you are performing it rightly when *ex hypothesi* you have as yet no moral rules; *ergo*—we pause for the conclusion. We should expect it to be that moral science either is impossible, or is possible only as a subordinate science whose office is merely to deduce propositions of morality from premises given by theology; and we more than suspect that Mr. Birks really inclines to the latter alternative. If he maintained it openly, we should attend to him with much more respect; his position would then at any rate be intelligible.

We find also the old misconception that a utilitarian can never do any moral act without first casting up a sum—an error which has been repeatedly corrected, and which we cannot stop to correct again. Likewise there is the not uncommon confusion (but this is perhaps venial) of the general reason, so to speak, for the moral quality of an act with the motive of the agent. When a man performs his contract, for instance, he very seldom thinks of the general precept of morality that men ought to perform their lawful contracts, nor is there any need that he should. In most cases his immediate motive is the desire of being paid for his work, which is a perfectly innocent and proper motive, but is quite apart from the reasons which make the execution of the work his duty.

When the substance of a book is so far from satisfactory, it is hardly needful to dwell on any small points of manner and style. Otherwise we might complain of vague and illusory definitions, of space wasted in unmeaning formal classifications, and of trains of argument which, instead of leading to a conclusion, break down and bide their discomfiture in a text. We might say that theories which, whatever may be their ultimate success, at least command the serious attention of the scientific world, ought not to be described by an educated man speaking in a seat of learning as "theories for manufacturing some miserable semblance of a conscience out of the transmuted instincts of the ape or baboon." And we might express a doubt whether it is tolerable for any writer of English to call democratic communities "plebiscites"

[sic] of mere floating political atoms." A French elector said of Napoleon III. in 1870:—"He would be President, and so we made him; he would be Emperor, and so we made him; he would be *Plébisuite*, and so we made him—and now that is not enough for him, but he must needs go to war." We did not expect to find this propriety in the use of political terms rivalled by a Cambridge Professor.

Finally, it may be observed that the publishers have borne strong indirect testimony to the real character of this book. The catalogue inserted at the end of the volume by way of advertisement is a special catalogue, not of scientific or philosophical, but of theological works. For aught we know, Mr. Birks may be successful as a theologian. At present we can only see that he fails as a scientific moralist.

THE ANTIQUITIES OF CYPRUS.

THIS work contains the best record remaining to us of the remarkable collection of Cyprian antiquities which about a year ago passed from London to New York at the price of 10,000*l*. It will be remembered that unusual interest was at the time aroused in archaeological circles by these objects of ancient art, nearly ten thousand in number, exhumed from temples and tombs at Golgoi and Idalion, cities sacred to Aphrodite. The vases, statues, and bas-reliefs delineated in these thirty-six photographs, some plates containing more than a dozen examples, have been judiciously selected by Mr. Newton with the purpose of elucidating the successive phases of plastic art in the island. The difficulties with which the subject is avowedly beset are met, and in some measure solved, by Mr. Colvin in a well-studied introduction which sets forth how

the Island of Cyprus is one of those points which stand marked in the map of the world as an ancient focus or radiating point of civilization. A key to much of the history of the origins and early development of Greek civilization, Greek forms of worship and of art, is the history of the early movements and contact of races along the coasts and in the coastward islands of the Mediterranean. The contact of Hellenic settlements with Semitic settlements along those coasts and in those islands, and the relations of the two with primitive populations—these constitute for the historical scholar a set of problems the most fascinating and the most difficult. Upon these the attention of much of the best modern scholarship has fixed itself, illuminating them bit by bit with results laboriously obtained, and in need of perpetual revision. But there has been one thing always obvious—that for the study of the primitive intercommunication between Greek and Asiatic, Cyprus is the centre of the position.

It was at once recognized that these archaic vases, these small terra-cotta images rudely modelled with the finger and thumb, these statues and statuettes of human figures carved in the soft calcareous stone of the island, some of unknown antiquity, others unmistakably Roman, might be read as the chronicles of intermingling races and of political vicissitudes.

The arts in Cyprus prove themselves moreover closely correspondent to the geographical position. Cyprus is so situated between Africa and Asia that her flora and fauna partake of the characteristics of both continents; and in like manner her arts show consanguinity with Egypt on the one side and with the Greek colonies of Asia Minor on the other. These remains, too, may be compared to geological *débris* washed together from many and remote strata. And what renders the phenomena presented of more interest is that the products are not importations, but home growths; they are impressed with a distinctive local character; they bear the physiognomy of the Cyprian race; they evidently pertain to the spot; the stone is not the granite of Syene, nor the marble of Pentelicus, but the soft sandstone that lay nearest to hand. And in this expressly native origin these vestiges differ from the otherwise analogous art deposits found in the ancient Crimean tombs near Kertch. Some of the treasures now removed from Kertch to St. Petersburg are of a type so highly developed as to lead to the conclusion that they were importations from Greece, or at any rate that the artificers were Greeks settled in the Cimmerian Bosphorus. It is true that certain of the works exhumed in Cyprus suggest a like alternative. Thus there are archaic vases which may have been taken thither by the great carriers of the old world, the Phœnicians; and again there are statues which wear so expressly the Egyptian and the Assyrian image as to point to the probable conjecture that artists from neighbouring nations came and planted schools in an island which, from its mineral riches and the fertility of the soil, presented irresistible temptations to any people who might happen to be on the move. Other analogies arise between Cyprus and the Crimea; in each is found local articulation and motive. The arts of Cyprus tell of the worship of Aphrodite, just as the sculpture of Attica proclaims the dominion of Athena; in place of the owl of Minerva we find the dove; here, for example, is a priestess of Venus bearing in her hand a dove. In the analysis of Crimean antiquities it has seemed not unreasonable to set down to local agencies what cannot be referred to foreign sources; there is, for instance, a presumption of localization in the favourite use of the griffin, inasmuch as a tradition prevails that the monster was born in those parts. Analogous arguments favour localization in Cyprus. Also rude execution may generally be taken as evidence of

native workmanship—a testimony to indigenous origin which bears on the arts of the Crimea and of Cyprus equally. We may add that like moot questions as to race, style, and date extend as far as the regions about the Danube, though the chronologies we there have to deal with are later, but equally confused. The fact is that in any locality where there have been great and continuous migrations of peoples, the antiquities that come down to us almost of necessity present mixed and anomalous characteristics. Chronologies seem to overlap each other, specific styles cross into hybrids, national systems of ornament interpenetrate and coalesce. It were well were it possible to analyse these art products as a chemist would reduce a compound into its original elements. That Mr. Newton, Mr. Colvin, and Mr. Stuart Poole have been working this rich mine gives assurance that we shall, if possible, obtain the clue to the perplexed arts deposited on the border-lines where three continents meet as on common ground. What seems to be wanted is some exhaustive work which shall do for Cyprus what the Russians, in the "Compte-rendu de la Commission impériale archéologique," and in a monograph on the "Antiquités du Bosphore Cimmerien" accomplished for the antiquities of Kertch.

The Cyprian antiquities here delineated and described are divisible, with more or less approach to certainty, into successive periods and styles. The series opens with vases and rude figures in terra-cotta. We seem to be here in the presence of that prehistoric, that "Homeric or pre-Homeric," art, of which it is difficult to assert anything with certainty. The Phœnicians are almost as a matter of course named as either the carriers or the artificers, and this conjecture tallies with our own experience in the Mediterranean. Certainly works of this archaic type are not circumscribed within the shores of Cyprus; we believe we have met with their like at various stations in the sea which washed the shores of the old civilizations. Indeed, in art creations, as in the works of nature, the further we go back in time the more nearly do we approach to certain elementary and generic forms which are widely diffused just as they are elementary and generic. This certainly is true of such rudimentary forms as flint implements; it also would appear to hold good of those simple shapes in fictile ware which are suggested by the necessities common to all primitive peoples. Mr. Colvin points to a wide geographic distribution of an archaic type, identified with a "set unmeaning smile of the mouth, and the more or less rigid attachment of the arms to the body, according to the traditional helplessness of the art before the innovations of Daedalus." Statues of this character found in Cyprus are of the transitional period when Egyptian and Asiatic styles were becoming Greek; thus we seem to see "Greek art dawning under our eyes." Mr. Newton in like manner discovers interesting points of consanguinity between this Cyprian statuary and Etruscan statuary found at Cervetri. Thus, again, we see that Cyprus contains an epitome of historic arts; she is the common ground whereon meet and intermingle the arts of many peoples, and yet each national art in turn takes on the local colouring of the spot; Cyprian art has a dialect peculiarly its own.

The most important remains—the statues and statuettes of human figures—come from the temple discovered by General di Cesnola at Golgoi. They may be broadly classified into "figures of priests or kings, and figures of the god Herakles." As to size, they vary from colossal to miniature. And as to distinctive styles, they range from Egyptian and Assyrian types to forms which may be designated as provincial Greek, the series ending with works of the late Roman period. Thus we have a history of rise and decadence which extends over more than a thousand years. The largest and most important head in the collection, Assyrian in treatment, is supposed to have belonged to a dominant statue no less than forty feet high. A figure of this import pronounces the scale of the containing or adjacent temple. Other figures speak equally plainly of that wave from Assyria which passed over Cyprus. Yet beneath and around this and other foreign elements there subsists, as we have said, a distinctive local character. Thus Mr. Colvin reminds us that modern travellers find in the receding forehead, high cheek-bones, sunken cheeks, and thick protruding nose, chin, and lips of the Cypriot population of the present day a remarkable correspondence to these heads exhumed from the old temple. We have here another interesting example, not only of the permanence of race, but of that inherent relation which is ever maintained between historic races and historic arts.

We think it must be admitted that these Cyprian antiquities possess an archaeological rather than an artistic value; indeed it is avowed that they belong either to "an imitative and third-rate provincial school" or to an "archaic and traditional school." In fact, the two schools lived side by side, of which there is an analogous case in the Temple of Argina, where the central figure is archaic and traditional, while the surrounding figures are studies from the life. The traditional school in Cyprus is as usual sacred to religious uses, and thus were perpetuated archaic forms "long after they had been enabled or grown out of elsewhere." Hence, as in the subsequent art of Byzantium, which in like manner for century after century preserved a prescriptive type, it becomes difficult to determine the date of many of these products. In fact, style ceases to be a criterion of age. It was the peculiar fatality of this Cyprian art that it passed into the decadence of the late Roman period without having touched the culmination reached in Greece or among the colonies of Asia Minor. These remains make confession that the artists of the island saved themselves the trouble of direct appeal to nature, and thus the works are alike wanting in actuality and ideality. We find neither broad and vigorous modelling from the life, nor

* *The Antiquities of Cyprus*. Discovered (principally on the sites of the ancient Golgoi and Idalion) by General Luigi Palma di Cesnola, U.S. Consul at Larnaka. Exhibited by Messrs. Rollin and Feuardent, Photographed by Stephen Thompson, and Printed by the Lithotype Press, permanent, from a Selection made by C. T. Newton, M.A., Keeper of Greek and Roman Antiquities at the British Museum. With an Introduction by Sidney Colvin, M.A., Fellow Trin. Coll., Camb. London: Mansell & Co. 1873.

generalization of the individual into an ennobled type of the species. Hence these figures are wide as the poles asunder from the creations of Phidias in the Parthenon. We shall anxiously look for further accessions of knowledge to clear the moot questions which arise out of these discoveries. We would gladly learn more of the actual condition of these tombs and buried temples; photographs which may have been taken on the spot, showing the position of the vases and figures when first uncovered, would be invaluable. We need scarcely say that it is of the utmost importance that notes should be preserved of the position in which the figures were found, especially when works of diverse dates or schools stood in juxtaposition. An analogous case is that of bone caverns where the remains of animals belonging to distant epochs lie together. Men of science boast that they take notes or sketches of the precise condition of things when a cave is first opened. We believe that a like practice has prevailed among careful excavators of tombs. At present these Cyprian remains, as they have come to us in fragments or in isolation, appear sadly in want of what may be termed foreground, background, and surrounding scenery. Wide is the field, and the labourers, though skilled, are necessarily few.

THE PRESCOTTS OF PAMPHILLON.*

MRS. PARR is the author of *Dorothy Fox*, a novel of sufficient merit to distinguish it from the mass of ephemeral literature which fills the shelves of circulating libraries. Her present performance is creditable in its way; but we are afraid that it is still of the tantalizing kind, and is always raising hopes which are never quite satisfied. Mrs. Parr writes in a natural and lively style; and the little vignettes of country life to which she treats us are fresh and interesting. The scenery of the Western counties has inspired more than one novelist, though we doubt whether it has yet received full justice. Mrs. Parr's strength, however, lies less in descriptions of scenery, though here and there a touch recalls to us the characteristic beauty of the Cornish coast, than in descriptions of the unsophisticated population. We fancy that we could without much trouble identify the naval port of Dockmouth, and make a fair guess at the little town of Mallett, in which the characters play their parts. The natives, at least, have every appearance of being sketched from the life. Their kindness, simplicity, and loyalty to the old families enable them to fill the minor parts of the little drama in a very satisfactory way; and we are willing to believe that such qualities still survive in some remote villages. There are two or three exemplary sailors who are in the habit of making free but friendly comments on the love affairs of the leading personages; and a quaint old nurse who may possibly be described as a distant relation of the immortal Mrs. Poyser. The country talk is shrewd and easy enough; and there is some real humour in the indications of religious and social prejudices. All this, which may be called the filling-in of the story, is so good that we are inclined to expect something better in the parts upon which the chief stress is laid. Unluckily it is just here that we become conscious of at least a partial failure. In fact, Mrs. Parr passes too frequently from the natural to the merely conventional, and fails to make her fine ladies and gentlemen talk with anything like the force of their humbler dependents. If we can show her what are her really strong points, we shall be doing her the greatest service which a critic can render to an author, and we shall therefore venture to insist a little upon the contrast of the two elements of the story.

The plot in which the fate of the various characters is involved reminds us a little too strongly of the rather whimsical cause of melancholy suggested in Mr. Mill's Autobiography. The philosopher, as he tells us, was at one time much grieved by the reflection that there was only a limited number of possible tunes in the world, and that when composers had discovered them all, our descendants' pleasure in music would be materially destroyed. We often feel that fiction is exposed to a similar danger. The number of possible plots is not perhaps limited, but the number of types to which they can belong is very limited indeed. So many variations have been played upon some of the most familiar tunes that the novelist's task is now rather selection than invention. Mrs. Parr's story belongs to a well-known variety which follow what may be called the circulating method. The recipe for such a story is easily given. Take any number of young ladies and gentlemen, arrange them in a circle as though they were about to play a game at cards, but let each person fall in love with his or her left-hand neighbour. The result of this is inevitably to produce a good many complications, which can easily be worked out to any length according to the taste of the author. A situation of this kind occurs in a good many of Mr. Trollope's stories, and in his hands is often amusing enough. Mrs. Parr's application of it in the present case is very simple. Sir Stephen Prescott is in love with Miss Carthew; Miss Carthew with Mr. Despard; Mr. Despard with Mrs. Labouchere, an interesting widow; and Mrs. Labouchere with Sir Stephen Prescott; thus completing the magic circle. The next point is to give us a little additional excitement by distributing good and bad qualities. Sir Stephen and Miss Carthew are therefore made into pattern characters; whilst Mrs. Labouchere and Mr. Despard, though not actually wicked, are so selfish as to repel our sympathies. In order to bring things right, the bad characters have to show their selfishness in such a way as to undeceive the good characters,

and thereby induce them to transfer their affections to each other, instead of wasting them upon undeserving objects. The same device is employed twice over: Mrs. Labouchere has jilted Sir Stephen Prescott before the story begins for the sake of a rich man; though, being now a rich widow, she is endeavouring to bring him back into bondage. Mr. Despard, from equally mercenary motives, refuses to avow an engagement to Miss Carthew, and endeavours to attract Mrs. Labouchere instead. Miss Carthew's illusions are thus destroyed, and she is at liberty to recognize the virtues of Sir Stephen, and reward them with her hand. In order to produce sufficient complication in the narrative, Mrs. Parr has recourse to the familiar device of a concealed marriage, which of course comes to light towards the end of the novel, and elevates the selfish Mr. Despard to the baronetcy and estates of the admirable Sir Stephen. The plan might seem to reward the villain at the expense of the virtuous hero; but, in fact, it only serves to show the nobility of the one character and the selfishness of the other, and moreover, the estates thus transferred turn out to be so heavily encumbered that we may congratulate Sir Stephen upon getting rid of them.

The story of which we have thus indicated the outline is obviously of the most conventional class, and naturally fails to interest us very deeply. In fact, Mrs. Parr hardly seems to care much about it herself. She does not care to avoid very gross improbabilities, or to realize very clearly the natural influences of their situation upon the characters concerned. Thus, for example, the original cause of all the mischief is the eccentric behaviour of a former proprietor of the Pamphillon estates. This gentleman has been cheated into a marriage with a woman of bad character, who has a son, and then deserts him. He is so much annoyed that he disowns his son, and tries to conceal his marriage. He has, however, some scruples about destroying his marriage certificate, and therefore takes the singular course of enclosing it in a sealed letter, which is given, after his death, to the mother of the supposed heir. The mother, to secure her son's prospects, not unnaturally, though very wrongly, puts the certificate in the fire, to the considerable trouble of her conscience, and supposes that she has destroyed all evidence as to the legitimacy of the disowned son. We do not mean to say that this eccentric proceeding of a gentleman who does not like to commit a crime himself, but puts a temptation to commit it in the way of an interested person, is altogether inconceivable, but certainly it is so queer that the author should take a little trouble to reconcile us to the improbability. When it is suddenly sprung upon us without any preparation towards the end of the story, we see too plainly that the old gentleman has been acting, not from any peculiar idiosyncrasy, but from a desire to further the interests of the novelist. The story is made still more absurd by the extreme ease with which the property is instantaneously recovered. So far from all evidence being destroyed, we are required to believe that the first inquiry into the matter immediately produces conclusive proofs of the marriage; and thus the fictitious nature of the whole transaction is made unpleasantly obtrusive. We are not merely aware that we are reading a novel; but the unreality is dashed in our faces. Plots of this kind should either lie left alone or be carefully constructed. Otherwise we are rudely disturbed in that measure of illusion which is agreeable even in a story which demands no serious attention. It is a worse blemish that the iniquity of the whole transaction is not turned to proper account. Mrs. Parr does not seem to realize the extremely disagreeable consequences to a lady of being found out in a long course of deception by which she has fraudulently kept a man out of an estate for many years. It is true that Mrs. Prescott, who has been guilty of an action for which she might have been sentenced to penal servitude, expresses a certain amount of annoyance, that she cries a good deal, and even goes so far as to faint away. But none of her friends seem to think any the worse of her, or to have recourse to any means of consolation beyond a smelling-bottle and a glass of water. Novelists who venture into tragedy cannot be allowed to put it aside in this summary fashion. A mother committing a crime for the sake of her son is in a position which has afforded the pretext for a great deal of powerful and would-be powerful writing amongst novelists of all calibres. It is a pathetic and forcible situation, and therefore, when once presented to us, it should lead to a catastrophe of corresponding magnitude; and certainly it should not be treated as though the criminal had only been guilty of a rather unladylike proceeding, to be fairly atoned for by a good fit of crying. When that is done, it is plain that the writer's imagination has not been exerted, and that she has merely been employing the first artifice which came to hand from the ordinary novelist's stock-in-trade, instead of endeavouring to work out a moral or artistic problem.

The characters engaged in carrying out the plot are for the most part rather feebly coloured. As may be expected from a lady novelist, the men are decidedly inferior to the women. The good hero is good, but commonplace. The bad hero is apparently meant to be outwardly attractive, but spoilt by a selfishness which he attempts to conceal from himself and others. Unluckily the selfishness becomes so prominent from the very first that we are never left in doubt as to the sentiments which we ought to entertain for him, and anticipate our final verdict from the earliest pages. The task, indeed, of displaying such a character satisfactorily is not an easy one. There are plenty of people in this world on very good terms with themselves and others, who would appear, if carefully analysed, to be selfish to the core. But to show this, whilst preserving the charm of their external good humour, requires a masterly hand; and Mrs. Parr becomes rather too angry with this creature

* *The Prescotts of Pamphillon*. By Mrs. Parr. London: Ishister & Co. 1872.

of her imagination to do him full justice. The worst result of this error is that it rather interferes with our appreciation of the otherwise charming heroine, Miss Hero Carthew. We should wish to see a more palpable excuse for her error in taste. We know that she is making a blunder in bestowing her affections upon Mr. Deepard; and we should sympathize with her more if her blunder appeared to be more natural. However, the love affairs of human beings are generally managed on such inscrutable principles that we are hardly shocked by a fact only too conformable to our general experience—namely, the misplaced affection of a charming young woman for a man who is anything but charming. Miss Carthew is not precisely a new creation. She is the fresh, healthy country girl with strong affections and no nonsense, of whom we meet a good many examples in novels. But we do not often see her described with more spirit than in Mrs. Parr's story; and we admit her to be thoroughly fresh, healthy, and lifelike. If we could expect our advice to be received, we should say that Mrs. Parr might write a really excellent story if she would take a young lady like Miss Carthew, surrounded by the society natural to the place, and make her fall in love with a substantial farmer or a half-pay naval officer, instead of introducing her to wooden ladies and gentlemen from London, and involving her in troublesome plots with fictitious marriages and hidden wills.

WEATHER WISDOM.*

NEW editions of Hone's *Every-Day Book* and *Year Book*, which supplied so much entertaining gossip to our fathers, have just been published, in the reasonable confidence that they will have no less a charm for our generation. It is indeed remarkable how well they deserve reprinting, and how little they have been put out of date by the subsequent appearance of Chambers's "Book of Days," and the invaluable volume of *Notes and Queries*. At present our concern is chiefly with the corroborations they furnish to a great many of the explanatory and illustrative notes of Mr. Swainson's collection, which clearly owes to them no inconsiderable debt. If the reader is at fault for fuller particulars of the strange saints of the Continental calendars, whose supposed influence on the weather makes up Mr. Swainson's first part, i.e. "the superstitious side of weather lore," Hone's volumes will rarely fail to supply his want. They illustrate, too, though in a less degree, the sun, moon, and star proverbs of the second part, besides containing a good deal of information about animal life and plant life, from both of which weather-prophets, ancient and modern, have drawn prognostics. Under April 4 in the second volume of the *Every-Day Book* will be found the information about an inexpensive and durable weather-glass, consisting of a leech in a phial of water, which Mr. Swainson has condensed in his *Prognostics from Reptiles*, p. 251. The phial is the common eight-ounce phial, three parts filled with water, and covered at the mouth with a piece of linen rag. It is placed upon a window-frame; and the water is changed in summer twice, in winter once, a fortnight. The leech moves restlessly up and down the bottle before wind; is agitated and convulsive near the very mouth of the phial before thunder and rain; is motionless, coiled, and calm at the bottom before frost or clear open weather; and in prospect of rain or snow is apt to creep to the surface, and betoken the duration of such weather by an indisposition to sink. From Hone's *Year Book* also we get a clue to other points of rustic natural philosophy, which renders intelligible certain sayings recorded by Mr. Swainson. "At New Year's tide" says one of these, of English origin, "the days lengthen a cock's stride." A Polish proverb has the same expression, and another form of the English adage goes on to say "At Candlemas an hour wide." We become curious as to the oddness of this manner of computation, when, under the day of St. Antony the Hermit (January 17th), we find the Italians saying that "At Antony's tide, the days lengthen a demon's stride," a stretch indicative of seven-leagued boots or the hill-to-hill stride of a Cornish giant. But the *Year Book* explains the origin of the expression:—

Everybody knows that this saying (that about the cock's stride) intends to express the lengthening of the days in a small but perceptible degree; yet few are aware of the ground for it, for there is something uncommon and seemingly improper in applying long measure, inches and feet, to time. But the countryman knows what he says from observing where the shadow of the upper lintel of his door falls at 12 o'clock and there making a mark. At New Year's day the sun, at meridian, being higher, the shadow comes nearer the door by four or five inches, which for rhyme's sake he calls a cock's stride, so expressing the sensible increase of the day. Before the style was altered, long after this saying came into use, the distance of time was greater by clever days between the solstice and New Year's day than it is now; and consequently the difference as to the sun's altitude, or day's length, at those two times would be more perceptible than it is now.

There can be no question that the application of long measure to time indicates very primitive observation, for Hesiod avails himself of something very like it in order to teach the rural Boeotians the spring season for sowing, to wit, "when the leaves at the end of a spray have grown to the length of a crow's foot."

It can hardly be doubted that much weather folklore has its origin in reverence for particular local saints, and some also may

have been due to the accident of verse or of alliteration. And although it may be going too far to endorse Gay's couplet—

Let no such vulgar tales debase thy mind,
Nor Paul nor Swithin rule the clouds and wind—

still it must always be safe counsel to "try" the saints and their weather-wisdom. As to the connexion of St. Paul with the weather following the festival of his Conversion (January 25), there is an old and constant opinion in many nations and languages. French, Germans, Italians, all endorse the four Latin lines which our English adage reproduces in eight:—

If the day of Paul be clear
Then shall betide a happy year.
If it do chance to snow or rain,
Then shall be dear all kinds of grain;
But if the wind be then aloft,
Warres shall vex this realm full oft;
And if the clouds make dark the sky,
Both neate and fowle this yeere shall die.

In Alsace the vulgar belief is that on the evening of this day, "omnia ventorum concurrere prelia," all the winds strive for the mastery, and that which holds its own at midnight takes rank as the predominant wind for the year. But still more fanciful is the calculation by which the country folk of North Italy prognosticate the weather of the year to come from the twenty-four days of January which precede St. Paul's. Beginning with New Year's Day, which is termed January, they go on up to the 12th, giving each day the name of the corresponding month, the weather of which it is considered to foretell. From the 13th they reverse the order till the 24th, making the 13th December, the 14th November, and so on. Thus, if the 7th and 18th, corresponding to July, are foul weather, such will be the character of that month. It is somewhat against this elaborate calculation to learn that it is liable to be vitiated and upset by a partly wet and partly fine 25th of January, which makes all uncertain. Somewhat of kin to this calculation is the theory of our ruder forefathers and their contemporaries in other lands as to the "Borrowing days"—the 29th, 30th, and 31st of March, which are generally stormy, and so were reputed to have been borrowed from April by grasping March. There is a vulgar belief that these days—on which it is unlucky to lend or borrow—are so called from the Hebrew loan on the Egyptians before the Exodus, and Dr. Jamieson traces this to the corresponding time of the year, Abib or Nisan, including part of March and April, at which the Israelites quitted Egypt. The inclemency of the "borrowing days," which is fully believed in Andalusia, may be connected with the storm that overwhelmed the Egyptians.

It must be owned that there is more to be said against than for a faith in St. Swithin's influence on the weather:—

If St. Swithin weeps, the proverb says,
The weather will be foul for forty days.

This saw has been shown to have no basis in what happened at the translation of the bones of the saint, but it derives a certain amount of confirmation, or consistency, from the tradition about St. Bartholomew's day, just forty days after—namely, August 24th. This runs:—

All the tears St. Swithin can cry
St. Bartholomew's dusty mantle wipes dry.

Unfortunately, though Continental nations cherish almost universally the same form of belief, there is great fluctuation as to the day and the saint. In France St. Médard (June 8) and St. Gervase and Protasius (June 19th) have the credit which St. Swithin holds with us. In Belgium St. Godelieve (July 6), in Germany the Seven Sleepers (June 27th), have a forty days' lien upon the weather for better or worse; and Poland, Denmark, and North Italy claim a like privilege for other saints. The term of forty days is obviously borrowed from Holy Scripture. Mr. Swainson, by the way, notices the apple-country proverb that when it rains on July 15 "St. Swithin is christening the apples"; he omits, however, a well-known and curiously trustworthy adage connected with hop counties and with St. James's day (July 25):—

Till St. James's day is past and gone
There may be hops or there may be none.

Another very curious tradition, founded no doubt upon careful observation, is that which introduces into the almanack a *second winter* and a *second summer*. The first occurs in May, on account of the east winds, of which divers Continental nations have a kindred proverb to our homely adage "cast not a clout till May be out." Mamertus, Pancratius, and Servatius, French saints whose festivals fall on the 11th, 12th, and 13th of May, are called in France ice-saints; and a special Bohemian saint, made up of the two last-named and St. Boniface (May 14), and called Pan Serboni, is commonly reputed "to wither the trees with frost." In Naumburg these saints are called, for a similar reason, "wine-stealers." A slight indication of the sound basis on which the proverbs about a second winter in May depend is to be found in the frequent nipping by frost of the plants bedded out in our parterres in that often treacherous month. The second summer—a short one—is All Saints' day, and is said to last three days, three hours, or three weeks; and it is to this that Prince Hal, in *Henry IV.* (act i., sc. 2), likens Falstaff, when he says to him, "Farewell, thou latter spring; farewell, thou All Hallow's summer." It is not at all uncommon to have at this season a spell of good still warm weather. It would save a vast deal of loss and vexation to amateur tree-planters if, reckoning on this second summer and its brief continuance, they would indoctrinate

* *A Handbook of Weather Folklore.* By the Rev. C. Swainson, M.A., Vicar of High Hurst Wood. Edinburgh and London: W. Blackwood & Sons. 1873.

Hone's *Year-Book*. London: W. Tegg.

Hone's *Every-Day Book*. 2 vols. London: W. Tegg.

their woodmen with an old English proverb which is worthy of acceptance—namely, "Set trees at All Hallows' tide, and command them to prosper; set them after Candlemas, and ontreat them to grow." We will not answer for the truth of this about fruit-trees, but as to forest-trees it is beyond a doubt that whereas, if planted in November, they have time to get rooted and settled before the cold sets in, to defer planting them till the cutting February or the changeable March, is a perilous procrastination. *Appropos* of tree-planting, we are reminded that another interesting English proverb—

If you would fruit have,
You must bring the leaf to the grave—

inculcates that trees should be transplanted at the fall of the leaf; not much sooner, because of the motion of the sap; nor later, in order that there may be time for their rooting before the deep frosts. Old Ray it was who enunciated this explanation.

It is a curious study to connect the immigration and emigration of birds, and their appearances and disappearances, with the calendar of the months and saints. According to the proverb of Bergamo, the swallow arrives in Europe on St. Gregory the Great's day (March 12); it flies over the roofs on St. Joseph's day, the 19th. On the 15th of September (St. Nicolas) "the wild geese fly away" from Russia, a token of the approach of winter. In Scotland we learn that the proverb about them runs as follows:—

Wild geese, wild geese ganging to the sea,
Good weather it will be.
Wild geese, wild geese ganging to the hill,
The weather it will spill.

In truth, and apart from the saints, the prognostics from birds are generally to be trusted; and, for one obvious reason, especially those from the migration of birds:—

When great abundance of winter migratory birds, and particularly field-fares, arrive early, they usually forebode a hard winter; and the same prognostic of severe weather is to be inferred from the early or numerous migration of wild geese, wild ducks, and other winter fowl.

Enough has been said to illustrate the wealth of the mine which Mr. Swainson has opened in the first part of his volume. The second part is not a whit less rich and interesting, whilst, in addition, it is more trustworthy. There is a substratum of truth in most of the proverbs about a red sunset or sunrise, a pale, or red, or clear moon, twinkling or shooting stars, a rainbow in the morning, and a bank of clouds in the west, and the weather they severally portend. Who can disabuse us of a belief in the "mare's tail" cloud, which forebodes winds, and which is commemorated in this rhyming adage:—

Hens' scarts and silly-tails
Make lofty ships wear low sails?

"Hen-scarts" are equivalent to light clouds resembling "the scratching of hens on the ground." Or who doubts the import of the roundish, small, and well-defined masses of cloud which our proverbs designate "A mackerel sky, neither long wet nor long dry"? There is a fund of homely wisdom and reflection in the Tuscan snow-proverb, "Under water dearth, under snow bread"—illustrated by the Russian adage, "Corn is as comfortable under snow as an old man in his fur coat"—which should teach the husbandman to get his seed sown in the open weather of November. About the phenomenon of "rain while the sun is shining," which our matter-of-fact English adage says is certain to be soon over, the Pole more imaginatively surmises that "the witches are making butter," while the German accounts for it by the conclusion that "the Devil is beating his grandmother; he is laughing and she is crying." Under prognostications from birds, the ill-luck attaching to the sight of a single magpie in spring is explained by a quotation from Sir Humphry Davy's *Salmonia*, showing how, in cold weather, one magpie leaves the nest to forage while the latter sits on the eggs or young; in warm mild weather the two go out together, and it is then good fishing time. All the prognostics are of course liable to fail at times; and after all the wisdom of the Tartar proverb is the soundest, that "the peasant prays for rain, the traveller longs for sunshine; but God gives each what is best."

It is impossible to peruse this collection of the weather wisdom of all nations without noticing the discrepancy between different nations and districts as to questions of prognostication and portent. In the Pyrenees "a red sunset bespeaks a fine morrow"; in the Eure and Loire district, wind or rain. Of the rainbow in the east the French say that it betokens fair weather, in the south, rain; but the Spanish expect rain to follow from a rainbow in the east, dry weather and wind from a rainbow in the west. Again, while Virgil (*Georg. i. 397*) counts it a sign of rain—

Tenuis—laus per cælum vellera ferri—

our rhyming proverb runs in the opposite direction—

If woolly fleeces spread the heavenly way,
Be sure no rain disturbs the summer day.

In like manner England and France are at issue in their proverbs as to the results of drought, and Scotland and Sicily on the luck to be looked for in leap-year. Climate, experience, observation, may account for these variations; it may be that "each is right and each is wrong." And it is to be remembered that these discrepancies are not in cases where much depends upon following or disregarding the voice of proverbial wisdom; whereas, as we have shown above, there are really useful and trustworthy lessons to be learned from weather-lore.

FENG-SHUI.*

ONE of the most important and perplexing questions which meet the foreigner in his dealings with the Chinese is that which concerns the nature and properties of the *Feng-shui* superstition. It confronts him at every turn. If he wants to build a house, if he wishes to construct a railway or erect telegraph poles, if, perchance, he is desirous of taking his steam yacht higher up the river than it has been wont to go, or if he wishes to make a cutting through a hill, he is met with the invariable objection that by doing all or any of these things he will destroy the *Feng-shui* of the district, and will thus introduce disease and death among his neighbours. Were this belief confined to the lower and more ignorant classes, we might leave its investigation to those scholars who take a delight in observing and searching out the popular weaknesses of mankind. But the votaries of *Feng-shui* are to be found among the rich as well as among the poor, among the learned as well as among the ignorant, and among the officials as well as among the laity. It figures in despatches as the foundation of weighty arguments, and in erudite and technical books it assumes as much importance as in the mystical works of the professors of the art. It is therefore a question which demands the consideration of both diplomatists and scholars; and to the attention of both these classes we commend Dr. Eitel's pamphlet.

In considering this subject, the first question to be asked is, "What is 'Feng-shui'?" To this Dr. Eitel replies that it is "the blind gropings of the Chinese mind after a system of natural science, which gropings, untutored by practical observation of nature, and trusting almost exclusively in the truth of alleged ancient tradition and in the force of abstract reasoning, naturally left the Chinese mind completely in the dark." Like the people of almost every Oriental nation, the Chinese look upon nature as a living, breathing organism, in which are inseparably bound together all things that exist in heaven above or in the earth beneath, the organic with the inorganic, the living with the dead. Heaven is to the Chinaman "the ideal type of which our earth is but the coarse material reflex." The sun and moon he regards as the celestial counterparts of the male and female principles of nature. The reflection of the five planets, Jupiter, Mars, Venus, Mercury, and Saturn, he sees in the five elements of nature—namely, wood, fire, metal, water, and earth; and he traces their influence in the five constituents of the human frame—that is to say, the muscles, veins, flesh, bones, skin, and hair; in the five inward parts or viscera—namely, the heart, liver, stomach, lungs, and kidneys; in the five colours, white, black, red, blue, and yellow; in the five fortunes, riches, honour, longevity, children, and a peaceful death; and in the five social relations, those of prince and minister, father and son, husband and wife, older and younger brothers, and friends. "And he contemplates the spangled firmament at night and compares with it its dimly-reflected transcript on the surface of our earth, where the mountain peaks form the stars, the rivers and oceans answer to the milky way."

Thus in the firmament of heaven the Chinaman watches those mysterious signs which, marking the fate of nations and the destinies of individuals, are intelligible only by the light thrown on them by a knowledge of the general principles or laws of nature. Now one of the first of these laws as understood by Chinamen is that every elevation of ground on the earth's surface indicates the presence of one of the two magnetic currents of which the *W'e*, or breath of nature, consists. The excess of either of these currents, known as those of male and female, positive and negative energy, and which are symbolically called the Azure Dragon and the White Tiger, is destructive to the health and well-being of those living within its influence. The great object, therefore, in fixing on a site for a house or for a grave is to choose a spot where these two currents balance and equalize one another, and thus shed a beneficent atmosphere around—for their absence is as fatal as is the excess of either one or the other. The intending builder should therefore carefully note the position, as indicated by the higher hills or mountains, of the Azure Dragon, and should assure himself of the presence among the lower and more undulating hills of the White Tiger. The spot then to select will be the corner formed by the junction or neighbourhood of the two ranges. The upper and lower portions of the human arm when bent are the usual figures employed to represent the Dragon and the Tiger, and the inside part of the elbow as the model of a lucky site, for, say the books on *Feng-shui*, the luckiest spot, like a modest virgin, loves retirement. As an example of a well-chosen locality, Dr. Eitel points to the city of Canton, which is situated in the angle of two chains of hills running southwards in gentle curves, and forming in their course the shape of a complete horse-shoe. Every visitor to the mountain districts of Southern China must have noticed how invariably the excavations forming tombs are of the shape of horse-shoes; and some travellers have even thought that in life form thus adopted may be traced the use of the Greek π to symbolize the end. But the true explanation is to be found in the fact that the pious survivors are anxious that the ashes of the departed should lie embosomed in the genial influences generated by the combined presence of the Dragon and the Tiger.

All this sounds fanciful enough; but to the Chinese mind it represents a genuine belief, as may be proved by their never-failing attempts to palm off upon foreigners, as concessions at the Porte, those spots which are especially marked out as being under unfavourable influences. The falling off of trade at Canton since the forma-

* *Feng-shui*; or, the Rudiments of Natural Science in China. By Ernest J. Eitel, M.A., Ph.D. London: Trübner & Co. 1873.

tion of the new settlement which consists of a dead level piece of ground reclaimed from the river; the fact that every house upon it is overrun with white ants, notwithstanding that every precaution has been adopted to prevent their inroads; and that the English Consul, who has a special residence built for him there, prefers living two miles away under the protecting shadow of a pagoda, are all with a secret pleasure attributed by the natives to the violation, in the choice of the site, of the laws of Feng-shui, and tend to confirm them in their contempt for the ignorance and simplicity of the outer barbarians. Indeed it is difficult to imagine how, until the idol of Feng-shui has been trodden under foot, any engineering works can possibly be carried on in China; for straight lines are of as evil import as even the total absence of the Dragon and the Tiger. A straight stream of water, a straight embankment, or a straight range of hills is quite enough to destroy the propitious influence of the most otherwise favoured spot; and to make a cutting through any portion of the hill or hills which form the Dragon or the Tiger is in the eyes of all true Chinamen to invite disaster. As an instance of this, and also of the sort of facts which so often give rise to and support popular superstition, we will quote a case mentioned by Dr. Eitel:—"When the Hong-kong Government," says the author, "cut a road, now known as the Gap, to the Happy Valley, the Chinese community was thrown into a state of abject terror and fright, on account of the disturbance which this amputation of the Dragon's limbs would cause to the Feng-shui of Hongkong; and when many of the engineers employed at the cutting died of Hongkong fever, and the foreign houses in the Happy Valley had to be deserted on account of malaria, the Chinese triumphantly declared it was an act of retributive justice on the part of Feng-shui."

But while it is declared to be the leading principle of Feng-shui that the influences of the natural configuration of the earth's surface are thus supreme, the power of modifying and moulding them is to some extent left in the hands of man. For instance, as we have said, the surface of our earth is but the dimly-reflected transcript of the celestial system, and in the mountains are to be traced the counterparts of the five planets and the stars. And it will be remembered that these planets—namely, Jupiter, Mars, Venus, Mercury, and Saturn—are also the prototypes of the five elements of nature—wood, fire, metal, water, and earth. When examining a site, therefore, it is the duty of every professor of the Feng-shui art to discover which planet is represented by any given mountain or hill, since the proximity of harmonizing elements is as important for the luck of a place as that of hostile and destroying elements is dangerous to existence. Thus no Chinaman in his senses would ever establish himself in the vicinity of two adjoining hills representing respectively the planets Jupiter and Mars and the elements wood and fire. But should he, from other reasons, deem the situation desirable, it is always open to him so to alter the shape of the hills as to change their identity. If, for example, he recognizes in a bold high mountain peak the characteristics of Mars (fire), and he wishes to convert it into the embodiment of Jupiter (wood), he has simply to level the top of the peak and the change is effected. In the same way a rounded Jupiter becomes a Venus, and a mound on the top of Saturn converts it into a Mars.

We have thus briefly sketched some of the leading principles of this extraordinary superstition which has for centuries enthralled the entire Chinese nation. For a complete view of the system we must refer our readers to Dr. Eitel's pamphlet, in which it is traced out with great care and perspicuity, and which we confidently recommend to the attention of all those foreigners in China who by force of circumstances are compelled to encounter and struggle against that bugbear of diplomatists and stumbling-block in the way of the nation's progress—Feng-shui.

CHRISTMAS BOOKS.

IV.

CHAPTERS on Animals, by P. G. Hamerton. With twenty etchings by J. Veyraat and Karl Bodmer (Seeley). Among all the books that have come before us there are few that show any better or more original work than these twenty etchings. There is a truthfulness to nature and a vigour in the sketches of animal life which at once carry away the mind to many a scene of the country and woodland. Mr. Hamerton's writing is pleasant and interesting, and not unworthy of the illustrations which adorn it. It is by no means one of the biggest, and it is one of the least showy, of the Christmas books. There would be no great credit, therefore, in giving it away. But to make up for this there would be a great pleasure in receiving it, or keeping it.

We have also received from the same publishers an abridgment of the *Unknown River: an Etcher's Voyage of Discovery*, by P. G. Hamerton. Of the thirty-seven illustrations of the original edition only eight are now given, and of these two or three are somewhat blurred. Mr. Hamerton's narrative, however, is very pleasing, and, if we are not mistaken, is given almost in full. These, therefore, who cannot afford the original work may be glad to get at all events the narrative, with a few of the etchings.

Sunday Reading for Good Children. With illustrations by Sir John Gilbert, Holman Hunt, John Tenniel, and others (Routledge). If those who are whole need not the physician, but those who are sick, we would venture to suggest that Sunday reading is needed quite as much for bad children as for good. But perhaps picture-books are not for them. The illustrations, though of course merely reprints, are for the most part very good. We cannot say

as much for the verses with which the book opens. We should be sorry to set a naughty child to learn by heart such lines as—

Balaam the prophet, and Balak the king,
Would curse God's people—a wicked thing.

With this book we must couple the *Child's Coloured Scripture Book* (Routledge). It also has a Scriptural alphabet, and thus deals with the letter B:—

Balaam the prophet, on an ass, a visit went to pay
To Balak; but an angel stood to meet him on the way.

It contains also the story of Joseph, told not in the language of the Bible. We are amazed at the audacity of a writer who ventures to tell in his own poor language a story so written that it can be enjoyed equally by the child and the man. The illustrations are of the gaudiest.

From January to December: a Book for Children (Longmans and Co.). In this book a good deal of information about Natural History is given to children in short stories, or in accounts of visits to museums and the Zoological Gardens. The book is fairly well written, though the language at times is a little too high-flown, and the words are occasionally too big. Why, we should like to know, do women when they write a book for children always bring in the word entail? A shawl, we read in the book before us, in the making "entailed a good deal of counting." The political economy taught in one of the stories, by the way, would fully justify schoolboys in throwing stones at the street lumps, and rioters in burning a whole town. The author is describing a City feast, and she says:—"Do not the careless attendants who on these festive occasions chip the finest glass and break the most exquisite china deserve the silent thanks of the philanthropist? Surely they create a never-ceasing demand for the work of active hands." We hope that the philanthropist will keep his thanks silent thanks, or glass is likely to go up in price.

The Reef, and other Parables, by E. H. Bickersteth, author of "Yesterday, To-day, and For Ever." With illustrations (Sampson Low and Co.). These parables are fairly well written; but to our mind the applications are far too long. The best parable is that which needs no application, and the longer the application needed, the worse is the parable. Nevertheless we have no doubt that by a large class of readers Mr. Bickersteth's new work will be as highly esteemed as his well-known poem.

Worby College; or, the Luscombe Prize: a Tale of Boy's Life, by the Rev. H. C. Adams. With illustrations (Routledge). Mr. Adams, as we learn from his preface, suffers greatly from his stories of school-boy life being called by his critics imitations of *Tom Brown's Schooldays*; while, as he is the older man and the earlier writer, if there is any imitation, it must be all the other way. So too at Chelsea or at Everton, the proprietor of the Original Bun Shop or the Original Toffee Shop suffers from the charge that he is an imitator of the more modern Old Original Shop. Without then comparing *Worby College* with *Tom Brown's Schooldays*, or trying to estimate whether the parson or the layman is the better at getting boys into scrapes and out of them, we will say that we have a fairly interesting story of school-life, such a book as a boy will read with pleasure and with profit.

Man on the Ocean: a Book about Boats and Ships, by R. M. Ballantyne (Nelson). This is, we are told, a Book for Boys. We hope, however, that the literature of the present day with its big words has not yet brought down boys so low that they will stand many such sentences as the following:—"Ships are, as it were, the electric sparks of the world, by means of which the superabundance of different countries is carried forth to fill, reciprocally, the voids in each." We are not surprised to find that a writer who is so silly in his language is full of errors in his facts. He says that "the expedition of the Argonauts to Colchis in the year 1250 B.C. in search of the *Golden Fleece* is the first ancient voyage that lays claim to authenticity." There are then still men who claim to be writers, and who in their historical knowledge have not yet got beyond Goldsmith. "During the first five hundred years after the birth of our Lord," he goes on to add, "nothing worthy of notice in the way of maritime enterprise or discovery occurred." Agricola's exploration of Britain was of no moment, it would seem. A few pages further we read that "the crusades now began, and for two centuries the Christian warred against the Turk [sic]." It is a pity that a man cannot write about ships without thinking it needful to show his utter ignorance of history.

The Boy's Book of Trades, and the Tools Used in Them. With numerous illustrations (Routledge). The compiler of this little work rightly says that "when a boy has just left school he seldom knows much about the operations of any trade, and cannot be expected to express any preference for one more than another." He hopes, therefore, and we think with some reason, that his book may be of use in guiding each one in the choice he has to take. It will be found interesting also by those boys of a higher class who, though they will never become craftsmen themselves, have yet a strong interest in all crafts. The illustrations are very full and clear, while the explanations are fairly well done.

Lob Lie-by-the-Fire, and other Tales, by J. H. Ewing, author of "Mrs. Overthway's Remembrances," &c. &c. With illustrations by George Cruikshank (Bell and Sons). Mrs. Ewing has written as good a story as her "Brownies" of two Christmases back, and that is saying a great deal. *Lob Lie-by-the-Fire* is a very pretty story, with by no means a pretty name. It has humour and pathos, and teaches what is right without making children think that they are reading a sermon. The other tales have

already appeared, as we are told, in *Aunt Judy's Magazine*. They are all good, but not one comes quite up to "Lob." We are glad to see three illustrations by that friend of our childhood, George Cruikshank. He must have nearly filled his fourscore years, and yet, so far as drawing goes, is not far removed from the young.

The Gospel of St. John, illustrated by Bida (Sampson Low and Co.) "The drawing, etchings, and engravings" of this book, as the publishers' announcement tells us in somewhat questionable English, "have been twelve years in preparation, and an idea of the importance of this splendid work may be gathered from the fact that upwards of fifty thousand pounds have been expended on its production, and it has obtained for MM. Hachette the Diplôme d'Honneur at the Vienna Exhibition." The work is in itself so admirable that it needs no puff, whether well expressed or ill expressed. The present volume, containing only the last of the four gospels, is illustrated with twenty-seven steel engravings. The publishers have done well in giving the English version of the gospel, and not the French, with which these illustrations were originally published. If M. Bida can read our language, he will find that our English version as much adorns his engravings as his engravings adorn the French version. We must not forget to add that the printer's work is all that could be desired. We reserve for another opportunity a fuller notice of the great work of which this book before us is a partial reproduction.

Martyrs of the Revolution (Bickers and Son). This is an excellent reproduction of a very interesting series of plates which were engraved by George Virtue from original pictures by Vanlyke and others about one hundred and thirty years ago. The original title of the work was undoubtedly somewhat long, but we think that the modern publishers, if they desired brevity, might have struck out one rather more accurate than that which they have chosen. It is difficult to see how Archbishop Juxon, for instance, was in any way a martyr, who, as we read in the quaint notice of his life affixed to his print, "had the happiness to see the King and Church restored, to place the crown on the head of the former, and be himself the head and crown of the other, being in 1660 translated to Canterbury, and on June 4, 1663, to that place where his character may be equalled but not excelled." Misleading and foolish though the title is, the work itself has great merits.

Goethe's Hermann and Dorothea, translated by Rev. Henry Dale, M.A., formerly British Chaplain at Dresden. With illustrations by W. Kaulbach and L. Hofmann (Bruckmann). Mr. Dale's version has considerable merits, and the illustrations are in themselves very pretty, and have been admirably reproduced by the photographer, while the printer (saving a few typographical slips) and the binder have done all that printers and binders can do in helping to render this translation of the German classic worthy to rank as one of the first among the Christmas books of the year. We hope that the spirited publisher will find that he is no loser by his efforts to bring out the great poet of his nation in an English dress.

Oxford and Cambridge: their Colleges, Memories, and Associations, by the Rev. Frederick Arnold, B.A. With engravings by Mr. E. Whymper, F.R.G.S. (The Religious Tract Society). Mr. Arnold has done his portion of the work fairly well, while Mr. Whymper's engravings are very interesting. We should have liked to see, by the way, a sketch of that portion of the University in which "the antiquarian may go back to the Saxon period." If Mr. Arnold had been at University College, he might have been almost pardoned for clinging, with all the members of that ancient foundation, to the pious belief in King Alfred as their founder. But a Christ Church man has no excuse for writing such nonsense. He admires, by the way, "the most sumptuous pile of buildings erected" a short while ago, close to the famous Broad Walk of his College. Sumptuous, no doubt, it is. For ourselves, we never felt to the full how greatly a town can be improved by standing a siege till we first saw this and one or two others of the new piles of building in Oxford. A few cannon-balls well aimed would turn what is now a dreadful eyesore into a most picturesque ruin. Mr. Arnold's book, however, is much better than the pile of buildings which he praises, and will be found a useful guide to the visitors to either of the Universities.

Beethoven's Sonatas, edited and fingered by Agnes Zimmerman (Novello). This is in every way an admirable edition of the great master, but will be found especially useful for the student. Each sonata is amply fingered, while particular attention has been given to the proper marking of the phrasing. Some few slight alterations have been made in the text, for which the accomplished editor gives reasons which at least show that they have not been made without consideration.

The Christmas Oratorio in Vocal Score (with a separate Accompaniment for the Organ or Pianoforte), by J. S. Bach. The English translation and adaptation by the Rev. J. Troutbeck, M.A. (Novello). This is the third great choral work of this great composer that has been brought out by Messrs. Novello. The price is so moderate that this noble composition, consisting as it does of sixty-four numbers, can be bought for about the cost of a couple of the so-called comic songs of the day.

A Midsummer Night's Dream. With illustrations by Alfred Fredericks (Bickers and Son). There is considerable merit in some of these illustrations, more especially in the sketches of woodland scenery. But the humour of the play seems to us to be entirely lost in Mr. Fredericks's drawings. He has read his *Midsummer Night's Dream* but ill if he thinks that the craftsmen of Athens are fit for nothing but a caricature.

Pheasants for Coverts and Aviries, by W.B. Tegetmeier, F.Z.S.,

author of the "Poultry Book," &c. &c. Illustrated with full-page engravings drawn from life by T. W. Wood (Cox). Mr. Tegetmeier is so well known as an authority on everything connected with birds, that it is necessary for us to do little more than call attention to the publication of this work on pheasants. So far, however, as we have looked into it, it is written in a clear and interesting manner. The illustrations are good, though a wood-engraving, we must admit, can do but little in reproducing the brilliant plumage of the cock-pheasant. It may surprise some of our readers to learn that in this country "hundreds of thousands are spent annually in rearing the pheasant." It is no wonder that so important a branch of production has a manual all to itself.

The Smaller British Birds, by H. G. and H. B. Adams. Illustrated with coloured plates of birds and eggs (Bell and Sons). This is an interesting book, containing full descriptions of the nests, eggs, and habits of the smaller birds. The coloured plates are abundant, though perhaps not very true to life. Our great fear is lest the British schoolboy may find his appetite for bird-nesting, which is already far too keen, whetted by what he reads in such a book as this. It would be as well, by the way, if the authors would stick to their birds and leave Latin alone. Even a bird-nesting schoolboy may be astonished to learn that, "if we dissect the above scientific name (*Alauda brachydactyla*) of this, to us, rare species, it will be found to consist of three Latin words—*alauda*, a lark; *brachius*, short; and *dactylus*, a finger."

A Very Young Couple, by the author of "Mrs. Jerningham's Journal," &c. (Marcus Ward). If the plot of this story is somewhat melodramatic, yet the story itself is so pleasantly and brightly told that it deserves high praise. The young wife's faith in her husband when he is missing and is believed by all his little world to be a thief, is very well described. They had made no doubt a great mistake in marrying on 170*l.* a year, but, though a very imprudent, they are nevertheless a very charming couple, and are sure to be liked. We must congratulate the authoress on having produced a work in every way equal to her *Runaway* of last year.

Women in Sacred History, by Harriet Beecher Stowe. Illustrated with fifteen chromo-lithographs (Sampson Low and Co.). We cannot say very much for this work. Mrs. Stowe's "object" is, as she tells us, "to show in a series of biographical sketches a history of Womanhood under Divine Culture, tending towards the development of that high ideal of woman which we find in modern Christian countries." She is helped in her object by a series of chromo-lithographs, selected for their "aptness of design and a rich variety of effect." Mrs. Stowe's narrative is certainly more interesting than the ordinary sermon, but the chromo-lithographs, on the other hand, are far more gaudy than the ordinary painted glass in some modern churches.

From Messrs. De La Rue we have received the usual selection of diaries and pocket-books, as admirable in their binding as they are astronomical in the information they impart. Not but that the editor duly considers the infirmities of those who are chiefly concerned with this earth, for he not only informs them at what time the occultation of B.A.C. 7077 will be visible at Greenwich, but also lets them know on what days the China mail starts.

From Messrs. Marcus Ward and Co. we have, as before, the diary of the year conveniently divided into four parts, in such a way that no one need carry in his pocket more than the diary of the actual quarter. From the same publishers we have also the *Year and its Festivals*, a pretty little calendar designed by Walter Crane, and some highly decorated Christmas cards.

Punch's Pocket-Book contains as usual "a variety of useful business information." It would, however, be greatly improved if it were made in portions like Marcus Ward's. Not every one likes to carry about in his pocket for a whole year seventy pages of jokes which, at their freshest, were rather poor.

GERMAN LITERATURE.

THE story of the Protestant immigration into Prussia* is one of the most agreeable and instructive in modern records, and corresponds more perfectly than most to the definition of history as "philosophy teaching by example." It shows how one great State may be built up from small beginnings by an unswerving adherence to a just and beneficent policy; how another may be humbled and drained of its life-blood by an opposite course; and strikingly of all, how natural disadvantages and public calamities may become the sources of national welfare. The systematic encouragement of foreign immigration into Prussia took its rise from the fearful devastations of the Thirty Years' War, and, reacting on the foreign policy of the Government, largely contributed to the assumption by the latter of the part of leading champion of Protestant interests on the Continent. Similar causes produced similar results after the almost equally ruinous Seven Years' War; while the necessity of attracting foreigners by liberal legislation powerfully promoted the adoption of enlightened maxims of administration. The indirect benefit of the immigration was thus even greater than the direct; while the positive addition made by the new settlers to the numbers, wealth, and intelligence of the population was very considerable. The circumstances under which the various settlements were formed, and the history of the colonists, now almost entirely

* *Hohenzollernsche Colonisationen. Ein Beitrag zu der Geschichte des preussischen Staates und der Colonisation des östlichen Deutschlands.* Von Dr. Max Bohn-Schwarzbach. Leipzig: Duncker & Humblot. London: Williams & Norgate.

absorbed into the general mass of Prussians, are narrated by Dr. Beheim-Schwarzbach with great circumstantiality and perspicuity. Less effect was probably produced by the direct and systematic efforts of the Brandenburg princes than by the steady influx of refugees, subjected rather to perpetual uneasiness than to absolute persecution by their Catholic rulers. Among immigrations *en masse*, the most remarkable was that of the Huguenots expelled from France on the revocation of the Edict of Nantes, and, after this, that of the Tyrolean refugees from Salzburg. The Vaudois likewise found a home in Brandenburg; and Protestant intolerance also contributed its recruits in the persons of the harmless Mennonites, banished from Switzerland. Dr. Beheim-Schwarzbach's history is not only written with ability and good taste, but from its ample details of the regulations proscribed by the authorities, is a valuable contribution to the science of colonization; while its copious statistical tables afford the best means of tracing the history of the respective settlements.

"The Staff Officer's" narrative of the operations of the German army during the late campaign, from the action at Weissenburg to the battle of Gravelotte, is manifestly the work of a very competent writer. It is, however, one of those dry professional histories which may be consulted with advantage by military students anxious to ascertain the exact position of every corps at any given quarter of an hour during an engagement, but offers nothing calculated to interest general readers.

Baron von Maltzan† is one of the most instructive of travellers, and, when his subject admits of being rendered amusing, one of the most entertaining also. It is not his fault that the most original portion of his last volume of travels should also be the driest. No human ability could impart much interest to the obscure details of the tribal organization of Yemen and Hadramaut, unless these were seasoned with a spice of lively personal adventure. The Baron's information, however, is principally collected at Aden, although his good sense and thorough knowledge of Arabic are guarantees of its value. It is gratifying to find the testimony of the adventurous and ill-used Wrede confirmed in all material respects. Attention has recently been directed to these neglected districts in consequence of the revival of the Ottoman power in Arabia—an unforeseen consequence of the opening of the Suez Canal. At the time of Baron von Maltzan's visit, the Sultan's influence in Hedjaz was a mere shadow; the Turkish officials, though treated with respect, were utterly impotent, and all real authority was in the hands of the Sheriff of Mecca. In Yemen, however, matters appeared ripe for a change, the oppressions of the petty Arab chiefs being almost intolerable to their subjects, who are for the most part settled residents, unable to remove beyond the reach of their exactions. There is, however, no reason to doubt that with proper firmness England may regulate these affairs as she pleases. The latter part of Maltzan's volume contains a full account of the geography of the various chieftainships in the vicinity of Aden, especially that of Lahej, to which the Gibraltar of the East originally belonged, and a history of British relations with this and other contiguous principalities. His account of Aden is probably the fullest of any extant; it is also extremely entertaining. The latter commendation is equally merited by his descriptions of Egypt, Masuah, and Jidda; everywhere we meet with the same lively style and ease of treatment, dependent not upon superficiality, but upon thoroughness of knowledge. His views of Islam are by no means favourable; he regards it as an invincible obstacle to all progress; at the same time the recent influx of European ideas into Egypt has, he considers, only served to convert stagnation into putrescence. The educational and philanthropic displays of the Government are pronounced to be for the most part mere pretences. The Khedive is a man of considerable capacity, but otherwise neither better nor worse than other modern Oriental sovereigns, all of whom affect the part of civilizers for their personal emolument, and in order to impress the public opinion of Europe, while in fact the ancient maxims of administration remain totally unchanged.

Notwithstanding our concern in the Ashantee war, the Germans are beforehand with us in producing a clear and interesting digest of information respecting Upper and Lower Guinea, prepared from the narratives of the principal explorers during the present century, and profusely and beautifully illustrated with wood engravings. Richard Oberländer's "West Africa"‡ is, indeed, merely a compilation, of no extraordinary literary pretensions yet executed with sound judgment, and reproducing the observations of many travellers whose works are hardly known in England. Among these are General Faidherbe, the governor of French Senegambia, since so distinguished in the war of 1870; Mago, the subsequent adventurous explorer of the head waters of the Niger and Senegal, and Ladislaus Magyar, the Hungarian, whose field of operations near Bihe, save for an occasional contact with Livingstone, is nearly peculiar to himself; Mungo Park, Baikie, and Du Chaillu are also drawn upon; perhaps too much space is accorded to the latter. Ashantee, Dahomey, Abbeokuta, and Liberia are not forgotten; the political

as well as the geographical information is brought up to the most recent date; and the woodcuts, both in number and in quality, surpass all that could have been expected at the price of the book.

Great must have been the love of enterprise which carried the well-known African traveller Von Heuglin* from Abyssinia to Nova Zembla, and we can only regret that the Arctic voyage of the *Germania* in 1871, to which he attached himself, should have been so unproductive of results. We cannot, indeed, discover that it yielded any geographical result whatever. The original design of pressing along the Siberian coast, so far at least as the mouth of the Obi, was frustrated partly by the unfavourable season, partly by the defects of the vessel, though constructed expressly for the Arctic navigation; partly, as Herr von Heuglin seems to imply, by the unenterprising spirit of the commander. The achievements of the expedition seem to have been almost confined to scientific, chiefly botanical, observations on Nova Zembla and the islands off the Siberian coast; which at least attest Herr von Heuglin's assiduity in making the most of his scanty opportunities, and are by no means devoid of interest. He states, for example, that the vegetation of Nova Zembla is decidedly in a progressive condition, both as regards the number of species and the area occupied by them. The volume is further eked out by a serviceable summary of the past history of discovery in Nova Zembla.

Gottfried Arnold† was one of the more conspicuous adherents of that pietistic reaction against the dryness and formality of Lutheranism which broke out in Germany towards the end of the seventeenth century. The movement presents some obvious analogies to Methodism in England, but, being confined within the walls of the churches, never obtained anything like the influence of the latter. Its leaders were also in general characterized by a mystical and contemplative spirit, rather tending to the formation of separate conventicles than to a transformation of the Church at large. Arnold appears to have had his full share of this quietism, and to have been, moreover, a difficult man to co-operate with under any circumstances. His principal work was an ecclesiastical history, which excited the most virulent animosity on the part of the orthodox. The contentions thus occasioned embittered a large portion of his life, but he eventually found repose in a country pastorate. He was also eminent as a writer of hymns. His biography is an interesting contribution to our knowledge of German Protestantism at the period, and the movement with which he was connected may be usefully compared with that attempted a century later in the Roman Church by Bishop Sailer and his circle.

Thilo's History of Modern Philosophy‡ offers a condensed but ample survey of all the principal philosophical systems, from Descartes to Herbart, of whom he professes himself a follower. The plan of the work includes ethics as well as metaphysics; such English moralists, therefore, as Clarke and Hutcheson receive a degree of attention not always accorded to them in Germany. The book would be well adapted to its object if exposition did not too frequently pass into controversy.

A complete edition of Schopenhauer's works§, under the editorship of "the apostle," Julius Fraenckstädt, will be a welcome addition to philosophical libraries. The first volume, however, only contains, of Schopenhauer's own writings, the abstruse essay *Ueber die vierfache Wurzel*, &c., and the Treatise on Colours. The remainder is occupied by a memoir and a preliminary disquisition, in which the editor, feeling perhaps that his services to his instructor's memory have hitherto been of a somewhat questionable character, claims for him the origination of many of the most characteristic principles of modern scientific investigation, and defends his system against the objections raised by Bona Meyer, Zeller, and others. The memoir is fairly executed, but contains no new matter. It is perhaps all that the purchasers of a collected edition of the works are entitled to claim, but is no substitute for that little gem of biography, the Life by Gwinner, on which it is mainly based, and whose language is frequently reproduced verbatim.

Under the unpromising title of "Schopenhauer as a Scholastic," || a writer calling himself "Moritz Venetianer," and belonging to the rising school of Von Hartmann, has composed a most pungent castigation of the Frankfurt sage, who would be exceedingly disgusted to find himself classed along with the very philosophers whom he is never weary of denouncing as sophistical corrupters of Kant. It might console him to find Kant comprised in the same sentence, and indeed the work is practically an attack upon Kant, who, having swayed the sceptre of philosophy for a century, is now called upon to resign it to Von Hartmann. The writer has paid Schopenhauer the compliment of going to school to him so far as style is concerned, and his vigorous assault is rendered still more lively by copious quotations from the incriminated philosopher himself.

The freedom of quotation in the New Testament from the Old has at all times been a subject of remark. Professor Böhl* seeks to explain it on the hypothesis of a popular translation from the Hebrew Scriptures into the colloquial Syriac, from which he supposes the quotations in the New Testament to be made. This translation, he thinks, corresponded in essentials with the Septuagint, and was executed at the same time. The variations of the New Testament quotations from the Septuagint text are thus explained by their being rendered directly into Greek from the Aramaic equivalent of the latter. The hypothesis is certainly a very convenient one, but Professor Böhl seems to require another equally convenient to account for the total disappearance of his Syriac version, of the existence of which, moreover, he has produced no evidence.

Dr. P. Nietzsche† appears to be what in England might be termed an Adullamite, who has set up a "cave" from which he proposes to deliver himself periodically of what, having regard to their presumable unpopularity, he entitles unseasonable reflections upon men and things in general. A man of parts can hardly hit all round without planting an effective blow somewhere, and in his first essay, devoted to Strauss's recent work, he directs some smart attacks against that author's complacent optimism, and, a matter more capable of direct demonstration, the inaccuracies of a style which lays claim to classic purity. Both criticisms may be well founded to a certain extent; yet cheerfulness is probably better than discontent, and Strauss is certainly more readable than Dr. Nietzsche, who writes ably indeed, but has neither the passion nor the pungency of his models Lassalle and Schopenhauer, and rather creates the impression of a moody Momus.

Professor Overbeck's‡ work on "the Christianity of our present Theology" is also mainly called forth by Strauss's treatise, and, while admitting the freest theological criticism in principle, contains some stringent criticisms on Strauss's practical application of his views in his section on the regulation of human life. So far as we can understand the Professor's own conceptions of the Christianity of modern theology, it rests upon an implied contract between the pastor and his flock corresponding to that between Frederick the Great and his people, in virtue of which he is to say what pleases them, and to think as pleases himself.

Rudolf Westphale§ Comparative Grammar of the Indo-Germanic Languages is a work terrifying to all except profound philologists, and may probably terrify some of them if, as we imagine, he contravenes several accepted doctrines. All we can venture to say is that, right or wrong, he evidently has a firm grasp of his subject, keeps his team of languages fairly abreast, and has prefixed a general survey of the members of the Aryan family of speech which might be reprinted separately as a compendious introduction to the subject.

Dr. Julius Jolly|| investigates the various forms which the infinitive has assumed in the Indo-Germanic languages, and also enumerates the views of grammarians respecting it, from the days of Panini to our own.

The leading object of Professor Pfaff's¶ work on geology is to determine whether geology in its present state can be regarded as an exact science. The reply is less explicit than one would have expected from a Professor of Geology. No science, he says, so abounds with theories as yet neither fully confirmed nor finally disproved; or with theorists who regard lack of absolute refutation as tantamount to positive truth. We must say that we observe, and not merely in geology, a growing and perilous propensity to shift the *onus probandi* from the advocate of a proposition to its opponents. Dr. Pfaff seems for his part more impressed with the difficulties than with the allurements of all theories, and lays chief stress whenever practicable on actual experiment. His volume is chiefly devoted to the more difficult problems of geology, such as terrestrial gravity, the igneous or sedimentary formation of rocks, the causes of elevation or depression, &c.

Professor Wundt's work** is a new and an important witness to the need now generally felt for basing psychology as far as possible upon physiological research. The technical character of the work forbids us to enter upon it more at length.

Professor Eugene Petersen's†† treatise on the "Art of Pheidias" consists principally of an investigation of the friezes of the Parthenon, with the view of reconstituting them as far as possible after the descriptions of Pausanias, the drawings of Cayrey, and the deductions derived from the remains yet extant. The author

acknowledges himself largely indebted to the great work of Professor Michaelis, although his own labours were begun and originally completed independently. The latter part of the book is devoted to Pheidias's colossal statue of Zeus at Olympia.

Friedrich Spielhagen's last novel* has the merits of brevity, dramatic force of situation, and fidelity to nature. It must be added that the nature represented is of a very unattractive and even repulsive character. "Ultimo" in the language of the German Stock Exchange signifies "settling day"; and the story moves throughout, not merely in a sordid, but in a rascally atmosphere of speculation and vulgar greed. The most offensive personage of all is the hero, the only conspicuous character not connected with finance, and the most mercenary and heartless of any. The moral standard of the tale, in fact, is nearly that of Thackeray's most cynical satires, with the difference that what Thackeray holds up to contemptuous reprobation, Spielhagen apparently accepts as natural and in order. The story is nevertheless so powerful and so well told that it raises the character of German fiction almost as much as it depresses that of German society.

Though written in English, Mr. Charles Grant's *The Charm and the Curse*† may rank among German books from the subject and place of imprint, as well as from the virtual naturalization of the author in Germany. Mr. Grant's gifts are rather those of a poet than of a dramatist; he does not evince much skill in the delineation of character; but his diction, always dignified, is frequently highly poetical, and his versification is harmonious and sonorous. The great fault of his fine dramatic poem is the incongruity between its polished speech and refined sentiment and the rugged barbarism of the characters to whom these are ascribed.

* *Ultimo, Novelle*. Von F. Spielhagen. Leipzig: Staachmann. London: Williams & Norgate.

† *The Charm and the Curse*. A Tale dramatized from the *Edda*. By Charles Grant. Jena: Frommann. London: Williams & Norgate.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

THE UNITED STATES.

The Annual Subscription to the SATURDAY REVIEW, including postage to any part of the United States, is £1 10s. 6d., or \$7 50 gold, and may be forwarded direct to the Publisher, at the Office, 38 Southampton Street, Strand, or to Mr. B. F. STEVENS, American Agency, 17 Henrietta Street, Covent Garden, London. International Money Orders can be sent from any office in the United States, and Subscriptions, payable in advance, may commence at any time.

Nearly all the back Numbers of the SATURDAY REVIEW may be obtained through any Bookseller, or of the Publisher, at the Office, 38 Southampton Street, Strand, W.C., to whom all Communications relating to Advertisements should likewise be addressed.

The SATURDAY REVIEW is duly registered for transmission abroad.

The publication of the SATURDAY REVIEW takes place on Saturday Mornings, in time for the early trains, and copies may be obtained in the Country, through any Newspaper, on the day of publication.

Now ready, VOLUME XXXV., bound in cloth, price 10s. Cloth Cases for Binding all the Volumes, price 2s. each. Also, Reading Cases, price 2s. 6d. each. May be had at the Office, or through any Bookseller.

ADVERTISEMENTS.

ARUNDEL SOCIETY'S COLLECTION of COPIES from
the ANCIENT MASTERS, including the celebrated Altar-Piece by Memling, at
Lubeck, ON VIEW daily at 21 Old Bond Street, W.

FAC-SIMILES in COLOUR of the ARUNDEL SOCIETY'S
DRAWINGS are sold to the Public as well as to Members. Prices from 10s. to 40s.
Lists sent on application to 21 Old Bond Street, W.

THE PAYMENT of £1. 1s. as an Entrance Donation to the
ARUNDEL SOCIETY constitutes Membership for Life. Members can purchase the
Publications at a lower Price than the Public. Circulars are sent on application to 21 Old
Bond Street, W.

THE SOCIETY of PAINTERS in WATER-COLOURS.—
The TWELFTH WINTER EXHIBITION of SKETCHES and STUDIES by the
Members is now OPEN at their Gallery, 5 Pall Mall East. Ten till Five. Admission, 1s.
ALFRED D. FRIPP, Secretary.

DORÉ'S GREAT PICTURE of "CHRIST LEAVING the
PRETHICUM," with "Night of the Crucifixion," "Christus Martyr," "Jesus on
the Mount of Olives," "Noah's Ark," "The Last Supper," &c., at the DORÉ GALLERY, 35 New Bond
Street. Ten till Six. Admission, 1s.

ELIJAH WALTON. EXHIBITION of OIL PAINTINGS
and WATER-COLORED DRAWINGS. Alpine, Eastern, Norwegian, &c. OPEN until
December 24, at Burlington Gallery, 191 Piccadilly. From Ten till Dark. Admission, with
Catalogue, 1s.

AUTOTYPE GRAND FINE ART GALLERY. ON
VIEW, AUTOTYPE FACSIMILES of the Oxford Drawings, Lower Pictures and
Ancient and Modern Masters. Christmas subject. 26 Rathbone Place (next to Winmar &
Newton's).

"THE SHADOW OF DEATH." Painted by Mr. HOLMAN.
Now on View from Ten till Five. 30 Old Bond Street. Admission, 1s.

CHRISTMAS LECTURES.—ROYAL INSTITUTION of
GREAT BRITAIN, Albemarle Street, Piccadilly, W. Professor TYNDALL, D.C.L.,
F.R.S., will deliver a Course of SIX LECTURES, adapted to a juvenile Audience, on "The
Motion and Sensation of Sound," commencing on Saturday, December 27, at Three O'Clock; to
be continued on December 30, 1873, and January 1, 3, 6, 8, 1874. Subscription to this Course,
One Guinea. Held on under sixteen. Half a Guinea to all the Courses in the Season. Two
Guineas. Tickets issued daily, between Ten and Four.

UNIVERSITY of LONDON.—MATRICULATION EXAMI-
NATIONS, 1874.—The Course of PRIVATE and CLASS LESSONS for the next June
Examination, under the direction of the Rev. PHILIP MAGNUS, B.Sc., B.A., will COM-
MENCE the first week in February. Address, 4 Portico Road, W.

THE LONDON INTERNATIONAL COLLEGE.—Principal,
Dr. LEONHARD SCHMIDT, F.R.S.E., late Rector of the High School, Edinburgh.
The WINTER TERM will commence on Monday, January 13, 1874. Applications for
admission to be addressed to the PRINCIPAL, at the College, Spring Grove, near Fawcett,
Middlesex.

THE EASTBOURNE COLLEGE.
Established 1867.
President.—His Grace the Duke of DEVONSHIRE, K.G., &c. &c.
Visitor.—The Lord Bishop of CHICHESTER.

Head-Master.—The Rev. THOMPSON POMEROY, M.A., First Classman in Classics, and late
Fellow of St. John's College, Oxford.
Master, Modern School.—The Rev. G. R. GREEN, M.A., late Scholar of Lincoln College,
Oxford.

The ensuing Term will commence on Thursday, January 22 next. Boarders to return
the previous afternoon.
For particulars apply to the HEAD-MASTER, or the Secretary, Major GARRARD, The
College, Eastbourne.

TRINITY COLLEGE, EASTBOURNE.
Master, Rev. JAS. R. WOOD, M.A.
The NEXT TERM commences on January 17.

MALVERN COLLEGE.
President and Visitor.—The Lord Bishop of WORCESTER.
Head-Master.—The Rev. ARTHUR FAHER, M.A., late Fellow and Tutor of
New College, Oxford.

There are two Departments—the CLASSICAL and the MODERN. Pupils are trained for
the Universities, the Civil and Military Examinations, and the Professions.
There is a LOWER SCHOOL preparatory to either Department, a Gymnasium, &c.
There are five Boarding-Houses within the College Grounds occupied by the Head-Master
and four of his Resident Staff.
Board and Tuition under Fourteen, £30; over Fourteen, £35. For Non-Scholarship
extra Fee of £5. Special advantages for Sons of Clergymen and House Boarders.
For further information, apply to the HEAD-MASTER.
The Next Term will begin on Monday, January 20.

MALVERN COLLEGE.—The next TERM will begin on
MONDAY, January 20, 1874.

BRIGHTON COLLEGE.
President.—The Earl of CHICHESTER.

Principal.—The Rev. C. BIGG, M.A., late Senior Student of Ch. Ch. Oxford.
There are special Modern Forms affording every necessary preparation for the India or Army
Examinations. The School is well endowed with Exhibitions. FOUR SCHOLARSHIPS, of
about £10 a year, will be awarded by open competition in January.—Apply to the Rev. the
SECRETARY.

CHRIST'S COLLEGE, Finchley, London, N.
Rector.—The Rev. T. H. WHITE, M.A., St. John's College, Cambridge.

Head-Master.—The Rev. R. W. GALLUP, M.A., Lincoln College, Oxford.
This SCHOOL, so successful in preparing for the Universities, the Indian, Woolwich,
and various Civil Service Examinations, and for Professional and Commercial life, RE-OPENS
on January 21. Prospectuses and Honour Lists may be obtained on application to the
SECRETARY.
N.B.—The Profits of the College are solely employed for the good of the Institution.

EXHIBITIONS.—CHATHAM HOUSE, Ramegate.—An
EXAMINATION will be held January 20, to award FOUR ENTRANCE EXHIBI-
TIONS, value £25, tenable for Two or more years.—Apply to Rev. the HEAD-MASTER.

WOOLWICH and ARMY DIRECT.—Rev. Dr. HUGHES
(Wragg, Cam.), who, with "Twenty Years" experience, has passed 300 (and last September,
for Woolwich), receives a few PUPILS expressly for the above.—Castlebar Court, Ealing, W.

ARMY CONTROL COOPER'S HILL, &c.—Mr. W. M.
LIFEY (Author of "English History and Arithmetic for Competitive Examinations")
PREPARES CANDIDATES for the above, at 5 Rathbone Place, Oxford Street, and at
Bedford House, South Hill Park, Hampstead, N.W.

GARRICK CHAMBERS.—LECTURES will be RESUMED
on January 2, 1874. The Honour List for the years 1868-73 contains the Names of 121
SUCCESSFUL PUPILS, appointed to the following Departments:—

- 57 to the Civil Service of India.
- 12 to Attachments in the Diplomatic Service.
- 14 to the Foreign Office.
- 14 to other Superior Offices of the Home Civil Service.
- 11 to the Ceylon Service and to Chinese Interpretships.
- 3 to the India Engineering College.

Of this number 33 gained the First place in their respective Competitions.
The List may be had on application by letter to the LITERARIAN, Garrick Chambers,
Garrick Street, London.

COOPER'S HILL COLLEGE.—TWENTY-FOUR of Mr.
ASHTON'S PUPILS have passed into the College since the Opening in 1871. Last July
Ten were sent up, and EIGHT passed.—24 & 25 King Henry's Road, S. Hampstead.

NAVAL CADETSHIPS.—EASTMAN'S
R.N. ACADEMY, SOUTHSEA.

At the last Naval Cadet Examination One-Third of the Successful Competitors passed
from Eastman's R.N. Academy. Pupils are received from Eight years of age and upwards.

AN OXFORD B.A., an Honour Man, and Scholar of his
College, desires a TUTORIAL ENGAGEMENT.—Address, A. H., Mr. Wakeling's,
Royal Library, Brighton.

CARSHALTON HOUSE, Surrey.—PREPARATION for
Woolwich, the Line, the Navy, the Indian, Civil and Forest Services, as well as for
Matriculation in Oxford, Cambridge, and London.—Terms moderate.

BERWICK GRAMMAR SCHOOL.—HEAD-MASTER
WANTED.—There being a VACANCY in the HEAD-MASTERSHIP of the above
School, Gentlemen who may desire to obtain particulars with a view to becoming Candidates
for the Office are requested to apply to the Underigned.

The Appointment will be made early in January next, so as the new Master may enter on
his duties at the close of the Christmas Vacation.

By Order of the Trustees,
Ravensdowne, Berwick-upon-Tweed,
December 8, 1873. H. J. WILLIAMS, Clerk.

AS DAILY GOVERNESS.—An Experienced LADY desires
a RE-ENGAGEMENT in London or within 12 miles. Accomplishments—advanced
English, fluent French (acquired in Paris), Music, Singing, Drawing, and the rudiments of
Latin. Highest testimonials. Liberal salary.—Address, M. S., 2 Compton Street, Regent
Square, W.C.

PUBLICATION of EDUCATIONAL WORKS.—AN
AUTHOR desires of bringing their WORKS under the direct notice of the
SCHOLASTIC PROFESSION are informed that RELIEF BROTHERS have unusual
opportunities of assisting them in this respect, as their Travellers, who visit the greater part of
England twice a year, call on all the Principal Educational Establishments in the Kingdom,
and by this means introduce in the most efficient way all Books committed to their care.
6 Charterhouse Buildings, Aldersgate, E.C.

OLD ARTIFICIAL TEETH wanted to PURCHASE.—
Persons having the above to SELL can apply "with the Teeth," or if forwarded by post
their value will be sent per return.—Messrs. BROWNLEE, 5 Chisworth Street, Westbourne
Terrace, London; and 11 Booth Street, Piccadilly, Manchester.

HYDROPATHY.—SUDBROOK PARK, Richmond Hill.
Physician.—Dr. EDWARD LANE, M.A., M.D., Edin. Turkish Baths. Consultations
daily (Saturday excepted) at 7 Prince Street, Hanover Square, from Ten till Twelve.

BRINDISI MAIL ROUTE to Egypt, India, China, Aus-
tralia, Rome via Palermo, Naples via Foggia, Shortest and Cheapest Route.
For Through Tickets and information, apply to the South Italian Railway—Agents,
LEBEAU & CO., 11 Bull Street, London, E.C.

MADEIRA.

THE PACIFIC STEAM NAVIGATION COMPANY'S
ROYAL MAIL STEAMERS.

Sailing from Liverpool every Wednesday, Bordeaux every Saturday, and Lisbon every
Tuesday.

Call at Madeira to land and embark First and Second Class Passengers only.

For Rates of Fare and other particulars apply to N. GUTHRIE, TAYLOR & CO., Fenchurch
House, Fenchurch Street, London; MACLEOD, MACLEOD & CO., Exchange Square,
Glasgow; or at the Offices of the Company, 31 James Street, Liverpool.

W. J. CONLAN, Secretary.

THE PALL-MALL.—This RESTAURANT is REMOVED to
more Spacious and Commodious Premises.
14 REGENT STREET, WATERLOO PLACE.

Embracing the late Gallery of Illustration, which is now available for Regimental Dinners
and similar Parties.

Entrance to Private Rooms in Carlton Street, adjacent.
Open for Suppers, as before, under an Examination License.

BRIGHTON.—BEDFORD HOTEL.—Every endeavour is
made to render this Hotel equal to its long-standing repute. Spacious Coffee Room for
Ladies and Gentlemen. Sea-Water Service in the Hotel. Communications to the
MANAGER, Bedford Hotel Company, Limited.

BERLIN PHOTOGRAPHIC COMPANY.—The largest
Collection of ORIGINAL PHOTOGRAPHS from ANCIENT and MODERN
PAINTINGS.

Sole Depot.

T. GERSON, 5 Rathbone Place, Oxford Street, W., and 40 Cornhill, E.C., corner of
Gracechurch Street.

NOTICE.—At T. GERSON'S Depot, 71 London Wall, E.C., the remaining Stock of
Miscellaneous Photographs will now be sold at greatly reduced prices.

BENNETT'S WATCHES.—Cheapside.

BENNETT'S GOLD PRESENTATION WATCHES. 10 gs.,
20 gs., 30 gs., 40 gs.

BENNETT'S LADIES GOLD KEYLESS WATCHES,
from 10 gs.

BENNETT'S SILVER WATCHES, with Keyless Action,
from 8 gs.

BENNETT'S HALF-CHRONOMETERS, compensated for
variations of temperature, adjusted in positions, with Improved Keyless Action.

BENNETT'S 18-carat, Hall-marked CHAINS and choice
JEWELLERY. Free and safe for Post Office Order.

TO CLOCK PURCHASERS.—JOHN BENNETT, having
just completed great alterations in his Clock Show Rooms, is enabled to offer to purchasers
the most extensive stock in London, comprising Clocks for the Drawing, Dining Rooms, and
Presentation, of the highest quality and newest designs.

JOHN BENNETT'S WATCH and CLOCK MANUFACTORY,
at 25, Cheapside.

CHINA for CHRISTMAS.—MORTLOCK'S, Oxford Street and
Orchard Street.

POTTERY for CHRISTMAS.—MORTLOCK'S, Oxford Street
and Orchard Street.

GLASS for CHRISTMAS.—MORTLOCK'S, Oxford Street
and Orchard Street.

MINTON'S ART POTTERY.—MORTLOCK'S, Oxford Street
and Orchard Street.

WORCESTER PORCELAIN.—MORTLOCK'S, Oxford Street
and Orchard Street.

THE LARGEST SELECTION in EUROPE—SERVICES
of every Description, from the least expensive. Discount on all Cash Payments.
One Room specially arranged with small tables suitable for Conversation.

JOHN BENNETT, Pottery Galleries, 25, Cheapside, and 25, Orchard Street,
Orchard Street, Tottenham Square, W.

THE FRENCH BUDGET.

THE proposals of M. MAGNE for the Budget of 1874 have now been presented in such a shape that the public whom they affect can study them with ease; they have been submitted to the criticism of a Committee, and are being slowly discussed by the Assembly. The main point of interest lies in the consideration of the means by which the deficit of six millions sterling is to be filled up. All parties are agreed that it must be filled up, however hardly the necessary taxes may bear on the country, and it may be observed that, in spite of all that has been truly said of the wealth of France, and the economy and industry of Frenchmen, the country generally is now passing through a time of severe trial, and at Paris especially there is much actual suffering and want. It is not therefore surprising that M. MAGNE and his numerous critics should find it hard to agree as to what new taxes are possible without crushing those who already find it hard enough to live. M. MAGNE, after making every reduction in expense that he thought possible, and having induced his colleagues to reduce their demands on the Treasury by a sum not far short of two millions sterling, found that he had still six millions to make good. He also found that scarcely any new taxes could be invented. It was only after long consideration that he rejected the notion of taxing manufactured products. A special Council was appointed in the Ministry of Finance to determine how these products could be taxed, and to estimate what would be the probable yield; and no proof could be more striking of the difficulty of putting on new taxes, and of the degree in which sanguine expectations fade away when practical difficulties are taken into account, than that which is afforded by the results at which this Council arrived. At first it was estimated that a tax on manufactured tissues would give four millions sterling a year; then, on consideration, this estimate was brought down to a trifle more than two, then to one and a half, and at last it became clear that during the first two years it would give nothing at all, as the receipts would be spent in the cost of collection. M. MAGNE was thus obliged to look almost exclusively to an augmentation of existing imposts. He proposed to obtain 83 millions of francs by the addition of a half-decimo on registration duties, on sugar, liquors, salt, and transport of merchandise by slow trains. Further he proposed to obtain 65 millions of francs by an increase of the duties on extra-judicial acts, on bills, on cheques, on the transmission of liquors, on mineral oils, and to augment certain charges made in the Post Office. By the increase of existing taxes he estimated that an annual revenue of about 120 millions of francs would be obtained, or nearly five millions out of the six millions sterling that he wanted. Somewhat more than one million sterling was to be obtained by the imposition of new taxes on salt used in the manufacture of soda, on vegetable oils, on candles, and on letters re-directed; and if all his proposals were accepted, he assured his countrymen that, to the best of his belief, not only would all the immediate financial wants of France be provided for, but his Budget would leave him with a surplus of more than fifteen millions of francs.

The French Parliamentary system subjects the Budget to a criticism far more elaborate than anything that is known in England. Here we do our financial work for the most part in a very easygoing way. If any set of people is much aggrieved by the Minister's proposals, and can get itself together quickly enough, as the matchmakers did, it may be able to stop what it thinks will be a grave injury to its interests. A Minister, too, feels the opinion of the House, and pretty much anything that he finds will not do, or the whole business is raised into a party question, and a Govern-

ment stands or falls as it succeeds or not. In France a Committee goes through every detail, looks into the estimated expenditure and receipts, examines any new taxes that may be asked for, and reports for or against each portion of the Ministerial scheme. The French system might at first seem better than ours, for it subjects the Government to a check applied in detail, and detail is the essence of finance. There would appear to be a considerable advantage in having a large portion of the Assembly instructed in finance and made to see its practical bearings, and no doubt those members of the French Committee who really work hard at their duties have an opportunity of learning how the country stands financially which is denied to all but the occupants of office in England. But the difficulty is to get the members of the Committee to attend, and often when the Committee has recently met to discuss M. MAGNE's proposals, the attendance has very little exceeded one-third of those entitled to be present. The Committee, too, has one source of weakness which it finds it difficult to surmount. It can agree with the Minister, which is easy enough, or it can positively disagree with him, which is not very hard work; but if it half agrees and half disagrees with him, it can but ask him to attend and argue with it, and the Committee can do its best to persuade him. But if the Minister is firm, and the point at issue is not of very great magnitude, and something is to be said on both sides, the Assembly which must decide between the disputants is tolerably sure to go with the responsible official, backed by the existing Government, and not with the irresponsible critics. The Committee on M. MAGNE's Budget accepted the principle that the deficit which incontestably existed must be filled up by taxation, and to some of his proposals for getting additional money it offered no objection. But it would not agree to sanction the imposition of a half-decimo on the transportation of goods by slow trains, nor the augmentation of the duties on bills and cheques, nor the new impost on salt used for soda. It thus cut away 56 out of the 149 millions of francs for which M. MAGNE had asked, and the question arose how these 56 millions were to be replaced. The Committee began by taking advantage of M. MAGNE's estimated surplus. His Budget was to leave him with an estimated surplus of 15 millions of francs, and this the Committee proceeded to cut down to two millions. Thus they had to provide for 43 instead of for 56 millions. They proposed to get this amount, or one not far short of it, by doubling the proposed extra duty on salt. This would give 16 millions; but M. MAGNE, although it is said he is disposed to yield, might have been expected to resist this proposal most strenuously. In his Report he has anticipated it, and has rejected the notion of taxing salt beyond what it will have to bear if his scheme is accepted. It would, he says, be a proceeding very unjust and very onerous to the poorest classes; and as salt is really a necessary of life, it is startling to find that what the Committee proposes is to put on salt a tax nearly three times as great as the value of the article in England. The Committee also propose to augment the tax on receipts from passengers and goods sent by fast trains, and to put a new tax on soap, which together would give nearly eighteen millions, and they also suggest a tax on goods sent otherwise than by railway. It will be seen that the difference between the proposals of M. MAGNE and the Committee is not of a very radical character, and some means of reconciliation may probably be found; or, if not, the Assembly will scarcely hesitate to support the Minister, and free itself from the wearisome discussions to which the Budget gives rise.

The question of the mode in which new taxation is to be

levied has not yet come before the Assembly, but many of the heads of expenditure have been discussed there, and some points of interest have been raised. Considerable warmth of debate was excited by the discovery that one of the savings in the War Department consisted in not calling out the second contingent of recruits for the year. M. THOMAS, who was steadily opposed to the scheme of a national army raised by a general obligation to serve in the ranks, contrived to leave a loophole in the Bill which the Assembly insisted on passing, and made the calling out of the contingents discretionary with the Government. Those who hoped that service in the army had been made compulsory on the bulk of the male population were discomfited by discovering that there was this defect in their scheme, and that M. MACRY, in order to save five millions of francs, had obtained the postponement of the calling out of the contingent at the time contemplated in the Bill. France was quite rich enough, it was urged, to have as good and large an army as she pleased, and it was absurd to spoil a good scheme for so paltry a sum. Perhaps, however, the present French Government does not look with any great favour on a scheme which would give every able-bodied man a military training; not because it fears, as M. THOMAS feared, that this would spoil the army, but because it knows that the mass of the able-bodied male population has very little sympathy with it and its policy. As is always the case, the discussion of financial questions has led to the discussion of small matters of the greatest variety, for everything for which public money is asked may be made the subject of debate. M. GAYARDIE amused the Assembly by declaring that, if public money was to be spent on statues, it ought not to be spent on statues so very made as those which now adorn or disfigure Paris; and M. MACRY insisted with success on the claim of the miserably paid teachers of primary instruction to have their tiny pensions increased. By a large majority the Assembly agreed to place at the President's disposal a sum to be spent in entertaining at the Elysée this winter, the Ministry explaining however that this was not to be taken as any indication of an intention to remove the seat of the Assembly back to Paris. A new grant will also shortly be asked for, also with a political object; a bargain having been concluded between the PRESIDENT and M. ROCHER, acting for the EMPRESS, under which the EMPRESS, in discharge of the claims of the Imperial family for property purchased out of the EMPEROR's privy purse, but retained by the nation, is to receive by instalments a sum of 120,000*fr.* No one can grudge the EMPRESS having an addition to her income, but it may be suspected that she will owe her improved fortune not so much to the justice of her claim as to the conviction of the Government that the alliance of the BONAPARTISTS is worth purchasing. All these are, however, very trifling matters, and the main thing is that the financial position of France is now ascertained, and that the Budget will, in one way or other, be balanced out of revenue, although the extreme limits of what a French Government can ask the taxpayers to bear have been almost, if not altogether, reached.

SPANISH AFFAIRS.

THE Government of Madrid will have welcomed, in the dearth of other causes of satisfaction, the decision of the ATTORNEY-GENERAL of the United States against the claim of the *Virginias* to the protection of the American flag. It follows, not necessarily that the act of the *Turnado* was lawful, but that the Government of the United States suffered no affront by the original capture. It will therefore be no longer necessary to offer an apologetic salute to the American flag; and it is possible that the vessel may be surrendered to the Spanish Government. The reported demand for the restoration to Spanish custody of the surviving crew of the *Virginias* has probably not been preferred. The massacre of Santiago still requires atonement; and no civilized Power would incur the guilt of possible complicity in the renewal of similar atrocities. The Spanish part of the crew may possibly have been amenable to the jurisdiction of the authorities in Cuba on a charge of treason or of technical piracy under municipal law. The English and American seamen were assuredly not pirates under the law of nations; nor had they committed either a moral or legal offence which could justify the infliction of capital punishment. It is not known whether there is any pretext for the up-

founded and incredible rumour that the English Consul at Havannah had summoned the English fleet on the station to enforce a demand for the punishment of the delinquent Governor of Santiago. The English Government, though it has every right to insist on the dismissal of General BERNIER, is not in the habit of communicating either with its own naval officers or with foreign Governments through Consuls who are employed for entirely different purposes. Although the offence was perpetrated by colonial officials in Cuba, it is of the Spanish Government alone that redress can be demanded. Señor CASTELAR will desire to afford just satisfaction to a Government which he may probably wish to conciliate; nor can it be doubted that he profoundly disapproves of the crime committed at Santiago. If he requires a reasonable delay before he enforces the submission of the offenders in Cuba, the English Government will not be disposed to embarrass him by unreasonable urgency. It oddly happens that while the matter is still unsettled a report has been spread that England is about to be the first of European Powers to recognize the Spanish Republic. The question whether the Republic has proved itself a regular and stable Government will not be mixed up with any controversy which may arise from transactions in Cuba.

The temporary misunderstanding with the United States has incidentally relieved the Spanish Government from one serious cause of anxiety. It has become evident that even in circumstances of grave provocation, and notwithstanding the inflammatory language of irresponsible journalists, the American people has no inclination to encumber itself with the possession of Cuba. A Constitution founded on political equality can only be administered on the condition that the community shall be in some degree really equal and homogeneous. The enfranchisement of the negroes of the Southern States, though it was perhaps unavoidable, has subjected American institutions to a severe and lasting strain. Two or three additional States inhabited by bigoted Spaniards, by degenerate Creoles, and by African negroes, could not conveniently be admitted to share in the sovereignty of the American Union. The active measures of the Executive Government for the equipment of the navy may perhaps have indicated General GRANT's persistence in his avowed policy of extending on all suitable occasions the territory of the Republic; but warlike projects met with no support in the country or in Congress. It happened that, simultaneously with the amicable arrangement of the Cuban controversy, another of General GRANT's schemes of aggrandisement finally collapsed. The impudent adventurer BAZ, who took advantage of his elevation to the Presidency of St. Domingo to negotiate the sale of the Republic to the United States, has succumbed in one of the obscure revolutions which constantly recur in the former possessions of Spain. As it is also announced that the American cruisers have been recalled from the coast of San Domingo, it may be presumed that the PRESIDENT has abandoned his plans of annexation. Either in Cuba or in San Domingo, it is probable that the American dominion would have been advantageous to the inhabitants; but it was not worth while to entail permanent embarrassment on the United States for the purpose of trying the doubtful experiment of promoting the civilization of alien communities. Only ten or twelve years have elapsed since Spain resumed possession of San Domingo, to find by experiment that the burden of governing the colony outweighed the benefit. No long time will probably elapse before it will also be found convenient to retire from Cuba. The Spanish MINISTER for the Colonies is now investigating the condition of the island, and perhaps his report may induce his colleagues to doubt the expediency of maintaining in perpetuity the boasted integrity of the Spanish dominions.

The condition of the Republican Government in Spain has not lately been altered. Although Admiral CHICABRO has not found himself strong enough to co-operate in the siege of Carthagen, the attack on the land side has been prosecuted with increased vigour. Two generals have, with the laxity which is peculiar to Spain, successively resigned the command of the besieging force, but General LOPEZ DOMINGUEZ has, since his promotion to the command, advanced his works nearer to the fortress. A complete investment is impracticable, as the insurgents retain the command of the sea so far as to receive convoys of provisions, notwithstanding a nominal blockade. It is thought that the employment of Señor DOMINGUEZ, who is a nephew of Marshal SERRANO, possesses some political importance. Although Señor CASTELAR long since an-

nounced his intention of employing generals of all parties without reference to their opinions, he has not hitherto thought it prudent to entrust important commands to the professed adversaries of the Republic. The most experienced soldiers in Spain have necessarily served the Monarchy which lasted into the present year. SERRANO himself and the two CONCHAS might perhaps have succeeded in crushing the Carlist insurrection, and in reducing Carthagena; but a Royalist general at the head of a victorious army would have been a formidable rival to the Republican Ministry. If Admiral TOPETE's reputation is founded on professional merit and energy of character, it is scarcely possible that, as commander of the fleet, he should not have excelled the exploits of LOBO and CINCARRO. General DOMINGUEZ, who may probably share the opinions of his family, has the political merit of being comparatively unknown. If he fails to take Carthagena, no party will be compromised by his defeat; and even if he succeeds, he is not so considerable a personage as to be necessarily formidable to the Government. It would seem that, with the usual tolerance or negligence of Spanish administration, General CEBALLOS has not been punished nor even censured for the abandonment of his duty. It is added that the proceedings of Admiral CINCARRO are fully approved by the Government.

The insurgents and the besiegers continue to exchange defiance with the energy of Homeric heroes. General DOMINGUEZ, on assuming the command, announced in the middle of the bombardment that it would be his painful duty to adopt measures of severity if resistance was prolonged. On the other hand, the Junta has issued a windy proclamation in which the members of the Government of Madrid are denounced as rebels and traitors. The Cortes had, as the Junta declares, established a Federal Republic, and consequently the champions of cantonal independence are the genuine loyalists. It is not thought necessary to remember that the Cortes, who may be supposed to be the best interpreters of their own legislation, have temporarily devolved their powers on CASTELAR and his colleagues with a special commission to restore by force the unity of the Republic. It is to be presumed that the fine language which is always current in Spain produces some effect; and the manifestos of the Junta are almost as rhetorically imposing as the speeches of the legitimate representatives of the Republic. The insurgents can scarcely hope for ultimate victory and independence; and it is generally supposed that they are fighting against time. The Cortes were to meet, in default of a new prorogation, on the 2nd of January; and the uncompromising faction hopes, on grounds which are not apparent, to secure a majority for PI Y MARGALL as the successor of CASTELAR. It is thought with good reason that a politician who, when he was Minister, connived at open rebellion, would probably offer favourable terms to the insurgents of Carthagena. There is no intelligible reason for a change in the opinion of the Cortes who raised CASTELAR to power; but perhaps the majority may be tired of a suspension of its powers, or may desire a change for the sake of excitement. The strange rebellion which has lasted so long may probably be regarded in Spain with a toleration which would not be extended to treasonable folly in any other country. It cannot be denied that the leaders of the rebellion have displayed perseverance and courage. The most wanton insurrection, if it is not suppressed within a moderate time, approximates to a civil war; and to a certain extent the rebels are justified in their claim to be the orthodox exponents of Federalism.

THE WRONGS OF SCOTLAND.

MR. M'LAREN has been trying to get the Scottish lion to wag his tail in wrath, but the noble beast shows he is uncommonly well off, and his tail is as quiet as if he and it were moulded in bronze. The three and a half millions of human beings who make up the Scotch nation are at this moment the most flourishing body that exists in any part of the globe. They have all that man can want, and perhaps more than is always good for him. They have ample room and means of cultivation to indulge their virtues or their vices. They have coal, iron, fine harbours, abundant water communication, splendid scenery, excellent Universities, with primary education far ahead of that of England, intelligence, health, and wealth. They have their own way in everything. They drink oceans of whisky, they make their streets on Sunday resemble those of a buried city, they have a succession of castled hotels

swarming with Cook's tourists. With the utmost freedom of making themselves uncomfortable they combine advantages which are not indeed superior—for of all privileges, that of making himself uncomfortable after his special fashion is the most highly prized by man—but which are really very considerable. They go through life like ROUSSEAU DU through the glen. Each of them has but to sound his bagle, and three millions and a half of human beings, minus one, spring up out of the heather to back him, to job for him, and to state that they know his aunts, who are most respectable women. They alone of mankind can tell Scotch stories to each other in real Scotch; and this, if pleasure could be put into a pecuniary slupe, might be safely set down as worth five pounds a head. The size of the estates of some of their nobility is rather oppressive, and it would be a relief in going from Taymouth to Oban to hear some one talked of besides the Earl of BREADALBANE. But then, on the other hand, these large estates sometimes afford opportunities for most interesting experiments being tried on them. No English nobleman is such a prince in England as the Duke of SUTHERLAND is in Scotland; but no English nobleman could do what the Duke of SUTHERLAND is doing to reclaim and improve land, to create new wealth, to make a poor and backward population rich and intelligent. They have their own laws and their own legal language, which is the most unfortunate gibberish known to jurisprudence, but which at any rate is eminently national. A lawyer cannot help feeling an honest pride when he thinks that it is under a solemn treaty between two kingdoms that in the nineteenth century he is still able to state, as if he were giving intelligible information, that "the Lords assailed from the passive title, but reserved reduction." Then the Scotch have great Parliamentary privileges. Such alterations as have been made in the details of the Treaty of Union have been naturally and properly to their gain, and they return an increased number of members at the expence of England. Not only do they vote very much as they please, but they get distinguished strangers to run down from London and subject themselves to the very candid criticisms and ingenious catechisms of Scotch constituencies. They have their Sovereign to reside among them even at times of the year when her Cabinet often sighs over the distance that separates her from London. They have all the romance of the STUARTS for the purposes of songs, illustrated tea-trays, and local memorials, without any of the inconveniences of having successfully adhered to them. All these good things and a thousand others they have and know they have. But a Briton is far above owning that he has no cause of discontent, for that would subject him to the injurious imputation of having got all he deserves to get. He must grumble about something in order that he may assert his general rights against the human race, and so Mr. M'LAREN steps forward to keep his countrymen up to the mark, and suggests that they should make themselves unhappy because Ireland is better treated than Scotland by the Imperial Parliament.

The benefits of the Union have been common to both nations; and if the Scotch have gained by the consequent increase of wealth, security, and area for their activity, England has immensely benefited by its intercourse with Scotland, by the working of the Scotch intellect in English politics and economics, and by having a new national playground thrown open to it in the Highlands. But it may be worth noticing that, whatever may have been the political tendencies of the United Kingdom since the days of ANNE, they have always found their most intense expression in Scotland. The Union produced a state of things common to both countries, but it was in Scotland that this state of things was most conspicuous. The Union was the formal manifestation of the desire which really prevailed in the kingdom that Jacobitism, and the ideas associated with Jacobitism, should not get the upper hand. England rendered the Scotch the signal service of twice saving them from giving way too far to a mistaken enthusiasm for a bad cause. During the greater part of the eighteenth century, what England and Scotland really wanted and got was a season of internal repose under the Hanoverian sovereigns; and Scotland, which benefited most by that repose, contributed most to it in one way. It is a very curious thing that at no time after the Union did Scotch members ever give any trouble at Westminster. There never was a Scotch party prepared, merely as a Scotch party, to intervene and purchase concessions as the price of its adherence. Any one who chooses to look at the Parliamentary

history of the last century will find that he may turn over volume after volume without coming on the speech of a Scotch member. The Scotch members were as quiet as mice, and always ran in a gentlemanly steady manner after the crumbs that were thrown down to entice them, and show them which way to go. The principal reason for their modest and unassuming behaviour was, no doubt, that they were returned to Parliament according to a system of representation which even in Cornwall would have been thought artificial and absurd. They were the nominees of great men, and often, for the most part, of one great man. But still, in whatever way it came about, the result was that it was in Scotland, or by the help of the Scotch, that the desire for internal repose was most abundantly manifested and satisfied. After the Revolution in France, both Scotland and England were seized with a violent spirit of Toryism and reaction; but it was in Scotland that this spirit had its way most freely. It was in Scotland that there were the sharpest and severest dealings with the disaffected; and it was in Scotland that Whigs were most openly looked down on by Tories, as blackbattles might be supposed to be looked down on by their Divine Creator. At last the tide turned. There was a pacific revolution and Liberalism gained the ascendancy. The Reform Bill of 1832 changed England very largely, but it changed Scotland much more. It soon appeared that, of all parts of the kingdom, in this new Liberal era Scotland was the most Liberal. The Liberal party boasts of what it has done in the last forty years, and it has done much that it may well be proud of; but nothing helped it to surmount its difficulties so much as the unwavering assistance of Scotland. At this moment Scotland is the backbone of the Liberal party. A Liberal whip has not to trouble himself much about Scotch members. They are his pet sheep, who know his voice, and are sure to come when he calls them. Scotch constituencies, too, do not like any trifling. They want a Liberal member to behave as such, and to stick like a limpet to his Parliamentary leaders. When a member goes into his reasons for this and his reasons for that, and shilly-shallies about his support of Mr. GLADSTONE, Scotch electors feel an instinctive loathing for him, just as they might for a man who urged them to pause after the twelfth glass of toddy, or who described the Shorter Catechism as a wearisome composition. Liberalism, and what is more, Liberalism in office or claiming office as its peculiar inheritance, is the present most conspicuous fruit of the Union; and the Scotch now as heretofore take care that the fruit of the Union which for the time being is the most conspicuous shall flourish most profusely and ripen most perfectly on their soil.

At the beginning of this century these two united kingdoms found it convenient to take a third kingdom into the Union. They were harassed by this third kingdom having a mock legislative body of its own, strong enough to give endless trouble, and perpetrate endless jobs, but not strong enough to do any good. Dealing in a coarse but practical fashion with men of a very low moral standard, they bought up this legislative body, and persuaded it for private considerations to sell its independence for the public good. Having made their purchase, they began to take stock of what they had bought, and they found they had undertaken to govern a poor, bigoted, disaffected, overgrown population. They soon discovered, as the purchasers of undesirable properties which they cannot help buying often find to their cost, that their new property brought in much less revenue than was expected, and required a much larger outlay than was pleasant. Blundering here and blundering there, often throwing away money to no purpose, often mistaken in their agents, sometimes befriended by lucky accidents, but animated by an unswerving tenacity of purpose and by sentiments of duty and justice constantly expanding, they have worked away till they have now made Ireland fairly tranquil and rich beyond what twenty years ago would have seemed possible. Of course Ireland is still far behind England and Scotland. We have still to govern by the Peace Preservation Act, and we have still to spend a million sterling annually on the Irish police. Nor can we get Ireland as yet to pay a contribution to the Imperial revenue at all in proportion to its population. Whereas every one in England pays 2*l.* 6*s.* to the Imperial Exchequer, and every one in Scotland pays 2*l.* 3*s.*, each inhabitant of Ireland only pays 1*l.* 5*s.* We do not in the least mind paying a trifle more here than is paid in Scotland. Long experience has shown

us that to get small advantages over us gives the Scotch so much pleasure that we should not think of grudging them the mild satisfaction, just as a kindly host affects not to notice a valued guest who, he observes, always helps himself to an innocent backhander. But Mr. M'LAREN, leaving entirely out of sight what England pays, calls on Scotland to lash itself into a fury because Scotland pays so much more than Ireland. He forgets the history of the partnership as an asset of which Ireland had to be taken over. Mr. M'LAREN gets on very different ground, and comes to something like a subject of useful discussion, when he calls attention to some of the smaller heads of Irish expenditure. The Irish judicial staff is probably too numerous, and perhaps too highly paid, and Mr. M'LAREN has come across the scent of a job in the management of a small Irish prison which has filled him with a sense of natural and legitimate triumph. It is but a small piece of jobbery, but it is, if the facts are as Mr. M'LAREN states them, a very scandalous one. The truth is, that all reforms, and especially all reforms under a system of Parliamentary government, can only be carried out very imperfectly and slowly. The Minister of the day wants, for example, to do something for Ireland, but he does not like at a critical moment to quarrel with the legal profession in Ireland. He is obliged to work through the Irish Attorney and Solicitor-General, and the Law Officers do not like to have the prizes of their profession diminished. Or he makes an effort to put the management of Irish prisons on a satisfactory footing; but as there are many persons interested in his not getting full information, he omits to notice the abuses that exist in the management of some tiny establishment. The next Session he has other things to think of, or events may have occurred which make it impossible to ask Parliament to attend to small Irish matters. So the opportunity goes by, and the little nest of jobbery remains untouched and unnoticed until some indefatigable, irrepresible investigator of small things like Mr. M'LAREN comes across it, and proudly reveals the scandal he has been the first to discover. It is a useful piece of work, and Mr. M'LAREN may be congratulated on having so congenial a piece of work to perform; and we trust he will persevere until he gets this ridiculous little prison abolished, or conducted at a proper cost. But his task has nothing whatever to do with the wrongs of Scotland, unless Scotchmen are prepared to think all Irish jobs special wrongs and insults to themselves, and in that case, no doubt, they will have ample opportunity of sitting on pins and needles for the rest of their lives.

RUSSIA AND KHIVA.

THE Russian Government has so far deferred to English opinion as to publish an official apology for General KAUFMANN'S Treaty with Khiva. The previous statement that the EMPEROR was dissatisfied with his lieutenant in Central Asia was received with disbelief or indifference, because it was not even alleged that General KAUFMANN'S treaty would be disavowed. The explanation of the reasons for establishing Russian forts on the Amoo, for controlling the navigation of the river, and generally for reducing Khiva to the condition of a Russian province, is sufficiently plausible to be accepted, especially as there is no possibility of interference with the Russian policy. It is impossible to reconcile the terms of the treaty with the personal assurances of the EMPEROR conveyed to the English Government through Count SCHUVALOFF; but it may be remembered that at the time the fulfilment of the Russian promises was assumed by many English politicians to be dependent on circumstances; and the Russian journals candidly declared that, instead of binding himself to a fixed course of action, the EMPEROR had only announced an intention which he would afterwards have the right to modify. It seemed doubtful whether the objects of the Russian expedition could be satisfactorily accomplished if the capital and the territory were evacuated, and if the KHAN were left in possession of his former independence. According to the *St. Petersburg Government Gazette*, the KHAN himself was the first to point out the difficulties of keeping his engagements with the conqueror unless he were allowed the privilege of receiving a permanent Russian garrison in his capital. The statement is a little overdone, although it may perhaps be literally true. The official apologist forgets for the moment that in the first clause of the KAUFMANN'S

treaty the KHAN renounces sovereign independence by professing himself the obedient vassal of the EMPEROR. A demand that his territory should be evacuated in conformity with Count SCHUYALOFF'S assurances would have been flagrantly inconsistent with the position of a loyal feudatory; and probably the unfortunate ruler was willing to court the favour of the conqueror by anticipating, in the form of a request, the conditions to which he would in any case have been compelled to submit. It was a still more delicate proof of deference to give the Russian COMMANDER-IN-CHIEF an opportunity of exhibiting his moderation. The request that a garrison should be left at Khiva was evidently designed to suggest the more acceptable alternative of a Russian fort to be built on the right bank of the Amoo, and of a large cession of territory.

The general in command, notwithstanding the language of the treaty which he imposed on Khiva, is now represented as having been anxious to maintain, if possible, the independence of the KHAN. Indeed he only converted the Khanate into a province in the fear that otherwise a fresh expedition would become necessary, "which would render it impossible to preserve the independence of Khiva any longer." Whatever may have been the intentions of General KAUFMANN, it is probable that the Russian Government would rather govern the Khanate through a native chief than by the direct agency of officers of its own. The Romans in ancient times, and the English in India, have in many cases left the nominal or actual administration of dependencies to vassal kings, who deadened the inevitable collision between alien rulers and a subject population. As the official writer truly states, the Russian Government has prolonged the nominal independence of Khokand and Bokhara, and there was no reason for deviating from its habitual policy in the case of Khiva. "The task was rendered difficult by the weakness of Khiva, which, like all Central Asian Principalities, is so utterly rotten that the slightest punishment inflicted threatens the downfall of the whole concern." The weakness of a protected State involves the compensating advantage of rendering ostensible independence purely fictitious and nominal. The means for securing at the same time the formal independence and the obedience of Khiva were found to consist in the establishment of a garrisoned fortress, which would by preference have been placed at the mouth of the river, on the shore of the Sea of Aral. Unluckily it was found that the delta of the river was an impracticable swamp, and that the navigation of the Amoo would be interrupted in winter. It consequently became necessary to annex to the Russian dominions the steppe which extends from the right bank of the river to Russian Turkistan. The military or geographical inference is not easy to follow, and the proverb that excuse is self-accusation seems exactly applicable to the official apology. The desert space which intervenes between Khiva and Turkistan will scarcely serve as a convenient base for military operations. The nomad tribes will plunder convoys which are not sufficiently guarded, without troubling themselves to refer to the map in which the steppe will be coloured as a Russian possession. If it is thought worth while to connect the new fort on the Amoo by a line of posts with the frontier of Turkistan, it can scarcely be doubtful that a similar road would have been constructed if the delta of the river had been as dry as Salisbury Plain. The logic of fact and of force is simpler than the elaborate deductions of State papers. The Russians, being absolute masters of Khiva, have taken from the Khanate whatever territory they thought it expedient to acquire, and it matters little whether they trouble themselves to justify their proceedings to the outer world. A detailed explanation of the motives for inserting various stipulations in the treaty would not repay laborious criticism. It seems that a monopoly of the navigation of the river is indispensable to the prevention of nomadic piracy; and that other arrangements have been made for the purpose of placing caravan routes under the protection of the Ameer of Bokhara. Generally it may be taken for granted that the Russian Government is bent on preserving internal peace and on encouraging its own trade, while it extends the area from which foreign commerce is excluded.

The appeals which the Russian Government sometimes makes to the goodwill and confidence of England would meet with a readier response if the semi-official Russian journals were not in the habit of representing every extension of Russian dominion as a menace to English power in India. Nevertheless it is both useless and indiscreet to

regard the progress of Russia in Central Asia with professed suspicion and jealousy. There can be no doubt that the approximation of the frontiers of two rival Empires involves an ultimate risk of possible collision; but at the same time it is true that the civilization of a vast and barbarous region is in itself a legitimate and meritorious undertaking. It would perhaps have been better that the absolute subjection of Khiva should have been openly avowed as the object of the recent expedition; but the explanations and promises which were tendered by Russia may be regarded as proofs of friendship or courtesy. In public or private affairs it is undignified and injudicious to remonstrate against acts which it is impossible to prevent. The most pugnacious of alarmists would have recognized the absurdity either of attempting to assist the Khan of KHIVA, or of commencing hostilities against Russia for the purpose of effecting a diversion. The GOVERNOR-GENERAL of India properly sent back the Envoy of KHIVA to his master with the advice to make amends to the best of his power for his undoubted offences against Russia. It is not the business of the English Government to protect uncivilized potentates which are within reach of Russia and which are out of reach of England or India. In the further East it is just and reasonable that steps should be taken for the maintenance of existing commercial intercourse with States which are still independent. Mr. FORSTH'S mission will probably result in the conclusion of a commercial treaty with the ATALIK CHAZEE; and in the contingency of Russian encroachments the right of intercourse may be justly maintained. It is unfortunate, though not surprising, that a great and aggressive Empire should abide by that obsolete theory of conquering markets which influenced the policy of England down to the early part of the present century. It is not probable that English manufactures at any time penetrated into Khiva; and they will henceforth be artificially excluded. The people of Central Asia will, in return for the blessings of order and civilization, be compelled for the present to buy inferior goods at an unreasonably high price. If at any time the Russian Government should become converted to the true principles of political economy, the most material objection to the extension of the Empire in Central Asia will be at once removed. In the meantime it is well that both the Indian Government and the Foreign Office should carefully watch the policy of Russia in the extreme East; but querulous protests against every step in an inevitable progress will only tend to aggravate dangers which are perhaps not wholly imaginary.

ECCLIESIASTICAL LEGISLATION IN PRUSSIA.

THE history of the Civil Marriage Bill is a good illustration of the spirit in which the new ecclesiastical laws are supported by the intelligent classes in Prussia. It is no necessary part of the contest with the Ultramontanes; indeed, in one respect it may incidentally be even favourable to Ultramontanism. It seems probable that the ultimate policy of the Roman Catholic Church—supposing that nothing happens to restore peace between it and the Prussian Government—must be to demand disestablishment; and the requirement in all cases of a civil ceremony as the binding element in the marriage contract is certainly a step towards disestablishment. Otherwise it is not a measure which really touches the Roman Catholic Church. The civil marriage is obligatory upon Catholics in France, and it is highly improbable that it would have ceased to be so even if the Count of CHAMORRO had been placed on the throne. The measure has been extracted from the Prussian Government as part of the price of the support given to their ecclesiastical legislation by the Liberal party. This party hates the Roman Catholic Church heartily enough, but it hates with even greater heartiness the orthodox party in the Evangelical Church. No direct attack could have been made on the "Protestant Jesuits" with any prospect of success, partly for want of a pretext, and partly from the affection felt towards them by the King. But when once the Government was committed to strong measures against the Catholics, it became possible, under cover of making provision for the celebration of marriage in Catholic parishes temporarily deprived of their priests, to deal a very serious blow at the religious side of Protestantism. The Berlin Correspondent of the *Times*, whose letters are for the most part an excellent reflection of the views taken by the educated and professional classes, tells us with remarkable candour what the effect of the Bill will be.

Throughout the Protestant population, he says, to enact such a law is like snapping the last link uniting Church and people. In the larger towns, at all events, civil marriage will soon be the rule, and ecclesiastical marriage the exception; and as baptism, which has hitherto been exacted as a condition of registration, is in future to be optional, the proportion of christenings to births will be equally small. These changes will have no counterpart among the Roman Catholics, since with them these rites are a matter of religious conviction, not of mere traditional observance. No professed Catholic will dispense with the marriage in church for himself, or with baptism for his child, because the State has provided him with a civil ceremony in the one case and with a process of registration in the other. There must be a great deal of secret discontent among orthodox Protestants at the turn which affairs are taking, but the enthusiasm in favour of the assault upon Rome is so universal that it is enough that a Bill should be identified with the new ecclesiastical legislation to ensure its popularity with the people at large.

In his paper on Casarism and Ultramontaniam Archbishop MANNING repeats the assertion that the conception of the new laws dates from 1866. He quotes in support of this a passage from a speech of Prince BISMARCK in which he says that peace began to be disturbed after the war with Austria. It is probable that this statement is true so far as this, that the Roman Court began at that time to foresee danger in the growing power of Prussia. But the alliance between the Prussian Ultramontanes and the Government remained to all appearance unimpaired down to the war with France. The Catholic vote was always at Prince BISMARCK'S disposal, and the action of the civil authorities in matters of education and religion was exceedingly favourable to the Catholic Church. And if the Roman Court had been content to regard only the spiritual interests of its subjects, there is no reason to suppose that this state of things would have undergone any change. The secret of the quarrel with Prussia is the determination of the Pope to treat the restoration of his temporal power as an object of paramount importance. Down to 1870 the Pope fixed his hopes on France; but when the end of the war showed conclusively that no more help was to be had from this quarter, he seems to have determined to sound the intentions of the Prussian Government. This at least is the probable explanation of the mission of Archbishop LUBOWSKI to Versailles in January 1871. He was chosen as a sort of informal legate, because he had always had the reputation of being in favour at Berlin. What passed between him and Prince BISMARCK has not been made public, but there is reason to think that Prince BISMARCK virtually took the initiative, and, instead of waiting to hear overtures from the Pope, began by making overtures on his own part. It is further supposed that these overtures amounted to an offer to give the Catholic Church in Prussia the full benefit of State support and patronage on condition that the clergy would support the Government in political matters. It is not difficult to imagine how such an offer was met. Perhaps if the Archbishop of POSEN had been a free agent, he would gladly have closed with an offer which secured to the Church all, and more than all, that it had enjoyed during that peaceful period from 1848 to 1870 on which so many ecclesiastical regrets are now wasted. But as the representative of Pius IX. the Archbishop had something else to think of than the condition of Catholics in Prussia. He had to extract, if possible, a promise that Germany would show herself favourable to the restoration of the Pope's dominion, and he may perhaps have hoped that when Prince BISMARCK was bidding for Catholic support, he would consent to throw in some assurance to this effect, so as at all events to give him something pleasant to report to Rome. Here, however, it is believed that Prince BISMARCK put down his foot, and the Archbishop of POSEN retired with the distinct offer of State countenance for the Church in Prussia, but with no hint that any help would be given to the restoration of the temporal power. At a later date Prince BISMARCK made a second effort to induce the Pope to accept his proffered alliance, but by that time the state of affairs in Prussia and the Chancellor's own temper towards Rome had changed for the worse. The Ultramontane party in Prussia had begun in the elections of 1871 to put forward candidates of their own instead of supporting the Government candidates; and this had perhaps warned Prince BISMARCK that, after refusing to assist the Pope

in regaining his dominions, it would not be safe to count on the good will of the Roman authorities. Partly, it may be, from this cause, partly from seeing that the Pope was resolved to give no quarter to the impugnors of the Vatican decree in Germany, Prince BISMARCK is understood to have added a fresh clause to his ultimatum. He still offered to maintain the Catholic Church in the position she had so long occupied in Prussia, but he stipulated for some concession in favour of the King's Old Catholic subjects. The Pope was not in a mood to listen to any such proposal as this, and the Prussian envoy retired from Rome in high dissatisfaction at the contumely with which he had been dismissed. It is understood that at this interview the outline of the laws which the Prussian Parliament has since adopted was communicated to the Pope; and as soon as he had refused to avert or delay the blow by making concessions, the necessary Bills were introduced.

When Prince BISMARCK speaks of the danger to the German Empire arising from the attitude of the Ultramontane clergy, he is really referring to the future, not to the past. Had he any evidence to produce of actual conspiracy against the State on the part of the Church, it is not likely that he would have kept it to himself. But when once the Pope had rejected his overtures of peace, he had good reason to expect that the German Empire would become the peculiar object of ecclesiastical hostility. The Pope had given him fair warning that at the Vatican every consideration would be subordinated to the restoration of the temporal power, and to such a restoration the German Empire is undoubtedly the greatest of obstacles. On the theory of Ultramontaniam therefore every Prussian Catholic is a potential enemy to the Empire, because as a Catholic he is bound to obey the Pope's orders in every political act, so far as the interests of the Church are affected by it. He may be ordered, under pain of losing the sacraments, to oppose the Government in every possible way. In time of peace such a command might only affect the results of a few elections, but in time of war it would supply traitors or spies in the person of every servant of the Pope. The difference between Ultramontanes and religious men belonging to other Churches, or to the opposite party in the Roman Church, is this, that the former are good subjects so long as their conscience does not tell them that the commands of the State are immoral, whereas the latter are good subjects so long as the Pope does not tell them that the commands of the State are immoral. The fact that this condition of things constitutes a real danger to the State is not affected by the doubt that may fairly be entertained, whether Prince BISMARCK has chosen either a wise or a legitimate way of meeting it.

MR. ARCH AND THE LABOURERS.

MR. ARCH, who is as usual engaged in a tour of agitation, seems for the moment to be embarrassed by a divided purpose. Although his professed object is to enlist emigrants for Canada, he is never tired of attacking the landowners and farmers for driving the labourers into a movement which he stigmatizes as exile. It is of course possible that emigration may be not so much a positive advantage as the less of two evils; but enterprise is not likely to be stimulated by exhortations to make the best of an acknowledged grievance. Colonel DENISON, who has been instructed by the Provincial Government of Ontario to accompany and assist Mr. ARCH, is much more single-minded and more encouraging than his coadjutor or principal. He is authorized to offer to English labourers free grants in a province which possesses waste lands of two or three times the area of Great Britain. As becomes an emigration agent, Colonel DENISON guarantees the goodness of the wares in which he deals; and some of his hearers will probably be attracted by the prospect of immediately becoming freeholders of 100 or 150 acres. In the absence of accurate local knowledge, it is impossible to form an opinion of the advantages of emigration to Ontario. Mr. CLAYDON, who is in disfavour with the Unionists because he differed from Mr. ARCH's opinion of the prospects of settlers in Canada, asserts that the greater part of the vacant lands of Ontario are not worth acceptance as a gift. According to his statement, the fertile lots and the water frontages have already been taken up; and the remainder consists almost entirely of stone or of sand. It is scarcely possible that Mr. CLAYDON can have visited all parts of the province, and there may be fertile places which have escaped his notice; but it seems

that even in Ontario there is a difference of opinion on the subject; and that the value or worthlessness of the State lands has, like other controversies, become a political question. The Conservatives hold that it is little better than a fraud to invite European settlers; and the "Clear Grit" party, on the other hand, having lately acceded to power, is responsible for the appointment of Colonel DENISON and for the correctness of his statements. As an additional supply of labour, whatever may be the effect on the English emigrants, can scarcely fail to benefit the province, it is only surprising that Mr. ARCH's proposals should not be unanimously approved in Ontario. Even if Mr. CLAYDEN's depreciatory estimate of the quality of the waste lands proves to be well founded, there is fertile land in abundance to be had by settlers in other parts of the American continent. Both Canada and the United States contain millions of square miles which will sooner or later be converted from desert or forest into profitable arable and pasture.

To robust, active, and enterprising men skilled in agricultural labour, emigration, notwithstanding Mr. CLAYDEN's warnings, offers a prospect of advantages which are not to be obtained at home. The prosperous farmers of the valley of the Mississippi are either settlers or the immediate successors of settlers who possessed little capital beyond strength and industry. To some minds ultimate independence will seem cheaply purchased by incessant labour and hard living during the earlier years of settlement. If an immigrant is inclined to postpone his aspirations to ownership, he can in Canada or in the States secure much higher wages than in any part of Europe, though probably he may be required to work harder. A large family will in a new country be a source of prosperity rather than an element of anxiety; and to some persons the absence of social superiors will be in itself a satisfaction. On all these points Mr. ARCH has nothing new to offer, although he may perhaps render a service to suitable emigrants by calling their attention to the opportunities which have long awaited them in the West. It is evident that labour can be more beneficially employed on virgin and fertile soils of unlimited extent than even in the more scientific and more productive operations of the best English agriculture. It may also be admitted that a large emigration of English labourers would tend to raise the rate of wages of those who remained. A thoughtful workman may usefully balance the statements of Colonel DENISON against the not unfounded warnings of Mr. CLAYDEN. If he is conscious of a vigorous constitution and an adventurous disposition, he will probably decide in favour of emigration. Those who shrink from unusual exertion may find in some of Mr. ARCH's speeches plausible reasons for staying at home. An economist who is also a demagogue naturally wavers between his two vocations. In the judgment of the most enthusiastic and sentimental of journalists, Mr. ARCH is destined to be "the CROMWELL of the 'working classes'"; and it is unnecessary to say that the title is intended to convey the highest possible eulogy. Mr. CROMWELL was by no means exempt from factional antipathies; but when he was engaged in a practical struggle he concentrated all his energies on success. Mr. ARCH is unable to choose between the immediate expediency of emigration and the more remote prospect of some political and social convulsion which would convert the labourers into petty freeholders in England.

The complaint of predial agitators that large quantities of land in England are uncultivated is, if not altogether baseless, at least grossly exaggerated. Pasture is not the less fertile or productive because it may happen to be enclosed by an oak paling or a wall instead of a hedge; and the space devoted to the exclusive maintenance of deer, which are probably regarded by Mr. ARCH as superfluous quadrupeds, is comparatively insignificant. Much rough or barren land which will produce nothing else is profitably employed in the growth of wood, which would have to be imported and paid for if the present wooded area were with much wasteful cost and labour converted into a checkboard of potato patches. A bare slope for which none of Mr. ARCH's clients would give five shillings an acre will produce in forty years a crop of larch poles worth 40*l.* or 50*l.* an acre. In some places and soils a rabbit warren produces, in proportion to its acreage, a larger amount of nutritious and popular food than a cornfield or a garden. The mountain tracts which are in Wales and some other districts exclusively devoted to the purpose of sheepwalks are more profitable in that form than in any other, except that great loss and inconvenience arise where the friends of the labourer have, for the exclusive benefit of large

and encroaching sheep-farmers, succeeded in preventing enclosures. It would be absurd to contend that the cultivable soil of England produces the largest possible return; but even in the amount of gross produce it may compare advantageously with France, notwithstanding the inferiority of climate; and in the proportion of produce to labour it excels any other country. The drawbacks which are caused by want of skill, by want of capital, and even in a few cases by caprice and extravagance, are inseparable from the institution of property in land. Under a system of free trade, and as long as abundance of unexhausted soils remains in the world, a partial waste of the productive qualities of land is neither more nor less culpable than the employment of any other commodity to gratify the tastes of the owner. Consistent Socialists would prohibit all indulgence and luxury; but as long as diamonds and carriage-horses are tolerated, there is no just reason for denouncing the crime of maintaining a gorse-cover or a flower-garden.

During his experience of two or three years as an agitator, Mr. ARCH has with commendable docility learned the expediency of dividing his enemies as a preliminary to conquering them. The managers of the Labourers' Unions have succeeded in thoroughly alarming and irritating the farmers, who were the more immediate objects of their hostility; and probably Mr. ARCH is sagacious enough to foresee that one result of his agitation will be to induce the tenants to forget or to suspend any differences which might exist between themselves and their landlords. The experience of the trading capitalists who have thought themselves obliged to unite against the combinations of artisans will not be lost on the manufacturers of wool, of meat, and of corn. The philanthropic and literary speculators who have hailed the appearance of Mr. ARCH as a beneficent reformer are not likely to enlist a single adherent among the farmers. With the control of the counties through the agency of his Unions, Mr. ARCH may perhaps hereafter do much; but for the present the county electors are not his followers, but his victims. He has consequently now begun to affect advocacy of the interests of tenants in opposition to landowners. They ought, he tells them, to have tenant-right; or, in other words, a share in the ownership of their lands; and he undertakes that the enfranchised labourers will help the farmers to dispossess their landlords. It is fortunate that he is not addressing absolute simpletons or willing dupes. His main agitation is utterly inconsistent with his incidental sympathy for the tenant-farmers. If the Lothians and Lincolnshire were divided among the present occupiers, there would be no tendency to split up large farms, at least in the first instance, into cottage freeholds. It is indeed probable that, if the subsequent accumulation of landed estates were legally prevented, it would follow that the larger holdings would be gradually broken up; but this is not the prospect which Mr. ARCH offers to the allies whom he hopes to conciliate. He will find it necessary to choose between the labourers, who are to maintain themselves by the cultivation of their own freehold tenements, and the farmers, who cannot farm without a supply of labour; and also to make up his mind whether emigration is a benefit or merely an unavoidable alternative.

THE APOSTLE OF ARBITRATION.

MR. RICHARD, M.P., who is at present engaged in a triumphal progress throughout Europe, will be eminently qualified on his return to speak with authority on international gastronomy as well as on international arbitration. He has been entertained at a great many public dinners, has received cartloads of addresses, and has made the necessary replies. The latest of these celebrations took place in Paris on Monday night. "The table," as we learn from a telegram in the *Daily News*, was "charmingly decorated, and the dinner well served." The guests were regaled with *petits pâtés à l'Alabama*, *poulardes truffées à la Cobden*, and *bombes pacifiques*. The speaking was perhaps not quite so successful. The Chairman, M. RENOUARD, in the enthusiasm of the moment, forgot his guest, and imagined that he was addressing RICHARD COBDEN. Some of the company laughed; and M. RENOUARD refused to proceed. It does not appear that arbitration was attempted, but another gentleman delivered the indispensable speech. Mr. RICHARD began to return thanks in French, but suddenly "broke into English." The company then adjourned for coffee, after which there were more speeches, including "one of great length in English from Mr. MILLS,

"of Boston." On the whole, the company no doubt spent a pleasant evening after their own fashion, and it may be thought that this is a very innocent kind of diversion. It will be asked, however, what is the object of all these festivals? At the Grand Hôtel this question was answered by a cluster of interwoven flags, and the inscription in large gold letters, "Chamber of Commons, 8th July, 1873." This referred to Mr. RICHARD's triumph of last Session over the common sense and self-respect of the House of Commons, when an idle and unmeaning resolution was passed by a majority of members, some of whom must now be very much ashamed to remember their weakness. The passing of this resolution is regarded by Mr. RICHARD and his friends as marking the advent of a new era of universal peace and brotherhood. Mr. RICHARD has put down war; and our admiration must be divided between the magnitude of the result and the simplicity of the process. If Mr. RICHARD has really put down war, he certainly deserves all the dinners and addresses; but it is just possible that some obdurate and sceptical people may see reason to doubt whether the celebration of the triumph is not a little premature. For Mr. RICHARD's foreign tour Mr. GLADSTONE, it seems, is in some degree responsible. In the debate of last Session Mr. GLADSTONE said he was in favour of the principle of Mr. RICHARD's resolution, but he "only" thought Europe was not ripe for it. Accordingly Mr. RICHARD, in order to prove that Europe was ripe for it, has undertaken a three months' pilgrimage; and he is now prepared to "certify to the disposition throughout Europe" to settle quarrels otherwise than by slaughter. The way in which Mr. RICHARD has arrived at this conclusion is exceedingly characteristic. He does not appear to have made out a list of the questions between different Powers which threaten at the present moment to lead to war, and to have then asked the various Powers concerned whether they would agree to go to arbitration on them. But he has been entertained at dinner by sentimental theorists like himself, and he has received addresses from any number of obscure and impotent societies of working-men and other people; and all this barren and ridiculous verbiage has convinced him that the reign of peace is at hand.

The address of the working-men of Venice to Mr. RICHARD is perhaps as good a specimen of these productions as any other. The working-men of Venice salute the "illustrious Mr. RICHARD" with enthusiasm and affection. In common with all other working people, they desire liberty, order, and peace; and they "desire that the troulblers" of nations may cease from wars of conquest, and forbear "to put forth their dishonourable claims over other nationalities," and no longer exercise violent control over liberty "of conscience." This is a desire in which we can readily join; but one difficulty is as to how the desire is to be accomplished. Of course if the troulblers of nations will only be good enough of their own accord to abandon their iniquitous projects, that will greatly simplify matters; but, if they decline to do so, it is difficult to understand how arbitration is to be accomplished. The other day there was a Congress on this subject at Brussels, at which, if we remember rightly, Mr. RICHARD was present. The Congress passed all sorts of beautiful resolutions as to the duty of arbitration and peace. It was proposed amid great enthusiasm that arbitration should be made compulsory on all nations—that is to say, that the nations which are in favour of peace should go to war in order to enforce their views upon those who are not—an eminently pacific conclusion. At the final dinner of the Congress, Dr. BLUNTSCHLI, who represented Germany, thought it necessary to reserve to his own country the right to vindicate the cause of intellectual freedom—even by the sword. It appears therefore that the advocates of universal peace have no objection to war so long as it is intended to enforce their own crotchets. It will be remembered that at another Peace Congress GARIBALDI intimated that the reign of peace was to be postponed until there had been one great war for the purpose of turning the world upside down to suit the views of Italian patriots. The Venetian working-men take a similar view of the question. They protest against the troulblers of nations putting forth their dishonourable claims over other nationalities—which means, we suppose, that neither France nor Austria is to presume to meddle with Italy; but they wish it to be understood that "the Italian working-men have given fresh proof" that they can sacrifice all they possess for the triumph "of a great national principle"—that is, by means

of war—and that they fully approve the spirit of the declaration recently made by one of their own statesmen, that "Italy desires to live in peace with all nations, but she will also insist upon securing her national rights and dignity." In other words, the Italians are perfectly willing to accept from arbitration anything they can get, but they are at the same time determined to fight for what they want if they do not see their way to get it otherwise. So far from accepting the principle of arbitration, they expressly repudiate it. Their enthusiasm for peace is limited by the condition that they shall be able to carry out their own views by peaceful means; if not, then they are bent on war. Yet so blind is the Peace Society in its fanaticism, and so incapable of understanding the plain meaning of language, that it has actually been at the expense of printing and circulating a translation of this address as a proof of the extent to which its Utopian fancies have found acceptance on the Continent. It is an old objection to chimerical projects for the suppression of war, that war is not a cause, but a consequence, and that peace can be established only by all men being made peaceful. The Venetian working-men thank Mr. RICHARD for his efforts "to bring about peace everywhere, even in the family and the workshop." No doubt all quarrels between husbands and wives, between fathers and sons, all disputes between employer and employed, and all other social differences, might just as easily and effectually be put down by an abstract resolution being entered on the Minutes of the House of Commons as war between one country and another; but neither the imbecility of members of Parliament nor their subserviency to popular cant has as yet reached the point at which it would be possible for them to issue a decree gravely commanding everybody to love everybody else.

There is a passing gleam of reason in one passage of the speech which Mr. RICHARD delivered at Paris. The peace movement, he admitted, greatly depended upon France. "It could not do without her, but with her it might do much." It is no doubt true that, if France would consent to submit to arbitration the question whether or not Alsace and Lorraine should be returned to her, the difficulty of bringing about arbitration on the subject would be to that extent diminished. It would then only remain to persuade Germany to agree to a similar ordeal. We should like to know, however, whether Mr. RICHARD himself, when he said he had found "a general disposition throughout Europe to settle quarrels otherwise than by slaughter," really meant to assert that he had found a single sane person in either France or Germany who was willing to submit the question of the frontier between these two countries to arbitration. Indeed, we may extend the inquiry, and ask whether in any country he had found a disposition to submit to arbitration any question of genuine importance? He said that "the Italian Chamber had risen like one man to adopt the principle of arbitration." But does he suppose that the Italian Government would agree to accept the decision of an arbiter as to whether the Pope should be replaced in his old position at Rome, or whether the King of the Two Sicilies should be invited to return to his former kingdom? Would the Austrian Government accept arbitration as to whether she should transfer the Southern Tyrol to Italy? Or would Germany agree to a similar reference in the case of Hanover? Everybody of course knows that none of these Powers would dream of allowing any of these questions to be determined in this manner, and it is incredible that Mr. RICHARD should not know it too. Mr. RICHARD says he can answer for Holland and Belgium, but even Mr. RICHARD can hardly believe in earnest that these States would allow an arbiter to decide how they should be divided between France and Germany.

If, instead of looking into the future, we go back upon the past, is there any great question of the last few years on which a suggestion of arbitration would have been listened to for a moment? Except the question of the *Alabama*, none; and in that case the proposal of arbitration was only a disguised surrender. The simple truth is that nations are ready to arbitrate as to things which they do not care to fight about, but that they prefer to fight about things to which they attach importance; in other words, they will not give up anything as to which they are very much in earnest unless they are obliged. The sum of Mr. RICHARD's exhortations, so far as there is any sense in them, comes to this, that people ought to be good and peaceable, and then there would be no war because

there would be no need for war. Mr. RICHARD appears to labour under the delusion that nations go to war because they are fond of it; he knew, he said at Paris, that "history, poetry, and romance had thrown a halo round the "military system which had taken deep root in the world." In point of fact, there is a very general abhorrence of war, and the only reason why nations resort to it is that they would rather endure the miseries and sacrifices which it involves than sacrifice anything which is very dear to them, as territory, independence, or national honour. The sentimental enthusiasts who have taken up this crotchet might perhaps clear their thoughts a little by endeavouring to define in what cases arbitration can fairly be recommended. Even Mr. RICHARD, we suppose, would hardly go so far as to say that there is no question on which a nation may not honourably submit to arbitration. For instance, there has been a long-pending question between France and Germany as to which has the best right to the Rhine provinces; but it is impossible to imagine Germany agreeing to give up these provinces if an arbitration court chose to say that it ought to do so. Again, can it be conceived that England should place itself unreservedly in the hands of arbiters who should determine whether Canada should not be transferred to the United States, or whether Ireland should not be constituted an independent State? In the course of time something in the nature of a system of international police, of which indeed the rudimentary elements already exist, may perhaps be developed. In the meantime it is unlikely that nations will care to confide their destinies into the hands of irresponsible, and possibly corrupt or incompetent, arbiters. It is unfortunate that the House of Commons should, in a nodding moment, have given countenance to the empty and chimerical proposition which has furnished a pretext for Mr. RICHARD's ridiculous tour.

THE LIVERPOOL SCHOOL BOARD.

THE decision whether elementary education shall ultimately be provided as at present by a combination of State schools and voluntary schools, or by State schools exclusively, practically rests with the Denominationalists. If they are wise, they can make the excellence and the economy of the existing order of things so conspicuous that it will be with difficulty superseded by a system involving sweeping changes, and at the outset necessarily costly. If present appearances are to be regarded as presumptive evidence of the position which the Denominationalists mean to take up towards the Act of 1870, this wisdom is not likely to be vouchsafed to them. Some of them appear to have had their heads turned by the unexpected reaction in their favour which has been produced by the disastrous activity of the Education League, and seem bent upon committing the immense mistake of throwing overboard the compromise which has been the source of their success. They had an admirable opportunity this winter of consolidating their strength throughout the country. The triennial School Board elections coinciding with the "Conservative Reaction," and with the general irritation at the burden of local rates, gave the supporters of a system which makes full use of existing schools a great advantage over the supporters of a system which proposes to provide new schools everywhere. The interest of Denominationalists was plainly to identify themselves with the Act of 1870, and to present themselves at every educational election as the advocates of School Boards and School Board schools wherever voluntary schools have failed to provide the necessary accommodation, and of such machinery of compulsion as will allow no school accommodation to be wasted. If they had not sense enough to see this fact for themselves, they might at all events have profited by the superior discernment of their adversaries. The Birmingham League knows perfectly well that its success depends on getting rid of the Education Act, and after this it was not expecting much of the Denominationalists to assume that they would see that their success depends on the efficient working of the Education Act. In a great number of instances, however, they have taken the exactly opposite course. They have come forward as the avowed enemies, or at most as the languid friends, of the very law which the Secularists are doing their best to destroy. What they expect to gain by this policy they probably do not know themselves; what they are likely to lose by it need not be told to any one who has studied the fate of parties which throw away favourable compromises be-

cause they think that they might have got better terms had they asked for them in the first instance.

A conspicuous mistake of this kind seems to have been committed by the Denominationalists of Liverpool. The School Board which has just completed its term of office was in all respects an example of what such a body ought to be. It had shown great ability and great moderation. It had done a great deal of work at a moderate cost and with no needless displays of eloquence. It had taken the Act as supplying the rule to which it was to conform itself, and had shown equal anxiety neither to go beyond what the Act contemplates nor to fall short of what it requires. Elected in the first instance by a Denominational arrangement, its success was the best possible proof of what could be achieved by Denominationalists when acting under a reasonable and patriotic zeal for educational progress. If there was one object which the Church party in Liverpool ought to have proposed to themselves, it was the prosecution of the work by the new Board in the same spirit which had governed the action of the former Board, and to this end it was of the highest importance to secure the services of the former Chairman. Mr. BUSHELL might very well have desired not to be re-elected to an office which must necessarily have withdrawn him from most other work. It is understood, however, that he was willing to serve again if those who had supported him at the first election had been unanimous in asking him to do so, and that his disappearance from the list of candidates at the second School Board election is due to the absence of this unanimity. The explanation of this strange folly is to be found in the concluding words of the "Report of the "General Purposes Committee," lately presented to the retiring Board. That Report claims on behalf of the Board that "neither as regards the letter nor the spirit "have the principles of the Act—which it was their "duty to administer, to the best of their ability, faithfully, zealously, and wisely—in any degree been "violated." This is the worst possible recommendation at the present moment to extreme Denominationalists. They desire to see the spirit of the Act violated, and they are not greatly distressed if the letter suffers somewhat in the process. Faithfulness to the principles of the Act is in their nomenclature extravagance, zeal in the execution of it they set down as irreligion. Though the Act says plainly that there shall be provided for every school district a sufficient amount of accommodation in public elementary schools, and directs that where such accommodation does not exist the deficiency shall be supplied in a certain specified way, they insist that nothing ought to be done until the places in all the existing schools have been filled, notwithstanding that these places, even if every one of them were filled, would not accommodate all the children for whom room is directed to be found, and quarrel with the Board for not accepting accommodation in schools which are not public elementary schools as constituting accommodation in public elementary schools. There is no dealing with impracticable persons of this type; all that can be done is to hope that the revelation lately made of their indifference to the extension of elementary education will not have its natural result in giving an unreal victory to fanatics on the other side.

The inquiries of the late Board showed that in 1871 there were close upon eighteen thousand children in Liverpool for whom no school accommodation was provided. Since that time new schools have been provided for something over seven thousand children, and the Board proposed to establish others which would accommodate about five thousand children more. The deficiency left after this last provision has been made will consist entirely of infants, and this it is hoped may be met for the present partly by a re-arrangement of the accommodation in existing schools, and partly by the hire of temporary buildings. The Board has discovered one fact of great importance as regards vagrant children. It has been usually supposed that this class would have to be dealt with in a wholly exceptional manner, but the result of a fortnight's "picking up" of such children by the police under the direction of the Board was that "in the "great majority of the cases—even where the children "were engaged in begging—the parents were found to be "in receipt of good wages, amply sufficient to support "themselves and their families respectably, if they were "willing." The Board consequently determined to try the effect of its compulsory powers on the parents before resorting to any special process for the benefit of this particular class of children. Still the Board is of

opinion that the compulsory powers conferred by the Act, even as increased by the amending Act of last Session, are quite inadequate to meet the case. Parents may be able to pay for their children's schooling and yet not be able to ensure their attendance. The father and mother may be out all day, and though they may be fined if their children do not come to school, it is difficult to say how they are to prevent them from staying away. The suggestion of the School Board is that its officers be empowered to detain any vagrant children found in the streets during school hours, and to take them either to their homes or to school or before a magistrate, and that the magistrates may order habitual truants to be whipped. As, however, the necessities of many families make the earnings of the elder children essential to their own or to the common support, the Board further proposes that no children of school age shall be employed in the streets without licences, which shall not be granted or renewed without a certificate from the School Board. The case of children employed in houses or workshops should be met, they suggest, by the extension to England of the principle of making the employer as well as the parent responsible for their education, which has already been adopted in the Scotch Act. A third proposal relates to private schools. These schools are much in favour with parents who wish to evade the by-law from their laxity in the matter of attendance. In point of fact, children are sent not so much to receive education as to secure a plausible excuse for keeping them uneducated. The Board recommends that attendance at private schools should not count as compliance with the by-law, unless the school is periodically inspected by the Education Department, and returned by them as efficient.

The experience of Liverpool shows what can be effected by an energetic School Board, but it is impossible to review its proceedings without reflecting on the difficulty of creating similar bodies in small places. In speaking the other day at Liverpool, Mr. Rayment proposed to meet these objections in some measure by consolidating all the local authorities into one, and thus providing in every district a Board which would "deal with public duties of sufficient magnitude to excite public interest," and be "constituted in such a manner as to represent fully the various classes of the community." Now that the question whether School Boards shall become universal promises to become the next important issue in the educational controversy, this suggestion deserves careful consideration.

THE YEAR.

THE general truth that in a twelvemonth many things may happen and much be changed is, if applied to the year now at its close, made sufficiently vivid by calling to mind that at the beginning of 1873 the strength of the Gladstone Administration seemed unbroken, and the King of Spain was reigning in apparent comfort and prosperity at Madrid. Before three months had passed, the King had bidden a prudent farewell to a country which he thought deserved the anarchy he left behind him, and Mr. Gladstone had been defeated, had resigned, and had unwillingly resumed office on the uninviting terms on which a leader must hold office when it has been discovered that he can be beaten. When on the 12th of March Mr. Gladstone found himself in a minority of three, it was evident not only that the ill-fated Irish University Bill had been killed by those whom it was intended to propitiate, but that English politics had assumed a new aspect. There was a weak Ministry instead of a strong one; there was an opening for the depreciation of men who had hitherto thought themselves above criticism, and there was an end of bold measures vigorously carried. The Judicature Bill was indeed passed, because Lord Cairns chose to bless it; but the Government had to endure the mortification of recognizing that, if they wished to make their measure in the slightest degree more complete than had been agreed on, Lord Cairns had only to wave his hand and whisper "Privilege," and they must bow to his decrees. The Chancellor brought in a Land Transfer Bill, which was to have been the other great legal measure of the Session; but Lord Cairns, assuming the attitude of a schoolmaster who tells a clever boy that he has done a good copy of verses and had now better go and play, said that the Chancellor's Bill was really a very meritorious performance, but that he could not recommend the Peers to go through the fatigue of discussing it. After cutting down a scheme for dealing with Local Taxation to the tiniest dimensions, and persuading the House of Commons to spend the best part of the Session in putting it into shape, Mr. Stansfeld sent his fragment to the Lords, and was informed that the Peers did not think it worth while even to inquire how far in its microscopic way it might be good or bad. As Lord Lyttelton said when he had to consent that the Endowed Schools Commission should be renewed only for a year, the Ministry seemed stricken with paralysis. Mr. Forster, who wished to do something more for education, could only manage to make Denison's

Act obligatory. Mr. Fawcett's Bill for removing Tests at Trinity College, Dublin, was rather forced on than accepted by Mr. Gladstone. Minor members got majorities against the Ministry on small or futile points such as the treatment of the Irish Civil Servants and the establishment of Universal Arbitration. And then, unfortunately for Mr. Gladstone, occasions arose when his colleagues made blunders of a most surprising kind. The scandals of the Zanzibar Contract and the misappropriation of the Post Office money gave a violent shock to the confidence of the public in the Administration, and when at the close of the Session Mr. Lowe and Mr. Ayrton broke into open war, it became obvious that the Ministry must undergo a considerable change or must cease to exist.

But it was not only in Parliament that the tide seemed to have turned against the Ministry. They seemed to have no longer any command over the constituencies. It was found that the offence given by Mr. Bruce's first Bill had never passed from the agitated breasts of the Licensed Victuallers, and Ministerial candidates discovered that they had everywhere beer and gin arrayed against them. Their Education Act had also excited much active and bitter feeling, and while the Nonconformists thought they had been betrayed, Churchmen thought that they could not confide in the support of a Ministry which was always being pressed by its adherents to alter the arrangements that had been made. There was, too, an unmistakable air of timidity and indifference creeping over the minds of a large section of the electors, and Mr. Gladstone's Government began to be first distrusted and then disliked as a Ministry that could never let things be quiet. Constituencies of the most varied kind showed a reluctance to support Mr. Gladstone any longer. Bath, Gloucester, East Staffordshire, and, above all, Greenwich, replaced Liberals with Conservatives, and the last-mentioned constituency actually sent a young Tory distiller to sit as the colleague of the Premier. Scarcely had Parliament risen when Mr. Gladstone, thus pressed on all sides, determined to run the risk of reconstructing his Ministry. He has gradually, as occasion offered, completed the reconstruction, and it must be owned that he has done well a very difficult task. He began by taking himself the Chancellorship of the Exchequer, thus at once utilizing his own great reputation in finance, and removing Mr. Lowe from an office which he could no longer hold with credit. By shelling Mr. Bruce and Mr. Monell in the Peers, he got rid in a handsome way of two of the weakest of his subordinates, and he did not hesitate to perpetrate a distinct job and silence Mr. Ayrton with a sincere. Later on he had to appoint two new Law Officers and to replace Mr. Monell, and in all these selections he showed that he would, be guided solely by the capacity to serve the public, and had learnt to forgive independence. The greatest, however, of all his means of strengthening the Ministry was the recall of Mr. Bright to office, for whom Mr. Childers good-naturedly made room. The Ministry is thus, no doubt, much stronger in its internal composition than it was, and the reconstructed Ministry has had sufficient success in the keenly-contested elections of Bath and Taunton to warrant it in saying that there is no decided voice of the constituencies against it, and that it will show what it can do in another Session. Mr. Disraeli, who had contributed in no small degree to the Liberal success at Bath by his letter to "My dear Grey," made a fuller and more sustained attack on the Government at Glasgow. Nothing could have been more clever or witty or better roading than his speech; but, as is usual with Mr. Disraeli, it rather raised the reputation of the speaker than did damage to his opponents. The Ministry is now in a better position to meet Parliament than seemed possible when the Session closed in August.

Mr. Gladstone's University Bill was to have been the crowning stroke of his Irish policy, but it will probably prove no great loss either to Ireland or to Mr. Gladstone that he was not destined to cut away what he once termed the third branch of the Uppas-tree. The Ultramontanes are endeavouring to construct a University system of their own, and whether they succeed or fail, it is as well that England should not have the responsibility of their success or failure. In other respects, the Government may be fairly satisfied with the results of their Irish policy. Ireland is rapidly getting rich and prosperous, and although Parliament was this year once more called on to hurry through a Peace Preservation Bill, yet, as in point of fact peace is tolerably well preserved now in Ireland, there is no serious complaint of the legislative cost at which the result is won. Mr. O'Keefe manages to keep up a constant war with his ecclesiastical superiors, and the Education Board which sides with those superiors has shown how difficult a Board is to beat, by having found an excuse in the unfortunate Father's violent language for not allowing him to benefit by the rule as to the management of Irish schools which was laid down as a fair compromise after he and his wrongs had occupied Parliament and bewildered the Government during a considerable part of the Session. That the prosecutions arising out of the Galway elections should fail was a matter of course, and it is easier for a judge to arrive at the general conclusion that spiritual intimidation has been used than to present in any one case evidence of such intimidation which a jury can be expected to find irresistible. The sign of the times in Ireland most gratifying to the Ministry is, no doubt, the collapse, for the time at least, of the Home Rule movement. Great things were prophesied as to what this movement was to do. The priests condescended to associate themselves with it, and a Conference met with a great flourish of trumpets to settle the terms on which the British Empire was to be invited to break itself to pieces. But the gathering proved a failure; no two members of any eminence could agree as to what

they wanted, and the proposal to have an Irish House of Lords was rendered palpably ridiculous by the absence of every Irish peer.

India generally allows Englishmen to forget it, except as a place of sound investments, and of an honourable career for enterprising relatives; nor was the House of Commons annoyed with any Indian question last Session, except discussions on the break of gauge and the designs of Russia. But the prospects of a dreadful famine in Bengal have aroused public attention and sympathy; and English opinion has been stirred sufficiently to ask the Indian Government to do its duty, which it would probably have done anyhow, and which it has, so far as is known, done in a satisfactory manner, without fuss and without stint. In its quiet way moreover the Indian Government managed to render us at home a considerable service at an earlier period of the year. We had sent out Sir Bartle Frere to Zanzibar with many good intentions and much philanthropic pomp: He was to make a treaty with the Sultan of Zanzibar by which the slave trade on that part of the African coast would be suppressed. Unfortunately the Sultan would not sign the treaty; but Sir Bartle Frere had something better than arguments at his disposal. He went to India, conferred with the Government, and got an admiral sent to Zanzibar, who by a threat of bombardment induced the Sultan to sign the treaty. We may thus hope to have done something to destroy African slavery, more especially as Sir Samuel Baker, after having been supposed to have been murdered, was suddenly discovered telegraphing that Africa was free to the Equator, and has since returned home to tell his tale. That we have some considerable influence with semi-civilized races is satisfactorily proved by our success in insisting on the right of personal audience at the Court of Peking, and in making the troops of the Sultan evacuate Lahoj, where the exaggerated pretensions of the Caliphate came into collision with our claims to collect provisions for Aden where they could most conveniently be found. The dangers, however, to which a vast Empire coming into collision or contact with men of every race is inevitably exposed have seldom been more strikingly illustrated than by the necessity in which we have found ourselves of engaging in an Ashantee war. The origin and the political issues of the war are still enveloped in obscurity, and the unfortunate expedition of Commodore Comberrell on the Prah teaches us that we must not too much despise the black creatures we have to fight. Even the successful skirmishes in which Sir Garnet Wolseley as soon as he arrived achieved great things with a tiny force and useless allies only point to the same conclusion, and the special dangers to which in the African service officers seem exposed make a war doubly lamentable. Englishmen, however, cannot refuse themselves the satisfaction of observing that those employed could not have done their duty more patiently and gallantly than they have done in an expedition which can bring them little glory, and exposes them to terrible risks.

In the region of social life we have had an uneasy time this year. Strikes, with all their painful consequences to employers and employed, have done much to paralyze industry. The great strike among the ironworkers in South Wales lasted long enough to test severely the endurance of the men and the resources of the masters; and in London the building trade was thrown sufficiently into confusion to make Londoners know by the silence and nuisance of half-finished buildings some of the outward signs of a strike. Recently some of the masters have decided on a counter movement, and have resolved to form a National Federation of Employers, with what precise object and with what success it yet remains to be seen. The discontent among the agricultural labourers was fortunately not sufficiently violent to interfere with the ingathering of a harvest which a continuance of wet weather had made poor enough, without accidental drawbacks to increase the bad consequences of a short supply. Mr. Arch has been to Canada, and has been entertained in the kindest manner by Lord Dufferin and the local authorities, but appears to have learnt that the life of an emigrant, unless he is a handy, bold, and vigorous man, is a life full of endless trouble and ill-requited toil. Even those who are not quite fit to emigrate are yet held to have shown so much political ability by simply joining a Union that they are, it appears, to be rewarded with the franchise; and one constituency at least is so absolutely in the hands of workmen that a fine relic of the old Whig school is to be made to disappear in order that Morpeth may return a representative of labour. Still it deserves to be noticed that the labourers of all classes have not, except by making everything dear, given much trouble this year. There was a large gathering in Hyde Park on Whit-Monday of the opponents of the law as to the punishment of working-men guilty of offences against their fellows or their employers, and the zeal of two clerical magistrates who sent to prison a large number of women guilty of such an offence gave strength to the outcry. But, as it happens, both the new Law Officers of the Crown have, as private members, endeavoured to meet the views of the employed as far as practicable; and those who are dissatisfied with the law as it now stands wait in hopes of an early change. Even the Licensed Victuallers are a little cheered by having to deal with the common sense of Mr. Lowe instead of the philanthropic restlessness of Lord Aberdeen, and, alarming as have been some recent disclosures as to what policemen will do and swear, Mr. Lowe has tried, perhaps not in vain, to reassure us as to the general state of the force.

It has also been a year of terrible catastrophes. The wholesale destruction of human life which attended the loss of the *Northfleet*, the *Atlantic*, and the *Ville du Havre* showed how awful may be the dangers that await travellers by sea. And travellers by land

have been kept in perpetual terror by an unbroken succession of railway accidents. The Wigan, the Kestford, and the Guildford accidents followed each other too closely not to startle the public, which would have been delighted if it could have seen clearly who was to blame and how railway accidents are to be prevented. But when the President of the Board of Trade addressed a circular of warning and inquiry to the different Companies, each of the Chairmen in turn explained that his line happened to be in perfect order, and was distinguished by every precaution having been taken on it that ingenuity could devise. How to control railways without impeding carriage and locomotion is a very difficult problem, and it is too early as yet to guess whether the new Railway Tribunal established last Session will do any practical good. It has first to show that it can arrive at a definite decision, and then to show that it can practically enforce obedience to this decision. In one department of the railway world Mr. Nass, the staunch friend of the servants of the Companies, goes on working with his usual perseverance, and he has made an inquiry on his own account the result of which shows that the accidents among its servants acknowledged by a leading Railway Company bear a most insignificant proportion to the amount of those that really take place. Mr. Plimsoll has on his part done a great public service by calling attention to the enormous waste of life attending the employment of untrustworthy vessels, although his recklessness of statement and the inability of the Commission which he got appointed to suggest any remedy have thrown a temporary cloud over the movement he set on foot. In the region of criminal law the history of the Bank forgeries showed with what ease even such a cautious institution as the Bank of England may be robbed, although it also showed the vigour with which criminals may be followed up and proof of criminality collected; while the interest of those who love the excitement of criminal trials has been gratified to a degree unknown in other days by the interminable Tichborne trial, with its startling revelations and incidents, and its unprecedented duration. But then, if we have had all these things to startle, to terrify, or to pain us, we have had, it must be remembered, an unparalleled set-off. We enjoyed the visit of our own romantic Shah. All England went mad in honour of this harmless Asiatic prince. What could we do enough to show him how great and glorious we were, and how much nicer and better people we were than the Russians? He took our frenzied homage with mild Oriental placidity, and at length escaped from the warmth of our exuberant affection, and went to Paris, where he was fêted and politely laughed at. He then faded away from one remote Court to another, until at last he got home to find that he could scarcely save his favourite Minister from destruction, and that he must revoke the celebrated concession which we were fondly told, when he was here, was destined to regenerate Persia.

Our colonies generally give us little trouble, and it was with satisfaction and without discussion that Parliament passed a Bill giving an enlarged power to the Australian colonies of dealing with revenue questions, which it is hoped may prove hereafter the basis of federation. Unhappily Canada, hitherto considered the chief pearl in the colonial chaplet, has been a cause of uneasiness. The House of Commons had scarcely passed the Bill by which, to compensate Canada for the Fenian raids, England guaranteed a portion of the cost of the railway through the territory of the Federation to the Pacific, when ugly rumours reached England that the railway had been the mainstay of a gigantic job. It was alleged that the Canadian Ministry had given the concession in return for money contributed to support electioneering contests last year. The facts were exaggerated; but one result was beyond doubt, and that was that the Ministry of Sir John Macdonald had received large sums of money from Sir Hugh Allan for electioneering purposes, and that the concession was subsequently given to Sir Hugh Allan. The Opposition in the Canadian Parliament was irritated by a Bill to permit witnesses to depose on oath being disallowed by the House Government, and it was subsequently suggested that Lord Dufferin had attempted to screen the offenders by a prorogation. But the conduct of Lord Dufferin was afterwards recognized to have been quite what it ought to have been, and when the Canadian Parliament reassembled, sufficient evidence had been collected under the authority of a Royal Commission to force Sir John Macdonald to resign. The lesson has been a severe one, and it may be hoped will be sufficient to crush corruption in the colonies before it has time to establish itself. In the United States some little has been done to show that corruption has at length provoked resistance. The notorious Tweed has been condemned to twelve years' imprisonment. Pennsylvania has accepted a constitutional amendment intended to arrest the evil. The Credit Mobilier scandal was revealed to Congress, and elicited some warmth of disapproval, although by a narrow majority it was decided not to impeach Vice-President Coffey. It is something, too, to have to record that General Butler had to retire from his candidature for the post of Governor of Massachusetts. Congress, indeed, has not set a very bright example of political purity, for it voted itself a few months ago an increase of pay, with retrospective effect—a proceeding known to American journalism as "the back salary grab." A commercial panic, principally due to the locking up of money in unfinished railways, has caused much distress in the States, and has set the President, after consenting to a re-issue of greenbacks which ought to have been cancelled, to hazard in his recent Message proposals as to the currency which are of very doubtful value more especially as to the prohibition by law of the allowance by banks of interest

on deposits. Happily the Message had to deal also with a more pleasant topic, and the President was enabled to inform Congress that the affair of the *Virginia* had been satisfactorily settled, and that the States were not under the painful necessity of crushing an infant Republic which they had been not only the first, but the only, nation of any importance to recognize.

On the 9th of January an event took place which, if it had occurred a few years ago, would have seemed of supreme importance, but which, coming when it did, had scarcely any political interest. The Emperor Napoleon died at Chislehurst, and ended a life which had been an epitome of almost every vicissitude of good and evil fortune. He had for some little time before his death lived in England in almost complete seclusion, but his popularity with ordinary Englishmen had not died out, and those who remembered that he had been the ally of England and the friend of Englishmen were many more than those who could never forget how it happened that he had gained the opportunity of forming alliances and bestowing Imperial patronage. His day had gone by in France, and no one at Paris was very much affected by the news that the late occupant of the Tuileries had passed away. France had indeed its own present, and that a perplexed and sombre one, to think of. From the beginning of the year to the 24th of May there was going on a long struggle between the Right and M. Thiers. For some time M. Thiers seemed to have the best of it. Afraid of his unrivalled power of debate, the Right wished to prevent him, while President, from speaking as a Deputy. He fought the point with his accustomed tenacity, and succeeded in securing that he should be allowed to speak on all questions of foreign policy, and on all home questions on which his Ministers in Council declared it to be necessary that he should speak. A great contest followed with the Committee of Thirty who were appointed to consider the constitutional changes that might be deemed necessary; but after they had rejected all his proposals, they at length succumbed and agreed to the terms of M. Dufaure's suggestion that a Second Chamber should be created, the electoral laws revised, and provision made for the transmission of powers when a dissolution took place. The success of M. Thiers so far was in part due to a manifesto published at this time by the Count of Chambord, in which the Pretender denounced the tricolour and everything connected with it as incentives to and memorials of Republicanism; and the supremacy of M. Thiers never seemed so well established or so wholly due to his personal qualities as when, by a timely speech he reconciled for the moment discordant factions by informing them that the Pact of Bordeaux still existed, meant everything and meant nothing, and left Monarchists all their hopes and Republicans all their gains. But M. Thiers cut away the ground on which he was treading when he achieved what in one way was the greatest triumph of his tenure of power, and negotiated a new treaty with Germany by which the enemy—restoring Belfort at once, though retaining Verdun—was to clear entirely out of France in September. M. Thiers was no longer indispensable. By making M. de Goulard a Minister, and by his Bill for regulating the Municipality of Lyons, M. Thiers offended the Extreme Left, and they determined in an evil hour to give him a lesson by returning M. Barodet, an obscure agitator of Lyons, as deputy for Paris instead of M. de Rémusat. At the eleventh hour M. Thiers tried to combat the Extremes opposed to him by throwing himself more than ever on the Centres. M. Jules Simon and M. de Goulard left the Ministry, and a Cabinet all of a moderate shade was appointed; but the Right was not to be pacified. Already, before the recess, it had managed to substitute M. Buffet for M. Grovy as President of the Assembly; and as soon as the recess was over its plans were complete. It challenged, and on the 24th of May defeated M. Thiers; and Marshal MacMahon, with the Duke of Broglie as his Minister, reigned in the place which the resignation of M. Thiers made vacant.

The new Ministry set to work heartily after its own fashion. Its business was to coerce France, where the growing strength of Republicanism had shown itself in one election after another. M. Boulé, the new Minister of the Interior, addressed the Prefects to tell them that, if they wished to remain in office, they must show an unhesitating devotion to him, his friends, and his subordinates. M. Pascal wrote a circular, a copy of which passed through the hands of M. Thiers into those of Gambetta, with the object of having a report made to him on the best means of buying up or winning over the provincial press. The discussion of the new Constitutional Laws was adjourned for six months, and M. Ranc, a Communist who had been returned for Lyons, was prosecuted, and had to fly for his life. Everything was, in short, made ready for the realization of the one pet scheme of the majority—the fusion of Orleanists and Legitimists, and the Restoration of the Count of Chambord. The scheme was very nearly successful. The Count of Paris went to Frohsdorf, and fell into his cousin's arms. All was love and harmony; and the Orleanists, who, much to their credit, insisted on constitutional liberties and the retention of the tricolour as the price of their concurrence, sent a special ambassador, M. Chesnelong, to Salzburg, and received through him satisfactory assurances of the Count's willingness to accept the Crown on the terms on which it was offered. M. Thiers returned to Paris, and exerted all his unrivalled skill in forming and consolidating a party strong enough to protect the Republic. But it seemed certain that a majority, although a narrow one, was assured, the Bonapartists being now opposed to the Government which they had supported on the 24th of May. All of a sudden it was discovered that there was a hitch; and at last

the thunderbolt fell in the shape of a letter from the Count of Chambord, in which he entirely threw his dear Chesnelong over, boldly said that the white flag must be his flag, and proclaimed that the sword must be used in order to make the ideas prevalent to which he was attached. The whole plan of a Monarchical Restoration came to an end, and Marshal MacMahon, after two Messages to the Chamber in which he said that he could only hold power if the principles of his Conservative friends were triumphant, was made President for a term of seven years. It was evident, however, that the country was against the Ministry. New elections were held in every part of France; and even in Brittany the result was the same, and Republicans were returned. The dread of a Monarchy and a civil war, and an equal dread of the clergy, who, thinking themselves sure of triumph, had got up a series of pilgrimages offensive in the eyes of lay Frenchmen, had provoked a spirit of resistance which the Ministry knew must be fatal to it unless checked in time; and recently all the efforts of the Government have been directed to devising a series of measures for repressing democracy. The Mayors are everywhere to be the creatures of the Government, and the electoral law is to be altered. Meanwhile M. Magne complains of a deficit, and cannot get the taxes voted to replace those which the Ministry abandoned when it gave up the Protectionist policy of M. Thiers, and negotiated in July a liberal Treaty of Commerce with England. The attention of France has, however, been momentarily directed from politics to the extraordinary trial of Marshal Bazaine, which was conducted with great skill by the Duke of Aumale, and ended in a Marshal of France being degraded, fined, and condemned to twenty years of seclusion. It was a sad spectacle, and perhaps Bazaine was not much more to blame than others whom the rotten system of the Empire raised to an undeserved eminence. But at any rate, even if he was not guilty of treachery, Bazaine had done less than France had a right to expect, and he was the author of so many evils and such dreadful shame to his country that his condemnation has been received with a very general expression of mournful approval.

Germany has also been going through a time of trouble which has been serious enough. It has quarrelled openly with Rome, and has fought Rome as England fought it in the days of the Tudors. Whether the conditions of modern life permit such a victory to be won now as was crowned the efforts of the Tudor princes is among the gravest and most interesting problems of modern politics. The new Ecclesiastical Bills were introduced early in the year, a large majority sanctioned the preliminary alteration in the Constitution that was necessary, and the Bills received the Royal Assent in the spring. Their purport was to lay down three great modes of asserting the supremacy of the State over the Church. All ecclesiastics, from the highest to the lowest, are to receive the approval of the Government before they can act; religious institutions are to be subjected to lay inspection, and are to be closed at the discretion of the lay power; and all ecclesiastics are to be compelled to undergo a lay training. Nothing could be more diametrically opposed to the claims and teachings of Rome. Since the Bills were passed the Government has found itself obliged to press continually forward in the path it has selected. It has been under the necessity of recognizing and patronizing the Old Catholics and their new bishop; it has submitted to the new Prussian Parliament a Bill for Civil Marriages, and it has begun prosecutions against a number of eminent Romanist ecclesiastics, and more especially the Archbishop of Posen. The Pope took it into his head to write a letter in August explaining how these accumulated wrongs disturbed his mind, and professing a belief that the German Emperor was acting against his will under the dictation of the wicked Bismarck. The Emperor replied by saying that he was perfectly independent, and that the servants of the Pope had nothing to complain of. A Parliament has been returned more hostile to Rome than the last one. Prince Bismarck has resumed the Premiership, and on the other hand the Pope has shot forth the bolt of another Encyclical, in which he points out how far on the road to destruction his enemies in Germany have advanced. Open war has thus been proclaimed, and the cases in which the new ecclesiastical laws are to be applied in their full force are now almost ripe for decision. On neither side is there any sign of flinching, and if the Pope is firm, so is Prince Bismarck, with the approval of Lord Russell. Which will win depends on the question which few would pretend to answer, whether the leading Catholic laymen of Prussia really care most for the State or the Church.

If, however, France and Germany have had their troubles this year, their disasters and anxieties have been nothing to those of Spain. At the beginning of the year Amadeo was King, and Zorrilla was his Prime Minister. But, disgusted with the resistance of the Spanish grandees and with the obstinacy of Zorrilla in quarrelling with the officers of the Artillery, the Italian prince one fine morning announced that he intended to set off for Portugal. As the only monarch then possible thus took himself off, and no other monarch was available, the Cortes was easily led to set up a Republic in despair. Figueras and Pi y Margall were the first to profit by the change, and Castelar lent them his aid. But the new Government began badly. It pandered to the mob, issued rifles to all the ruffians of Madrid, and with the aid of the mob forced the Cortes to dissolve. Then new elements of discord immediately began to show themselves. The new Cortes was elected to represent the views of those who wished the new Republic to be a Federalist one; there was a party discovered both in the Cortes and the provinces, which thought even a Federalist Republic a bad measure, and longed

to set up a copy of French Communism; and lastly the Carlists began to show themselves, achieved some small successes, and were cheered by the arrival of the Pretender and his brother. After some changes not worth noticing in detail, Castelar at the end of August was made Dictator, the newly elected Cortes was prorogued till January, a respectable force was got together, the arrangements for a Federal Government were postponed, and some degree of vigour and of unity of action appeared in the course taken by the Government. The Carlists have not been crushed, but their progress has been arrested; and Valera, Aleny, Malaga, and Seville were wrested from the Intransigentes. Unfortunately Carthage proved a more trustworthy refuge for a Communist Government, and, with the aid of a body of released convicts and of five ironclads that mutinied, the revolutionary leaders have made a defence which still baffles the efforts of the Madrid Government. A situation so anomalous as that of Spain also very naturally gave rise to complications with foreign Powers. Two ironclads which fell into the hands of a German captain, whose action was subsequently disapproved by his Government, were by his orders transferred to the custody of an English Admiral, and were subsequently, in defiance perhaps of the rules of strict impartiality, given up by England to the Spanish Government. An English vessel, the *Deerhound*, carrying military stores to the Carlists, was captured with her crew either in French waters or on the high seas, and the Spanish Government was forced to avow that it had been in the wrong. Lastly the civilized world was shocked to hear that the *Virginia*, a vessel sailing under the American flag, had been captured on the high seas, while proceeding to give help to the insurgents in Cuba, and that a considerable portion of her crew had been brutally murdered under the disguise of a military execution. Although England was equally aggrieved so far as the executions went, yet as the American flag had been disregarded, the Government of President Grant took up the matter much more seriously than we did, and at one time it appeared that war and an American intervention in Cuba were inevitable. Castelar, however, was strong enough and prudent enough to be able to give way. The *Virginia* was restored, and it appears that Spain has now the satisfaction of hearing that the captured vessel had never any real right to bear the American flag. Nothing, however, can lessen the permanent injury which Cuba does to Spain by compromising its policy and draining its resources; and when it is added that Carthage still holds out, that the Carlists still occupy the greater part of the North of Spain, and that the period assigned to Castelar's dictatorship is almost at an end, the prospects of Spain will appear sufficiently dark.

Two small nations have found themselves engaged in much the same tasks which have fallen to the lot of greater Powers. Holland has its Ashantee war in Sumatra, and has, after undergoing a discomfiture, sent out an expedition big enough to bring the Sultan of Acheon to submission. Switzerland has, like Germany, been fighting the Pope. The quarrel began in consequence of the Pope appointing a Vicar-General of Geneva with jurisdiction over a portion of the Canton of Vaud, which the Swiss say was contrary to established practice; and the Federal Government having taken the matter up with abundant energy, the Vicar-Apostolic has been banished from Switzerland, while Geneva has decreed that all curés shall be elected by the people. The phases of the quarrel are different, but both in Switzerland and in Germany the supremacy of the laity over the Church is the real ground of dispute, and both countries have been equally denounced by the Pope in his Encyclical, while both revenge themselves by patronizing in the Old Catholics the special objects of the detestation of Rome. Austria was to have had a grand time this year, and politically it has, in the return of a decidedly Centralist Parliament, achieved a conspicuous success; but the Exhibition was a failure, owing partly to the cholera, and partly to a monetary panic, which threw Vienna into utter confusion at the very moment when signs of its triumphant prosperity ought to have been given. Italy, too, has been passing through a Ministerial crisis, and its Budget exhibits a deficit which appears equally to baffle all Ministers of Finance. Still the courage and resolution with which the Bills as to ecclesiastical property and the residences of the chiefs of the ecclesiastical orders were carried, and the welcome given to Victor Emmanuel at Vienna and Berlin, must be set on the other side. Russia alone has been steadily triumphant. Its policy has prevailed at Constantinople; and Khiva, after having been conquered by an expeditionary force handled with great skill, has been, if not annexed, yet placed for every practical purpose under the exclusive control of Russia, in spite of the assurances given at the beginning of the year by Count Schuvaloff, who was sent on a special mission to tranquillize the apprehensions of England.

Excepting the Emperor Napoleon and Count Bernstorff, the German Ambassador in London, no foreign public men of any great eminence have passed away this year. The King of Saxony and the Duke of Brunswick scarcely deserve to be noticed as exceptions, although some curious questions will probably arise as to the disposal of the enormous fortune of the latter. In England, however, we have lost many men of considerable eminence. Lord Westbury and the Bishop of Winchester died within a few hours of each other, and each in his way—a very different way—was a prominent figure in English public life. Lord Lytton, too, had so long amazed or delighted England with his astonishing fertility in writing romances and in dilating on every possible topic, that a sincere feeling of pain was awakened when it was known that he would write no more. In art Mr. Macready and Sir Edwin Landseer had each reached the summit in

their respective walks, and had made their victories a part of the intellectual store of Englishmen. Philosophy has lost Mr. Mill. Dr. Lushington, Chief Justice Bovill and Vice-Chancellor Wickens had each done so much to serve the public, that the regret for their loss extended beyond the regions of the profession to which they belonged. In the political world Mr. Graves and Mr. Clay were well-known figures, and in Mr. Winterbotham we have to lament the loss of one of the few men of the younger generation who have shown much promise of Parliamentary success. Perhaps, however, it may be said that death has not taken more from us this year than it must inevitably take in every year that goes by.

CHRISTMAS.

IT is an unfortunate part of the human constitution that our emotions show no tendency to periodicity. We are in pretty much the same state of mind in winter and summer, except in so far as the direct influence of external circumstances is concerned. A frost may spoil our tempers by pinching our fingers, and a fog may lower our spirits by affecting our bronchial tubes. But we are not subject, like some of our animal and vegetable ancestry (we speak after the manner of Mr. Darwin), to annual gushes of sentiment. The sap does not rise in us at stated periods, nor do we instinctively burst into song at the vernal equinox. We leave it to natural philosophers to decide why we have not inherited some such peculiarities. Whatever the reason, this defect in our organization makes itself painfully felt upon a good many occasions, and especially at such anniversaries as Christmas. Some people are always piping when others are utterly unwilling to dance. One half of the world accuses the other of being cynical, and the attack is met by a counter-charge of levity. Some contrast of feeling must indeed always result from the simple fact that the human race does not grow up in successive and distinct generations like butterflies, but that some of us are going down hill whilst others are climbing up. Every anniversary necessarily changes its colouring to "the eye which hath kept watch o'er man's mortality." There was a story in the papers the other day of a party which used to dine together in Paris. As successive members dropped off, their places were still prepared, and no fresh guests invited to fill them; and thus, on the last occasion, a solitary old man was dining by himself, with a score of empty chairs set round the table. Most of us can find melancholy enough in life without wishing to embody it in so ghastly a ceremony. But every anniversary feast necessarily partakes of the same character. The chairs are invisible as well as the guests; but the friends who have gone over to the majority are perceivable to the mind's eye so clearly that we have no need to advertise the fact by external symbolization. The melancholy which testifies to the unseen companionship should not indeed make a healthy mind unsympathetic. It may soften, but it need not quench, the spirits; and even a connoisseur in melancholy, like Jacques, may feel himself in harmony with childish conviviality. If he cannot quite share it, neither need it jar upon him.

There is another contrast of feeling which is more troublesome. Characters may be divided into two classes according as they are sympathetic or antipathetic. The first impulse of some people when they hear a new doctrine proclaimed is to exclaim, How true! and of others to say, How false! So the emotions of one man seem to be in a permanently positive, and those of another in a permanently negative, condition. Any wave of feeling set up amongst our neighbours may generate either a similar or an inverse feeling in ourselves. We may be carried away by the contagion of excitement, or may be absolutely repelled by it and driven back into our own private meditations. Everybody who has made a speech or acted in a play is conscious that an audience is generally composed of two different materials. Some of his hearers act, for a time at least, like a non-conducting medium, and oppose frequently insuperable obstacles to the establishment of the proper chain of electric sympathy. Of course it is usual to denounce the stolidity of such human blocks; and it may certainly be said that a man who is sensible that he is a purely refrigerating body should avoid going into societies for mutual stimulation. But it is quite unfair to assume that a character of this kind, however unsocial, is necessarily unfeeling. In some cases it is the very excess of sensibility which makes people instinctively struggle against yielding to a sympathetic emotion. The man who has a natural inclination to mysticism shrinks from all external manifestations, because they tend to substitute a purely mechanical ceremonial for the pure emotion which he values so highly. He is shocked by the inferior elements which necessarily make part of every stated performance; by the forms which have ceased to represent any inward feeling, and the mixture of mere superficial or sensuous excitement with genuine spiritual emotion. He suppresses altogether any outward symbols for fear lest they should lose their savour, and become part of a merely formal routine. His emotions are too valuable to be squandered in public, and should be kept for hours of solitary retirement, when he can abandon himself to them without any shock from less congenial sentiments. It is not that he is really unsympathetic, but that he unfortunately suffers more from the false notes which must blend in any general chorus than he is charmed with the true ones. Such a frame of mind may be more or less morbid; but it is very different from the cynical frame of mind which occasionally mimics it. When a man says that his feelings are so exquisitely fine

that he is put out by any attempt to give them a concrete embodiment, it may possibly be that he is a mere hypocrite who has not any feelings at all, and, therefore, if we may make a bull, finds it perfectly easy to conceal them; but it is also possible that the statement may be accurate. Such people, however, cannot be allowed to have their own way in the world. Possibly they are too good for it; but in some cases an excess of goodness is almost as mischievous as an excess of the opposite kind. In fact, they encourage a kind of hypocrisy as distinct as that which belongs to the opposite temperament, and a good deal more disagreeable. People of a very demonstrative temper, who profess a warmth of feeling which they do not really possess, and never meet an acquaintance without squeezing his hand into a mummy, and, figuratively speaking, weeping upon his neck, are certainly very offensive, and they have their reward. There is no more certain road to unpopularity than an excessive desire to be popular. We all like flattery, but we always dislike the flatterer; partly because there is nothing more disagreeable than the sense of being done, and we naturally resent the spectacle of that tribute of praise which has become in some sense our own property being bestowed with equal liberality upon our friends and inferiors. The injury which a demonstrative person inflicts upon our self-esteem by excessive civility to our neighbours more than cancels the benefit which a similar civility has conferred upon ourselves. On the other hand, the affectation of excessive coolness, if it makes us less angry with the offender, is more noxious in the social atmosphere generally. The too unctuous person incurs our contempt, but at any rate the function which he discharges with more zeal than could be wished is necessary to our social comfort, and is favourable to the spread of that general complacency without which we should very soon become mere savages in dress-coats. If we attempted to suppress all external ceremonial because it may become nonsensical and hypocritical, society would either be brutalized or become as dull as a Quaker's meeting; and though the Quakers are in many respects a most exemplary people, it must be admitted that their tendency to quietism and extreme plainness of speech is the most obvious cause of their decay.

Every such anniversary as Christmas brings up some of the practical problems which are suggested by these divergences of temper. How are we to solve such problems? How are the convivialities in which we have to indulge to be made tolerable to the very varying minds of the persons who are to share them? To all who have finally parted company with childhood, the annual consumption of turkeys and mincepies will be at least as suggestive of melancholy as of pleasure. Nobody thinks his birthday a very delightful occasion of festivity when it is distinctly marking another downhill stage. Life is too much like the childish game of ducks and drakes, in which the intervals between successive blows diminish in geometrical progression. And if we can get over this difficulty and manage to enjoy the childish entertainment of a pantomime though we don't much care for the Clown ourselves, yet a greater remains behind. Why should we run into such danger of hypocrisy? Moralists on a larger scale may dwell upon the fact that, whilst we are all talking about Christian goodwill, there is nothing for which one-half of professing Christians is more ardently longing at the present moment than the complete humiliation, and possibly decimation, of the other half. But within the bounds of private life we have difficulty enough in reconciling practice and principle. It is a popular belief that at this season of the year we are to be specially civil to poor or alienated relations. We know quite well that we shall not like them any the better for it. We are not so foolish as to forgive a man for an injury because he has eaten a mincepie at our expense. The perverso impenitency of our improvident cousins will not become a less monstrous neglect of duty because they have added to their score another item which they choose to consider rather as a matter of right than a cause for gratitude. The sentiments in which we indulge for the amusement of children are no more real than the conviviality of a man who drinks a glass of coloured water when the fear of gout prevents him from taking real wine. The whole thing is a sham, and, like other shams, only ends by intensifying the sense of the evils which it professes to ignore. Why not adopt the simple rule which some people advocate? Let everybody be perfectly natural. If a man feels sulky at Christmas time, let him eat his chop in private without being scouted as a cynic and a killjoy. The miser in Dickens's story was perfectly right for not getting up a show of geniality. In the story, of course, his conversion is taken to be genuine, and his concession to the ordinary customs of mankind is rewarded by his becoming permanently a social being. It would not have been so in reality. Next morning he would have had a bad headache from the excess to which he was not accustomed; and a week afterwards he would have been as hardened a skinflint as ever, with perhaps an additional touch of bitterness due to the sense of the folly he had committed. If only everybody would act up to his own character, the jovial might be as jovial as now, but they would not be allowed to insult or annoy their less excitable fellow-beings by dragging them at the ear of a sham festivity.

Luckily, the question need not generally be put in this uncompromising fashion. A large part of the population is at the age when genuine high spirits are still to be had for the asking, and habit has not ossified their tissues into unbending rigidity. Another large part is unhappily in a condition in which a rough approximation to a satisfactory meal is still a cause for unfeigned rejoicing. They can take such goods as Christmas provides them without any uncomfortable doubts, and will need no casuistry to

persuade them of the advantages of even animal forms of enjoyment. People who have become more morbidly sensitive must strike out such a rough compromise as is available under the circumstances. The suggestion that we should be perfectly natural is unfortunately impracticable. Whatever philosophers may attempt to prove to the contrary, human beings are not a set of unconnected units, and the purely self-regarding class of actions is simply a class which does not exist. We are bound to settle some terms of communication with our neighbours, and every social rule involves certain compliances which may at times become hypocritical. Unless we are prepared to reveal to everybody who comes in contact with us all the emotions of dislike or weariness or ill-temper which he may excite, we must sanction a certain number of formalities which are at times more or less distressing. The only comfort is that, as the world becomes more civilized, its ceremonial tends to become less cumbersome. The old elaborate observances of former days which look very picturesque in artistic representations would undoubtedly be intolerable bores in practice. We have become too old for the minneries which amused our more simple-minded ancestors, and so far we are freed from a vexatious bondage. As time goes on, we may hope that the tendency will be not to abolish observances founded upon a real need, but to make the machinery work as smoothly and with as little complexity as possible. Perhaps, too, when we all regard each other with unfeigned brotherly love, we shall be all glad of any excuse for giving the first possible vent to the sentiments with which we are oppressed. At present that day seems to be rather distant, and the best we can do is to submit with as much good temper as we can to the demands of our friends, and at least avoid damping their spirits, if we cannot indulge in very extravagant outbursts of hilarity. In return we can only invite them to look with toleration upon our comparative calmness.

THE GOVERNMENT OF PUBLIC SCHOOLS.

THE Governing Body of Rugby School have not yet issued any formal explanation of their reasons for dismissing Dr. Hayman from the Head-Mastership, but the *Times* has published what it calls a "fair description" of the transaction, which has apparently been derived from an official source. This document shows, as the *Times* puts it, that a series of collisions had arisen between Dr. Hayman and his assistants, that the Governing Body always pronounced with greater or less severity against the Head-Master, and finally dismissed him on the ground of general failure in office. As it appears that the failure in office, if there was any failure, was owing to the collisions between the Head-Master and his Assistants, it is natural to inquire how these collisions arose. Dr. Hayman was elected Head-Master of Rugby at the end of 1869, in succession to Dr. Temple, who had just been made Bishop of Exeter. There were eight other candidates for the appointment, and, as might be expected under such circumstances, the choice of Dr. Hayman did not give universal satisfaction. The friends and admirers of the disappointed candidates naturally thought that a better selection might have been made, and the Assistant-Masters had also preferences or pretensions of their own. Whether Dr. Hayman was or was not the best man for the place is a question with which we have for our present purpose nothing to do. The Trustees thought that he was the best man, and the decision rested with the Trustees, and not with any other persons. It is no doubt desirable that the Head-Master of a Public School should enjoy the confidence of his subordinates; but, according to the existing organization of these institutions, it is not the Assistant-Masters who are called upon to elect their chief. It is necessary to lay some emphasis on this point, because, obvious as it is, it seems to have been overlooked in some of the criticisms on this subject. The right of election is vested absolutely in the Governing Body—at that time the Trustees—who act on their own responsibility, and not under a *conseil d'enfer* from the Assistant-Masters. It is possible that the Assistant-Masters may be much more capable of discharging this duty than any other persons; but that is one of the questions which we do not propose to discuss. The law, as it stands, says that the Head-Master shall be chosen by the Governing Body; and when he has been chosen, it is clearly the business of the staff of the school to submit themselves loyally and faithfully to their superior. Whether he does or does not come up to their standard of an ideal Head-Master is a question with which it is unnecessary that they should trouble themselves. They may reflect that they are not responsible for his appointment, and that there is no compulsion on them to serve under a principal whom, for good or bad reasons, they dislike.

What happened at Rugby was this. Dr. Hayman was no sooner elected than a number of Assistant-Masters protested against the appointment on the ground of certain alleged informalities in some of Dr. Hayman's testimonials. They declared that their sense of honour was outraged, and that they could not serve under any one who had done what Dr. Hayman had done. The Trustees, however, who were the proper judges of the relevancy and value of testimonials, did not take the same view of the matter, and the appointment was confirmed. A second request from the Assistant-Masters—we are now quoting from the *Daily News*, one of the organs of the Masters on this subject—to the Trustees to hear their views was ignored. The Masters, it is stated, were at this time ready to resign, but they took counsel with their friends, and were strongly advised to remain and do their best for the

school. Accordingly they not only remained, but from time to time accepted promotion at the hands of their new chief. In what manner they acted upon the other part of the counsel is one of the questions at issue between them and Dr. Hayman. They may have thought that the best they could do for the school was to get Dr. Hayman out of it; and that this was their policy may almost be inferred from the fact that they again revived in the form of a Parliamentary petition the accusations against their chief which had already been disposed of by the Trustees. At the same time Dr. Hayman was persistently attacked by anonymous correspondents of the newspapers, who continually repeated the same charges. It is obvious that attacks of this kind could not fail to keep alive in Dr. Hayman's mind the recollection of his first reception by the Masters, and to colour his interpretation of their subsequent conduct. There can be no doubt that for the last four years the atmosphere of Rugby has been charged with stormy elements; the Masters and their chief did not work cordially together, and the want of concord among the teachers naturally produced a bad effect among the scholars. A Head-Master is, or ought to be, an autocrat, yet there is no one who is so dependent on his subordinates in almost every part of his work. It is quite clear that a Head-Master cannot carry on a great school single-handed. He must have assistants; and, if he and his assistants do not work together in mutual confidence and esteem, it is certain that the work must break down. A Public School cannot be managed successfully as long as there are collisions between the Head-Master and the other Masters; but the question here is, who is responsible for these collisions? It will be observed that the Assistant-Masters received Dr. Hayman on the very threshold of office in a hostile spirit; that they repeated their aspersions after the Trustees had set them aside; and that they continued to adhere to this line of conduct after Dr. Hayman had been for some time in office, and after they had themselves decided not to resign, but to remain and "do the best they could for the school." What the Trustees thought of the conduct of the Masters will be seen from the following Minute, which was published in the course of 1871:—

They think that the under Masters should never confer with the boys, not even with the sixth form, on points of school discipline, without the knowledge of the Head-Master.

The Trustees feel it now their duty, in justice to the Head-Master, to impress upon the under Masters generally the necessity, for the good of the school, of giving to the Head-Master not only a nominal, but a cordial, co-operation and support.

We now come to a change in the government of the school. Dr. Hayman had been little more than a year at Rugby when the Trustees who had elected him were replaced by the new Governing Body, which contained several members who had from the first keenly and violently opposed the appointment. Bishop Temple, for example, forgetting the decencies of official life, had taken a prominent part in the early attacks upon his successor; and he had now to sit as a judge upon a cause in which he had held a brief as an advocate. It is almost amusing to observe how when the new Governing Body came into power, it was tacitly assumed that the whole place lay under the spell of some kind of superstitious bondage to the spirit of the late Head-Master, so that everything was to be done exactly as he had been accustomed to do it, and everything was to stand exactly as he had left it, and not a pipkin was to be displaced. The Trustees had set aside the original charges against the Head-Master; but as several of the new Governors had identified themselves with the Assistant-Masters in this respect, it was perhaps not unnatural that the latter should be encouraged to imagine that they had now the sympathies of at least a part of the Governing Body on their side. It is obviously hopeless for a Head-Master to attempt to cope with disaffected subordinates unless he is firmly supported by the Governing Body; and this support appears from the moment the new Governors came into office to have been systematically withheld from Dr. Hayman. If a school is to be managed through the Head-Master, it is indispensable that he should be allowed a certain amount of discretion in dealing with the personnel of the establishment. It would seem, however, that at Rugby the Governing Body insisted that Dr. Hayman should carry on the school without making any change in the original staff; and on all the questions submitted to them they sided with the Masters against their Head. Dr. Hayman complains that some of the Masters treated him in an unfriendly and disrespectful manner, and it is easy to understand that there are many ways of thwarting and insulting a Head-Master without doing anything which can be very distinctly proved. The broad facts of the case are that the Assistant-Masters, in the first instance, assumed the right of sitting in judgment on their superior, condemned him, and took care to publish their verdict; that they maintained this attitude of hostility even after the Trustees had condemned it; and that the new Governing Body insisted upon the Head-Master conducting the school with a staff of assistants a large proportion of whom were committed to a public declaration—for it was, if not formally, at least practically public—that, on moral grounds, he was disqualified to hold office. For the Head-Master this was simply an impossible task. What could be expected of a commander-in-chief who at the beginning of a campaign received a public intimation that his generals deemed him deficient, not only in military qualities, but in personal honour? It must be remembered that in a school, as in an army, it is not merely a question between the chief and his assistants; there is, in the one

case, the school, in the other, the army looking on. It is evident that Rugby School must from the outset of this affair have been put in a fair way of becoming disorganized by the position deliberately assumed by the Assistant-Masters towards their superior. And, in order to mend matters, the Governing Body not only espoused the cause of the disaffected Masters, but themselves did all they could to discredit the head of the school, and to paralyse his activity—as, for instance, when they last year issued the Minute suggesting to Dr. Hayman that "it was due to the interests of the school that he should lose no time in retiring from the office of Head-Master." The mistake which the Governing Body committed was, it seems to us, in imagining that a Head-Master could possibly conduct a school under such circumstances. If they thought that Dr. Hayman was unfit for the position he occupied, they should have assumed the responsibility of removing him at once; and as they refrained from doing so, it must be supposed that they had not sufficient grounds for taking this step. On the other hand, as they allowed him to remain at the head of the school, they were bound to give him a staff of assistants with whom it was possible for him to work. What the Governing Body in effect did was to make the conditions of the task impracticable, and then to dismiss Dr. Hayman because he could not perform an obvious impossibility. It was perhaps from the beginning a question whether the Head-Master, or certain of the Assistant-Masters who had taken the lead in opposing him, should be dismissed. We do not say which course the Governing Body should have taken; we say only that they should have taken one course or the other openly and boldly. They might or might not have been justified in dismissing Dr. Hayman, but assuredly they were not justified in retaining him in office, and at the same time refusing him the necessary means of maintaining his command over the school. It would appear, therefore, that for Dr. Hayman's "general failure in office" the Governing Body are themselves responsible, and that from first to last he has never had fair play.

It may be said broadly that the Head-Master of Rugby has been dismissed because the Assistant-Masters disapproved of him. The Masters may or may not have been right in forming this opinion, but it is rather a serious question whether Public Schools are henceforth to be managed in deference to the opinions of the teaching staff. The importance of this question is strikingly illustrated by the recent conduct of the Masters at Eton. It may be said that, if the boarding charges had previously not been excessive, the addition which was asked for was not unreasonable; but that was not the question. The question was whether the school was to be governed by the Governing Body or by the Masters. The former had forbidden the Masters to make any increase in their charges, and the Masters claimed the right to disregard this prohibition and to use their own discretion in the matter. It appears that other differences—happily of a minor kind—have since arisen between the Head-Master and some of his assistants. It is clearly necessary that some understanding should be come to as to the extent to which Assistant-Masters are entitled to dictate to their superiors how a school should be conducted. It is important to remember that Public Schools exist after all, not for the benefit of the Masters, but for the benefit of the public. Hitherto it has been supposed that the only way of managing an institution of this kind efficiently was to make the Head-Master absolute, and to throw upon him the responsibility of keeping everything in order. The new Governing Bodies have not been long in existence, but it cannot be said that they have attained much success in the discharge of their delicate and important duties. If they attempt to reverse the old system, to depose the Head-Masters, and to manage the schools themselves under the advice of the Assistant-Masters, the consequences may be expected to be exceedingly disastrous to the institutions under their charge.

THE LESSER CHURCHES OF ROME.

WE have spoken of the Basilican type of church in general, and of some of those great churches in Rome to which the name of Basilica is applied in a special sense. But, after the havoc which the greater buildings have undergone, almost more may be learned from these smaller buildings—including some which technically rank as Basilicas and some which do not—on which the hand of Papal devastation has on the whole fallen less heavily. In the case of the smaller churches the destroyers have commonly been contented with disfiguring the outside, sticking up some fulsome inscription to record the munificence of the disfigurer, and spoiling the inside as far as may be by incongruous attempts at ornament. But the main features, the columns with their arcades or entablatures, have, with a few exceptions, been spared, and the apse with its mosaics has very commonly been spared also. Hence many a church which looks most unpromising without will be found to contain rich stores of instruction within, and it may be laid down as a practical rule at Rome, and indeed in Italy generally, to pass nothing by simply because the outside is unattractive.

It is not easy to throw oneself into the position of the disfigurers of these ancient Roman buildings. We can understand how—especially at Rome—men may have preferred classical to mediæval architecture, and may have thought it a good work to make the one give way to the other. We can understand a man thinking a monolith column with a Corinthian capital a fairer object than

the richest cluster at Lincoln or Ely. The truth of course is that each is equally beautiful, equally fitting, in its proper place. But the strange thing is that a man should think that he was working an improvement by taking away or hiding the columns of St. John Lateran to put masses of Jesuitical ugliness instead; and it is no less strange that even a Pope should think it worth while to commemorate such an achievement as cutting through the original round-headed windows of the famous church of St. Clement to stick in hideous square things instead. Yet a later Clement—we forget his number, but we felt inclined to turn Clement into Inclement—has thus barbarously dealt with the church of his apostolical namesake. Still St. Clement has not suffered like the patriarchal church. The columns are there; the primitive arrangements are there; nay the earlier church is there below, and the temple, or whatever it was, of Mithras is below that. Rome contains so much that even a succession of *Renaissance* Popes could not destroy everything; their wasting fury has mainly spent itself on the greatest objects of their city, and the smaller buildings, with their rich stores of art and history, have thus escaped comparatively unhurt.

The Christian Basilicas, as we have already explained, arose largely out of the spoils of heathen buildings, and not uncommonly on the sites of heathen temples. The columns of the churches were commonly the columns of earlier buildings used up again. But their architects seem seldom to have made use of the columns of the temples on the site of which they were building. The fact is that the columns of the temples were seldom suited for that purpose. The columns of the portico of a temple, columns which, with their entablature, made up the full height of the wall, were too lofty to be employed in the inside of a church which came at all short of the very greatest scale. Translated to the inside of the Basilica, the column had to bear its arch, perhaps a stilt between its abacus and the arch, to bear the clerestory range above, and the space between arcade and clerestory devoted to mosaics or other kinds of enrichment. Sometimes, again, in the Christian, as in the heathen, Basilica there was one arcade or colonnade above another. Smaller columns than those of the temples had therefore to be used for all but the very greatest churches, and we thus get the curious sight of churches built on the sites of ancient temples, out of the spoils of ancient temples, but with the columns of the temples on whose site they stand remaining unused and embedded in the walls. This may be seen at St. Mary in *Comedien*, where five stately columns of the original temple are built up in the western and northern walls. It is almost more striking at St. Nicolas in *Carcere*, where the church—one of no great size—takes in parts of three neighbouring temples, with columns of different orders. In both churches the arcades rest on much smaller columns, doubtless brought from somewhere else. Had the columns of the original porticoes been used for the churches, the churches must have been built on the scale of the Lateran or the Vatican Basilica.

The different churches made up in this way out of heathen fragments show widely differing degrees of skill in the way in which the fragments are worked together. A range has to be made in which the arches must spring from the same level, while the columns which serve to support them are often of different sizes, very often of different orders, and therefore with shafts of different proportions and capitals of different forms. Add to this that at Rome, as at Ravenna, the need was often felt of putting in a new member, a stilt or its equivalent, between the abacus of the capital and the actual springing of the arch. Sometimes all this is done in a very rude and inartistic way. Thus, at St. George in *Felabro* the arches hang in the most awkward way over the capitals of various kinds, with and without stilts; and some slender columns with Corinthian capitals are cruelly set to support a wide projecting mass, after the fashion of the market-place at Verona. In other cases the work is done far more skilfully. The arch, the stilt, if there be any, and the capital itself, are all worked harmoniously together. Any inequality in the height of the columns is often got over by making a difference in the bases, where it strikes the eye less than it does in the capitals. This is done with one of the columns in the small church of St. Bartholomew-in-the-Island, said to be the work of the Emperor Ottó the Third. It is but a small building; but so much as has escaped the disfiguring hands of Popes and Cardinals is worthy to have been the work of the Wonder of the World. Two fine arcades, with Composite columns well fitted to their arches, form the main feature. In other cases where columns and capitals of different kinds are used, those opposite to one another are often made to agree. Ionic capitals are often set opposite Ionic, Corinthian opposite Corinthian, plain shafts opposite plain, and fluted opposite fluted. In this way we get that same diversity in uniformity, or uniformity in diversity, which distinguishes mediæval art from classical. It is especially common, according to a fashion which we have already noticed as being usual in the Basilicas of Lucca, to mark the extent of the choir by some difference in the architecture at that point, by breaking the continuous range of columns by a square pier, by using a pair of columns at that point different from the rest of the range, or by any other means which might come into the architect's head. The breaking of a continuous range by a square pier at this point comes out very conspicuously in the famous upper church of St. Clement, the building where the primitive arrangement of the *chorus cantorum* in front of the altar is better preserved than anywhere else. And in St. Mary in *Comedien*, though the actual arrangement of the choir is less perfectly preserved than in St. Clement, its effect on the arrangements of the structure is yet

more marked. Instead of a continuous arcade, we have in this church a range in which three groups of arches are divided by two massive pieces of wall. The altar stands in its proper place on the chord of the apse; its steps are marked by a group of three arches on each side; the ambones stand against a massive pier; four arches again mark the extent of the choir; then another massive pier and four more arches to the west. Again, in the centre of the eastern group of four arches a pair of fluted columns, with plain ones on each side of them, stand opposite to each other; and in the centre of the western group two capitals with figures stand opposite to each other, all the other capitals in the church being Corinthian of different degrees of goodness and badness. From this there is only one step to the spanning arches of St. Praxedes cutting through the line of the entablature, the forerunners of the glories of St. Zeno.

When the custom of thus marking off the choir has been once taken in in churches where it is so clearly marked as in St. Clement and St. Mary in *Comedien*, it becomes easy to recognize the same feeling in a less strongly marked form elsewhere. Though the primitive choir did not, like the mediæval choir, stretch across from pillar to pillar, though it was not marked off by any great architectural feature like our chancel-arches, yet there clearly was a wish to mark in the building itself the point to which this division of the church was meant to reach. We see this in the Basilica of St. Agnes-without-the-Walls, a building remarkable on many grounds. This church has round three sides a gallery following the same arrangements of columns and arches as the greater stage below. Allowing for the difference between classical columns and massive square piers, the arrangement is exactly the same as that of the Great Minster at Zürich. Here again the only pair of fluted columns in the lower range seems to mark the extent of the choir, and in the smaller upper range, where there is greater variety, plain, fluted, and twisted columns carefully answer to one another. St. Agnes is one of the most pleasing of the Roman churches, and it is still more important as supplying the key to the original state of a far more wonderful building, the great church of St. Laurence-without-the-Walls. Here we are staggered to find the purely Greek construction with the column and entablature applied to the inside of a church so late as the days of Honorius the Fourth, the adversary of Frederick the Second. We are hardly less staggered to find the altar standing, without any apse or triumphal arch, against a flat east end—we use the word "east" conventionally—with a gallery like that at the east end of St. Agnes. Nor is it much less wonderful in a Roman church to find that altar at the end of a long raised choir, parted off from the nave by an arch after the manner of churches north of the Alps. The key to all this is to be found in one of the strangest transformations that any church ever went through. The present choir is the original church turned round, with the original apse pulled down and a nave built on in its stead. The arch of triumph thus becomes a chancel-arch in the English sense, leading into what is now the choir, and the altar with the Bishop's throne behind it is moved to the (conventional) west end of the original church, now become the (conventional) east. In this choir—the original church—a gallery like that of St. Agnes, taking the form of an arcade, rests on a lower stage which consists of noble fluted Corinthian columns. These support an entablature, one pair alone having capitals introducing human figures. The greater part of the height of the columns is hidden by the arrangements of the choir, and their full proportion can be seen only by looking down into what were the aisles. The entablature is made up of scraps of friezes from different places. Yet they fit together better than might have been looked for, and the whole effect is striking and not wholly unsatisfactory. The entablature does not seem out of place when it merely supports the light gallery above; and it forms a marked contrast to the effect of the same construction in the nave, where the columns have, as in the Liberian Basilica, to support a heavy wall, answering to the triforium and clerestory range.

The capitals of these churches are of course commonly classical capitals used up again. Among them we get every variety of Ionic, Corinthian, and Composite forms; the Doric, as at St. Peter in *Vincula*, is rare. Sometimes, as in a side chapel of St. Praxedes, we find later imitations, such Ionic, for instance, as would be made in the time of Pope Paschal the First. We have already mentioned a few cases of the use of the capitals which introduce human forms. These belong to a class whose history needs minutely working out. The trophy capital, as we may call it, made up of armour without any actual human figure, is found in the Temple of the Twelve Gods. Capitals with the actual human figure, capitals of the most splendid workmanship, may be seen lying about, seemingly uncared for, in the Baths of Caracalla. Among the fragments found in the lower chambers of the Tabularium or the Senatorial Palace are capitals no less well wrought, in which volutes are made of animal forms. These varieties are most important in the true history of architecture. Here, in classical Rome, we find ourselves on the high road to the ruins of St. Ambrose, to the eagles of Lucca, Wetzlar, and Gelnhausen. In everything, to one who recognizes the continuity of history, and therein the continuity of architecture, to one who does not dream that there was any time when the building art perished from the earth, the works of classic Rome are but a transition to the more perfect works of Pisa and Durham; and the age of Diocletian, though its bricks may be wider apart than bricks were in the golden age of Nero, is seen to be the age of the greatest architectural development that the world ever saw.

NEW CHICAGO.

THE second anniversary of the great Chicago conflagration has been celebrated by one of the local magazines, the *Lakeside Monthly*, in a special number containing seventeen papers, every one of which bears a title of this kind—"The Chicago of the Educator," "The Chicago of the Business Man," "The Chicago of the Manufacturer," and so on. In short, we have seventeen special Chicagos considered in a review of the big general Chicago, whose name has already been so widely "advertised" (as the inhabitants themselves say) by the remarkable rapidity of its growth and the suddenness of its destruction.

What the United States are to the rest of the world, Chicago is to the United States. It is the concentrated essence of Americanism. The peculiar state or temper of the human mind in which material growth and extension are its only objects, and all its forces are concentrated with the utmost intensity on these, has never been so perfectly developed as in the United States; and if we were asked what city in that country showed that temper in its most energetic form, we might possibly think once of Boston or New York, but should certainly relinquish them for Chicago. Just as the United States are the newest of great nations, so Chicago is the newest of great cities; and as the States look forward to an almost indefinite increase of wealth and population in the future, so Chicago expects in its own mind to become the biggest and richest city on earth. In this condition of temper and feeling, it is not surprising that we should hear a good deal of exultation. A people very busy and prosperous, and just enough educated to be capable of reading and writing incessantly about itself in a multitude of cheap periodical publications, is sure to develop a continual supply of brag. Such a people is very much in a condition that is known to us by specimens in our own country, the condition of the clever and active Manchester or Bradford man who, beginning with nothing but native strength and ability and a very little elementary education, fights his way to a brilliant material success, and naturally looks back upon his career with a self-complacency that expresses itself in boasting. American brag has been long quite familiar to us, and we imagine that there must be a use for it, that it must have been ordained amongst the inscrutable intentions of nature. It acts no doubt as a stimulus, and keeps the Americans well up to their work. The Americans are like very strong boys who are always wanting to show off their strength, and who look upon every piece of physical labour to be done as an opportunity for athletic display. We really believe that when Chicago was burned down the inhabitants inwardly chuckled over the calamity as the finest possible opportunity for proving to the world the pluck and energy that was in them. The building of a new city was a match against time. So they set to work as if they had made bets with all other cities that they would rebuild Chicago in a couple of years, and they laboured all along with the idea that they were watched by the whole world.

The Chicago papers of the *Lakeside Monthly* begin with a poem by Mr. B. F. Taylor, imitated in some degree from Macaulay's manner, but decidedly above the average of magazine verses. Mr. Taylor had rather a perilous kind of subject to deal with, for it is difficult to do the tremendous in poetry when there is hardly a refuge in anything else, and this writer, we should imagine from his graceful beginning, would have done more justice to a quieter theme. Here is the central passage of the poem, in which the conflagration is described, but with rather incongruous imagery:—

The stately piles of polished stone were shattered into sand,
And madly drove the dread simoom, and snowed them on the land,
And rained them till the sea was red, and scorched the wings of prayer!
Like thistle-down ten thousand homes went drifting through the air,
And dumb Disney walked hand in hand with frozen-eyed Despair!

The thunder of the fiery ruff rolled human accents dumb;
The trumpet's clangour died away a wild bee's drowsy hum.
And breakers beat the empty world that rumbled like a drum.
O cities of the silent land! O Graceland and Rosehill,
No tombs without their tenantry? the pale best sleeping still?
Your marble thresholds dawning red with holocaustal glare
As if the waking Angel's foot were set upon the stair!

There is a very sensible paper by Mr. John F. Binckley, called "The Chicago of the Thinker," in which the writer really does try to think out certain interesting questions about Chicago which suggest themselves to an intellectual inhabitant. He says that "it is the prevalent practice to ascribe the development of Chicago to the uncommon enterprise of spirit of its inhabitants," and he then immediately inquires whether there is a constitutional difference of character between the Chicagoans and the inhabitants of smaller towns in the North-West equal to the difference in the size of the towns they live in. The answer is that "when a man is known to be from the North-West, there is little about him to show whether he lives at Chicago or elsewhere." And then come some observations about one point in Chicago character which are well worth quoting at length:—

Perhaps if any characteristic of Chicago is personal enough to strike a stranger, it is the settled mental habit of taking ulterior good for granted—a business optimism in which solicitude is reserved for particular expedients, and not indulged upon comprehensive doubts, or the sometimes startling possibilities that generalizations foretell. Were a Philadelphian to experience conviction that manufacturing was to become unprofitable in Pennsylvania and New Jersey, nothing could rescue his peace of mind from destruction. But if a Chicagoan could be convinced of a time when grain and live stock would no longer seek his market, I think he would accept the event with composure, trusting, with tranquil confidence, that by the time it should come other and better trade would occupy their place.

Mr. Binckley, however, is convinced that this is "a matter of superinduced habit, not of temperament." He considers this faith in a good future as the result of an exceptionally favourable experience. It took some time to imbue the Chicago people with this trustfulness. It is true that land was sold dear, or withheld from sale when it would have fetched high prices, in the early period of the city's prosperity; but Mr. Binckley does not think that this proved the foresight of the landholders, only the disposition to make as much as possible out of what seemed to them the folly of eager enthusiasts. Even down to 1857 there remained something of the stolidity of the early settlers. The ground had been appropriated as early as the beginning of this century, but the hydrographic schemes on which the future of the place depended do not seem to have awakened the interest of the settlers. In 1830 an official came to lay out a town in the interest of the canal, yet the event "seems to have made no impression until immigrants came from the East, seeking so promising a site." From this year dates the beginning of speculation at Chicago, though not yet of any healthy trade:—

The rapid influx of emigrants, the Government work on the harbour, the location of a public land office, the presence of labourers on the harbour and canal, and the incursion from older communities of scores of adventurers, awakened not a spirit of enterprise, but of sheer speculation. For years nothing was produced for sale; and supplies from the East, even including flour, were paid for out of the proceeds of extortion upon strangers, or with money and goods unconsciously got from the Indians on occasion of their receiving annuities or in traffic. More than once legislative interference was requisite for moderating hotel charges and the like. The inhabitants held the future of their own town in such contempt that the wharf rights and school lands, worth a hundred millions to-day, were sold and bought for a few nominal thousands, the former as late as 1835, and probably never paid for at that; the supposed necessity consisting of the equally significant fact that the town, then with a population of four thousand, and no considerable municipal debt, had not a public credit for 2,000 dollars. In 1836 the port of Buffalo received a million and a quarter bushels of wheat, including a thousand brought from a petty town across the lake in Michigan; and yet even the export of a few bags by lake to Buffalo was not ventured on for two years later, without which the Chicago business mind could not comprehend the opportunity. To be sure the next year (1839) witnessed that the experiment warranted the trade, if it did not amaze the experimenters, and it went on until last year it was nearly a hundred million bushels of grain.

Even in 1851, when the population was already thirty thousand, Chicago supplied itself with water by means of an engine of twenty-five horse-power, and the contractor was to receive no profit for ten years but the excess power of that engine. Nobody had the least confidence in the future, and the people would not listen to projects which were based upon an anticipated increase of population. In 1849 there was no gas in the place. Mr. Binckley affirms that "a less enterprising population have seldom been found in America than that of Chicago, until a series of the most unique and irresistible constraints that ever flattered an undeserving people had made the city great." It was a people "dull, unspiritual, and strong, conditioned so as to be necessitated to execute the ideas and participate the hopes of a more fertile, polished, and luminous people." There occurred "a kind of translation of one man's ideas into another man's motives." This resulted from "the extraordinary fact that the policy of Eastern enterprise involved as an incident, at national expense, the creation of a harbour, the digging of a canal, and the endowment of a great railroad, and the building of vast plexus of railroads by private enterprise, all tributary to a place having not the least aspiration for greatness." Mr. Binckley has some exceedingly interesting observations on the influence of the first inhabitants of Chicago, showing how it has maintained itself to this day in various habits and customs which, being already established in the little town that was called Chicago, have perpetuated themselves in the great city. We are glad to observe that he sees how necessary culture is to the life of such a city as Chicago is now rapidly becoming. Perhaps he is even too severe upon its present deficiencies in this respect. European experience proves two things which ought to be a consolation for every inhabitant of Chicago who has aspirations in this direction. It proves that culture does not establish itself firmly just at first in an enterprising trading community, and it proves also that any town that is very rich and populous, and inhabited by men of European blood, is sure to have a cultivated society in it before very long. The misfortune is that the cultivated class should be so much apart and have so little influence on the general public of the place, especially on the wealthiest traders. We do not doubt that Chicago is sure to become, in the course of a generation or two, as cultivated a place as Manchester is now; that is to say, there will exist some cultivated groups of citizens in the place, and a few public buildings for the three great divisions of culture—a library for literature, a museum for science, and a gallery for art. But the bulk of the community will resist culture there as it does in Manchester. The merchants and manufacturers and their wives may have a kindly feeling towards culture, and be willing to do something for it (and even this is hoping a good deal, for there is apt to be some jealousy of cultivated people); but they are not likely to see culture otherwise than from the outside, or to have that perfect and true sympathy with it which is only possible for those who really have a share in it. No one can have a share in culture without long-sustained intellectual labour, and it is difficult for men who are occupied in trade, and for women who are occupied in the duties or pleasures of a vulgar existence, to set to work strenuously for the improvement of their minds. Even in great capitals, although the society there has the advantage of external polish and refinement from the presence during a part of

the year of the national aristocracy, the really cultivated people are a few little groups who have not very much influence on the general mass of the inhabitants. We have all possible means of culture in London, yet how many well-to-do Londoners live without making the least use of them! There is a paper in this series by Dr. Powers, the well-known Episcopalian clergyman, in which he expresses a similar desire for culture, more especially of an artistic kind:—

While the reconstruction of Chicago is such a marvel, it cannot be denied that its æsthetic aspect is dispiriting. The city, as a city, does not wear the crown that her position and resources would seem to entitle her to. No one can view her magnitude and business, or read the truthful descriptions of her material greatness given in the present number of the *Lukewarm*, without a sense of incongruity and disproportion. She does not lack brain, but symmetry. She is heavy, ill-balanced, almost grotesque, with all her splendour. The city does not suggest cultivation and refinement; but immense material energy.

Whilst fully sharing the desire which Dr. Powers expresses for a better æsthetic culture in Chicago, we think that he cannot reasonably expect much more for the present than what the place has already attained to. He says that "the idea of art, of a great multitude, seems to be limited to fine tailoring, upholstery, and crockery." All this is very natural; it is not quite satisfactory, but it is quite in accordance with the usual habits and tendencies of human nature. A prosperous business community likes tailoring, upholstery, and crockery, and likes to see its wealth reflected in these things. Even when it begins to buy pictures and engravings it likes to see something for its money. The art that it most enjoys is highly finished handicraft, such as the gilding and painting on a pretty dinner-service, or the clever printing of a fine carriage. We think that Dr. Powers gives an example of good taste to his fellow-citizens when he objects to the modern American custom of arranging shops and counting-houses in such enormous palatial blocks. They have considerable grandeur, no doubt, but as Dr. Powers judiciously observes, they interfere with the effect of the real public buildings, which are dwarfed by them. There is scarcely a church in Europe which would not be either dwarfed or at least considerably injured by the immediate neighbourhood of a block like the new Sherman House at Chicago. It would do harm even to the loftiest cathedral.

There are some interesting statistics in the paper on Education by Mr. Leander Stone. The value of school buildings and their furniture is nearly thirteen hundred thousand dollars. There are fifty-one buildings and between five and six hundred teachers, with an actual attendance of thirty-five thousand pupils. The Bible has been removed from the public schools of Cincinnati and St. Louis, but is still read in those of Chicago, the teachers being "careful to select such portions as are not controverted by any body of Christian people; and up to the present time no serious objection has been raised to this course." Besides the children in the public schools, there are more than fourteen thousand in private educational institutions. Then there are medical schools, a law school, and a university. Notwithstanding all this rich provision for education, there would still however be room for the action of a School Board, as 28,000 children ought to be in school and are not. "But this," says Mr. Stone, "though a large number, should be considered in connexion with the fact that, in the bustle and whirl of our great commercial activity, very many children are removed from school and put to work as soon as they obtain a knowledge of the most elementary branches."

Mr. Stone tells us that all the places of worship, without exception, that were destroyed by the great fire have been rebuilt, or are in process of rebuilding, in a manner very superior to their former style. This is what always happens after destruction by fire, when a community is wealthy enough to seize the occasion. Men seek in the improvement a sort of compensation for their loss, and find a satisfaction in reflecting that, if a great misfortune has deprived them of what they had before, at least they have improved their condition by erecting in its place a structure either more useful and commodious or else more in accordance with their ideal. It is natural that when all the "business blocks" are re-erected on a scale of unprecedented magnificence, the churches must be larger and handsomer than they were before. For reasons already given, all public buildings in a city like Chicago, where the "business blocks" are so imposing, have a difficult part to sustain, and need both size and beauty, but size especially. Different writers agree in telling us that there is an unusual degree of mutual respect and forbearance among the sects of Chicago. It is said "that Chicago contains the most liberal orthodox and the most orthodox liberal clergy and people to be found anywhere in the world."

Under the head "The Chicago of the Business Man," Mr. Sherman tells us that there is a Clearing-house to which go daily the cheques given in the course of ordinary business, and whilst they do not represent the entire expenditure in buying and selling, any increase or decrease in this volume indicates the increase and decrease of the general buying and selling in the daily trade of Chicago. Computing a period in 1872—namely, from the week ending May 5, to the week ending September 20, inclusively—with the corresponding period in 1873, we have the following figures, which are interesting as evidence, in a very compressed form, of the amount of business done and the proportionate increase:—

1872	\$439,794,329
1873	\$505,358,386

Chicago is a great centre of periodical literature. It supplies seven hundred different country editors with newspapers printed on one side, leaving the other blank for the local news. Thirty monthly

magazines are published in Chicago, and the daily papers appear also in other forms, three times a week or weekly. There are very large morning and evening journals with very long telegraphic despatches, and the wonder is how the Americans absorb such a huge supply of periodical literature of all kinds. Another American peculiarity is the great amount of good hotel accommodation. There are forty of what are called "principal" hotels (we know not how many others), and these forty offer more than five thousand rooms amongst them.

We are sorry not to have space for more details about Chicago, its tunnels far out under the lake to get pure water, its vast system of sewers, its river whose current was actually reversed and made to flow from the lake instead of into it for sanitary reasons, its great number of railways, its docks, wide streets, good lighting, smooth pavements, tramways, manufactures. In all the practical setting-up of a great modern city the Chicagoans have proved themselves not less clever and decided than the builders of modern Paris. We can readily excuse a little boasting, which is natural under the circumstances, whilst it does nobody any harm, and we heartily wish the people of Chicago a long enjoyment of the fine new buildings they have just erected, and prosperity in the future to a lid indefinitely to their number.

BISHOP REINKENS'S LAST PASTORAL.

IT is hardly to be wondered at that the Papal Encyclical to which we called attention a fortnight ago should have provoked a rejoinder from the Old Catholic Bishop Reinkens. The Pope did not indeed perpetrate the gratuitous blunder which the *Times* theologian, with characteristic inaccuracy, put into his mouth. He never asserted that Reinkens could not possibly be a bishop because he was out of communion with the Holy See, which would have involved the whole Oriental episcopate in the same condemnation; nor did he "declare his pretended consecration invalid." On the contrary, he was careful to distinguish between the "uncanonised, unlawful, and utterly invalid election" of "the said Joseph Hubert," whom he therefore pronounced to be "no lawful bishop," and his "sacrilegious consecration"—sacrilege being, of course, the profanation of a sacrament, not the imitation of it. At the same time "those new heretics who call themselves Old Catholics" were, not to mince matters, very soundly rated for their misdeeds. They are "unhappy sons of perdition"; they are "going on more boldly in the way of iniquity"; there is "nothing wanting to their impudence"; and the Pastoral of a "certain notorious apostate from the Catholic Faith," whom they have made their bishop, is designated "that impious and most impudent of documents." Hard words, it has been truly said, break no bones; but these are very hard words indeed—and we have given but a few specimens of the Papal rhetoric—and it is only natural that the victims of so many and such hearty maledictions should claim the right of reply. The question has now become so variously complicated with Prussian politics that it is difficult sometimes to disentangle the religious quarrel of the Old Catholics and the "Vaticanists" from the quarrel of the German bishops with Prince Bismarck; and Pius IX. not unnaturally does his best to confound the two. It would perhaps have been better if Bishop Reinkens had shown less readiness to follow his lead, for the theological and political controversies, however closely connected, are really quite distinct. It looks certainly as if the only chance of ultimate success for the ecclesiastical policy of the Prussian Government must be found, as we have before had occasion to remark, in such a development of the Old Catholic party, or at least of the principles it supports, as may supply a religious basis for the grave alterations in the existing system of Church discipline which Bismarck is seeking to enforce. But it does not follow that the Old Catholics are wise in identifying themselves so completely as Bishop Reinkens seems inclined to do with what must be regarded on the whole, and in the method of applying it, as a policy of downright persecution, however justifiable or even valuable some of the particular regulations—as, for instance, about clerical education—may be in themselves. Even if every incident of the new system were in itself beneficial—and Bishop Reinkens would probably scruple to affirm so much as that—an internal reform of the Church differs materially in character from an external change forced on her by a hostile Government. The Tudor Reformation was a tolerably rough and ready procedure; but the Tudor sovereigns were at least professedly members, and claimed to be supreme governors, of the communion they were engaged in remoulding. The German Emperor is a Protestant, and does not pretend to any spiritual fellowship with the Church which he is so rudely manipulating, still less to any spiritual jurisdiction over it. The only plea on which his legislation can be consistently justified is precisely that which its author seems unable or unwilling to establish. Prince Bismarck has no doubt publicly charged the Roman Catholic bishops and clergy with disaffection, and something more than disaffection, to the new order of things in Germany, and there is nothing intrinsically improbable in the allegation. But when challenged by the inculpated parties to prove his charges, he vouchsafes no response; yet nothing short of proved disloyalty could excuse—to take one instance only—the imposition of the revised form of episcopal oath which has just been published, and of which we shall have a word to say presently.

The Civil Marriage Bill, or, as it should rather be called in its present form, Civil Registration Bill—for it applies to births and deaths as

well as marriages—stands on a different ground. Whether the introduction of the measure in a compulsory shape is desirable, or is best suited to the actual circumstances of the case, is a point fairly open to debate; but in some shape or other such an arrangement has become almost a necessity in countries of divided religions, and the only wonder is that it should not have been introduced into Prussia before now. Discretionary civil marriage is already the law of Austria, and compulsory civil marriage has prevailed for half a century in the Rhineland. It is curious that a change which, in the peculiar religious atmosphere of modern Germany, is thought likely to promote a further loosening of the remaining bonds of popular belief, should have been brought about, as it evidently has been, by the action of the Ultramontane party now dominant in the Church. It is a fresh example of the widening circles of influence radiating from the Vatican dogmas in a direction the very opposite of what was contemplated by those who framed them.

But it is time to say something of Bishop Reinkens's Pastoral, the principal passages of which, containing a severe criticism of the last Encyclical, have now been reproduced in the *Allgemeine Zeitung*. The writer is more successful in exhibiting the weakness of Papal rhetoric than the justice of the new Prussian laws. Constantine, Justinian, and Charlemagne may have exercised a greater authority in things spiritual than the Emperor William, but they were members and strenuous supporters of the Church, and were acting in substantial accord with the hierarchy of the day. No doubt, again, the favourite Ultramontane analogy between the old heathen persecutions and the present action of the Prussian Government, or the two "Cæsarisms," as Archbishop Manning calls them, breaks down in essential particulars; but that does not prove that the Prussian laws afford no legitimate ground of complaint. There were persecutions and persecutions, and a nineteenth-century statesman, however unfriendly to Christianity or to any one form of it, would not be likely to offer recalcitrant Christians their choice between apostasy and the lions. Bishop Reinkens seems to think the disobedience of the Prussian bishops to the new laws sufficient evidence of their disaffection to the State, and in this he does but echo Dr. Falk's words in the recent debate in the Landtag. Yet Prince Bismarck's legislation can hardly have been called forth by the conduct to which it has given rise. It is more to the purpose to point out that many of these regulations have been sanctioned or quietly acquiesced in elsewhere by the Roman authorities, without any such disastrous results as the Pope now professes to anticipate; but this plea by no means covers the whole ground. Several examples of usurpations on the temporal domain by former Popes, from Innocent III. downwards, which will be familiar to readers of "Janus," are next cited; but, except on the principle of "an eye for an eye, and a tooth for a tooth," they do not seem more relevant than Lord Russell's rather perplexing postscript to Sir G. Bowyer about the former services of the Whigs to the cause of Catholic Emancipation. The Prussian bishops might reply with much plausibility that it was rather hard that their spiritual rights should be invaded in retaliation for the civil encroachments of mediæval Pontiffs, or that the zeal of Liberals for religious liberty in the past should be held to give them *carte blanche* for religious intolerance in the present. Bishop Reinkens is more in his element, and writes with moderation and force of argument, when he comes to vindicate his own religious position as that of "the ante-Vatican Catholic Church," and the legitimacy, on principles of ancient canon law, of his election and consecration to the episcopate, and of the line taken by the "deeply injured Church of Utrecht," from which he derived his succession. The closing paragraph of the Pastoral is dignified and Christian in tone, but does not call for special remark.

The Pastoral makes no reference, as far as we have observed, to the new episcopal oath which has been published within the last few days, and which is henceforth to be exacted of every newly elected bishop in the kingdom of Prussia. Bishop Reinkens, we believe, took it himself, and was no doubt able to take it with a good conscience; but as it includes, among other things, an express stipulation to obey strictly, and cause others to obey, "the laws of the State," objections may not unreasonably be raised by others to a formula so comprehensive, or—to use Dr. Manning's term, so "cynical"—as apparently to embrace all future legislation of whatever kind, while it at once implicitly endorses the very laws which are just now the subject of such bitter contention. There is nothing, indeed, in an engagement to observe and enforce on others the observance of the law, and to give no support to any association whatever either within or without the country prejudicial to the State, but, on the contrary, to warn the sovereign against it, that is not easily susceptible of a reasonable interpretation. But the wording of the oath, when interpreted by the circumstances of its composition, points unmistakably to a promise to obey the laws which the Prussian bishops are just now, one after another, incurring fines and prospective deprivation for refusing to comply with, and to hold no communication with the Court of Rome. The see of Falda is vacant at this moment by the death of its last occupant, and five names of candidates have been submitted to the Government by the Chapter; and other sees will shortly be vacated by civil deprivation, if not by death; and in all these cases the new oath will be required as a condition of the Royal sanction to any fresh nominee. It is difficult to see how any bishop in communion with Rome can take it in the sense in which alone it would be accepted by the civil power. When, therefore, Dr. Falk said the other day in his reply to Herr Reichen sperger, "To say that we wish to disturb the Catholic faith

is an untruth; nay, I will go further and change the objective into the subjective—it is a lie," his statement requires explanation. It may be true "objectively" that the new laws do not interfere with the Catholic faith, and that Bishop Reinkens is quite as good a Catholic as Archbishop Ledochowski. But, even so, it is not the less certain "subjectively" that they do very seriously trench on what the Roman Catholic prelates regard as matters of principle. And, while the objective aspect of the question is what mainly concerns theologians, we cannot but think that in an age and country of mixed religions the subjective can alone be fitly dealt with by the State.

At the same time we need not travel beyond the elaborate paper already referred to on "Cæsarism and Ultramontanism," which Archbishop Manning read last Tuesday before the "Academia of the Catholic Religion," to understand how professedly Liberal statesmen may have been prompted to enter on a policy so little in accordance with Liberal ideas. There is force in much of what the Archbishop says about "the Falk legislation," but he seems unconscious of the very vulnerable points in his own defensive armour. It is startling to be told that "Ultramontanism"—it is a term Dr. Manning glories in—is absolutely identical with Christianity and with "the liberty of the soul"; and Ultramontanism is expressly and with reiterated emphasis explained to mean the absolute supremacy of the Church over the State "within its own sphere" of faith, morals, "and mixed questions," the limits of which it can alone decide and decide infallibly. The Bull *Unam Sanctam*—which declares every creature to be subject to the Roman Pontiff—and the definitions of the Vatican Council are quoted as examples of such decisions. On the other hand, the tyranny and religious persecution which follow from denying these Ultramontane principles is exemplified by the Tudor legislation, which "enforced a legal religion in England and Ireland by penal statutes." We have nothing to say for the Tudor legislation, but Dr. Manning has apparently forgotten that Mary Tudor enforced the "legal religion" with the most stringent "penal" severity of all who bore her name, and that the same legal religion was similarly enforced under the penalty of fire for centuries before the Tudors came to the throne. That religion was, of course, he may plead, the true one, and it was enforced with the full sanction of Rome; but this does not make its enforcement any the less persecuting, or more compatible with that liberty of conscience of which we are assured that Ultramontanism is the sole adequate guardian. Now Dr. Manning may be taken to represent fairly enough the spirit of the existing Roman Curia and of the hierarchy under its control; and when he gravely puts forward the *Unam Sanctam* and the Vatican decrees as simply "declaratory acts," defining the normal relations of the Church with the civil powers of the world, our surprise at the hardly less extravagant counter-claim of civil supremacy put forth by the Prussian Government is sensibly diminished, though what we cease to wonder at we do not therefore approve.

THE MODERN CHESTERFIELD.

A SERIES of articles which has been appearing in one of the monthly magazines, under the title of "The Chesterfield Letters of 1873, by Lord G— H—," has attracted a degree of attention which is certainly not due to its literary merits. Cynical letters from a father to a son, or from an uncle to a nephew, in imitation or in caricature of those which Lord Chesterfield addressed to the slovenly booby in whom he vainly hoped to prolong his social triumphs, have long formed a hackneyed subject for cheap satire. The latest attempt to extract humour from this exhausted topic appears to be chiefly remarkable for coarseness of language and ideas, and for the impudent repetition of stale jokes and second-hand indecencies. We cannot pretend to have read more than a few pages of it, but the rest seems to be in the same strain. In the part we happened to fall upon, an uncle is endeavouring to persuade his nephew against a love-match, and here are some samples, taken at random, of the delicate wit and sparkling epigram of the modern Chesterfield. The writer points out "the vulgarity of all this business of falling in love with a view to matrimony," and "the small probability of your spouse retaining your affection and continuing to you hers for many months after you are made one." "Pretty you say she is; but 'all women are alike in the dark,' and after the first fortnight you will be as much accustomed to her as you are to the old cane-bottomed chair." "Women," we are told, "are charming creatures no doubt, but no woman is nice enough to be a wife; whatever her charms, she would madden you as the Greeks thought a sweet perfume would madden a cat." "No charm on your part will make you an exceptionally favoured husband; remember that Pasiopath, the consort of a prince, was enamoured of a bull, Titania of Bottom, &c.," and "it is therefore madness 'to join company with one who will become in a few months your mortal enemy, for the felicity of being able to 'jaw, and brawl, and maunder' at one another during the term of your existence.'" And so on. We are not concerned to become the apologist of Lord Chesterfield's morality; but at least he wrote like a wit and a gentleman. The dismal rubbish which we have just quoted will show the general quality of the Modern Letters. The writer was perhaps aware that trash of this kind would fail to secure readers, and he therefore hit upon the expedient of seasoning his dreary prose with a dash of real or apparent personalities. Various

characters are introduced under names or in connexion with circumstances which have led to the supposition that they are not fictitious, but are intended to be identified with real persons. It is easy to imagine the amount of annoyance, and even pain, which may be caused in this way. It gets whispered about that this character is meant for such a person, and that character for such another; and a malicious, or perhaps only an idle, ingenuity is exercised in endeavouring to attach names to the different portraits. For this the writer may plead that he is not responsible; but he cannot escape responsibility if he has mentioned matters which naturally suggest a personal identification.

This point has just been put to the test in the case of "The Chesterfield Letters of 1873." One of the characters sketched in these letters is "Harry Browne, the Honourable Harry Browne, a lieutenant-colonel in Her Majesty's Fourth, or Chancery, Regiment of Guards, and member of Parliament for Ballykilljohnstown-Kennedy-borough." "Can you," it is asked, "resist his deep musical voice, his slow impressive manner of stating the most evident truism, his beautiful belief in himself, his splendid contempt for all others, his graceful attitudes, and his riches? What does it matter if his father did make his title and earn his pension by"—and then follow some atrocious imputations which we prefer not to reproduce. This description was suspected to be levelled at Colonel Charles White, who is the son of a peer, a Lieutenant-Colonel in the Fusilier Guards, and a member for an Irish constituency, and whose efforts at Parliamentary oratory are perhaps chiefly characterized by artistic vocalization. Colonel White accordingly determined to investigate the authorship of the letter; and on Saturday last the following remarkable letter appeared in the *Times*:—

SIR,—We have to request that you will insert the following declaration, which was read in our presence at Desart House, Kilkenny, on the 12th of December, 1873.

Sir, yours most obediently,

CHARLES CRAUFURD FRASER, Colonel.
FRANCIS BARING, Lieutenant-Colonel.

London, Dec. 10.

"I, William, Earl of Desart, acknowledge that I am responsible for the 'Chesterfield Letters—1873,' which have been published in the magazine known as *London Society*.

"I deny emphatically, upon my solemn oath, that the article about 'Harry Browne' in any way, however vaguely, referred to Colonel Charles White individually, or to any member of his family.

"I deny that he, or they, were in any way in the mind of the writer at the time, or in mine when I corrected the proofs. Had it been so, I freely admit that that article would have been defamatory, unwarranted, unwarrantable, blackguard, infamous, and utterly unworthy of a gentleman's pen.

"I hope that Colonel White will give the utmost publicity to this statement.

"DESART."

It will be observed that this is not exactly the style of Chesterfield; and perhaps still less is it the sort of letter which, if written by another, and presented with an imperative demand for signature, would, under any circumstances, have been signed by Chesterfield. Lord Chesterfield was a cynic and a loose man of the world, but he was not deficient in those other qualities by which men of the world usually feel bound to atone for their failings.

The history of this letter appears to be as follows. It was discovered that the Earl of Desart had some connexion with the recent *Chesterfield Letters*; and Colonel White, Colonel Craufurd Fraser, and Lieutenant-Colonel Baring went to Desart House, Kilkenny, to inquire into the matter. On the 10th December, Colonel Fraser waited upon Lord Desart, while Colonel White and Lieutenant-Colonel Baring remained outside. As it happened, it was found to be unnecessary for Lieutenant-Colonel Baring to do more, than witness Lord Desart's signature to the declaration which he was requested to sign, or for Colonel White to appear at all. From a subsequent letter by Colonel Fraser it appears that the Declaration which was published under Lord Desart's name, and in which Lord Desart was made to say that he desired Colonel White to give the utmost publicity to it, was drawn up by Colonel White, who instructed Colonel Fraser not to allow Lord Desart to alter it in any material respect; and that Lord Desart had this Declaration before him for an hour, and finally consented to sign it. In the interval, however, Lord Desart produced a private letter addressed to Colonel White, and purporting to be "dated the day before our arrival, but"—for some reason—"not posted," and this letter, oddly enough, was to the same effect as the Declaration. This, however, was not accepted as a substitute for the Declaration. Lord Desart demurred to the sentence beginning "Had it been so, I freely admit that that article would have been defamatory, unwarranted, unwarrantable, blackguard, infamous, and utterly unworthy of a gentleman's pen"—a good strong sentence, not exactly Chesterfieldian, but with merits of its own, and highly appropriate to the circumstances of the case: but Colonel Fraser said that it could not be omitted "because Colonel White will not allow it." He also said "most impressively," "I tell you, Lord Desart, upon my honour, that, if you do not sign this Declaration, I consider that you will cause much unhappiness to your friends." Upon which Lord Desart "consented"—to use his own words—"to submit to what certainly may have seemed to be dictation." It does not appear that Lord Desart expressed any desire for a personal interview with Colonel White. Perhaps the Declaration would have been still more impressive if Lord Desart had only thought of adding the motto of his coat-of-arms—"Virtus repulsa nescia sordidus."

Lord Desart acknowledges that he is "responsible" for the "Chesterfield Letters of 1873"; but in a second letter to "Dear White," written after the interview with Colonel Fraser, he says he did not actually write the offensive article, although he "is, and must be, unfortunately, responsible for it." Whether Lord Desart wrote it or inspired it, or simply ordered it from some person whose trade it is to write such things, does not of course in the least affect Lord Desart's responsibility for the publication of the article. He admits that he saw the proofs, and the question remains whether the article can be considered a culpable one. On this point we may quote Lord Desart's own words to Colonel White:—"That it was possible for people to point to some degree of caricature likeness to you in the first part of the offending paragraph I admit, but how the latter part can be in the remotest degree connected with you or your family I never did, and I do not now, understand." A little reflection would perhaps enable Lord Desart to understand that, if Colonel White was thus labelled in the first part of the paragraph, readers would be led to suppose that the rest of it also applied to him or his family. A writer of sketches of this kind is not justified in drawing a picture in which "it is possible for people to point to some degree of caricature likeness" to a well-known person, and then coupling it with infamous charges which must appear to be directed against the family of the person thus caricatured. Lord Desart's confession that Colonel White might be identified in the first part of the paragraph appears to supply a conclusive condemnation of the article. Truth and fiction cannot be fairly mingled in this way. On the whole, although the original Chesterfield no doubt wrote from a low moral point of view, the modern Chesterfield who is "responsible" for the letters in *London Society* would seem to have something to learn from him. Perhaps, on the other hand, Colonel White and his friends would have acted more wisely if, while compelling Lord Desart to sign the Declaration, they had refrained from calling public attention to the matter. They have invested with a factitious interest a paltry and stupid article which otherwise very few people would probably have taken the trouble to read, and which none would have remembered. It is to be hoped that Lord Desart will be careful not to become "responsible" for any more productions of a similar nature.

KNIGHTHOOD FOR FIVE GUINEAS.

HUMAN nature testifies against that social equality which philosophers admire:—

The heavens themselves, the planets, and this centre,
Observe degree, priority, and place;

and in obedience to a universal law artisans dub themselves "R.W.P.G.M.," while gentlemen attempt to revive the Orders of the Temple and St. John. The Queen is still the "fountain of honour" for her subjects, but some of them appear to think that a further supply of crosses and stars ought to be turned on. The members of a convivial or social club are at liberty to adopt among themselves any titles they may choose; and we can only hope that the Grand Master and Arch-Chancellor of the United Orders are pleased with the lofty names and pretty badges which they have assumed. The artists whom they have employed were at liberty to indulge fancy to the utmost, but we do not understand by what authority the royal arms of England have been placed upon the shields of the officers of the United Orders. We have all heard of the rich American who had a particular coat-of-arms painted on his coach-panel because he liked the pattern. In England, however, we have still a Herald's College, and we ought to show ourselves thankful for so great a mercy. We read in an old book of heraldry that, in order that fame might not lose itself in an unbounded notion, it was thought fit to reduce honour into form and order, and thus knighthood originated. According to the same authority, the Order of the Garter excels all other institutions of honour in the whole world, and the ensign of that Order was to put in mind the Companions that, as by their Order they were joined in a firm league of amity and concord, so by their Garter, as by a fast tie of affection, they were obliged to love one another. And lest this strict combination might seem to have any other aim or end than what was honourable and just, the King caused to be enamelled on the Garter a motto which might retort shame on him that should dare to think amiss of so just an enterprise as the invasion of France. A newly-elected Knight is exhorted to tie about his leg for his renown "this noble Garter," that thereby he may be admonished to be courageous, and having undertaken a just war, to stand firm, valiantly fight, and successfully conquer. The ribbon is to be worn about his neck adorned with the image of the blessed martyr St. George, by whose imitation provoked he may so overpass both prosperous and adverse adventures, that having stoutly vanquished his enemies both of body and soul, he may not only receive the praise of transient combat, but be crowned with the palm of eternal victory. The surcoat of crimson is to be worn to the increase of honour "wherewith you being defended may be bold, not only strong to fight, but also to offer yourself to shed your blood for Christ's faith, the liberties of the Church, and the just and necessary defence of them that are oppressed and needy." The mantle of "heavenly colour" is to be received "in augmentation of thy honour, ennobled with the shield and red cross of our Lord, by whose power thou mayst safely pierce troops of thy enemies, and be over them ever victorious, and being in this

temporal warfare glorious, in egegrious and heroic actions, thou may'st attain eternal and triumphant joy." The next thing is the cap and feather, which being put upon the head of the elect Knight, the investiture is completed, "and so after several religious ceremonies and offerings at the high altar, they with trumpets sounding march to dinner."

The statutes, which are before us, of the "Convent-General of the United Orders," show that the members of this new chivalry imitate carefully the ceremonies of the ancient Orders, and we believe that the concluding banquet is not forgotten. A candidate for the Order must be a master mason of two years' standing, must be twenty-one years of age, and must profess the doctrine of the Trinity. He must promise fealty to the Grand Master, and observance of the rules of the Order. The insignia of the Order are a black silk riband and a seven-pointed silver star, with a passion-cross in a circle in the centre, and the motto "In hoc signo vinces" round the circle. The habit shall be a white stuff or woollen mantle with an equal-limbed cross patent gules on the left shoulder. In a priory of the Order of St. John the Knights shall use a black mantle with a white eight-pointed cross. Each Knight shall wear a straight cross-hilted sword. The banners of the Order are the Beauceant and the Vexillum Belli. The former is a parallelogrammic banner, parted per fess, sable and argent. The latter is argent a cross patent, gules, charged with an eight-pointed cross argent. We suppose that this Vexillum Belli has been invented to signify the modern alliance between two Orders which anciently were more hostile to one another than to Sin or Saracen; and we are happy to think that the only war likely to be waged under this new banner will be against beef and pudding. Perhaps we might best describe this institution as a superfine sort of Freemasonry adapted for aristocratic and Royal use. It is proper that Masons should build the Temple in which its sworn defenders, fearing no hostile assault, may comfortably carouse.

By the payment of five guineas, the signing of a declaration, and the exercise of a good deal of imagination, any gentleman may persuade himself that he is a Knight of the ancient and illustrious Orders of the Temple and of the Hospital of St. John. He cannot wear both the red and the white cross at the same time, but he pays his money, and he takes his choice. We believe that the Prince of Wales is Grand Master of the United Orders in the three kingdoms, and the Duke of Leinster is Grand Prior in Ireland. The statutes appear to have been framed for the Order of the Temple, but it is provided at the end that they shall apply also to the Order of St. John of Jerusalem, Palestine, Rhodes, and Malta. While you are about it, you may as well accumulate upon yourself as many sounding titles as possible, and it is almost a pity that you cannot wear the robes and badges of two different Orders of Knighthood at the same time. It is remarkable that the ladies have not, so far as we are aware, entered upon this new road to distinction which gentlemen have invented. No lady is likely to become a nun for what may be called artistic reasons, but it deserves consideration that there were formerly Sisters of the Order of St. John, and we see not why the Temple as well as the Hospital might not be made accessible to ladies. The "schedule of designs" appended to the statutes of the United Orders may be regarded as a collection of notions for feminine adornment. We think that the Senechal by wearing the appointed badge of the office would take an unwarrantable liberty with the royal arms. But the star of a Knight Grand Cross or a Knight Commander would be a pretty and perfectly lawful ornament for a lady's neck. The white and red crosses of the two Orders are combined and placed upon a silver star, of which the laub bearing the banner Beauceant, and the motto "Non nobis Domine" form the centre. It is a pity that this book could not have been brought out as a Christmas number of the *Young Englishwoman*, or some other of those publications which supply patterns for work in coloured silk or thread. There is a dash of religious sentiment in the designs which properly accompanies all efforts of Christian art. Among the officers of the Order is an organist, whose badge is not an organ, but a harp. The statutory riband is black, with or without gold fringe, but the schedule shows that red and white ribands may also be worn. We presume that the black riband is for the Hospital, and the red and white riband for the Temple. There are keys for the Chamberlain and Treasurer, and two pens crossed for the Secretary; and we need not remind ladies that such badges in silver or other bright material might be made to look pretty. We do not find in the statutes of the Order any recognition of those duties towards the ladies which were an essential part of ancient chivalry, and we think that the time has therefore come for the ladies to take care of themselves.

Who fights for those eyes and that sacred cross
Can neither meet sad accident nor loss—

this was the religion of youthful aspirants to the Order of St. John when that Order was a reality. The modern Knights of that Order believe, at least for ornamental purposes, in the cross, but they make no profession of faith in the power of ladies' eyes. Indeed they partake of the suspicion which attaches to all Masonic and similar institutions, that they are mere contrivances for social intercourse of the male sex. A Chapter of the Garter moves with sounding trumpets towards a banquet, and a Masonic Lodge offers facilities for consuming—of course after all business has been transacted—bread and cheese and beer, followed by spirits and tobacco. We think that the establishment of the

United Orders of the Temple and St. John ought to be completed by the appointment of an Arch-Chancellor and a Grand Teapot, and we are prepared to suggest designs for the badges of these and other necessary officers. The ancient device of the Templars appears to require modification, for if two persons ride upon one horse, one of them ought, as we submit, to be a lady.

The ceremonies of investiture of the Garter are probably the same now as are described in the old book from which we have quoted. There is an obvious incongruity with modern ideas in the exhortations which accompany the putting on of the collar, the surcoat, and the mantle. But such ceremonies are rare, and the tradition of ages preserves them from ridicule. When, however, an attempt is made to revive the Orders of the Temple and the Hospital, and to admit members at five guineas a head, we cannot but remember that there was a time when it could be truly said:—

Who takes upon him such a charge as this,
Must come with pure thoughts, and a gather'd mind,
That time nor all occasions ever may
After disperse or stain.

But the modern Knighthood of St. John asks no other ornament than

A jingling spur, a feather, a white hand.

It seems a pity that some enterprising manager of a theatre could not engage the Arch-Chancellor and the Arch-Treasurer to appear in full robes and insignia of office in a pantomime. These Orders were a great and probably useful power in their day, but that day is long since past. Mr. Cook personally conducts tourists to Jerusalem, and the English subaltern smokes his short pipe and votes duty a bore in Malta. The Knights are dust, their swords are rust, and their modern imitators are merely performing a tedious burlesque.

REVIEWS

THE PARISIANS.*

WE have before us the last product of Lord Lytton's untiring industry in this novel, which appeared in *Blackwood* and was cut short by the author's death. It was, indeed, so far completed that little cause is left for regret at a few gaps in the last pages. The work itself belongs to a peculiar class of his writings, and though it would be superfluous to describe once more the qualities by which Lord Lytton obtained a high place in our literature, we may briefly point out which of them are most conspicuous in the *Parisiens*, and may endeavour to estimate, if not its absolute value, at least its place relatively to his other works. The *Parisiens*, we may remark in the first place, resembles *Middlemarch* in certain respects. It appears in four volumes in paper covers; a form which, if we may express our personal prejudices, is rather less appetizing than the familiar old three volumes in cloth. That, however, is a matter on which we do not wish to dogmatize. The resemblance to *Middlemarch* does not entirely cease at this point. It is the work of a celebrated author, and of one who never escamoped his work. Moreover, it is an attempt to represent a special form of society, though the inhabitants of Paris occupy a considerably larger space in the eye of the world at large than the inhabitants of an English country town. And, finally, the didactic element which showed itself in *Middlemarch* is prominent—indeed it is a good deal more prominent—in the *Parisiens*. Lord Lytton's last three novels, as his son points out in a preface to the last volume of the present work, form a group by themselves. They are all intended to signalize the danger of certain political and social theories. *The Coming Race* did this by means of purely fanciful symbols; *Kenelm Chillingly* was a psychological romance; and the *Parisiens* is a didactic novel. Against such novels there is a natural, and we hold a generally well-grounded, prejudice. The objection indeed may be removed where the didactic purpose is thoroughly fused with the artistic, and the symbols in which the principles are embodied are by themselves interesting and impressive. It is only where the imagination has not operated with sufficient intensity, and where consequently raw masses of sermon are interspersed in the middle of story-telling, that we have a fair right to object to the result. How far we hold this to be the case in the *Parisiens* may appear from our subsequent remarks.

We will, however, begin by remarking that Lord Lytton's general design was objectionable, if objectionable at all, only on the ground of too great daring. It was plainly a legitimate scheme for a thoughtful observer to set before us a picture of the social life of Paris during the German war and in the months immediately preceding. To show us the millionaires who had made fortunes by speculation in the luxurious times of the Empire; the epicurean critics and the immoral poets who had flattered the tastes of a dissolute society; the politicians who tried to fish in those troubled waters; the workmen excited and unsettled by the revolutionary ideas which have so long been fermenting amongst them; the old nobility, retaining a high sense of honour and religion, and yet incapacitated by their antiquated opinions from exercising much influence upon the discordant elements around them; the middle classes, loving repose and money above all things, but still endowed with many sterling virtues; and to show how the predominant character of the versatile, brilliant, logical, and excitable nation

*The *Parisiens*. By Edward Bulwer, Lord Lytton. Edinburgh & London: Blackwoods. 1873.

is manifested in all these various combinations—this is a task which might be too much for the powers of a French Shakespeare. If Balzac were still living, and if Balzac had been a man of less morbid mind, he might have done it successfully in a series of stories like that which composes the *Comédie humaine*, and which has so forcibly represented the society of the previous generation. Victor Hugo, again, has given us one side of the picture in the *Misérables*; and whatever objections may be made to the art or the morality of that great work, nobody can deny that it is a work of true genius. But for an Englishman, however able and well informed, to carry out such a design successfully in a single novel blending all these composite elements, was to give an unmistakable proof of considerable courage. Indeed we may as well say at once that the task really exceeded the powers of any man; and, on the moderate assumption that Lord Lytton was not equal to Shakespeare, we may add that partial failure was inevitable. The canvas was too vast, the number of figures too great, the point of view too near, and the time too close, to admit of a large measure of success. It was almost inevitable that much of what he desired to say should refuse to crystallize into artistic form, and that unmanageable fragments of dissertation should intrude themselves into the midst of the narrative.

The method in which Lord Lytton undertook his self-imposed duty may be easily understood. He wished to introduce to us a number of characteristic types, and it was difficult to include them all in the working of an intelligible plot. However, as a novel must have a story of some kind, he devised one of his usual intricate construction, which we cannot consider as very interesting in itself, and which has constantly to be interrupted for the sake of social and political reflections. We shall not attempt to describe the story; and, in fact, we are not certain that we understand it very clearly. It involves, however, the presence in Paris of a young English politician with a large fortune, who is exceedingly anxious to hand over by far the greater part of it to an undiscoverable young lady, supposed to be the daughter of the original proprietor of the fortune, now deceased. How she came to disappear, how he endeavours to trace her, and how the clue is always breaking, and then always being picked up again, are matters on which we must confess ourselves to be profoundly indifferent. The whole affair is one of those conventional entanglements which properly belong to an earlier stage of novel-writing; and though in the hands of a skilful inventor of plots, such as Mr. Wilkie Collins, they may give amusement to a certain class of readers, we feel that the story, whenever it turns up, is rather a nuisance than a source of interest. The young English politician who does detective business is a terrible prig, who writes letters about the object of his affections much as he would write a diplomatic despatch. "No one," he says, "can feel more sensible than I of the charm of so exquisite a loveliness; no one can more sincerely join in the belief that the praise which greets the commencement of her career is but the whisper of the praise that will show its progress with loud and louder plaudits." This epistolary style is worthy of a Complete Letter-writer, as his conversation seems to have been framed on a careful study of *Hamlet*, with an occasional touch about the True and the Beautiful. The lady of his love belongs to a family with whom Lord Lytton had previously made us familiar. We met her, for example, as Violante in *My Novel*; she is a beautiful Italian, without much education, but with a soul for the Beautiful, and the noblest aspirations after the Ideal. She has learnt from a feminine novelist, who has the poorest style in the French language, but who has objectionable theories about marriage, yet who is not George Sand, that "art and hope were twin-born, and they die together." She is fond of this and similar aphorisms; and generally a very noble creature. Many people admire the type, and we will admit that we think her too good for the English prig whom she ultimately marries. Her great office, however, is to point a contrast between the purity of a virgin soul and the demoralization of Parisian cynics and sentimentalists. It is, however, in the direct description of these latter persons that Lord Lytton appears to us to be most successful. The youthful poet, Gustave Rameau, falling into premature decay from absinthe and general debauchery, aiming at success by blasphemy and obscenity, and yet with some genuine touch of genius running through his limy work, is a portrait to which various originals may have contributed, and which is really drawn with much force. Considerable praise may also be bestowed upon the refined critic, M. Savarin, who from a single sentence written by the Italian beauty immediately divines her possession of literary genius even more remarkable than her power as a singer, but whose fine taste is marred by his want of high moral purpose. Portraits not showing so much delicacy, but still excellent in their way, are the speculators who fight out their battles with financial weapons, and who are not devoid of real insight or even of real generosity, though unfortunately their intellects and their emotions are narrowed and debased by their absorption in the struggles of the Bourse. In such portraits Lord Lytton shows his powers at their best. He can satirize without caricaturing; he can draw men of the world who are not, like Balzac's, mere monsters of selfishness and cunning, and who, though their portraits do not show the same intensity as that of the great French novelist, are living and moving human beings.

We feel more doubt as to M. Victor de Mauléon, who appears to have been Lord Lytton's favourite, and who is in some respects his mouthpiece. M. de Mauléon is another variation upon the same theme; he is a noble by birth, who has been ruined and subjected to

a false imputation by a singular combination of circumstances, and, when thrown early upon his own resources, has learnt to know the world and to look beneath the surface of politics. He acts the character well, and we are willing to believe in his audacity and intellectual vigour. Unluckily he too suffers from the exigencies of the plan. He appears first as head of a secret society, which is apparently destined to exercise a great influence upon the development of the story. The society, however, not very vigorously described, soon drops out of notice, though we are given to understand that it had a good deal to do with the events of the 4th of September, and its chief use seems to be to introduce us to an excellent artisan ruined by the poison of Socialism. The artisan strikes us too much like the hero of a tract; he points a moral too obtrusively, and is but a conventional portrait of a member of the International. M. de Mauléon, however, appears more conspicuously on the stage of open politics than as a secret conspirator. We believe in him as long as he does not preach too much. He shows, of course, remarkable insight in foretelling the result of the German war; but, not content with this safe performance, he takes great trouble to explain to us his own political panacea. So much emphasis is laid upon this "legacy to his countrymen," as he calls it, that we are safe in assuming that Lord Lytton is here speaking for himself. The way to the salvation of France, it appears, is to recognize three principles. The French are to borrow from America two safeguards against democracy; first, no article of the Constitution is to be changed without the consent of two-thirds of the legislative body; and secondly, a Senate is to be formed which will secure universal respect, though the method of doing this will "need the most deliberate care of the ablest minds." Thirdly, France is to adopt from England the principle that the head of the State can do no wrong. A Ministry is to be changed instead of a dynasty. With curious inconsistency, this last doctrine, which makes a Ministry responsible to the Legislature, is afterwards represented as identical with the American system in which the Ministry is independent of the Legislature. Not, however, to insist upon such matters, we must confess that M. de Mauléon disappoints us. That a man who has really seen the world and knows by what motives men are really moved should fancy that a country is to be saved by a bit of constitution-mongering may be not surprising when he is a countryman of Sieyès; but it certainly gives a most unworthy conclusion to the novel. Lord Lytton's opinion—we need not ask how far it is accurate—seems to be that the French nation has been seriously demoralized because a large part of it has lost faith in God, in another life, and in the most sacred institutions of social life. To infer that the Constitution should not be altered without a majority of two-thirds of a Senate is surely a most lame and impotent conclusion. How is this universally respected Senate to be provided? By some new manipulation of ballot-boxes, or by infusing a new spirit of loyalty and self-respect into the nation? Lord Lytton's answer here would appear to be in favour of the ballot-box; and though he elsewhere speaks more worthily the sentiment is only too characteristic. In short, the moralizing, though it affects to be that of a poet and philosopher, often sinks to be that of a mere man of the world nourished in lobbies and ante-rooms, and falls upon us by the want of genuine force. The talk about religion savours of a rather faded sentimentalism, and we could wish that the confutation of Socialism and other objectionable tendencies showed a deeper appreciation of the real difficulties of the great social problems of which Socialism would supply a very summary and totally inadequate solution. Difficult as it always is to embody religious and philosophical views in the form of fiction, it is certainly desirable that they should be at least imaginatively impressive. The didactic part of the book, in short, is not only in excess, but is of no great substance. And thus the *Parisians* appears to us to be the inevitable failure of a very able man in attempting a book which would be probably beyond the powers of the ablest. With much good portraiture and some clever writing upon political and social topics, it does not produce a satisfactory impression as a whole.

LYELL'S ANTIQUITY OF MAN.*

IN the fourth edition of his *Antiquity of Man* the Nestor of geology and palæontology has embodied such gains to those departments of science and the allied provinces of knowledge as have accrued during the ten years which have elapsed since the preceding issue of his work. It is gratifying to see one so long looked up to as the head of this particular realm of study preside with unabated powers over the ever-growing domain of discovery, and bring the light of the same serene judgment to bear upon controversies which have divided the ranks, and at times heated the passions, of a younger class of explorers. Sir Charles Lyell may well feel pride and satisfaction, even beyond the public recognition of his labours, in the extent to which the whole course of physical exploration and discovery has tended to confirm and verify the principles which he has given a long life's labour to uphold and demonstrate. The unity of nature everywhere and at all times has been throughout so leading a maxim of his philosophy as to leave us only in doubt whether to speak of it as the conclusion

* *The Geological Evidence of the Antiquity of Man; with an Outline of Glacial and Post-Tertiary Geology, and Remarks on the Origin of Species, with special reference to Man's First Appearance on the Earth.* By Sir Charles Lyell, Bart., M.A., F.R.S., &c. Fourth Edition, revised. London: Murray, 1873.

to a life-long process of proof, or as the postulate which his mind carried with it to the very threshold of inquiry. It is to be regarded in logical truth as not more the result of every sound series of induction from phenomena than the assumption which must underlie and vivify every generalization of physical facts. As the one all-pervading law, it is the groundwork upon which all less general or subsidiary laws depend for their sanction and their harmony. It is in no slight degree owing to Sir Charles Lyell's powerful and steady leadership of geological opinion in this controversy that the convulsionist forces may be said at the present moment to be routed along the whole line. Scarcely of less value have been his balanced judgment and keen appreciation of facts in steadying the mind of the educated public, and dispelling a cloud of unreasoning prejudice in regard to the lately multiplied evidences of the antiquity of the human race. The results of scientific discovery and research in this department of knowledge have had upon a number of minds well disposed towards the truth, but shrinking from aught that might clash with received ideas of history or theology, much the same effect as that of the Copernican system or the theory of gravitation some generations ago. Nothing can be better calculated to still the disquietude of such good people and prepare the way for a general absorption of these new truths among the masses of traditional opinion than a summary of the evidence on their behalf, calm, clear, and full, like that before us. The most timid or prejudiced readers may rise from its perusal satisfied that the religion and morals of mankind are no less safe under a scheme of history which carries back man's presence upon the globe to possible millions of years than when the span was limited by Archbishop Usher's figures, foisted (by whose authority nobody can find out) into the margin of our Bibles. The public demand which has absorbed so many copies of the *Antiquity of Man* must have had the effect of sowing broadly the seeds of sober and sensible teaching upon a subject so essential to all sound education.

Besides the new facts which will help towards this result, the arrangement which Sir Charles Lyell has adopted for his latest edition will do much to make clear the natural connexion between the separate portions of the inquiry. The three sections, although placed under distinct titles, will be seen to form one organic whole. The first, giving the direct evidences of the Antiquity of Man, comprising what might with greater strictness of expression be called the Geological Memorials of Man, naturally introduces the subject of the Glacial period, which forms the second part. The age of man, conclusively as it has been thus far traced through the Post-Tertiary period, acquires a range of indefinitely greater extent if it can be proved to have preceded the Glacial epoch. The third part, treating of the origin of species with reference to man's place in nature, is no less vitally connected with the previous branches of the argument. It is in this section of his work that Sir Charles Lyell has to speak of the most important additions which recent research has brought to his array of facts. At the date of the last preceding issue of his work, the absence of admitted links intermediate between so-called species was a difficulty continually urged against the advocates of transmutation. Since then three or more intermediate fossil forms have been discovered, linking together the classes of birds and reptiles. The first of these consisted of fragments of a swimming bird, considered to be a gull, from the upper greensand of the Cretaceous series near Cambridge. The second was the famous bird from Solenhofen, now in the British Museum, named by Owen *Archæopteryx macrura*, showing distinct reptilian affinities. Still more decided is the case of the reptile from the Stonesfield slate, called *Compsognathus longipes*, described by Professor Huxley as in some respects more ornithine than even the ordinary Dinosauria, having a slight bird-like head provided with numerous teeth, the hind limbs large and disposed as in birds, the femur shorter than the tibia. Still another link has been found as late as last year in the Upper Cretaceous shale of Kansas, described by Professor O. C. Marsh, of Yale College, as *Ichthyornis dispar*, about the size of a pigeon, having teeth well displayed in both jaws. Till the whole remains were brought together, the Professor had classed them as reptilian. To these links may now be added the discovery, announced within the last few weeks by Professor Owen, of a bird in the London clay of Sheppey having teeth like those of the hooded-lizard of Australia. These forms present us not merely with transitions between species, or genera, or even orders; but even between what are set down as distinct classes of the animal kingdom—an important accession to Mr. Darwin's view of species as simply indicative of gaps in our knowledge of the continuity of nature. Among mammals, the discovery of two extremely ancient and less specialized forms of the horse in the Upper and Lower Miocene formations of Nebraska supplies the proof of a gradual modification of the genus *Equus* from a very different ancestral type.

The analogy of language is brought in with great force by our author to illustrate the origin and development of species. We have here an easy and natural transition to the subject of the antiquity of man, to which this portion of the argument would otherwise seem to have but a remote application. Albeit there is no question as to the existence of diverse species in man, there are sufficiently wide and numerous diversities of type to introduce difficulties of the severest kind into the problem of his origin and antiquity. As well ask the philologist, reasons Sir Charles, whether in the beginning of things there was one, or five, or a greater number of languages, as whether there was a single race or many races of primæval man. It is more to the point to ask, on the supposition of the human race having been raised by gradual transmutation or evolution out of some lower form of animal, where are the links which

should bear witness to the intermediate stages of this progress? How is it that we have no remains of fossil species to show midway between man and the lower primates? Till lately, indeed, no answer at all satisfactory had been given to this question. Few or no remains of fossil quadrumanæ were ever known. Of late years many links of this kind have rewarded the researches of science; whilst the argument drawn from the corresponding absence of gradational forms between the recent and the Pleistocene mammals goes far to destroy the force of this negative evidence. Nor, in fact, have those pages of the recent book of nature been at all adequately searched in which we should especially look for these missing links. The countries of the anthropomorphous apes, Sir Charles Lyell urges, are the tropical regions of Africa, and the islands of Borneo and Sumatra, lands which have been scarcely at all opened to science. Man is an Old World type, and it is not in Brazil, the only equatorial region where ossiferous caverns have yet been explored, that the discovery in a fossil state of extinct forms allied to the human could be looked for. Lund, a Danish naturalist, did indeed find in Brazil not only extinct sloths and armadillos, but extinct genera of fossil monkeys, all however of the American type, differing in their dentition and other characteristics from the primates of the Old World. Recent exploration among the Miocene strata of Europe, which would appear to have enjoyed a much warmer climate than the present, has brought to light not a few remains of the anthropomorphous class. Of these the *Dryopithecus* of Lartet, obtained in 1856 from the Upper Miocene of Sansan, near the Pyrenees, a gibbon or long-armed ape, about equal to man in stature, has been described by Professor Owen, and a single bone of the same ape has been since procured from a deposit of the corresponding age at Eppelsheim, near Darmstadt. The jawbone of a monkey (*Cenopithecus lemuroides*), allied in some points to the Mycetes, or howling monkey of America, and in others to the Lemurs, has been discovered in Eocene strata in the Swiss Jura by M. Rattimayer. But it is not so much in these Miocene or Eocene strata as in the Pliocene and Pleistocene and nearer the tropics, that the doctrine of progression would bid us look for the discovery of some species more highly organized than the gorilla or the chimpanzee, which may serve to span the chasm which separates man from the highest of lower animal forms.

The possible causes to which this chasm may be due are briefly discussed by our author towards the close of his work, the researches of Darwin, Wallace, and other leading naturalists being made the subject of instructive analysis and criticism. The same train of reasoning involves the causes which have kept man from any perceptible change of bodily structure for the vast period during which we have proof of his existence—a period long enough for whole groups of mammals, once his contemporaries, to have died out, whilst others have undergone organic changes of the most extreme kind. Of these causes the chief is doubtless to be sought in the intellect of man, whereby he has been enabled, in the face of changing conditions in nature, to maintain himself in harmony with the world without him and to make nature subservient to his necessities and his will. To fix anything like a date for the endowment of man with the distinctive privilege of this intellectual superiority is a problem as insuperable as to assign the first stage in the evolution of life itself. But there is at all events nothing in the hypothesis of variation and natural selection that compels us to assume that from the highest intelligence of the inferior animals to the improvable reason of man there was an absolutely insensible passage. The birth of an individual of transcendent genius, together with his influence on his age, comparable to the case of a spurt in vegetation, is a phenomenon too well known in history to be lost sight of in calculating the possibility of occasional strides such as to constitute apparent breaks in the otherwise continuous series of psychical changes. By what but a process of partly unconscious selection, asks our author, quoting Mr. Galton, did nature build up within the limit of three or four generations that magnificent breed of human animals, the race of Attica at her prime? Though we consider that in the structure of "Hereditary Genius" the author, as we sought to show at the time, aimed at more than his foundation was at all able to bear, there is much in the origination of new points or qualities in gifted individuals, and their transmission by way of example no less than of blood, to explain the formation of distinct national characters and even races. Through all, as Sir Charles Lyell emphatically urges in closing his work, fortifying himself with the able advocacy of Dr. Asa Gray, it is to be kept in mind that there is nothing in the doctrine of transmutation, any more than in the simple extension of man's antiquity, to weaken the foundations of religion. That all changes, organic or inorganic, in the universe are and have been carried on under the operation of fixed and orderly laws, is a view which, so far from de-throning the Ruler or efficient cause of all things, tends to enhance his wisdom, authority, and glory. If the succession of life is to be explained by transmutation, the perpetual adaptation of the organic world to new conditions leaves the argument in favour of design and therefore of a designer, as valid as ever, if it is not even rendered more cogent and attractive. So far from having a materialistic tendency, the author of the *Antiquity of Man* may well plead that the proofs with which his work abounds of the successive introduction into the earth of life, sensation, instinct, the intelligence of the higher mammals bordering on reason, and, lastly, the improvable reason of man himself, present us with a picture of the ever-increasing dominion of mind over matter.

In his enumeration of the direct proofs of the antiquity of man newly acquired from exploration of the drift and cave deposits,

Sir Charles Lyell has incorporated the important discoveries of worked flints, made as lately as last year in Kent's Cavern, near Torquay, associated with teeth of *Machairodus latidens* and other extinct animals, as well as similar works of man's art from Brisham, Wokey Hole, near Wells, and other ossiferous caverns. For actual bones of man he has had to look abroad to the memorable yields of Bruniquel, Mentone, Tron du Frontal, and elsewhere on the continent of Europe, as well as to those of the coral reefs of Florida, and the Delta at New Orleans. His discussion of the age of these and similar indices of man's presence at remote times is full and judicious. His work was closed just too soon for the incorporation of the recent remarkable find of a bone in the Victoria Cave, Settle, recognized as indubitably human by Mr. Busk and Professor Flower. His candour is shown in withdrawing the opinion he had formerly adopted on the evidence of Mr. Geikie, that there had been a rise of twenty-five feet since Roman times in the central districts of Scotland. In treating of the question of ice-action during the Glacial period both in Great Britain, the Alps, and elsewhere, he has made valuable use of the observations of MM. Nordenskiöld, Richard Brown, Rink, Heer, and others, upon the phenomena exhibited on a remarkable scale by the Continental ice of Greenland, giving a parallel survey of the glaciation of Scandinavia and the Scottish Highlands, with the chronological relations of the Human and Glacial periods. All these lines of evidence lead up to the problem of paramount interest at the present time. Did man witness the striking changes which marked the breaking up and dissolution of the ice-sheet in Northern Europe? Here, though too cautious to dogmatize while the materials for judgment are so imperfect, our author lets us see that he leans strongly towards an affirmative reply. In no part of his work, however, does he more conspicuously give proof of that philosophical temper and that power of balancing evidence which mark his writings throughout.

LIFE OF BISHOP PATTESON.*

IT was on the 20th of September, 1871, that Bishop Patteson was massacred on the island of Nukapu, and only now is the authentic history of his life presented to us. We regret that this has not been given to the world with more promptitude, not because we think that people have lost the impression which his unselfish life and martyr-like death could not fail to produce, but because we believe that, if more expedition had been used, we should have had the story told us in briefer form and with no abatement of anything that could interest us. As it is, Miss Yonge has given to the world two octavo volumes, containing nearly twelve hundred pages. We can quite believe that it has been to her "an almost solemn work of anxiety, as well as one of love." She has written the life of a kinsman with whom it must have been a privilege to be connected, and the history of a work which, it is well known, she has herself done much to advance; but on no reasonable principle can we think it necessary to have given twelve hundred pages even to the life of such a man as Bishop Patteson. A biography is not a cairn whose builders show their reverence for the dead by the number of stones which they accumulate. Admitting that some notice of the home in which a man's earliest impressions are received forms an essential part of a biography, is there any reason for Miss Yonge making us familiar with the whole country-side; for our having accurate details of "the Coleridge kith and kin"; for our being informed that Lady Patteson's cousin, the Bishop of Barbados, was "the son of Dr. Luke Coleridge, one of the thirteen children of John, the schoolmaster"? In fact, Miss Yonge finds it impossible to begin a biography any more than a work of fiction without a genealogical tree in which the remotest degrees of cousinship have a place. We confess to being more than indifferent to the anecdotes which are generally forthcoming concerning the childhood of those whose after-lives have been conspicuous. Patteson was brought up in a home where the atmosphere was healthily religious, but the self-consciousness for which he afterwards took himself to task, and which was always present to him in the shape of a too introspective habit, increased perhaps by the solitary life which he was obliged to lead until it became a morbid feeling, was undoubtedly developed in his early years in the shape of priggishness. It adds nothing to the interest of his biography, as we think, to learn that at the age of five he read his Bible and exercised his brains as to what became of the fish at the Deluge, and that, when summoned to the nursery, he begged to be allowed "to finish the binding of Satan for a thousand years." There seems to us nothing prophetic of the work to which he gave his life in the fact that, when he heard of the exertions of the Bishop of Barbados already mentioned, during the West Indian hurricane of 1833, the lad of six summers exclaimed, "I'll be a bishop, I'll have a hurricane"; especially as in 1835 he reconciled himself to going to school by the thought—"I must go to school sometime or other, or else I shall never be a judge, as I hope to be." Many very commonplace children have made similar statements concerning their future career, which events have shown to have been rash prophecies; and it is with regret we find that a hundred and fifty pages are given up to Patteson's life as a layman, and not merely to his own doings, but to

the doings of his remote connexions, to a description of the Eton Montem, and other matters which are in no degree essential to the story of his life. The same fault runs throughout the book. Unfortunately it appears that all Patteson's letters have been preserved, from the earliest one, which was written in 1834, when he was sent from home to recover from scarlet-fever, to an unfinished one dated September 19, 1871, and the abundance of material has been too great a temptation to his biographer. Scores of letters are given which only prove the ardent affection which he felt for his relatives and friends, a fact to which every single letter bears sufficient witness. Scores of pages are taken up with descriptions of New Zealand scenery, of the manners and appearance of the natives, which are repeated over and over again; and with such statements as that he had roast mutton for dinner at the College at Auckland. And even hundreds of pages are given to chronicles of the mission work year by year, the number of scholars, their studies, their failings, their marriages, and the like, which have already appeared in the form of annual reports, and which, by their repetition, rather divert our thoughts from the man who directed all this complicated machinery.

Having indulged in these complaints, let us add that even a less skilful biographer than Miss Yonge could hardly have failed, with the materials available, to produce a book of no common interest. For John Coleridge Patteson was, in many respects, a very remarkable man. A popular Eton boy, devoted to his school, and foremost in its sports, he on more than one occasion gave tokens of unusual moral force of character. At Oxford he was not happy; one of his friends writes:—"He was a reluctant and half-interested sojourner, ever looking back to the playing-fields of Eton, or forward to the more congenial sphere of a country parish"; but he took a second class from Balliol, and was elected a Fellow of Merton. Before ordination he spent a long period on the Continent, where he discovered much artistic taste, and ever after he was enthusiastic in regard to sculpture and music; but it was at Dresden that, having acquired German thoroughly, he gave himself up to the study of Hebrew, Sanscrit, Arabic, and Syriac, and began diligently to cultivate that marvellous gift by which he was able in after years to acquire from living lexicons and grammars, in the persons of his Melanesian scholars, a knowledge of the many unwritten languages and dialects of the two hundred islands which formed his diocese. Thus prepared, he offered himself for ordination in 1854, and was placed in charge of a district church near his own home and that of his uncle, Sir J. T. Coleridge. Here he was busy in schemes for the good of his people—allotments, school-farms, spade-husbandry, &c.—and specially he was bent on having "a boy's home, two cottages with plenty of room for the F— family and eight boys, with half an acre of garden, at 11l. 5s. the year." But it was not to last long. Bishop Selwyn, who, before going to New Zealand in 1841, had said to his mother, "Lady Patteson, will you give me Coley?" returned to England in 1854, and the subject was renewed. Lady Patteson had died in the meantime; and Sir John Patteson, who had retired from the Bench in consequence of increasing deafness, delighted in the society of his elder son, who was settled so near to him; but when the proposal was made that he should go to the Antipodes, his great grief broke out in the exclamation, "I can't let him go," but even as the words were uttered, they were caught back, as it were, with "God forbid I should stop him." How great was the trial thus voluntarily undergone, few can know, for few have experienced such a one. We can picture to ourselves nothing more affecting than the way in which he turned his back on his home and his family for ever:—

He chose to walk to the coach that would take him to join the railway at Cullumpton. The last kisses were exchanged at the door, and the sisters who watched him out of sight then saw that their father was not standing with them. They consulted for a moment, and then one of them silently looked into his sitting-room and saw him with his little Bible, and their hearts were comforted.

Not less affecting is his own letter written from London on the evening of the same day:—

I write one line to-night to tell you that I am, thank God! calm and even cheerful. I stayed a few minutes in the churchyard after I left you, picked a few primrose buds from dear mamma's grave, and then walked on. At intervals I felt a return of strong violent emotion, but I soon became calm. I read most of the way up, and felt surprised that I could master my own feelings so much.

In Melanesia and among his scholars, whom he would never allow to be called savages, he found his vocation; for six years his time was divided between the College near Auckland and the *Southern Cross*, the schooner in which Bishop Selwyn and himself visited the various islands, in many instances the first white men who had landed on them; and where this was not the case, their safety was not increased by the fact that previous visitors, trading for sandalwood, had too often stirred up ill-feeling by their conduct. Here it was that Patteson's Mezzofanti-like powers were so valuable. Landing on any particular island, he would sometimes find two entirely distinct languages spoken; in adjoining islands the structure of the languages would sometimes show a common derivation, but all the words would be different. Writing after two years' experience to Professor Max Müller on this subject, he says:—

There is a vast amount of confusion caused by the repeated migrations, intentional or casual, always taking place in these islands. Canoes are often drifting about and landing small colonies of people on islands over several hundred miles distant, the trade winds taking them safely along. In this way we find occasionally words introduced to languages quite distinct in their structure and phraseology generally.

* *Life of John Coleridge Patteson, Missionary Bishop of the Melanesian Islands.* By Charlotte Mary Yonge. 2 vols. 8vo. London: Macmillan & Co. 1873.

How much these migrations must have puzzled a man who wanted to reduce to a scientific system this Babel of tongues is self-evident. Neither were his living dictionaries and grammars always at hand; the children whom he succeeded in borrowing from their parents could not winter in so high a latitude as New Zealand, and thus every autumn involved a voyage of thousands of miles, during which they were returned to their homes, to be picked up again when summer should return. To avoid such interruptions a winter school was tried on one of the Loyalty Islands; but ultimately the head-quarters of the mission were established at Norfolk Island, Mr. Patteson having in 1861 been consecrated bishop.

Of what nature his manifold labours were we must leave the book to tell. In the many languages which he studied, narrowing down the meaning of each word as at first vaguely apprehended, until by a patient process its English equivalent was reached, he found a congenial study; and how remarkable were his gifts may be estimated from the fact that he could speak fluently not fewer than twenty-three of the languages of the Southern Pacific. But, in addition to this intellectual toil, he was translator, printer, schoolmaster, navigator, builder, gardener, farmer, for there were no servants in the establishment. Life was a communal one; and if Melanesians had to become cooks, or gardeners, or farmers, they could only do so by first seeing their teachers cooking or gardening. The discomforts of such a life were many, although Patteson never referred to them except to say that the fastidiousness of his early years had been conquered; and yet almost at the last he "wondered how any one could go to sea for pleasure; he always felt dizzy, headaching, and unable to read with comfort; the food was greasy, and there was a general sense of dirt and discomfort." On shore in New Zealand his accommodation consisted of "three rooms together 17 feet by 7," and these were often occupied by coughing and sneezing Melanesians during the frequent epidemics of influenza, the Bishop giving up to them his bed and his warmest rugs, and nursing them with the tenderest anxiety. Still harder must his life have been when, as the work extended, it became necessary to reside for weeks together on some small island where there was the nucleus of a Christian Church. Thus in 1860 he spent some weeks with only one English companion in a native hut on Motu, the only furniture being four boxes, which were tables, desks, and chairs in turn:—

As to beds, was not the whole floor before us? Now I saw the advantage of having brought planks from New Zealand to make a floor. We all had something level to lie on at night, and, when you are tired enough, a good smooth plank or a box does just as well as a mattress.

And yet, with all these manifold duties imperiously claiming his time, he steadily maintained habits of study, giving an hour from 5 to 6 A.M. daily to Hebrew, reading also with the young Englishmen whom he was training for ordination, and eagerly devouring all the best books which from time to time were published in Europe. It is instructive to read the comments of an able man removed by half a world from the talk of clubs and societies. Thus he writes to one correspondent about Maurice:—

I don't charge him with heresy from his standpoint, but remember that you have not been brought into contact with Quakers, Socinians, &c., and that he may conceive of a way of reconciling metaphysical difficulties which a far inferior but less inquisitive and *corseherender* Geist pronounces for itself simply contrary to the word of God.

Of Professor Jowett he wrote, soon after the publication of *Essays and Reviews*:—

I hope that men, especially bishops, who don't know and cannot understand Jowett, won't attempt to write against him. A man must know Jowett, be behind the curtains (to) know what he means by the phraseology he uses.

He revered profoundly the author of the *Christian Year*. Bishop Colenso he utterly gave up, and in 1866 he wrote:—

I don't see that men are better men or humbler Christians because they know something of geology beyond what their fathers knew. Here is all the educated world worshipping John Stuart Mill as an idol, and Stanley quoting in his sermon as objectionable a passage of Mill as could well be written.

The secret of Patteson's success—for we presume that no one will say that his labours were unsuccessful—lay more perhaps in the wise and loving way in which he regarded his pupils than in his intellectual powers. He set forth his own idea of a missionary in a letter to a friend in England whom he asked to select for him a suitable recruit:—

A man who takes the sentimental view of coral islands and cocoa-nuts of course is worse than useless; a man possessed with the idea that he is making a sacrifice will never do; and a man who thinks any kind of work "beneath a gentleman" will be simply in the way.

On another occasion he wrote:—

Half-educated men will not do for this work; it is not at all probable that such men would really understand the natives, love them, and live with them; but they would be great dons, keeping the natives at a distance, assuming that they could have little in common, &c. . . . I must not run the risk of the mission being swamped by well-intentioned but untaught men. We must have gentlemen of white colour, or else I must rely wholly, as I always meant to do chiefly, on my black gentlemen, and many of them are thorough gentlemen in feeling and conduct, albeit they don't wear shoes.

A man who could write thus would be likely to declare,—

I have quite learned to believe that there are no savages anywhere, at least among black or coloured people. Savages (so-called) are all Fridays, if you know how to treat them.

We have not space to notice at greater length the wisdom with which he set about the task of teaching these heathen peoples, building up even on the foundation of their superstitions, finding in every slight yearning after something better his *point d'appui*. Nor can we do more than record the way in which he shrank from all publicity; writing as he did hopefully yet fearfully to his relations, he always entreated that his letters might not be published.

I can't write brotherly letters if they are to be treated as public property. . . . No one in England can be a judge of the mischief that letters occasion when printed contrary to my wish by friends.

It is, indeed, a question whether a biographer has the right to publish the letters of the dead, even with the consent of executors and representatives. There are several letters which passed between Patteson's father and himself which we cannot think were intended by either of the writers to be seen by a third person. We forbear from quoting them; they present to us a standard of saintliness such as few can hope to attain, and such passages make these volumes more suitable to take their place with St. Thomas à Kempis and the "Confessions of St. Augustine," and to be read as a devotional exercise, than to lie on drawing-room tables or to be among the attractions of a circulating library. It is a privilege to read such letters, but without them we have before us the life story of a man of no ordinary power, calm and clear of head, warm of heart, patient of spirit. As one of his New Zealand friends described him, he was "fearless as a man, tender as a woman, showing both the best sides of human nature." He turned his back on fair prospects, and though there were many reasons for his revisiting England, if but for a brief time, he steadily lived his laborious life for more than sixteen years, until he fell a victim, virtually, to the rapacity and violence of English traders.

Such a life, with its grand lessons of unselfishness, is a blessing and an honour to the age in which it is lived; the biography which we have here reviewed cannot be studied without pleasure and profit, and indeed we should think little of the man who did not rise from the study of it better and wiser. Neither the Church nor the nation which produces such sons need ever despair of its future.

MOUNTAIN, MEADOW, AND MERE.*

WE have little doubt that, as a rule, it is the keenest sportsmen who have the most intense appreciation of the beauties of nature, and to those who love the country and have a sympathy with sport, there is no more agreeable reading than an unpretending book by a sportsman. By "sportsman," we do not mean the millionaire who plays into the hands of stump orators and cockney political economists; who over-preserves until sport changes to slaughter; whose hares swarm in his covert-like fens in an Arab's burnous, and who massacres his hand-fed pheasants as he sits on the cushions of an easy chair. Our idea of a sportsman is the man who either leaves his preserving altogether to nature, or only assists her sufficiently to counteract the encroachments of poachers and pot-hunters. His game may be great or small; he may follow the chase in tropical forests or in the suburbs of a city. He may bug elephants or crocodiles, gudgeon or sparrows; but so long as he follows the chase fairly, he has a fair claim to be recognized as a sportsman. When such men take the pen in hand, it will generally be found that they have some gift of writing. Enthusiasm of any kind is apt to be eloquent, while it is sure to awaken the dormant sense of poetry which has been nursed unconsciously in a course of solitary sport. Sir Cornwall Harris, the "Old Forest Ranger," Gordon Cumming, and a long catalogue of kindred spirits readily occur to us as cases in point. These men would probably never have taken to the pen had they not been impelled to write a record of their sporting adventures. Some of them at least had no special literary gifts. To single out an instance, the pages of Cumming are for the most part monotonous records of butchery, written while arms of precision were as yet comparatively in their infancy, and hunters still had much to learn as to the anatomy of the beasts they bombarded. Yet Cumming's account of his midnight watchings by the solitary fountains in the desert contain enough of nervous poetry to set up a shool of poetasters of the sickly school, and they might be studied with profit by mannerists of the brush who servilely copy the stock subjects of Academicians. We may refer to this little volume of Mr. Davies as being in its way another illustration of our theory. Its subjects are of course comparatively tame, because he sought his sport in England and Wales. But if the book has none of the dramatic grandeur of the epic, where the hunter's life is staked on the steadiness of his nerves, on the other hand it is pervaded throughout by the graceful melody of a natural idyl, and the details of sport are subordinated to a dominating sense of the beautiful and picturesque. To us the great charm of a book of this kind lies in its reviving so many of the brighter associations of one's early existence.

For an alliterative title, *Mountain, Meadow, and Mere* is very fairly descriptive of the contents of the volume, although it makes no reference to the author's off-days of sea-fishing. Mr. Davies shot and fished for the most part among the Welsh mountains and the Shropshire meres and the streams that meander through the flat meadows of the neighbouring counties. He never shot over properties where a strong staff of keepers was employed, and

* *Mountain, Meadow, and Mere*. By G. Christopher Davies. Henry S. King & Co. 1873.

he seldom fished where the waters were strictly preserved. What he enjoys most in the way of sport is wild shooting, and we thoroughly sympathize in the taste. He likes filling a mixed bag in rough walking through picturesque scenery, or following wild-fowl and water-fowl into their lonely haunts at unseasonable hours. As to the wilder fishing which fills so many of his chapters we are not so sure. Fishing is a sufficiently precarious sport at best, even when you make your casts in the choicest salmon pools, or in the most tempting trout water that ever was watched. It seems to us an excessive strain on the patience to set yourself to circumvent the coarser fish under unfavourable conditions, when they have been made induly wary by persistent persecution. Yet we envy the temperament that is satisfied with little and enjoys difficulties; that can content itself with pike in the absence of salmon, and can fall back upon bait when the flies fail as a lure; that takes genuine pleasure in pulling up night lines and trimmers, and can enjoy a rough day's sea-fishing by way of *pisaller*. What gives sport its zest with men like Mr. Davies is their enjoyment of the scenery and surroundings into which their pursuits lead them. And men who love English nature in her milder and quieter forms, and who dislike being jostled by the crowds of tourists who swarm to the fashionable points of attraction, might do much worse than take him for their guide. His volume introduces us to many a district whose charms to most people are altogether unfamiliar. There are the Shropshire meres, for instance, lying in the beautiful country that surrounds the Wrekin. The little town of Ellesmere, the best headquarters for exploring them, is in the immediate neighbourhood of the greatest of them—*Ellesmere*, the greatest mere—which bears the same name. The depressions in a prettily undulating country have all been filled with water, although from some of them the water has drained away in the course of time. There is much bog and moorland, but the banks of the mere are often richly wooded. Most of them are sequestered from life and cultivation, and as a consequence they are favourite haunts of the shy waterfowl, and are frequently the resort of the rarer birds of passage. The weeds that overgrow their shallow margins in rank luxuriance, the delights of the pike and the bane of the fishermen, are admirable breeding-places. We can conceive few scenes more picturesque in the calm of a summer day than one of these lovely sheets of water, with the flocks of swans floating on the black polished surface, while the divers are picking in the skirts of the weed and the reeds are "alive with the low songs of the reed wrens." Or, by way of change, we may accompany Mr. Davies into the mountainous country beyond the Welsh border. He takes us up to lonely pools and tarns, doubtless the property of some one and supposed to be strictly preserved, yet lying so far out of the beat of keepers that you may poach them in a tolerable sense of security. We must observe, in justice to Mr. Davies, that all the poaching expeditions he owns to were indiscretions of his youth, and he keeps the secret of the precise locality of these exploits. He first came up in one of them on a boyish bird-nesting expedition. The black water, with its tall rushes and flags, was girtled on three sides by a belt of gloomy fir-trees. A heron who had been fishing there before the arrival of the schoolboys rose in his heavy flight on their approach, and they saw "circling about and breaking the calmness of the water, dozens and dozens of big brown back-fins projecting above the surface." The fish belonged to monster carp, and to boys on the ramble the temptation was irresistible. The inhabitants of the pool were protected by the thickets of rushes, and the fishing was by no means free from danger. The carp must be waded for, and the bottom was bog and was covered with a treacherous floorcloth of matted roots. That, of course, enhanced the charm of the sport to the adventurous young scapegraces, who were light weights into the bargain; although a middle-aged angler might consider the chance of a boggy grave a decided drawback on the day's amusement. By way of pendant to the pool of the carp, we have a picture of another that was stocked with tench. The tench pool was surrounded by a wood of mediæval oaks, broken into glades that were scattered over with silver birches, while under the oak-trees was a perfect shrubbery of rhododendrons, loaded in the season of the tench-fishing with their gorgeous masses of blossom. Beyond the rhododendrons were beds of water-lilies, growing luxuriantly in the mud in which the tench fattened, and making it excessively difficult to manage the line and the float. No less beautiful in its way, and even more hard to fish, is the stream which Mr. Davies selects as the representative scene of his "burn fishing." Here the niceties of the craft come into play, for in some places there is no covert at all, and in others there is a great deal too much to be pleasant. Where the brook flows along open meadow, with the bright noonday sun shining on the clear shallow water, you must crouch down at a distance to watch for the dark shadows that come floating up to the surface, and then drop your fly light as a thistle-down right over the biggest of these. But soon the brook goes tumbling downhill in a rapid alternation of pools and cascades, in the deep channel it has worked for itself under the arching boughs of alders and hazels, thickly interlaced with thorny brambles. Then again, there is nothing for it but to wade, picking your way over the slippery stones as you best can in the darkness, pitching a shortened line with a single fly into the bits of broken water ahead of you. And that, too, is glorious fishing for a boy, although by no means the kind of sport that recommends itself to elderly gentlemen of rheumatic tendencies, however sensitive may be their appreciation of the beautiful.

There are some pleasant chapters on shooting—rabbiting, wild-

duck shooting, &c.—interspersed with some avowedly fictitious adventures which we like the least; but decidedly the most characteristic of those which do not treat of fishing is the one which gives the story of a dog-hunt in the Berwyns. The Berwyns are a range of hills to the east of Bala, given up to sheep pastures. Except for the sheep and the shepherds, the upper grounds are almost deserted; the scattered population is gathered into the hamlets and farmhouses in the lower valleys. In such a country, when an intelligent dog once acquires a taste for mutton, he may do incalculable mischief before he is hunted down, and, like a weasel in a poultry-yard, he kills apparently for the mere pleasure of killing. The Berwyn sheep-farmers had been terribly victimized by an animal that long eluded detection. At length she was identified, and proved to be a black and white foxhound bitch; but although every one who could procure a gun carried one, no one had succeeded in getting a shot at her. At last the whole country rose; a regular hunt was organized with twelve couple of foxhounds, and a motley field, mounted and on foot, and armed with all manner of weapons. Mr. Davies describes the scene extremely vividly; the picturesque grandeur of the wild glen, they were drawing, the enthusiastic excitement of a chase in which all were so deeply interested. The sheep-killer was viewed at last, and then all the pursuers went to work in earnest. He led them over mountain and moor, rock and bog, until the hunt began to tail off like Fitzjames's train in the *Lady of the Lake*. But in the hunt on the Berwyns, the villages sent out fresh relays as the chase swept by, and when one set gave over in sheer exhaustion, there was another ready to press on in its place. The first night they were brought to a check in the darkness. The second day they drew everything blank and hunted in vain. On the third, when they were about to give up in despair, news was brought by a quarryman that the object of pursuit was lying on a rock apparently exhausted, and she was stalked, surrounded, and slain. The narrative is told with spirit, yet its chief merit is in the force and faithfulness of the local colouring which Mr. Davies imparts to it. It is that, indeed, which makes the whole of his little volume such bright reading. A vein of poetical description runs through the whole; but Mr. Davies never sacrifices truth of detail to form of expression, and each description is redeemed from the reproach of monotony by a distinct and characteristic individuality of its own.

ELENA.*

WE have seldom read a more melancholy book than this. The whole story is pitched in the minor key, and nothing can exceed the plaintiveness of the somewhat meagre melody that results. Character and circumstance are alike sad; had they been more powerful, they would have had the higher quality of true tragedy, but tragedy presupposes a certain power and passion to which our present author is apparently unable to rise. Weakness indeed is the inherent defect of *Elena*, as it was of *Atherstone Priory*. Well conceived and tenderly touched as is the story of this Anglo-Italian girl, it fails in all that constitutes superior excellence by want of force. It is milk for babes, with water superadded; and though the milk is sweet and the water pure, the diet is not invigorating. The heroine Elena, who gives her name to the book, is a beautiful character enough—seen from a distance; close at hand she would be horribly tiresome. She is not beautiful in person, for, like Percy in *Atherstone Priory* she is decidedly plain, save for her eyes—fine eyes being imperative and part of the furniture of a heroine, and the proper use of them as necessary for her salvation as orthodoxy. But though she is "plain," eyes which are "large, and soft, and limpid, and black as the blackest velvet," will, as we all know, redeem the most homely features, and make even a snub aristocratic. Moreover she is graceful in movement, and with a high-bred air about her which is unmistakable even when she is only "a bit hessie" of fifteen, hungry and shabby and utterly uncared for. In character she is simply faultless. Her patience is sublime, her selfishness angelic, her devotion pathetic; but with all this she lacks the presence of more active qualities to individualize and consolidate her, to make her more than a mere type, and to round her off into living womanhood. She is too much after the pattern of those statues which represent a single virtue or a single sentiment, such as pity, resignation, charity, patience, pity, and the like; statues which express no other emotion or attribute of humanity than this one of which each is meant to be the symbol. Or perhaps we may take her as too misty for firm flesh and blood; a sad Niobe seen all in tears, but seen only as a fidr face among the clouds; a shimmering creature as intangible as the vapours of which she is formed. It is a great mistake in authors to make their heroines too perfect or their stories too melancholy. Everything wants its energizing force, and humanity is no exception to the rule. All saintliness in character, and all sadness in life, are apt to produce a certain vagueness, which ends by wearying the most good-natured and the least irritable reader.

Had Elena been "overlooked" by some malevolent witch, she could not have been more painfully devoted to sorrow than we find her in this Italian tale. In her childhood half-starved, cruelly beaten, neglected, and ill-treated by "la cugina," who hates her for some unexplained cause connected with her black velvet eyes; in her

* *Elena: an Italian Tale.* By L. N. COMYN, Author of "*Atherstone Priory*." 2 vols. London: Longmans, Green & Co. 1873. 7s.

adolescence deceived by the man and defrauded of the love to which she had given herself; in her happier womanhood bereaved almost as soon as it had learnt its happiness; her very maternity but the sad reflex of her widowhood, and the joy of the one never able to heal the heart-break of the other—we wonder why such an unoffending creature should have been so severely scourged, and hold it rather barbarous to lay so many stripes on her tender back. At least she might have been left to live in peace and happiness with her husband after she had "won him to her love." It was hard to shoot him just as he had begun to repent of his folly and to love the light better than darkness, and we owe the author a grudge for this piling up of the agony when we think we might have been let off with a little sunshine.

Growing up and living in such an atmosphere of depression, it is not to be wondered at if Elena is somewhat sickly and without "suff." She reminds one of some delicate plant feebly struggling into life in the damp shade, where no sunlight ever penetrates, and where there are always dank dead leaves and the drippings of over-lunging boughs. Of course the plant must be sickly and colourless in such a habitat; and a woman in Elena's circumstances of ever-flowing tears and perpetual gloom will also as naturally be feeble and depressed. It is a pity she had not so much time of vigorous happiness allotted to her as would have allowed her to become a trifle more robust than she is, or at least have allowed her to be, as it were, dried; for, though she comes into one gleam of sunshine in her miserably clouded life, it is but a watery gleam at the best, and soon passes off, leaving a deeper gloom than that it has illumined and dispersed. The consequence is, that the book is as it were damp with tears, and that we never meet Elena without seeing her cry or being expected to cry for her.

The character of Pauline, whom she calls her sister, but who is only her stepmother's daughter, also wants more "making out." We grant that certain girls are abominably disloyal and treacherous and deceitful about their sisters' lovers, as about most other things; but there ought to be a stronger motive assigned than mere girlish vanity for such a grave amount of flirtation as takes place between Elena's betrothed, Marco, and this pretty brightly-coloured butterfly, this brilliant laughing coquette, who is made to look only light and frothy, but who ought, by all the rules of art, to have been shown as something stronger than froth—bad, not only naughty. Girlish vanity is a reprehensible thing enough, but it has not stuff in it for continuous baseness; and Pauline is very base. That Marco should marry Elena, or rather her fortune, all the same, whether he loves her quasi-sister or not, and thinks he does no harm, but on the contrary that he does his duty like a man, is thoroughly Italian. Our author is too pure-minded to have added what the real Italian would have accepted as the sole solace of his position—the speedily-arranged marriage of Pauline, probably with the lover's dearest friend, and the tears of poor lachrymose Elena forgotten in the laughter of bright curly-headed Pauline. A hint of this kind would have revolted the British public; but it would have been ethnically truer than Marco's conversion to his wife, and Pauline's being suffered to escape into the hands of a detested Austrian.

We cannot help thinking, too, that Marco was wonderfully unwise in remaining at San Cesaro, compromised as he was in the effort of that small town to remain one of the many members of "Italia Una." True, his father was ill; but the smallest amount of reasoning faculty would have told him that it was better for him to save his own life, and leave his father, if needs must, to die without his personal superintendence, than to remain for certain arrest and execution. All his other friends escaped in the breathing time allowed between the collapse of the Liberal movement and the return of the town to its old rule; and the Papal Government had wisely enough connived at this escape of the compromised; but Marco, who was the leader and the boldest spirit of them all, who had made himself the most prominent of all and had most to lose, chose to remain. Nothing can be weaker than the three reasons given for this suicidal rashness. No doubt "the idea of consulting his own safety when his father was dying, the thought of deserting the old man in his last extremity, of leaving his young wife alone with such a charge," may have been "repugnant to every feeling of his warm and generous heart"; but these very reasons would have forced a sounder decision from a sane and collected head. He knew that he would be shot if he remained; and it really seems a rather odd method of calculating virtues and weighing proprieties for a man to do that which he knows will deprive his young wife of his protection for ever because he will not let her bear alone the distress and trouble consequent on his father's death. Men who are so intensely domestic as this do not venture into the stormy sea of politics. If they prefer home to even their own safety, they are not likely to do things by which they will find their necks in a noose unless they make good their escape; and, had Marco thought so much of his family duties, he would have interfered less in political matters. These are the slips in the logical rendering of character which make such books as *Elena* so puerile. Of course as Marco insists on remaining, he is taken and shot; by the "irony of fate" the command of the shooting party devolving on his bosom friend Louis, who, in his turn, has always loved Elena to distraction, though he has been as pure and loyal as he is devoted.

After the death of her husband Elena passes into a kind of clouded state of mind, from which she is only awakened by the birth of her little boy, whom she however regards more as a bit of Marco than her own child. She must have made rather a depres-

sing playmate for the little fellow, for she never smiled when she spoke. "The blow that had fallen on her had been too heavy for her to be again what she had been, and smiles would probably be never hers again on earth"; and "even in speaking to her child, gentle and caressing as were her ways and words with him, her face never lost its expression of sadness, or her voice its touching melancholy." Thus the chord of misery is complete. In the beginning we see her as a girl of fifteen who has "something inexpressibly mournful in the anxious timidity which marked her features," whose "large dark eyes had a sad wistful look, as if for ever pleading for something—for something which she could never have"; in the middle she is a young wife coming to a home where the furniture frightens her and makes her think of ghosts, where she covers her face with her hands and the tears trickle fast through her slender fingers, where she knows that her husband does not love her and that he does love her sister; at the end, after a brief moment of married happiness when she has won Marco's love, she is a widow looking to death as her release.

Why has this author thought it necessary to give his—or her—readers these little lessons in Italian which perpetually break up the page and call the eye down to the foot-note? It is to be supposed that Marco and Elena, "la cugina" and Pupina, speak in Italian all through. Why, then, with two-thirds of the sentence in fair English, must we have here a word and there an exclamation in pure Italian, with the meaning set below under proper numerals? It would have been easier to have written in English from first to last, and then to have thrown in a compact little vocabulary at the end. When Elena binds up Marco's broken head in the beginning, what good end does it serve that she should say when going for water, "I will get you some 'subito' (1)—(1) Directly; in a minute"? When Marco sees that his mare is not injured, why does he say "Meno male" (2) in the body of the book, in large type, and (3) "So much the better" in small type below? When Elena talks to herself after the interview she speaks English, until at the last she bursts out with "Vorrei tanto rivederlo." As her colloquy was certainly all made in Italian, this little bit of lingual patch-work seems unnecessary; and the effect is a curious mixture of pedantry and grotesqueness, not conducive to the harmony of the book. These, however, are adventitious blemishes, and could easily be removed; what remains as the greatest blemish of all is the weakness, in which we include the hysterical sentimentality, of this Italian tale.

WOODS'S HERODOTUS.*

IN a less degree perhaps than any other ancient writer can Herodotus be enjoyed at secondhand. The "Father of History" is such a genuine gossip, so artless and yet so quaint and arch on occasions, that his flavour gets dissipated in translation, and almost disappears in any attempt to represent it by a sketch or summary. For this reason probably the *Herodotus* of the *Ancient Classics for English Readers* Series has always struck us as disappointing; and even the two brighter and more elaborate attempts of Mr. Talboys Wheeler to portray the life and travels of the Halicarnassian sage are a very poor substitute for the undiluted matter of Herodotus himself, whose connecting links between chapter and chapter disclose a method in his seeming garrulity, and whose reflections are so naive as seldom to survive the process of transference into another tongue. It is plain, therefore, that a good handy edition of *Herodotus* deserves a cordial welcome in the interest of students who wish to make as thorough a first acquaintance with him as possible, and also of such as desire an easier and pleasanter recurrence to him than is consistent with diving into the four thick octavos of Baehr, which, till the appearance of Dean Blakesley's two volumes, were the scholar's edition of *Herodotus*. Of the latter it is impossible to speak without respect and approval; for while the text has been well considered, and the explanatory matter is lucid and scholarly, it contains such a fund of illustration from history and travels as perhaps no editor could have so ably brought together as the "Hertfordshire Incumbent." Yet this valuable work is obviously designed for mature scholars, and its limits preclude minute notices of construction and other details, which in its author's view ought to be sought for in books of reference. Mr. Woods aims at furnishing a "multum in parvo" edition, in which a young scholar may find difficulties of the text, points of grammar, historical questions, modern illustrations, all dealt with in turn. It cannot be said that in endeavouring to compass this aim he errs, to judge from the volumes before us, in point of diffuseness; nevertheless the only drawback to be apprehended to his edition of Herodotus in the *Classica Classics Series* is that, if all the Nine Muses are severally put forth in as many neat suits of plain colour, they will take up even more room on a shelf than the octavos of Blakesley or Baehr. But, even so, the fault may be said to be inherent in the original; and any credit to be got from succinctness and compression will be entirely Mr. Woods's own. We should hope that, by due study of the reader's requirements in the first three or four books, it may be feasible to limit the whole work to five or six volumes. When the prefatory matter of the first book, the accounts of Egypt in the second, and of Scythia in the fourth have been got over, there is nothing

* *Herodotus*. Books I. and II. With English Notes and Introduction. By Henry George Woods, M.A., Fellow and Tutor of Trinity College, Oxford. Kivingtons: London, Oxford, and Cambridge. 1873.

in the Persian War proper to forbid succinct annotation and limited illustration.

Assuredly it cannot be laid to Mr. Woods's charge that he wastes time or space in long introductions. Indeed we should say that his short chapters on the style and on the dialect of Herodotus, well thought out as they are and put forth with due compression, have tended considerably to relieve the foot-notes from overcrowding. His short life of Herodotus, too, proceeds on the principle of embracing all that is positively known and all that is most reasonably conjectured about it. In opposition apparently to the modern theory that Herodotus was a sort of Oliver Goldsmith who compiled travels in his study, and after the fashion of stay-at-home travellers made his excursions in handbooks and encyclopædias, or whatever served in the place of such compilations in his day, Mr. Woods enumerates the quarters which the historian actually visited, and infers from internal evidence that the order of his travels was first the East, then Egypt, and after that Tyre and Thasos; and that, though this is less decisive, his expeditions to the East and North both date back to the time of his residence at Halicarnassus or Samos, and not at his later Western home. His personal acquaintance with many chief cities and places of Greece cannot be doubted, and there is internal evidence of his travels to the westward as far as Southern Italy. This editor adopts also to some extent the plausible suggestion that Herodotus pursued travels which must have entailed much toil by land and sea, from strange men and from strange beasts, under the guise of a trader; and he quotes Palgrave's recent experiences in Central Arabia to show the comparative safety of the merchant amidst uncivilized nations who regard with dislike and jealousy the professed tourist or traveller seeking information. He does justice to what must strike every reader of Herodotus as one of his finest traits of character—his breadth of view, freedom from local prejudice, and thoroughly cosmopolitan wisdom; and analyses his theological views, which, if severe and, so to speak, ultra-Calvinistic, did not interfere with the cheerful tone of his writings, or lead him to propound or practise a blind and passive folding of the arms as the natural consequence of fatalism. The libels of Ctesias on Herodotus are perhaps too briefly noticed; but this may have been because a larger field is needed for refuting the charge of wholesale falsehood which he brought against Herodotus for his own purposes. Lovers of the old Hellenic story—and there will always be many such—are ready to concede that he was no philosophic historian in the modern sense of the term, and will cherish a secret thankfulness that he was not so far in advance of his generation as to prefer a strict and rigid system of historical composition to the charming discursiveness, gossip, and story-telling which endear him to all who are capable of enjoying him in the original, as the "Froisart of antiquity."

We have already said that only in the original can Herodotus be thoroughly enjoyed. A few notes may serve to show that this edition of Mr. Woods's goes some way towards making this enjoyment more widely available by an intelligent appreciation alike of his author's peculiarities and his reader's needs. How well he has apprehended the former cannot be better shown than by quoting an excellent passage from his chapter on "the Style of Herodotus," which is at the same time a key to the understanding of the Herodotean manner, and a refutation of the unjust imputation of twaddling:—

The happy mean [writes Mr. Woods] between jejuneness and turgidity, which characterizes the greater part of his work, is one point in which the style of Herodotus resembles the conversation of a well informed and well-bred talker. Whether there is any truth in the story of the Olympic recitation or not, his writings remind us much more of a man telling the story of his travels in natural, unpremeditated language to a few familiar friends, than of one who is reciting a studied composition before a large audience. His redundancies and repetitions, his frequent *ἀνακάλυψαι*, his occasional use of the second person singular (with reference to the reader), and his invariable practice of referring to himself in the first person—so unlike the dignified reserve of Thucydides—are all illustrations of this conversational style. Some modern commentators have seen in his redundancies and repetitions the garrulity and forgetfulness of old age. But there is a sustained strength about the work which prevents us from believing that the greater part of it was composed when his powers had begun to decline. And though diffuse, he is rarely—if ever—prolix. When force is to be gained by brevity, he can be brief. The redundancies of his work must be ascribed, not to the old age of the writer, but to the infancy of the age in which he wrote.

One of the features in the style of Herodotus which it takes a shrewd study of the original to appreciate is the undercurrent of fun and humour to which, had he been an oral story-teller, he would have given vent without so much as moving a muscle. Thus, when he is describing how the wise men of Greece flocked to the Court of the millionaire Ctesias, there is a bit of genial sarcasm in the remark that, not only the rest of them, but even Solon himself were attracted to Sardis because it was *ἀκμίζουσα* *λοῦτρον*, rolling in riches. Gold can not only bribe guards, but can command the services and good word of *savans*. In c. 147, 2, of the first book he has a playful and covert hit at the extravagant pretensions of the Asiatic Ionians on the ground of their supposed pure descent, where he says *ἔσονται δὲ καὶ οἱ καθαρίως γεγεννημένοι Ἴωνες*—"let us call them then the thoroughbred Ionians." And again in II. 143, 1 there lurks a quiet touch of irony, where he draws a contrast between Hecæteus the Milesian, as influenced by the Ionian weakness of quoting a god-descended pedigree, and himself who made no such pretence (*ὡς γενεολογῆσαντι ἱμῶντι*). These are instances cited by Mr. Woods, but it would be easy to adduce many other proofs of quizzical humour

—e.g., where in the eighth chapter of the first book Herodotus chronicles, with all apparent gravity, that Candaules *ἡμέτερος τῆς ἰουραῖς γυναῖκος*—"was in love with his own wife"—such a passage being exceptional, as Mr. Woods notes, in an Oriental despot. The same mixture of shrewdness and naïveté in a casual remark, liable sometimes to be taken as mere matter of fact, but at other times provoking a smile from the reader, is also discernible in such passages as Herodotus's hit at Spartan cupidity in I. c. 70, where he suggests that, whereas the Samians attribute their possession of the Spartan cup which was destined for Ctesias to a fair open purchase from the Lacedæmonian envoys, the latter, when they found that his empire had collapsed, would most likely aver that they had been robbed of it by the Samians; and the happy way in which, in c. 79, 1, of the first book Herodotus describes the sudden and unexpected appearance of Cyrus before Sardis and the surprise of Ctesias; *ἔλασας γὰρ τὸν στρατὸν ἐν τῇ Ἀσίῃ αἰὶνος ἀγγέλος Κροίσῳ ἐγγέλλει*. He had not taken the trouble to send heralds or envoys, but had carried his own errand; the use of the pluperfect being, as Mr. Woods surmises, to emphasize the suddenness of his advance.

Another point which Mr. Woods has made duly prominent in his foot-notes is the frequent parallelism of Herodotus with Homer. As one might expect, so early a prose style would have many poetic images and features, and the editor whose work is before us has not failed to make this felt by copious illustration. Does Ctesias dream a dream, it is, in Herodotus's phrase, a dream-spirit, or personified *ἔννεμος*, that stands at his couch's head. Does the same monarch find that his dreams have proved true, but in a sense he never dreamed of, the reflection that Herodotus puts in his mouth, *ἀλλὰ τί ποτα εἰρήσεται καὶ εἶλον ἢ οὐκ εἶρησεται* (I. 88, 4) differs very slightly, if at all, from the Homeric *οὔρα καὶ δὲ μῆλα ἔπεισεν εἶλον εἶναι* of II. II. 116. All such coincidences are, as far as our observation goes, carefully noted by Mr. Woods, so that the student has the advantage of an interesting comparison between an early Ionic prose-writer and a still earlier poet of the same country, with whom his reading has brought him in contact.

In a few instances it has struck us that a note is wanting in this edition, in consequence of the editor's conviction that the learner had better find it explained in the lexicons. In I. 24, for example, there is no note at *ἀνακάλυψαι*, an unusual expression, and the same is the case at I. IV. where it is said of Ctesias's experience of the Delphic Oracle, that, when he was convinced of its veracity, *ἐκτοπῆρα αἶμα* (he took his fill of it; he consulted it greedily, the metaphor being taken from the habits of a glutton). On the other hand, Mr. Woods is so helpful and honest in cases of manifest difficulty, and so satisfactory in his choice of illustrative matter, that we cannot complain of omissions, especially where other helps are within reach of the intelligent and painstaking student. Apropos of the oracular responses, one illustrative note of Mr. Woods's at I. 49, on the correctness of the answer to Ctesias as to what he was doing at a certain point of time, about which there could have been no collusion, has struck us as quite exhaustive in its way, and as an excellent specimen of a model note for such an edition. It gets on one side the oracles which led to their own fulfilment, those which were invented after the event, those which enforce a maxim or religious precept, those which were given under the direct influence of a political party, and those which, like the answers to Ctesias about crossing the Helys, were clearly the result of imposture. All these are capable of explanation, and a study of the samples of each which are cited abundantly proves this. But "here," writes Mr. Woods, "we must either disbelieve the story altogether, or attribute the answer to clairvoyance." He seems to incline to the former solution when he says that "probably Herodotus derived his information from the Delphian priests."

We have examined with interest the solutions proposed in this edition to certain knotty bits of construction which occur in the first and second books, and which have puzzled scholars before Mr. Woods. In the conversation of Bias of Priene with Ctesias (I. 27 § 4) occurs a crabbéd passage of this kind, most of the suggested remedies for which are over-violent. In the sentence—*ἡρώτας δὲ τι δοκίμους εἶχεσθαι ἄλλα, ἢ ἐπὶ τι τάχιστα ἐπιθῆναι αἰνῶνι πηγεσθαι νίαν, λάβαν ἀρόμενοι Λόδου ἐν θαλάσσῃ*—the difficulty is enhanced by the strong manuscript authority for *ἀρόμενοι*. Dean Blakeley would omit *εἶχεσθαι* and *ἢ*, and secure a good sense at the cost of liberties with the text. We prefer Mr. Woods's more conservative resort to an *ἀνακάλυψαι*, the idea of *εἶχεσθαι* being carelessly reiterated in *ἀρόμενοι*, which follows as if the sentence had begun with *νηπῶτας δὲ ἄρ' οὐκ εἶχοντο*; in which case the sense would be—"and what thinkest thou the islanders wished more as soon as they learnt, &c.?" Are they not prying to catch the Lydians at sea? In I. 160 another puzzle is caused by *ἦν* following *ἦν* *εἰ χρόνος οὗτος οὐκ ὀλίγος γενημένος*, but we think that Mr. Woods meets it by showing that *ἦν* is not, i.e. *ἦν* *ἦν*, but that *οὗτος* anticipates *ἦν*; "that was no long time which passed, wherein." In a case of difficulty at II. 22 § 2, where the text is surely at fault, he is led from his usual sound judgment by following Stein into violent omissions and liberties with punctuation.

We may add in conclusion, that, though Mr. Woods is, from the necessity of the case, far more chary of illustration than Dean Blakeley, there is quite enough of it in his foot-notes to enliven the task of following the old historian through his rambling descriptions and episodes; and all that is given in this way is appropriate and well chosen. In the elucidation of the details of

the topography of Babylon in the first book, and of the chapters relating to the Nile, its overflows and its exploration, in the second, he is so careful, full, and exact, as to leave nothing to be required by the intelligent reader.

THE SIMANCAS RECORDS.*

(Second Notice.)

DON PASQUAL DE GAYANGOS is a new editor in the series of Calendars issued under the superintendence of the Master of the Rolls. We therefore in our previous notice of his volume gave more space than we usually do to an estimate of the qualifications which, judging from the mode in which the work was done, he seemed to us to possess for such a task. We do not at all wish to detract from the high praise which we think is his due, or to express any other opinion than that to which we have already committed ourselves—that it would be difficult to find another person who could so well act the part of a successor to the late Mr. Bergenroth. And yet we think it worth while to draw attention to one more fault which is very evident to a scholar, though probably it would pass unnoticed by an ordinary reader, who would skip, or only perhaps just glance at, official documents which are printed in Latin.

We noticed what appeared to us must be mistakes in copying in the two Breves which we described in our previous article, for the dispensation for the Emperor's marriage, and at first we were inclined to suppose that the editor had followed his copy, not noticing the blunders which a contemporary scribe will sometimes make in copying such papers. We attributed the mistakes to the scribe and not to the editor; but upon closer inspection there can be no doubt that they arise from the carelessness of the editor or the want of scholarship of his amanuensis, or perhaps we ought to say from both. When *numero* is printed for *numero*, and when the loss of a few letters in the middle of a word is supplied in so careless a manner as the following—*cla[ri]mus*—and two lines further on *cla[ri]ma*, we naturally turn to the end of the document to see who transcribed it, and we can scarcely think that the rest of the blunders in the document can be attributed fairly to Secretary Perez. Moreover there is a fatal mistake which makes nonsense of one of the sentences of the Breve by beginning a new paragraph in the middle of a sentence, where the separation should have been noted by a comma only. The matter is more important than might be judged at first sight. The Breve is specially difficult to make out, and is needlessly complicated by so many blunders. Perhaps *nequaque obstante* for *nequaquam obstantibus* would puzzle no one; nevertheless it is a disfigurement in so handsome a volume as this.

We now return to the historical matters contained in this volume, and we can scarcely give a better illustration of the mode in which these foreign despatches dovetail into and complete the accounts which may be gathered from papers previously published than by reference to some documents of the first two months of the year 1525. Mr. Brewer, who has analysed every document yet brought to light from any source, has printed only two letters of Wolsey's which belong to the period in question, and which are addressed to foreign Courts. There are two other letters of Wolsey's, one addressed to the King, the other to Sir Thomas More, which we omit for the present to notice, as not touching the particular point we mean to refer to. There are about a dozen documents, nearly all of them analysed from the Imperial Archives at Vienna, which refer to Wolsey's policy during that period of mutual suspicion when it must have been so difficult for either party to fathom the intentions of the opposite side. On the night of Sunday, February 12 (not, as Wolsey's relation of the affair gives it, on the 11th), a man on horseback was arrested as he was riding from London to Brentford. Suspicion having arisen from his evasive answers to questions put to him, he was searched, and some ciphered and other despatches were found upon him. The packet was forwarded to Sir Thomas More, who was informed by the bearer that the letters were written by De Praet, and saw by their superscription that they were addressed to the Emperor. More went off immediately to the Cardinal, who unsealed the packet; or, as the other account gives it, found the packet already broken open, and read the contents.

The story is told in the Life of Wolsey by Dr. Fiddes, who had seen and analysed the Cardinal's letter of February 13, 1525. We know from that and from other sources what Wolsey thought of De Praet. We here learn from his own letters what the Imperial Ambassador thought of Wolsey. They are full of complaints against the Cardinal of York, and probably their contents very much resemble those of the intercepted packet of letters which was presented to Wolsey on the morning of the 13th of February, as he was sitting in Court as Lord High Chancellor. The letters were then read by Wolsey, and so important did he think the charges alleged against himself to be, that he ordered some letters which had been despatched the day before to the Lady Margaret to be seized and opened. The effect of these letters, as described by Wolsey in his letter to Sampson, the contents of which were to be represented to the Emperor, was that "the

King's amity with the Emperor was faint and slender." They also contained "malicious words" touching himself and the Pope, as Wolsey writes, "which are little to be regarded." He also drew the Emperor's special attention to the words used by his Ambassador:—"If we should gain the battle all will be well; our master will escape the danger of such friends and confederates as he has had hitherto; and let me say that he is little obliged to any of them, whoever they may be"; and to another sentence in his letter which ran as follows:—"When matters succeed well he" (Wolsey) "knows not what to say, and when otherwise he talks wonders. I hope one day to see our master avenged, for he is the main cause of all his misfortune." We need not inquire whether the seizure of the first packet of letters led as accidentally as Wolsey represented the matter to the discovery of the secrets which the Ambassador was communicating to the Emperor. Undoubtedly Wolsey carried the matter with a high hand, absolutely forbidding De Praet to write again to the Emperor on the subject, saying that the King and he would advertise the Emperor of all the circumstances of the case, and forbidding him to appear again in the King's presence or his own (p. 52).

Now, though these particular intercepted letters of course cannot now be found at Madrid or Vienna, there is enough in the rest of De Praet's correspondence to bear out all Wolsey's accusations of him, though readers accustomed to modern rules of etiquette will probably wonder that the Cardinal should have so unblushingly paraded the fact of his breaking open a second packet of despatches to the Emperor on a suspicion founded upon the (if so be) accidental discovery of the first packet open. De Praet understood something of the turn things were taking in England, and suspected more than he could see through, but he was no match for Wolsey. He truly observed that, after a long conference with the Cardinal, he was unable to guess what his real sentiments were, as he seemed at one time to disapprove of the Pope's behaviour in seeming to favour the French King, and immediately after said that he did not blame him for what he had done, but that he could have acted better—all which the Imperial Ambassador thought was very much in contradiction to the instructions which had been given to Sir Gregory Cassali when he was sent off to the Viceroy of Naples. But De Praet was certainly wrong when he fancied that

The Legate was very much embarrassed from fear of his past acts and words coming perchance to the King's knowledge; for if they should, it will be found out that they have greatly tended to produce the present evils, and perhaps to have been done and said without the King's sanction.—*l.* 42.

And now, in order to cap this sagacious conjecture of De Praet's, we must recur to Mr. Brewer's last volume, and quote Wolsey's letter to Henry, written just nine days later than the communication from the Imperial Ambassador to Charles—i.e. the very day when the intercepted packet had been presented to him in Court, "and twelve days before the fatal battle of Pavia":—

The result must be dangerous for the French King; bloody if he wins; if he loses, the Imperialists will not fail to pursue him so as hard and almost impossible it shall be for him to escape into his country, the great snows yet lying in the mountain. The coming of Gregory Cassali will encourage the Imperialists, confirm the Venetians, and make the Pope change his mind; by which means, and the grant of 50,000 crowns, it will be known that, whatever good effect arises is to be ascribed to your Highness, "who in time of extreme desperation of the Emperor's affairs in Italy, have been the only reviver of the same." The Duke of Milan will be no less grateful for the methods adopted by the King for securing the investiture, which he could not obtain from the Emperor. Should the Imperialists get the worst, which is not probable, thanked be God! your affairs be by your high wisdom in more assured and substantial train by such communications as be set forth with France apart than others in outward places would suppose.—*Brewer's Calendar, Vol. IV. p. 471.*

What would not De Praet have given to see that letter?

It is extremely interesting to see the Imperial Ambassador's own account of the seizure of these letters, which he asserts, and probably with truth, were broken open designedly. De Praet paid no attention to the prohibition laid upon him, and on the 25th of February gave the Emperor a full account of everything, and then inveighed in no measured terms against the Cardinal of York for his duplicity in playing a game which would answer in either case of the Emperor's winning or losing at Pavia. Of course under the circumstances De Praet had nothing to do but to ask to be recalled. Accordingly he was soon afterwards withdrawn from the English Court and transferred to the Court of France. Whichever version of the story be adopted, the Emperor might easily have made it a *cuius belli*, but he was in no position to do so, and he was obliged to put up with the insult; and, though really upholding his Ambassador's conduct in his private letters to De Praet, bore with Henry and Wolsey in their representations or misrepresentations, whichever they may be called. It was of course necessary for the King and the Cardinal to justify their conduct, and the *Justification des Anglois*, as the document is called, occupies twenty-six pages in the copy deposited in the Archives at Brussels. And on the 8th of March, the day before the tidings of the Imperial victory at Pavia, the King and Wolsey each addressed a letter to Charles. The King accused his Ambassador of being indiscreet, unloyal, and ungrateful, and behaving in a way very different from his own "paternal affection, acts, and proceedings towards the Emperor," and asking for De Praet to be punished accordingly. The Cardinal vindicated his own honour, faith, and loyalty towards Charles, and asked him to refuse belief to the abusive reports and advices of his Ambassador, and not to allow his loyal servant—namely, himself—to be thus treated and made a subject for scandal, without any cause or reason for it.

About a fortnight afterwards, when the news of the battle of

* *Calendar of Letters, Despatches, and State Papers, relating to the Negotiations between England and Spain, preserved in the Archives at Simancas and elsewhere. Vol. III. Part I. Henry VIII. 1525-1526. Edited by Pascual de Gayangos. Published by the authority of the Lords Commissioners of Her Majesty's Treasury, under the direction of the Master of the Rolls. London: Longmans & Co. 1873.*

Pavia had arrived, De Praet again wrote to the Emperor, and informed him that he had been told "the Cardinal would give anything not to have acted as he has done in the affair, especially since the arrival of the grand and most happy news just received in this capital," adding that "the Cardinal had indeed reasons to repent of what he had done; but his Imperial Majesty is wise and prudent, and cannot fail to make good use of his victory according to time and circumstances" (p. 86).

The proceedings subsequent to the battle of Pavia are at least as interesting and as copiously illustrated as those we have been referring to. The Emperor's replies, both to Wolsey and the King, are dignified, and he does not adopt the haughty and peremptory tone which might have been expected; and, in a letter afterwards addressed to his Ambassador, explains to him that he is seriously displeased, but thinks proper to disguise his resentment, and threatens that he will make the Cardinal suffer for it. In the midst of all these recriminations there is a very pretty letter from Catherine of Aragon to her nephew, congratulating him on his victory. The last instructions issued to the Imperial Ambassador were to the effect that he was to tell the King and Legate that the Emperor was fully determined to follow up his victory. But they never reached De Praet, who had been recalled by the Regent of the Netherlands, and had had to quit London without taking formal leave of either the Cardinal or the King, who absolutely refused to see him.

And here we must take our leave of the Ambassador and of the volume, and shall only add that we consider it to be one of the most important of the whole series of Calendars which are so creditable to the Government in respect to the initiation, and to the Calendarers as regards the execution, of the project.

CHRISTMAS BOOKS.

v.

MEMORIALS of Wedgwood, by Eliza Meteyard, author of the "Life of Wedgwood," &c. (Bolland Sons). Miss Meteyard here gives us another admirable selection from the works of the great Staffordshire potter. "It will be found," she says, "to include a more miscellaneous assemblage of objects than her previous volume, and a few others more archaic in design, fabrication, and material than those usually received as specimens of Wedgwood's skill as an artistic potter." Not only does she aim at revivifying the taste by the diffusion of such beautiful works of art, but she also seeks to preserve from destruction the designs at all events of this frail kind of work. "The destruction," she writes, "of Wedgwood's finest works has been great; and the time has certainly come when it becomes a national, as well as an individual, duty to gather up and preserve the precious works of this illustrious Englishman." She also seeks to protect the collector against the worthless imitations of Wedgwood which are sold in such abundance. The race of collectors is indeed a credulous one. Who does not know some traveller who, in a visit of a couple of days to Damascus, has chanced to light upon some brass pot of immense antiquity and inestimable value which had escaped the notice of all the local collectors? Who does not know some other traveller who, in his first afternoon in a Dutch town, has found in some back street an undoubted Holbein, and carried it off for a mere song from the unsuspecting dealer? In the potter's art, at all events, Miss Meteyard is doing her best to guard against trickery those who are unwilling to be tricked. The photographs in this collection are perhaps the best we have ever seen. The figures on the medallions so stand out from the paper to the eye that the mind is not satisfied till the touch has convinced it that the surface is flat.

Scarcely inferior is the *Castellani Collection*, a series of twenty photographs by H. Thompson, selected and described by C. T. Newton, M.A., Keeper of the Greek and Roman Antiquities, British Museum (Ball and Sons). It is in such works as these that the real power of photography is seen. Disappointing as so commonly are the photographs of scenery, or of pictures, where all colouring is worse than sacrificed, in the representation of the art of the workers in stone it stands forth at its best. It is not only, however, in the artistic point of view that the interest of the present series lies. By the antiquary it will be as highly esteemed as by the artist, while by that not inconsiderable portion of the public which, in estimating every book, first considers how it will look upon the drawing-room table, this splendid volume will be valued no less highly.

The *Boydell Gallery: a Collection of Engravings illustrating the Dramatic Works of Shakespeare*, by the Artists of Great Britain. Reproduced from the originals in permanent Woodbury type, by V. Brooks, Day and Son (Bickers and Son). In this magnificent volume we have an admirable reproduction of the well-known Boydell Gallery. This great gallery, which was nearly twenty years in preparation, and which cost, as we read, above a hundred thousand pounds, almost ruined its fine old projector, Alderman Boydell. A few years after he had taken the enterprise in hand, just when everything seemed to promise very well with him, "that Gothic revolution," he writes, "which broke out about this time, and still convulses the whole Continent, soon made an end of those happy days." Instead of presenting, as he had hoped, the original paintings of his Shakespeare Gallery to the nation, the engraver was forced in his eighty-sixth year to apply to Parliament for leave to sell them all by lottery. Leave was granted, but just

as the last ticket had been sold the Alderman died. We hope that the present publishers, free as they just at present are from a "Gothic revolution," may find their spirited undertaking as successful as it deserves to be.

Scenes of Scottish Story, by William Ballingall (Edmonston and Douglas). "The present volume," the author writes in his preface, "is to be regarded as a companion to my larger and kindred work, the *Shores of Fife*, already published." The *Shores of Fife* we noticed last year, but with no great praise. Its companion volume, if it is smaller, is nevertheless by far the better book of the two. Mr. Ballingall has in the present work either found subjects more suited to his pencil, or else—and this we think is the right explanation—he has greatly gained in artistic power and skill. The Scotch do not keep so hoathen a festival as Christmas, we believe. May we advise them to satisfy their feelings of patriotism and gratify at the same time their love of art by presenting to each other on New Year's Day these *Scenes of Scottish Story*?

Thorwaldsen; his Life and Works, by Eugène Plon. Translated by Mrs. Cashed Hoey. Illustrated by thirty-nine engravings on steel and wood (Bentley and Son). The original memoir is well put together, the illustrations are good, and the translation is fairly done. The life of the great Dane was not very eventful, nevertheless M. Plon has made an interesting memoir.

Old and New London: a Narrative of its History, its People, and its Places, by Walter Thornbury. Illustrated with numerous engravings from the most authentic sources. Vol. I. (Cassell, Petter, and Galpin). The illustrations to this volume are certainly not new, though many of them are interesting; but then, on the other hand, 200 new engravings, together with 576 large pages of letterpress, could scarcely have been given for nine shillings. The book on the whole is well done, and will, if it spreads abroad in its weekly numbers as much as it deserves, enable many a lad to people the dull streets through which his daily walk lies with a race of whom he will never weary. It is a pity that Mr. Thornbury will, like all the rest of the compilers, go out of his way to blunder over early history. Why "in Cannon Street by the old central milestone of London" will "grave Romans meet us and talk of Cæsar and his legions"? What had Cæsar to do with London, we should like to know? Curiously enough Mr. Thornbury has read "that most reliable (*sic*) writer on this period, Mr. Freeman," quotes from him largely and praises him highly, and yet, even when he quotes him, writes of Saxon London. Mr. Freeman must be ever feeling the same kind of disappointment as the missionary who, just when he has brought his converted savage to rely on baptismal regeneration, finds that he is still quite ready to dine off his old grandmother.

Lyrics of Love, from Shakspeare to Tennyson. Selected and arranged with notes by W. Daveyport Adams (Henry S. King and Co.). Mr. Adams has this Christmas published two excellent selections from the English poets. We have in an earlier notice already praised his *Student's Treasury of English Song*. No less worthy of praise is his *Lyrics of Love*. The full title, however, is not altogether accurate. No one would much expect with such a title to find extracts either from a poet of Henry VIII's reign or from the younger generation of the poets of the present day. "Lyrics of Love from Wyatt to Swinburne" would have been nearer the truth; but perhaps would not have looked quite so well on the title-page.

Storm Warriors; or, Life-Boat Work on the Goodwin Sands, by the Rev. J. Gilmore, M.A., Rector of Holy Trinity, Ramsgate, author of "The Ramsgate Life-Boat in 'Macmillan's Magazine'" (Macmillan and Co.). Mr. Gilmore has written a very interesting account of some of the most gallant adventures with the life-boat. We have no doubt that his work will render more dear to every Englishman than ever one of the noblest of all Societies—the Royal Life-Boat Institution.

Recollections of a Rambler, by G. A. Simcox, M.A., Fellow and Classical Lecturer, Queen's College, Oxford, author of "Prometheus." With forty illustrations (Chapman and Hall). The forty illustrations to this book are for the most part very poor. The book itself is still poorer. Mr. Simcox no doubt writes with a certain air which might perhaps for a time impose on any one who had learnt to read, but had not at the same time learnt to think.

The *Licensed Victuallers' Year-Book for 1874*, by H. D. Miles, editor of the "Licensed Victuallers' Gazette." In this Year-Book is given a list of members of Parliament with an "arrangement of prefixes that, it is believed, will be found useful to electors and to readers of the debates." Any licensed victualler and any licensed victualler's friend can at a glance tell the course each member took in the vote on the Permissive Bill. Happy is "that 'true Liberal' majority (including Whigs, Conservatives, and Radicals) whose names are honoured with a star!" Less happy are they who "abstained"—ill-omened word!—"or were absent from the test-vote and are marked a"; while hopeless is the fate of those who "are pledged to the Permissive Bill and have a p prefixed to their names." Among these last we notice Mr. Whalley. Could he not by a happy inspiration convince the electors of Peterborough that p stands for Protestant? The editor has not confined himself to politics and drink. He goes into the derivation of words. September, he tells us, "is compounded of *Septem*, seven, and *imber*, a shower of rain." The author *supra* *crispidum*, we would say. Licensed victuallers had better leave showers of rain alone.

Hammond's Good Templar Almanac and Four-Books, &c. A poor show against its powerful rival. It gives no marked list of

members of Parliament, and but six portraits of Good Templars against the nine portraits of Jolly Victuallers. It is, however, edited by the Rev. John Thomas, D. V. T. for Middlesex, and S.D., G.W.O.T. What these letters mean we have not been able to find out, though in a short account of the reverend gentleman with the letters, in his capacity of preacher, written, we suppose, by him in his capacity of editor, we read "that there are many of his congregation who thank God that he has been the instrument in the hands of the Holy Spirit by which they have been brought into a higher and nobler fellowship than that of Good Templarism, even the fellowship of Christ." In the "Good Templar Almanac," while December 29, 1689 (*sic*) is remarkable as the day on which Lord Stafford was beheaded, December 31, 1871, is no less remarkable as the day when "G. T. Battle-cry was preached. Rev. J. Thomas."

Memoirs of Sir Edwin Landseer, by F. G. Stephens, author of "Flemish Relics" (Bell and Sons). Mr. Stephens in this elegant volume gives us "a sketch of the life of the artist, illustrated with reproductions of twenty-four of his most popular works, being a new edition of the *Early Works of Sir Edwin Landseer*." Interesting as are the illustrations, and admirably as some of them—not all—have been reproduced, yet the book itself is a little disappointing. Mr. Stephens is not nearly so happy in his style as in many of his other works on art. We have not a few sentences as clumsy and as inartistic as the following:—"Edwin Landseer was born in 1803, the year before another animal-painter of modern note, Mr. T. S. Cooper, and that event took place at his father's house, No. 83 Queen Anne Street, East (Turner's Queen Anne Street), and he was consequently at his death in his seventy-second year." Edwin Landseer's great popularity, however, and the twenty-four reproductions, will, we have no doubt, cover a multitude of errors in style, and render these Memoirs one of the most popular of Christmas books.

English Sonnets: a Selection, edited by John Dennis (King and Co.). Mr. Dennis has shown great judgment in this selection. "It is designed," he tells us, "for the student of poetry; not for the reader who takes up a volume of verse in order to pass away an idle hour." And yet perhaps the chance reader, if he lights on such a volume as this, may in time become a student of poetry. At all events, as hees— to quote the line of one of our greatest writers of sonnets—"will murmur by the hour in foxglove bells," we do not know why a man who has no claim to be a student may not pass away an idle hour deep in such sonnets as these.

Virtue's Imperial Shakespeare, edited by Charles Knight. With illustrations by Cope, R.A., Leslie, R.A., MacIae, R.A., &c., &c. (Virtue). This is the fifth division of Messrs. Virtue's great reprint of Knight's *Imperial Shakespeare*. The book is on so great a scale, and the print is so large and so clear, that the only difficulty is to get far enough away from it to read it with any degree of comfort. The engravings are of very unequal merit. In the present number we have two excellent ones from pictures by Sir John Gilbert and Mr. Pettie.

Recollections of the Life of Countess Matilda von der Becke Volmerstein, by her Daughter. Translated from the German; with an introduction by the Lord Bishop of Bath and Wells (Seeley and Co.). The daughter has done well in writing the memoirs of such a mother—a woman who, while she was a good wife and a good mother, had yet love and strength to spare for the hundreds of orphans who came beneath her care and that of her noble old husband. He shortly after the close of the great French war had founded a home for orphan children. He took in those whose depravity had barred to them the doors of many a charitably disposed household. Before many years had passed he and his wife had a household of 375 to manage. His health was delicate, and on her the chief burden fell. She thus describes her daily life:—"From five in the morning until half-past ten at night I am not free from work. I have to order everything, to see after the meals every day, to give out work and to superintend it, to preserve fruit, to visit the sick, to provide for the girls' school, and out out linen." Add to this that she kept all the accounts, brought up a large family of her own, and had a husband in delicate health to look after. The Memoir is interestingly written, and is not unworthy of such a woman.

Illustrated Games of Patience, by Lady Adelaide Cadogan. Dedicated by permission to H.R.H. Prince Leopold, K.G. (Sampson Low and Co.). In this handsome volume we have the fullest explanations of twenty-four games of Patience, while an abundance of diagrams does all that diagrams can do to clear away difficulties. Of the twenty-four games no fewer than twenty bear French names. Can it be the case that these games have been the invention and consolation of the various factions—Royalist, Republican, Imperialist, Socialist—that have had in turn to pass long years of exile on our shores? To any one who is not well up in the language of Patience, such an explanation as the following is a little strange:—"Marriages may be made in the Zodiac with cards from the Equator (but not vice versa) and from the talon or pack; but cards in the Zodiac cannot marry each other, neither can those in the Equator do so." If, as we doubt not, His Royal Highness, to whom this elegant work is dedicated, understands all this, it is an additional proof to how highly cultivated a house he belongs. Happy for him that, unlike the members of other Royal families, he can cultivate patience as an amusement.

But these more considerable works, we have still left on hand a host of stories for young people, which we would gladly notice

had we time and space to spare. As it is, we must content ourselves with selecting to the best of our power a certain number as typical of the rest.

Thwarted: or, Duck's Eggs in a Hen's Nest (Bentley). This is a very pretty story by the author of *Missunderstood*, of which, by the way, we have received from the same publishers a new edition, with eight very pretty full-page illustrations by George de Maurier. Those who found great delight in *Missunderstood* will find, we believe, no less in *Thwarted*. A story for the young, we would remark, scarcely requires the dignity of two or three blank pages at the end of each frequently occurring chapter, like a three-volume novel. A little compactness in printing would have rendered *Thwarted* none the less attractive.

Pet; or, Puntimes and Penalties, by the Rev. H. R. Haweis, M.A., author of "Music and Morals." With fifty illustrations by M. E. Haweis (Lebister). We cannot say much for this story. The writing is somewhat careless, and the tone is not altogether what we could desire.

In His Name: a Story of the Dark Ages, by Edward E. Hale, author of "Ups and Downs" (Sampson Low and Co.). Mr. Hale is already known to us as an author who can write a simple but interesting story. In *His Name*—the scene of which is laid among the Waldenses—is not inferior to his *Ups and Downs*.

Life in the Red Brigade: a Story for Boys, by R. M. Ballantyne. With illustrations (Routledge). Save that Mr. Ballantyne's words are often a great deal too big, there is considerable merit in these stories. They are full of astounding adventures, and will be enjoyed by those for whom they are written.

The Children's Voyage: or, a Trip in the Water Fairy, and *Katty Lester*, both by Mrs. George Cupples (Marcus Ward). These stories are not nearly so good as Mrs. Cupples's earlier ones; while the illustrations by Edward Duncan and Harrison Weir are altogether spoilt by the colouring process through which they have been put.

A Practical Treatise on the Art of Illuminating, by Marcus Ward. Illuminator to the Queen, seems to be a very complete manual. Young people who have some taste for art would spend with pleasure many hours in "illuminating" the uncoloured devices that are given in this book in great abundance.

In the *Story of the Robins*, by Mrs. Trimmer, and in the *Book of Flowers*, translated from the German edition, both with coloured illustrations, and both published by Warne and Co., we have reprints of old favourites. One story is "designed to teach children the proper treatment of animals," and in the other are shown "piety and truth triumphant." We are ourselves immoral enough to like stories without a moral. However, for moral stories, these are a good deal above the common run.

Easydale: a Story, by Edis Searle, author of "Friends and Neighbours," &c. (Seeley and Co.). We have in this book a story of a model clergyman, who converts a careless squire and makes him all that a modern squire ought to be. The influence that a young child has over this rough man, and the way in which he tames him down and refines him, is prettily described.

The *Three Sisters*, by Mrs. Perring, and *Marian Ellis*, by a "Clergyman's Wife" (Routledge), may be described as highly proper prizes for Sunday Schools. They are full of good teaching, of painfully good fathers and mothers who are always ready to improve the occasion and to deliver a sermon on the shortest notice.

The *Story of Waterloo* (Nimmo). In this little book is given a brief but not uninteresting account of the story of Waterloo. The writer has drawn largely on Mr. Hooper's excellent work, and has drawn with judgment.

Blanche and Beryl, by Madame de Stolz. With illustrations by Emile Bayard (Routledge). The picture of French life given in this book is pleasant enough, while the story itself is pretty and wholesome. Emile Bayard's illustrations are unusually good. The translator's work, however, has not been very well done.

Elsie's Choice: a Story, by the author of "May's Garden." With eight illustrations (Seeley). We do not like this story at all. The author might surely find something better to do than to write about the flirtations of girls who are still children and of boys who are scarcely out of their knickerbockers. When such young people begin to ape the follies of those who are a few years older, instead of having them written about, we would much rather have them—the boys, at least—soundly birched.

Fifteen Glimpses from Fancyland, by Edith Milner. With sixteen illustrations drawn on wood by the Hon. Mrs. E. Stanhope (Holliston). "It seems to me," says one of the children in this book, "that sentiment is a poor morbid thing." If children like to read about such a child as this, they are not what we take them to be.

Tell Mamma, by the author of "A Trap to Catch a Sunbeam." With illustrations (Routledge). In this book girls are taught what they should do by showing them at great length what they should not do. It is too old a book for young girls, and too badly written a book, we trust, for young ladies.

Six by Two: Stories of Old Schoolfellows, by Edith Dixon and Mary de Morgan. With eight plates (Virtue). English girls will not like these pleasantly written stories because they are all about foreign school-life. The illustrations, by the way,

as having so little to do with the story that we should regret that they must have served at least once before.

Maggie's Mistake: a Schoolgirl's Story, by the author of "Aunt Annie's Stories." With twenty-four illustrations by L. Frölich (Sooley). We fancy that little maids of nine or ten years old will like to follow Maggie in all her mistakes. Let us hope that they may take warning from her, and be saved from at least some of her blunders. We cannot say much for Mr. Frölich's illustrations.

Miss Moore: a Tale for Girls, by Georgiana M. Craik. Illustrated by A. W. May (Sampson Low and Co.) Miss Moore is the new governess whom all the children dislike and tease, but who ends by winning their love. The story, though not perhaps very original, is well told.

Chris Miller, by Mrs. F. Marshall Ward (Benrose). We have over again in this story the moral of the Idle and Industrious Apprentices, with this important difference, however, to suit the requirements of our age, that in the end both the heroes do well. It strikes us as rather poorly written; but a very youthful critic, to whose judgment we submitted it, differed from us in this.

AMERICAN LITERATURE.

WE have received during the current month but few American books, and those of comparatively small interest or importance. From a political point of view none is so important as a Blue-Book presented to Congress on the subject of the Cuban Insurrection*, containing a full account of the negotiations which took place between the Spanish and American Governments in 1869, with reference to a possible armistice and ultimate recognition of Cuban independence. It is remarkable that the Spanish Ministers appear to have been more willing than might have been expected to contemplate the abandonment of the most valuable relic of their once vast Transatlantic possessions; probably believing that its permanent retention, in face of the strong sympathy shown by the Americans as a people—whether Democratic sympathizers with slavery or Republican propagandists of abolition might be in power—with every form of rebellion and disaffection in Cuba, and of the immense difficulty which the violent divisions of faction and feeling in the island presented in the way of conciliation, would prove impracticable. But the pride of the Spanish nation was roused to fierce and formidable ebullitions of indignation by the first rumours of such a proposition, and, above all, by the suspicion that the cession was to be brought about by foreign interposition; and ultimately, as our readers know, the negotiation proved abortive, the Spanish Government insisting that it could not treat with rebels in arms—a ground absurd enough if the idea of conceding the independence of those rebels were seriously entertained, but a very troublesome *argumentum ad hominem* for the President, whose party and whose predecessors had steadily maintained the same position in regard to a nation in arms whom they chose to denounce as rebels. The manner in which the United States were hampered by their own extravagant pretensions during the Civil War, and by precedents of their own making, aptly turned against them by Spain, is clearly and often ludicrously perceptible in the course of these despatches: as, for example, when Spain complains that the Cuban rebels, like the Fenians, had set up a pretended "Government of Cuba" in the States, with obvious reference to the expostulations of the Federal Government against the existence of an organized Confederate agency which it chose to call "a department of the rebel Administration," but which never claimed such a title or such powers in England. In a similar way the United States were hindered from recognizing the insurgents as a belligerent Power, or allowing vessels flying the insurgent flag to be built in or to make use of their ports; and Spain gained time to let it appear how feeble the insurrection really was if left to itself. The despatches also afford strong evidence of the antipathy of foreign residents to the rebellion; an antipathy which has, we fear, been very much mitigated by the ferocious cruelties of the Spanish party; not that the rebels are less savage, but that, as the weaker party, they have less opportunity of committing these most useless and impolitic atrocities. The entire collection, however, and the negotiations to which it refers, have now become mere matter of history, and are interesting chiefly in the light they throw on the dispositions of General Grant and his advisers.

Another publication of a different character, and of more lasting interest and value, is the latest volume—at least the latest that we have received—of the United States Geological Survey†, which extends the purview of the Survey over the territories of Montana, Idaho, Wyoming, and Utah. The most interesting portion of this work—at least to the general reader—is the description of the marvels of the Yellowstone Valley, fortunately secured

as a grand national park on a gigantic scale, which has been anticipated in these columns. We need not, therefore, repeat what we have said of the unrivalled geysers, hot-springs, and sulphur basins of that extraordinary region, the discovery of which has enabled the New World, rich as it is in natural wonders of its own, to outvie some of the most striking marvels of the Old; but may simply refer those of our readers who did not study the volume to which we then drew attention, or who wish to learn more of these strange vagaries of nature, to the chapter in which Mr. Hayden deals with them. The illustrations—a peculiar feature of American blue-books—though roughly executed and of the lowest artistic character—do really illustrate the text, and give a far clearer idea of the appearance of the geysers and springs than could be obtained from the most elaborate verbal description, and not unfrequently bring out in relief important details which are slurred over in sketches of more artistic purpose and perfection. They also exhibit the grotesque resemblances of basaltic rocks to human works; here a ruin which might in England be ascribed to Roman or Saxon; here the remains, the very reality, of a Norman castle; and again, pieces of architecture which recall the remnants of Assyrian cities and fortifications recovered by Mr. Layard. It is important from an industrial point of view to learn how largely beds of lignite, regarded by Mr. Hayden as available if not good coal, extend over the district with which the present Survey deals; from a geological point of view, it is perhaps equally interesting to learn that they appear to extend from the Cretaceous into the Tertiary strata, and with their fossils to form a link between the two, and indicate that, in some cases at least, they have immediately succeeded each other. We leave to men of science the appreciation of Mr. Hayden's views. For us it suffices to mention in conclusion that he requests the scientific Societies of other countries, in exchange for the Reports and specimens which he is willing to send them, to furnish him with works in their possession which may help to form a library for the use of the Survey.

The second volume of the collected works of Count Rumford*—the first, containing his memoir, we have already noticed—is occupied with a number of papers and tracts on topics of natural philosophy, chiefly relating to the nature and laws of heat, several of which were read before the Royal Society and Institutes of corresponding rank abroad. The writer's views are often completely obsolete—as where he supposes that a cold body not merely abstracts heat from warmer neighbours, but actually radiates cold; sometimes, as in the paper on the density of water just above the freezing-point, they contain the germ, or more than the germ, of modern discoveries; but the recent progress of knowledge or of theory on scientific subjects generally, and especially on Count Rumford's favourite topic, has left him so far behind that his treatises have for the most part only an historical value or interest. But his essays on the consumption of fuel and the construction of fireplaces still deserve the attention of a generation which has not learnt, and even under the pressure of enormous prices is not yet learning, to construct its chimneys so as to obtain half the heat given out by the fuel consumed to warm its rooms or cook its food.

A little treatise, in the form of a dialogue between teacher and pupil, on the use of the voice‡ may be serviceable to others besides singers and actors and other professional students, though we doubt whether it will receive much attention in any other quarters. In American schools what is called "declamation" is taught as a necessary accomplishment and an essential part of a complete education; and Mr. Daniell's volume may find more favour there than here. To those, however, who are aware how valuable and how rare an accomplishment is the art of reading aloud, reciting, or delivering the shortest and simplest reply to a toast or compliment in public, the American practice may seem to have its merits, and this slight volume to have claims on popular notice.

Dr. Clarke, in a practical treatise§ which cannot be too earnestly recommended to the attention of those elders of either sex who are guilty of encouraging the younger members of the Woman's Rights sect in the folly of pursuing a masculine education with the aim of following a masculine profession, discusses at length the physiological reasons which render it dangerous to work young girls as boys are expected to work; and he points out how large a share the habit of educating the two sexes on the same system and with the same degree of exacting strictness and emulous competition has had in rendering American women unfit to be wives and mothers, and bringing about that early loss of health and beauty which is their characteristic. He is not bold enough to deny that girls can learn what boys can, or can fit themselves for the same pursuits. But every man who knows anything of school work and college work, and admits Dr. Clarke's premises, must draw that conclusion for himself. Granted that girls from fourteen to twenty—the critical period of education—can only work at the most

* Correspondence between the Department of State and the United States Minister at Madrid, and the Consular Representatives of the United States in the Island of Cuba; and other Papers relating to Cuban Affairs; transmitted to the House of Representatives in Obedience to a Resolution. Washington: Government Printing Office. London: Trübner & Co.

† Sixth Annual Report of the United States Geological Survey, embracing portions of Montana, Idaho, Wyoming, and Utah, being a Report of Progress of the Explorations for the year 1872. By F. V. Hayden, United States Geologist. Conducted under the Authority of the Secretary of the Interior. Washington: Government Printing Office. London: Trübner & Co. 1873.

* The Complete Works of Count Rumford. Vol. 2. Boston: Published by the American Academy of Arts and Sciences. London: Trübner & Co.

‡ The Voice, and How to Use it. By W. H. Daniell. Boston: Osgood & Co. London: Trübner & Co. 1873.

§ The Fair Chance for the Girls. By Edward H. Clarke, M.D., Member of the Massachusetts Medical Society, Fellow of the American Academy of Arts and Sciences, late Professor of Materia Medica in Harvard College, &c. &c. Boston: Osgood & Co. London: Trübner & Co. 1873.
